

# **AM335x ARM® Cortex™-A8 Microprocessors (MPUs)**

## **Technical Reference Manual**

Literature Number: SPRUH73G  
October 2011–Revised November 2012

|   |            |
|---|------------|
| <b>Preface .....</b>  | <b>146</b> |
| <b>1    Introduction .....</b>  | <b>147</b> |
| 1.1    AM335x Family .....  | 147        |
| 1.1.1    Device Features .....  | 147        |
| 1.1.2    Device Identification .....  | 148        |
| 1.1.3    Feature Identification .....   | 148        |
| <b>2    Memory Map .....</b>  | <b>150</b> |
| 2.1    ARM Cortex-A8 Memory Map .....   | 150        |
| 2.2    ARM Cortex-M3 Memory Map .....   | 159        |
| <b>3    ARM MPU Subsystem .....</b>   | <b>161</b> |
| 3.1    ARM Cortex-A8 MPU Subsystem .....  | 162        |
| 3.1.1    Features .....   | 163        |
| 3.1.2    MPU Subsystem Integration .....  | 163        |
| 3.1.3    MPU Subsystem Clock and Reset Distribution .....                                       | 164        |
| 3.1.4    ARM Subchip .....  | 167        |
| 3.1.5    Interrupt Controller .....   | 168        |
| 3.1.6    Power Management .....   | 168        |
| 3.1.7    ARM Programming Model .....  | 171        |
| <b>4    Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS) .....</b> | <b>173</b> |
| 4.1    Introduction .....   | 174        |
| <b>5    Graphics Accelerator (SGX) .....</b>  | <b>175</b> |
| 5.1    Introduction .....   | 176        |
| 5.1.1    POWERVR SGX Main Features .....  | 176        |
| 5.1.2    SGX 3D Features .....  | 176        |
| 5.1.3    Universal Scalable Shader Engine (USSE) – Key Features .....                           | 177        |
| 5.1.4    Unsupported Features .....   | 178        |
| 5.2    Integration .....  | 179        |
| 5.2.1    SGX530 Connectivity Attributes .....   | 179        |
| 5.2.2    SGX530 Clock and Reset Management .....  | 179        |
| 5.2.3    SGX530 Pin List .....  | 180        |
| 5.3    Functional Description .....   | 181        |
| 5.3.1    SGX Block Diagram .....  | 181        |
| 5.3.2    SGX Elements Description .....   | 181        |
| <b>6    Interrupts .....</b>  | <b>183</b> |
| 6.1    Functional Description .....   | 184        |
| 6.1.1    Interrupt Processing .....   | 185        |
| 6.1.2    Register Protection .....  | 186        |
| 6.1.3    Module Power Saving .....  | 186        |
| 6.1.4    Error Handling .....   | 186        |
| 6.1.5    Interrupt Handling .....   | 186        |
| 6.2    Basic Programming Model .....  | 187        |
| 6.2.1    Initialization Sequence .....  | 187        |
| 6.2.2    INTC Processing Sequence .....   | 187        |
| 6.2.3    INTC Preemptive Processing Sequence .....  | 191        |

|          |  |            |
|----------|--|------------|
| 6.2.4    | Interrupt Preemption .....                                 | 195        |
| 6.2.5    | ARM A8 INTC Spurious Interrupt Handling .....              | 195        |
| 6.3      | ARM Cortex-A8 Interrupts .....                             | 196        |
| 6.4      | ARM Cortex-M3 Interrupts .....                             | 200        |
| 6.5      | PWM Events .....   | 202        |
| 6.6      | Interrupt Controller Registers .....                       | 203        |
| 6.6.1    | INTC Registers .....                                       | 203        |
| <b>7</b> | <b>Memory Subsystem .....</b>                              | <b>249</b> |
| 7.1      | GPMC .....   | 250        |
| 7.1.1    | Introduction .....   | 250        |
| 7.1.2    | Integration .....  | 253        |
| 7.1.3    | Functional Description .....                               | 255        |
| 7.1.4    | Use Cases .....  | 354        |
| 7.1.5    | Registers .....  | 365        |
| 7.2      | OCMC-RAM .....   | 397        |
| 7.2.1    | Introduction .....   | 397        |
| 7.2.2    | Integration .....  | 398        |
| 7.3      | EMIF .....   | 399        |
| 7.3.1    | Introduction .....   | 399        |
| 7.3.2    | Integration .....  | 401        |
| 7.3.3    | Functional Description .....                               | 403        |
| 7.3.4    | Use Cases .....  | 421        |
| 7.3.5    | EMIF4D Registers .....                                     | 421        |
| 7.3.6    | DDR2/3/mDDR PHY Registers .....                            | 466        |
| 7.4      | ELM .....  | 475        |
| 7.4.1    | Introduction .....   | 475        |
| 7.4.2    | Integration .....  | 476        |
| 7.4.3    | Functional Description .....                               | 477        |
| 7.4.4    | Basic Programming Model .....                              | 480        |
| 7.4.5    | ELM Registers .....  | 486        |
| <b>8</b> | <b>Power, Reset, and Clock Management (PRCM) .....</b>     | <b>498</b> |
| 8.1      | Power, Reset, and Clock Management .....                   | 499        |
| 8.1.1    | Introduction .....   | 499        |
| 8.1.2    | Device Power-Management Architecture Building Blocks ..... | 499        |
| 8.1.3    | Clock Management .....                                     | 499        |
| 8.1.4    | Power Management .....                                     | 505        |
| 8.1.5    | PRCM Module Overview .....                                 | 513        |
| 8.1.6    | Clock Generation and Management .....                      | 514        |
| 8.1.7    | Reset Management .....                                     | 531        |
| 8.1.8    | Power-Up/Down Sequence .....                               | 540        |
| 8.1.9    | IO State .....   | 540        |
| 8.1.10   | Voltage and Power Domains .....                            | 540        |
| 8.1.11   | Device Modules and Power Management Attributes List .....  | 541        |
| 8.1.12   | Clock Module Registers .....                               | 544        |
| 8.1.13   | Power Management Registers .....                           | 701        |
| <b>9</b> | <b>Control Module .....</b>                                | <b>742</b> |
| 9.1      | Introduction .....   | 743        |
| 9.2      | Functional Description .....                               | 743        |
| 9.2.1    | Control Module Initialization .....                        | 743        |
| 9.2.2    | Pad Control Registers .....                                | 743        |
| 9.2.3    | EDMA Event Multiplexing .....                              | 744        |
| 9.2.4    | Device Control and Status .....                            | 745        |
| 9.2.5    | DDR PHY .....  | 752        |

|        |   |     |
|--------|---|-----|
| 9.3    | CONTROL_MODULE Registers .....  | 753 |
| 9.3.1  | control_revision Register (offset = 0h) [reset = 0h] .....            | 759 |
| 9.3.2  | device_id Register (offset = 600h) [reset = 0x] .....                 | 760 |
| 9.3.3  | control_hwinfo Register (offset = 4h) [reset = 0h] .....              | 761 |
| 9.3.4  | control_sysconfig Register (offset = 10h) [reset = 0h] .....          | 762 |
| 9.3.5  | control_status Register (offset = 40h) [reset = 0h] .....             | 763 |
| 9.3.6  | control_emif_sdram_config Register (offset = 110h) [reset = 0h] ..... | 764 |
| 9.3.7  | core_sldo_ctrl Register (offset = 428h) [reset = 0h] .....            | 766 |
| 9.3.8  | mpu_sldo_ctrl Register (offset = 42Ch) [reset = 0h] .....             | 767 |
| 9.3.9  | clk32kdivratio_ctrl Register (offset = 444h) [reset = 0h] .....       | 768 |
| 9.3.10 | bandgap_ctrl Register (offset = 448h) [reset = 0h] .....              | 769 |
| 9.3.11 | bandgap_trim Register (offset = 44Ch) [reset = 0h] .....              | 770 |
| 9.3.12 | pll_clkinpulow_ctrl Register (offset = 458h) [reset = 0h] .....       | 771 |
| 9.3.13 | mosc_ctrl Register (offset = 468h) [reset = 0h] .....                 | 772 |
| 9.3.14 | rcosc_ctrl Register (offset = 46Ch) [reset = 0h] .....                | 773 |
| 9.3.15 | deepsleep_ctrl Register (offset = 470h) [reset = 0h] .....            | 774 |
| 9.3.16 | dev_feature Register (offset = 604h) [reset = 0h] .....               | 775 |
| 9.3.17 | init_priority_0 Register (offset = 608h) [reset = 0h] .....           | 776 |
| 9.3.18 | init_priority_1 Register (offset = 60Ch) [reset = 0h] .....           | 777 |
| 9.3.19 | mmu_cfg Register (offset = 610h) [reset = 0h] .....                   | 778 |
| 9.3.20 | tptc_cfg Register (offset = 614h) [reset = 0h] .....                  | 779 |
| 9.3.21 | usb_ctrl0 Register (offset = 620h) [reset = 0h] .....                 | 780 |
| 9.3.22 | usb_sts0 Register (offset = 624h) [reset = 0h] .....                  | 782 |
| 9.3.23 | usb_ctrl1 Register (offset = 628h) [reset = 0h] .....                 | 783 |
| 9.3.24 | usb_sts1 Register (offset = 62Ch) [reset = 0h] .....                  | 785 |
| 9.3.25 | mac_id0_lo Register (offset = 630h) [reset = 0h] .....                | 786 |
| 9.3.26 | mac_id0_hi Register (offset = 634h) [reset = 0h] .....                | 787 |
| 9.3.27 | mac_id1_lo Register (offset = 638h) [reset = 0h] .....                | 788 |
| 9.3.28 | mac_id1_hi Register (offset = 63Ch) [reset = 0h] .....                | 789 |
| 9.3.29 | dcan_raminit Register (offset = 644h) [reset = 0h] .....              | 790 |
| 9.3.30 | usb_wkup_ctrl Register (offset = 648h) [reset = 0h] .....             | 791 |
| 9.3.31 | gmii_sel Register (offset = 650h) [reset = 0h] .....                  | 792 |
| 9.3.32 | pwmss_ctrl Register (offset = 664h) [reset = 0h] .....                | 793 |
| 9.3.33 | mreqprio_0 Register (offset = 670h) [reset = 0h] .....                | 794 |
| 9.3.34 | mreqprio_1 Register (offset = 674h) [reset = 0h] .....                | 795 |
| 9.3.35 | hw_event_sel_grp1 Register (offset = 690h) [reset = 0h] .....         | 796 |
| 9.3.36 | hw_event_sel_grp2 Register (offset = 694h) [reset = 0h] .....         | 797 |
| 9.3.37 | hw_event_sel_grp3 Register (offset = 698h) [reset = 0h] .....         | 798 |
| 9.3.38 | hw_event_sel_grp4 Register (offset = 69Ch) [reset = 0h] .....         | 799 |
| 9.3.39 | smrt_ctrl Register (offset = 6A0h) [reset = 0h] .....                 | 800 |
| 9.3.40 | mpuss_hw_debug_sel Register (offset = 6A4h) [reset = 0h] .....        | 801 |
| 9.3.41 | mpuss_hw_dbg_info Register (offset = 6A8h) [reset = 0h] .....         | 802 |
| 9.3.42 | vdd_mpu_opp_050 Register (offset = 770h) [reset = 0h] .....           | 803 |
| 9.3.43 | vdd_mpu_opp_100 Register (offset = 774h) [reset = 0h] .....           | 804 |
| 9.3.44 | vdd_mpu_opp_120 Register (offset = 778h) [reset = 0h] .....           | 805 |
| 9.3.45 | vdd_mpu_opp_turbo Register (offset = 77Ch) [reset = 0h] .....         | 806 |
| 9.3.46 | vdd_core_opp_050 Register (offset = 7B8h) [reset = 0h] .....          | 807 |
| 9.3.47 | vdd_core_opp_100 Register (offset = 7BCh) [reset = 0h] .....          | 808 |
| 9.3.48 | bb_scale Register (offset = 7D0h) [reset = 0h] .....                  | 809 |
| 9.3.49 | usb_vid_pid Register (offset = 7F4h) [reset = 4516141h] .....         | 810 |
| 9.3.50 | conf_<module>_<pin> Register (offset = 800h–A34h) .....               | 811 |
| 9.3.51 | cqdetect_status Register (offset = E00h) [reset = 0h] .....           | 812 |
| 9.3.52 | ddr_io_ctrl Register (offset = E04h) [reset = 0h] .....               | 813 |

|           |  |            |
|-----------|--|------------|
| 9.3.53    | vtp_ctrl Register (offset = E0Ch) [reset = 0h] .....           | 814        |
| 9.3.54    | vref_ctrl Register (offset = E14h) [reset = 0h] .....          | 815        |

## Introduction

### 1.1 AM335x Family

#### 1.1.1 Device Features

This architecture is configured with different sets of features in different devices. This technical reference manual details all of the features available in current and future AM335x devices. Some features may not be available or supported in your particular device. The features supported across different AM335x devices are shown in [Table 1-1](#). For more information on the different packages, refer to your device-specific data manual.

**Table 1-1. Device Features**

### 1.1.2 Device Identification

Several registers help identify the type and available features of the device. [Table 1-2](#) and summarize these registers.

**Table 1-2. Device\_ID (Address 0x44E10600) Bit Field Descriptions**

| Bit   | Field    | Value | Description   |
|-------|----------|-------|---|
| 31-28 | DEVREV   |       | Device revision<br>See AM335x errata for specific information on each revision.<br>Value is revision-dependent. |
| 27-12 | PARTNUM  |       | Device part number<br>0xB944  |
| 11-1  | MFGR     |       | Manufacturer's ID<br>0x017  |
| 0     | Reserved |       | Read always as 0<br>0x0   |

### 1.1.3 Feature Identification

The AM335x has many different feature sets available. The DEV\_FEATURE register in the control module identifies which features are available in each device in the AM335x family. See [Table 1-3, dev\\_feature Register](#), in the control module chapter for more information on the bits in the DEV\_FEATURE register.

**Table 1-3. DEV\_FEATURE (Address 0x44E10604) Register Values**

| Bit            | 3<br>1                               | 3<br>0      | 29       | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 1<br>7           | 1<br>6           | 15       | 14 | 13 | 12 | 11 | 10 | 9                                    | 8                | 7        | 6 | 5 | 4 | 3 | 2 | 1                | 0                | Register Value |

## Memory Map

This section describes the memory map for the device.

### 2.1 ARM Cortex-A8 Memory Map

**Table 2-1. L3 Memory Map**

| Block Name                | Start_address (hex) | End_address (hex) | Size   | Description  |
|---------------------------|---------------------|-------------------|--------|--|
| GPMC<br>(External Memory) | 0x0000_0000         | 0x1FFF_FFFF       | 512MB  | 8-/16-bit External Memory<br>(Ex/R/W) <sup>(1)</sup> |
| Reserved                  | 0x2000_0000         | 0x3FFF_FFFF       | 512MB  | Reserved   |
| Boot ROM                  | 0x4000_0000         | 0x4001_FFFF       | 128KB  |  |
|                           | 0x4002_0000         | 0x4002_BFFF       | 48KB   | 32-bit Ex/R <sup>(1)</sup> – Public                  |
| Reserved                  | 0x4002_C000         | 0x400F_FFFF       | 848KB  | Reserved   |

<sup>(1)</sup> The Wakeup M3 may access the UMEM and DMEM using the L4\_WKUP (OCP Bus) or it may use its direct buses, by accessing address 0x00000000 – 0x00081FFF.

<sup>(2)</sup> These addresses correspond to L3 regions. These are reserved regions with respect to Wakeup M3.

<sup>(3)</sup> Accessing these bit-band alias regions results in an access to the corresponding bit-band region.

<sup>(4)</sup> Peripherals located on L4 Wakeup Bus can be accessed by Wakeup M3.

## ARM MPU Subsystem

This chapter describes the MPU Subsystem for the device.

| Topic  | Page       |
|--|------------|
| <b>3.1 ARM Cortex-A8 MPU Subsystem .....</b> | <b>162</b> |

### 3.1 ARM Cortex-A8 MPU Subsystem

The Microprocessor Unit (MPU) subsystem of the device handles transactions between the ARM core (ARM® Cortex™-A8 Processor), the L3 interconnect, and the interrupt controller (INTC). The MPU subsystem is a hard macro that integrates the ARM® Cortex™-A8 Processor with additional logic for protocol conversion, emulation, interrupt handling, and debug enhancements.

Cortex™-A8 is an ARMv7 compatible, dual-issue, in-order execution engine with integrated L1 and L2 caches with NEON™ SIMD Media Processing Unit.

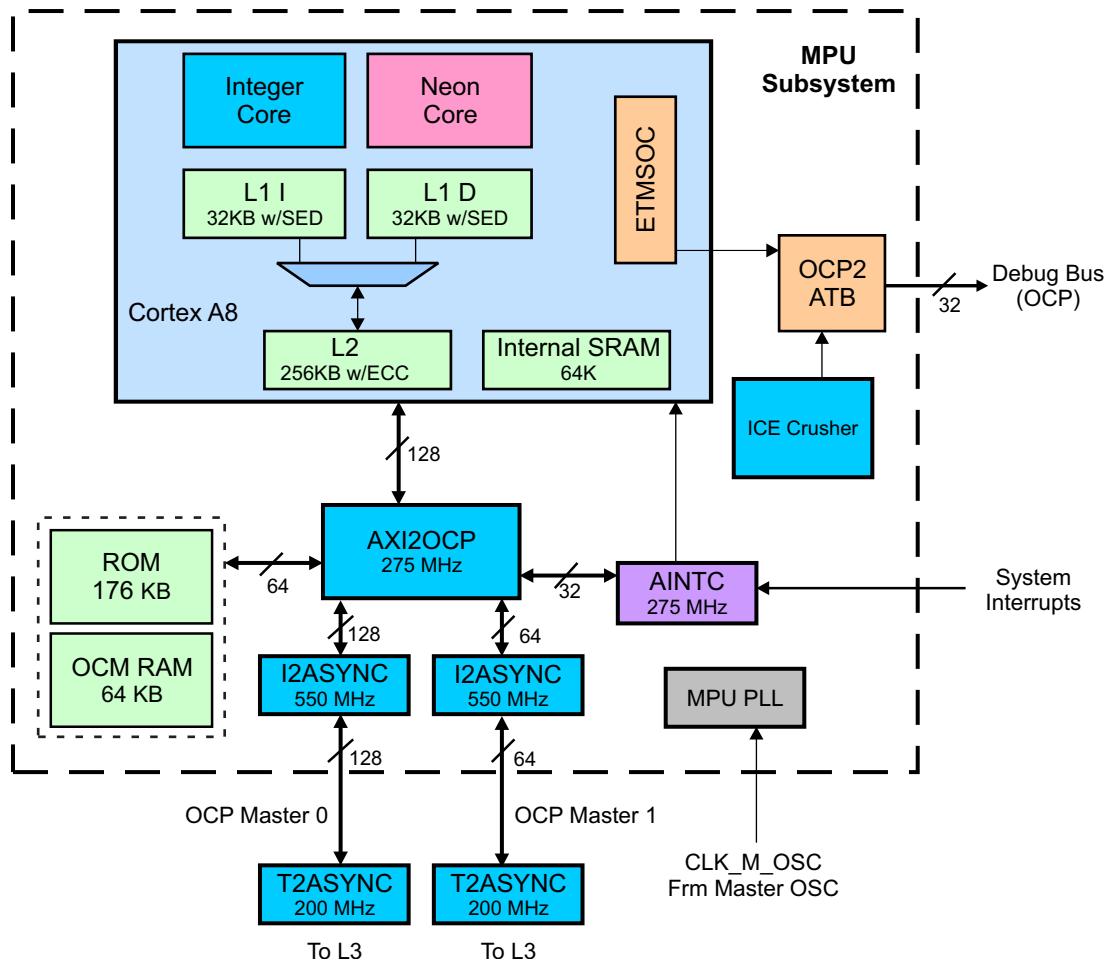

An Interrupt Controller is included in the MPU subsystem to handle host interrupt requests in the system.

The MPU subsystem includes CoreSight compliant logic to allow the Debug Sub-system access to the CortexA8 debug and emulation resources, including the Embedded Trace Macrocell.

The MPU subsystem has three functional clock domains, including a high-frequency clock domain used by the Cortex™-A8. The high-frequency domain is isolated from the rest of the system by asynchronous bridges.

Figure 3-1 shows the high-level block diagram of the MPU subsystem.

**Figure 3-1. Microprocessor Unit (MPU) Subsystem**

### 3.1.1 Features

This section outlines the key features of the MPU subsystem:

- ARM Microprocessor
  - CortexA8
  - ARM Architecture version 7 ISA.
  - 2-issue, in-order execution pipeline.
  - L1 and L2 Instruction and Data Cache of 32 KB , 4-way, 16 word line with 128 bit interface.
  - Integrated L2 cache of 256 KB, 8-way, 16 word line, 128 bit interface to L1 along with ECC/Parity supported.
  - Includes the Neon Media coprocessor (NEON™) which implements the Advanced SIMD media processing architecture.
  - Includes the VFP coprocessor which implements the VFPv3 architecture and is fully compliant with IEEE 754 standard.
  - The external interface uses the AXI protocol configured to 128-bit data width.
  - Includes the Embedded Trace Macrocell (ETM) support for non-invasive debugging.
  - Implements the ARMv7 debug with watch-point and breakpoint registers and 32-bit Advanced Peripheral Bus (APB) slave interface to CoreSight debug systems.
- AXI2OCP Bridge
  - Support OCP 2.2.
  - Single Request Multiple Data Protocol on two ports.
  - Multiple targets, including three OCP ports (128-bit, 64-bit and 32-bit).
- Interrupt Controller
  - Support up to 128 interrupt requests
- Emulation/Debug
  - Compatible with CoreSight Architecture.
- Clock Generation
  - Through PRCM
- DFT
  - Integrated PBIST controller to test L2 tag and data ram, L1I and L1D data ram and OCM RAM.

### 3.1.2 MPU Subsystem Integration

The MPU subsystem integrates the following group of submodules:

**ARM® Cortex™-A8 Processor:** Provides a high processing capability, including the NEON technology for mobile multimedia acceleration. The ARM communicates through an AXI bus with the AXI2OCP bridge and receives interrupts from the MPU subsystem interrupt controller (MPU INTC).

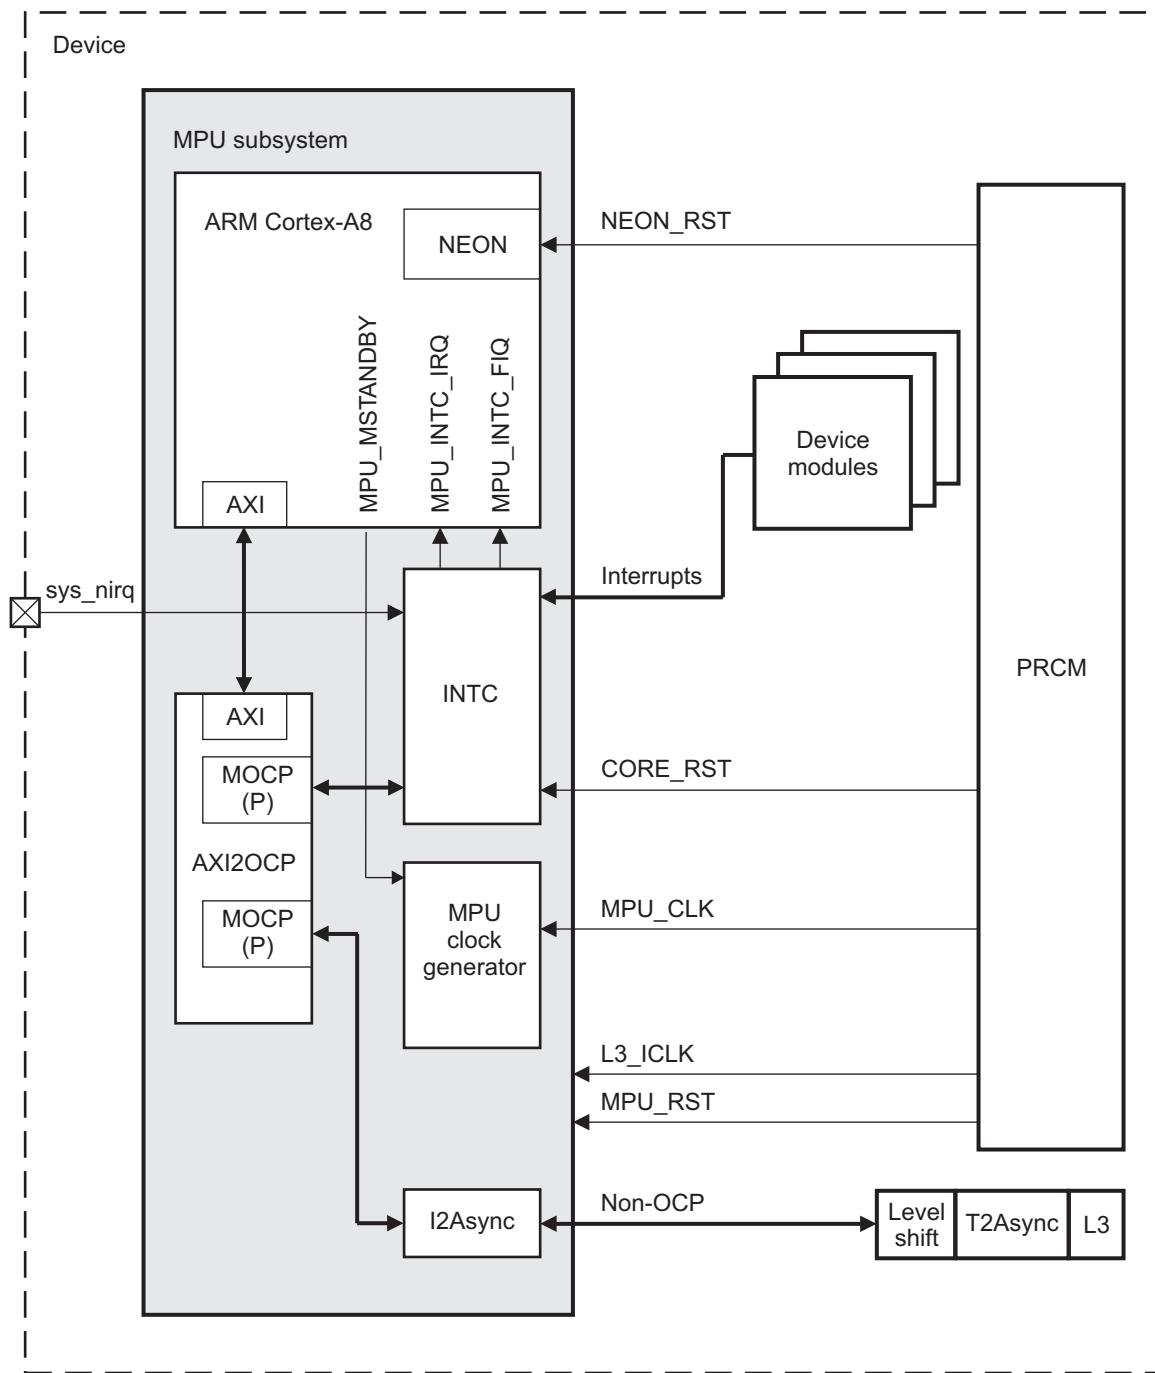

**Interrupt controller:** Handles the module interrupts (for details, see [Chapter 6, Interrupts](#)).

**AXI2OCP bridge:** Allows communication between the ARM (AXI), the INTC (OCP), and the modules (OCP L3).

**I2Async bridge:** This is an asynchronous bridge interface providing an asynchronous OCP to OCP interface. This interface is between the AXI2OCP bridge within the MPU subsystem and the T2Async bridge external to the MPU subsystem.

**Clock Divider:** Provides the required divided clocks to the internal modules of the MPU subsystem and has a clock input from SYSCLK2 which is fed by the power, reset, and clock management (PRCM) module of the device.

**In-Circuit Emulator:** It is fully Compatible with CoreSight Architecture and enables debugging capabilities.

**Figure 3-2. Microprocessor Unit (MPU) Subsystem Signal Interface**

### 3.1.3 MPU Subsystem Clock and Reset Distribution

#### 3.1.3.1 Clock Distribution

The MPU subsystem includes an embedded DPLL which sources the clock for the ARM Cortex-A8 processor. A clock divider within the subsystem is used for deriving the clocks for other internal modules.

All major modules inside the MPU subsystem are clocked at half the frequency of the ARM core. The divider of the output clock can be programmed with the PRCM.CM\_CLKSEL2\_PLL\_MPUMPU\_DPLL\_CLKOUT\_DIV register field, the frequency is relative to the ARM core. For details see the Power, Reset, and Clock Management (PRCM) chapter.

The clock generator generates the following functional clocks:

**ARM (ARM\_FCLK):** This is the core clock. It is the base fast clock that is routed internally to the ARM logic and internal RAMs, including NEON, L2 cache, the ETM core (emulation), and the ARM core.

**AXI2OCP Clock (AXI\_FCLK):** This clock is half the frequency of the ARM clock (ARM\_FCLK). The OCP interface thus performs at one half the frequency of ARM.

**Interrupt Controller Functional Clock (MPU\_INTC\_FCLK):** This clock, which is part of the INTC module, is half the frequency of the ARM clock (ARM\_FCLK).

**ICE-Crusher Functional Clock (ICECRUSHER\_FCLK):** ICE-Crusher clocking operates on the APB interface, using the ARM core clocking. This clock is half the frequency of the ARM clock (ARM\_FCLK).

**I2Async Clock (I2ASYNC\_FCLK):** This clock is half the frequency of the ARM clock (ARM\_FCLK). It matches the OCP interface of the AXI2OCP bridge.

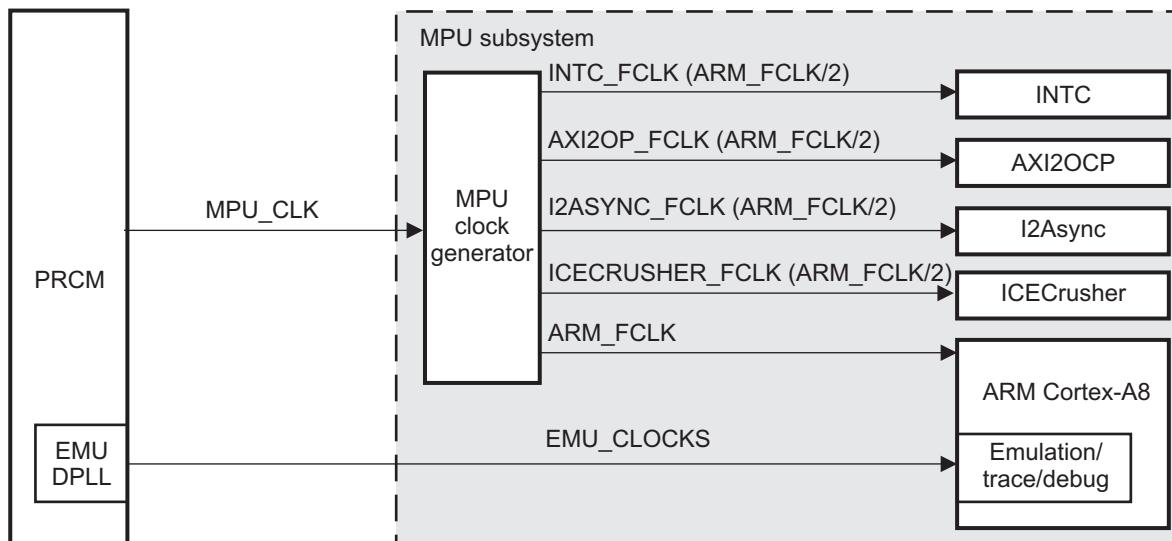

---

**NOTE:** The second half of the asynchronous bridge (T2ASYNC) is clocked directly by the PRCM with the core clock. T2ASYNC is not part of the MPU subsystem.

---

**Emulation Clocking:** Emulation clocks are distributed by the PRCM module and are asynchronous to the ARM core clock (ARM\_FCLK) and can run at a maximum of 1/3 the ARM core clock.

Table [Table 3-1](#) summarizes the clocks generated in the MPU subsystem by the MPU clock generator.

**Figure 3-3. MPU Subsystem Clocking Scheme**

**Table 3-1. MPU Subsystem Clock Frequencies**

| Clock signal                    | Frequency   |
|---------------------------------|-------------|
| Cortex A8 Core Functional Clock | MPU_CLK     |
| AXI2OCP Bridge Functional Clock | MPU_CLK / 2 |
| Device Clock                    | MPU_CLK / 2 |
| I2Async Bridge Functional Clock | MPU_CLK / 2 |

### 3.1.3.2 Reset Distribution

Resets to the MPU subsystem are provided by the PRCM and controlled by the clock generator module.

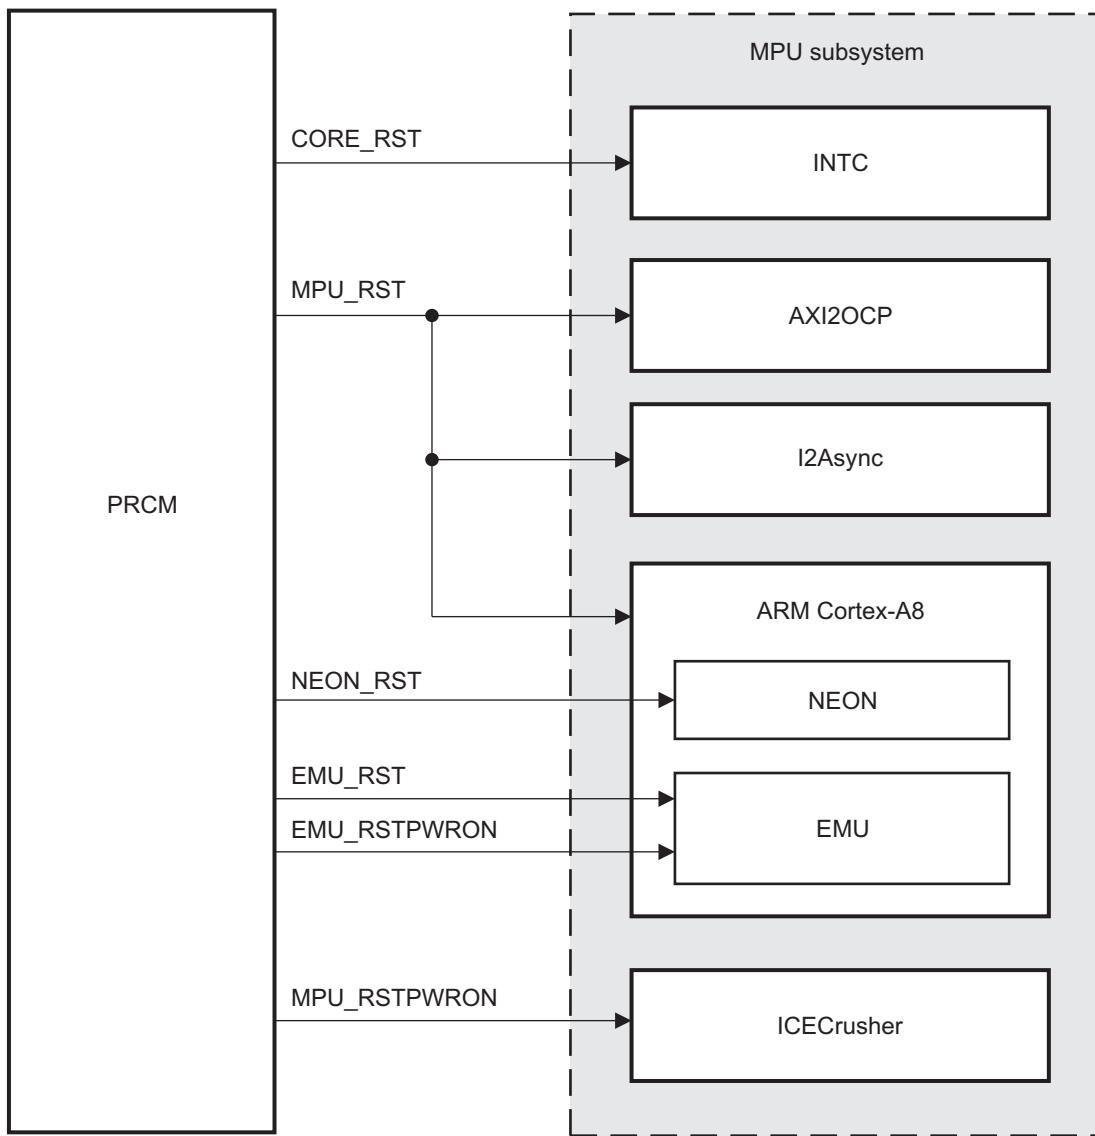

Figure 3-4. Reset Scheme of the MPU Subsystem

Table 3-2. Reset Scheme of the MPU Subsystem

| Signal Name  | I/O | Interface |
|--------------|-----|-----------|
| MPU_RST      | I   | PRCM      |
| NEON_RST     | I   | PRCM      |
| CORE_RST     | I   | PRCM      |
| MPU_RSTPWRON | I   | PRCM      |
| EMU_RST      | I   | PRCM      |
| EMU_RSTPWRON | I   | PRCM      |

For details about clocks, resets, and power domains, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

### 3.1.4 ARM Subchip

#### 3.1.4.1 ARM Overview

The ARM Cortex-A8 processor incorporates the technologies available in the ARM7™ architecture. These technologies include NEON™ for media and signal processing and Jazelle™ RCT for acceleration of realtime compilers, Thumb®-2 technology for code density and the VFPv3 floating point architecture.

#### 3.1.4.2 ARM Description

##### 3.1.4.2.1 ARM® Cortex™-A8 Instruction, Data, and Private Peripheral Port

The AXI bus interface is the main interface to the ARM system bus. It performs L2 cache fills and non-cacheable accesses for both instructions and data. The AXI interface supports 128bit and 64-bit wide input and output data buses. It supports multiple outstanding requests on the AXI bus and a wide range of bus clock to core clock ratios. The bus clock is synchronous with the core clock.

See the ARM ® Cortex™-A8 Technical Reference Manual for a complete programming model of the transaction rules (ordering, posting, and pipeline synchronization) that are applied depending on the memory region attribute associated with the transaction destination address.

##### 3.1.4.2.2 Secure Monitor Calls to Access CP15 Registers

The device supports special secure monitor functions that allows access to certain ARM core registers in privileged mode. Functions to write to the Auxiliary Control Register, Nonsecure Access Control Register, and the L2 Cache Auxiliary Control Register are provided (see the ARM Technical Reference Manual for a description of these registers).

| Service ID (R12) | Description  |
|------------------|--|
| 0x100            | Write value in R0 to Auxiliary Control Register          |
| 0x101            | Write value in R0 to Non Secure Access Control Register  |
| 0x102            | Write value in R0 to L2 Cache Auxiliary Control Register |

In general, the procedure to use these secure monitor call is as follows:

- Write the appropriate service ID to R12 .
- Load R0 with the value to write to the ARM core register.
- Perform barrier operations to ensure proper execution.
- Use SMC #1 (or SMI #1) to make the secure monitor call

Barrier instructions are also necessary to ensure a clean state before entering the secure monitor. Refer to the following example which provides the proper code sequence. This code provides an example of enabling ECC on L2 cache. Note: This function should be executed in an ARM privileged mode.

```
_enableL2ECC:
    STMFD sp!, {r0 - r4}          ; save context of R0-R4, which secure monitor call may use
    MRC p15, #1, r0, c9, c0, #2    ; Read L2 Cache Auxiliary Control Reg into R0
    MOV r1, #0                     ; Clear R1
    MOVT r1, #0x1020              ; enable mask for ECC (set bits 21 and 28 to enable ECC)
    ORR r0, r0, r1                ; OR with original register value
    MOV r12, #0x0102              ; setup service ID in R12
    MCR p15,#0x0,r1,c7,c5,#6     ; invalidate entire branch predictor array
    DSB                         ; data synchronization barrier operation
    ISB                          ; instruction synchronization barrier operation
    DMB                          ; data memory barrier operation
    SMC #1                       ; secure monitor call SMC (previously SMI)
    LDMFD sp!, {r0 - r4}          ; after returning from SMC, restore R0-R4
    MOV pc, lr                    ; return
```

### 3.1.4.2.3 ARM Core Supported Features

Table 3-3 provides a list of main functions of the Cortex™-A8 core supported inside the MPU Subsystem.

**Table 3-3. ARM Core Supported Features**

| Features                           | Comments   |
|------------------------------------|--|
| ARM version 7 ISA                  | Standard ARM instruction set + Thumb2™, JazelleX™ Java accelerator, and Media extensions.  |
|                                    | Backward compatible with previous ARM ISA versions.  |
| L1 Icache and Dcache               | 32 KB , 4-way, 16 word line, 128 bit interface.  |
| L2 Cache                           | 256 KB, 8-way, 16 word line, 128 bit interface to L1, ECC/Parity is supported. The L2 cache and cache controller are embedded within the ARM core.               |
|                                    | L2 valid bits cleared by software loop or by hardware.   |
| TLB                                | Fully associative and separate ITLB with 32 entries and DTLB with 32 entries.  |
| CoreSight ETM                      | The CoreSight ETM is embedded with the ARM core. The 32KB buffer (ETB) exists at the Chip Level (DebugSS)  |
| Branch Target Address Cache        | 512 entries  |
| Enhanced Memory Management Unit    | Mapping sizes are 4KB, 64KB, 1MB, and 16MB. (ARM MMU adds extended physical address ranges)  |
| Neon                               | Gives greatly enhanced throughput for media workloads and VFP-Lite support.  |
| Flat Memories                      | 176 Kbytes of ROM  |
|                                    | 64 Kbytes of RAM   |
| Buses                              | 128 bit AXI internal bus from CortexA8 routed by an AXI2OCP bridge to the interrupt controller, ROM, RAM, and 3 asynchronous OCP bridges (128 bits, and 64 bits) |
| Low interrupt latency              | Closely coupled INTC to the ARM core with 128 interrupt lines  |
| Vectored Interrupt Controller Port | Present.   |
| JTAG based debug                   | Supported via DAP  |
| Trace support                      | Supported via TPIU   |
| External Coprocessor               | Not supported  |

### 3.1.5 Interrupt Controller

The Host ARM Interrupt Controller (AINTC) is responsible for prioritizing all service requests from the system peripherals and generating either nIRQ or nFIQ to the host. The type of the interrupt (nIRQ or nFIQ) and the priority of the interrupt inputs are programmable. The AINTC interfaces to the ARM processor via the AXI port through an AXI2OCP bridge and runs at half the processor speed. It has the capability to handle up to 128 requests which can be steered/prioritized as A8 nFIQ or nIRQ interrupt requests.

The general features of the AINTC are:

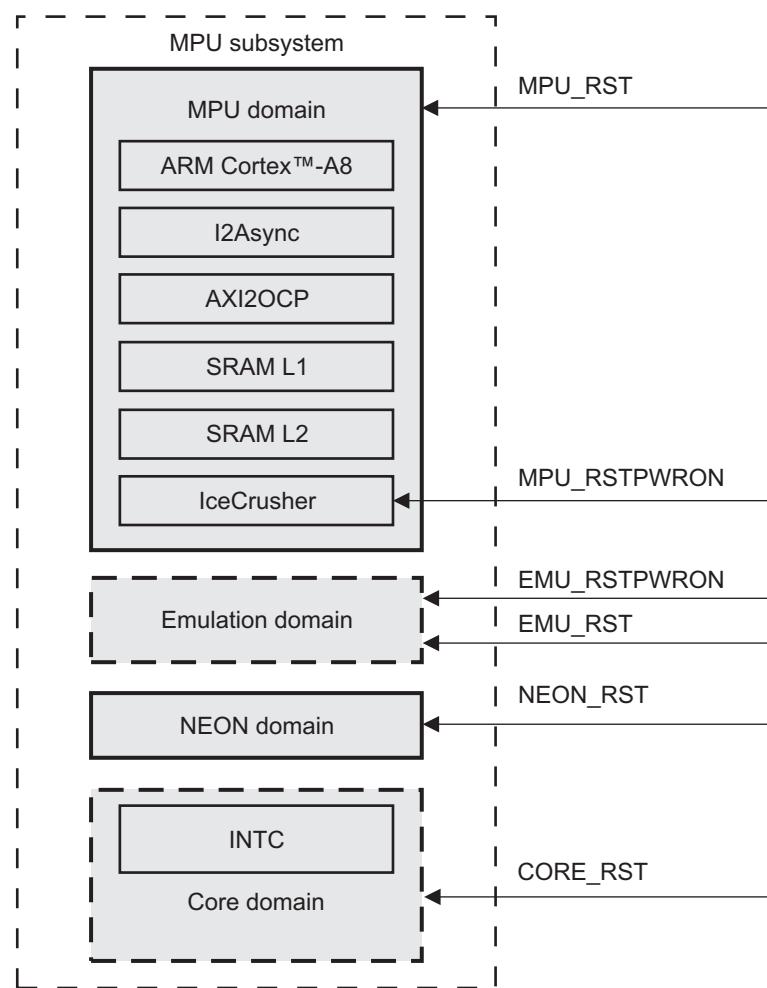

- Up to 128 level sensitive interrupts inputs
- Individual priority for each interrupt input
- Each interrupt can be steered to nFIQ or nIRQ
- Independent priority sorting for nFIQ and nIRQ

### 3.1.6 Power Management

#### 3.1.6.1 Power Domains

The MPU subsystem is divided into 5 power domains controlled by the PRCM, as shown in Figure 3-5.

**NOTE:** The emulation domain and the core domain are not fully embedded in MPU subsystem.

**Figure 3-5. MPU Subsystem Power Domain Overview**

Power management requirements at the device level govern power domains for the MPU subsystem. The device-level power domains are directly aligned with voltage domains and thus can be represented as a cross reference to the different voltage domains.

Table 3-4 shows the different power domains of the MPU subsystem and the modules inside.

**Table 3-4. Overview of the MPU Subsystem Power Domain**

| Functional Power Domain | Physical Power Domain per System/Module   |
|-------------------------|---|
| MPU subsystem domain    | ARM, AXI2OCP, I2Asynch Bridge, ARM L1 and L2 periphery logic and array, ICE-Crusher, ETM, APB modules |
| MPU NEON domain         | ARM NEON accelerator  |
| CORE domain             | MPU interrupt controller  |
| EMU domain              | EMU (ETB,DAP)   |

---

**NOTE:** L1 and L2 array memories have separate control signals into the in MPU Subsystem, thus directly controlled by PRCM. For details on the physical power domains and the voltage domains, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

---

### 3.1.6.2 Power States

Each power domain can be driven by the PRCM in 4 different states, depending on the functional mode required by the user.

For each power domain the PRCM manages all transitions by controlling domain clocks, domain resets, domain logic power switches and memory power switches.

**Table 3-5. MPU Power States**

| Power State | Logic Power | Memory Power | Clocks                  |
|-------------|-------------|--------------|-------------------------|
| Active      | On          | On or Off    | On (at least one clock) |
| Inactive    | On          | On or Off    | Off                     |
| Off         | Off         | Off          | Off (all clocks)        |

### 3.1.6.3 Power Modes

The major part of the MPU subsystem belongs to the MPU power domain. The modules inside this power domain can be off at a time when the ARM processor is in an OFF or standby mode. IDLE/WAKEUP control is managed by the clock generator block but initiated by the PRCM module.

The MPU Standby status can be checked with PRCM.CM\_IDLEST\_MP0[0] ST\_MP0 bit. For the MPU to be on, the core (referred here as the device core) power must be on. Device power management does not allow INTc to go to OFF state when MPU domain is on (active or one of retention modes).

The NEON core has independent power off mode when not in use. Enabling and disabling of NEON can be controlled by software.

**CAUTION**

The MPU L1 cache memory does not support retention mode, and its array switch is controlled together with the MPU logic. For compliance, the L1 retention control signals exist at the PRCM boundary, but are not used. The ARM L2 can be put into retention independently of the other domains.

[Table 3-6](#) outlines the supported operational power modes. All other combinations are illegal. The ARM L2, NEON, and ETM/Debug can be powered up/down independently. The APB/ATB ETM/Debug column refers to all three features: ARM emulation, trace, and debug.

The MPU subsystem must be in a power mode where the MPU power domain, NEON power domain, debug power domain, and INTc power domain are in standby, or off state.

**Table 3-6. MPU Subsystem Operation Power Modes**

| Mode | MPU and ARM Core Logic | ARM L2 RAM | NEON INTC | Device Core and ETM | APB/ATB Debug       |
|------|------------------------|------------|-----------|---------------------|---------------------|
| 1    | Active                 | Active     | Active    | Active              | Disabled or enabled |
| 2    | Active                 | Active     | OFF       | Active              | Disabled or enabled |
| 3    | Active                 | RET        | Active    | Active              | Disabled or enabled |
| 4    | Active                 | RET        | OFF       | Active              | Disabled or enabled |
| 5    | Active                 | OFF        | Active    | Active              | Disabled or enabled |
| 6    | Active                 | OFF        | OFF       | Active              | Disabled or enabled |
| 7    | OFF                    | RET        | OFF       | OFF                 | Disabled or enabled |
| 8    | Standby                | Active     | Standby   | Active              | Disabled or enabled |
| 9    | Standby                | Active     | OFF       | Active              | Disabled or enabled |
| 10   | Standby                | RET        | Standby   | Active              | Disabled or enabled |
| 11   | Standby                | RET        | OFF       | Active              | Disabled or enabled |
| 12   | Standby                | OFF        | Standby   | Active              | Disabled or enabled |
| 13   | Standby                | OFF        | OFF       | Active              | Disabled or enabled |
| 14   | OFF                    | OFF        | OFF       | OFF                 | Disabled or enabled |

### 3.1.7 ARM Programming Model

For detailed descriptions of registers used for MPU configuration, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

#### 3.1.7.1 Clock Control

For clock configuration settings, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

#### 3.1.7.2 MPU Power Mode Transitions

The following subsections describe transitions of different power modes for MPU power domain:

- Basic power on reset
- MPU into standby mode
- MPU out of standby mode
- MPU power on from a powered off state

##### 3.1.7.2.1 Basic Power-On Reset

The power-on reset follows the following sequence of operation and is applicable to initial power-up and wakeup from device off mode:

Reset the INTC (CORE\_RST) and the MPU subsystem modules (MPU\_RST). The clocks must be active during the MPU reset and CORE reset.

##### 3.1.7.2.2 MPU Into Standby Mode

The MPU into standby mode follows the following sequence of operation and is applicable to initial power-up and wakeup from device Off mode.

1. The ARM core initiates entering into standby via software only (CP15 - WFI).
2. MPU modules requested internally of MPU subsystem to enter idle, after ARM core standby detected.
3. MPU is in standby output asserted for PRCM (all outputs guaranteed to be at reset values).
4. PRCM can now request INTC to enter into idle mode. Acknowledge from INTC goes to PRCM.

---

**NOTE:** The INTC SWAKEUP output is a pure hardware signal to PRCM for the status of its IDLE request and IDLE acknowledge handshake.

---

---

**NOTE:** In debug mode, ICE-Crusher could prevent MPU subsystem from entering into IDLE mode.

---

### 3.1.7.2.3 MPU Out Of Standby Mode

The MPU out of standby mode follows the following sequence of operation and is applicable to initial power-up and wakeup from device Off mode.

1. PRCM must start clocks through DPLL programming.
2. Detect active clocking via status output of DPLL.
3. Initiate an interrupt through the INTC to wake up the ARM core from STANDBYWFI mode.

### 3.1.7.2.4 MPU Power On From a Powered-Off State

1. MPU Power On, NEON Power On, Core Power On (INTC) should follow the ordered sequence per power switch daisy chain to minimize the peaking of current during power-up.

---

**NOTE:** The core domain must be on, and reset, before the MPU can be reset.

---

2. Follow the reset sequence as described in the Basic Power-On Reset section.

## **Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)**

---

---

---

This chapter describes the PRU-ICSS for the device.

| <b>Topic</b>                     | <b>Page</b> |
|----------------------------------|-------------|
| <b>4.1    Introduction .....</b> | <b>174</b>  |

## 4.1 Introduction

The Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS) consists of dual 32-bit RISC cores (Programmable Real-Time Units, or PRUs), memories, interrupt controller, and internal peripherals that enable additional peripheral interfaces and protocols. The subsystem available on this device is the next-generation PRU (PRUSSv2) compared to the AM1x and OMAP-L13x.

Among the interfaces supported by the PRU-ICSS are the real-time industrial protocols used in master and slave mode, such as:

- EtherCAT®
- PROFINET
- EtherNet/IP™
- PROFIBUS
- POWERLINK
- SERCOS III

---

**NOTE:** For the availability of EtherCAT in the AM335x family of devices, see [Table 1-1, Device Features](#).

---

## **Graphics Accelerator (SGX)**

This chapter describes the graphics accelerator for the device.

| Topic                                   | Page       |
|---|------------|
| 5.1 <b>Introduction</b> .....           | <b>176</b> |
| 5.2 <b>Integration</b> .....            | <b>179</b> |
| 5.3 <b>Functional Description</b> ..... | <b>181</b> |

## 5.1 Introduction

This chapter describes the 2D/3D graphics accelerator (SGX) for the device.

---

**NOTE:** The SGX subsystem is a Texas Instruments instantiation of the POWERVR® SGX530 core from Imagination Technologies Ltd.

This document contains materials that are ©2003-2007 Imagination Technologies Ltd.

POWERVR® and USSE™ are trademarks or registered trademarks of Imagination Technologies Ltd.

---

The 2D/3D graphics accelerator (SGX) subsystem accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics applications. The SGX subsystem is based on the POWERVR® SGX core from Imagination Technologies. SGX is a new generation of programmable POWERVR graphic cores. The POWERVR SGX530 v1.2.5 architecture is scalable and can target all market segments from mainstream mobile devices to high-end desktop graphics. Targeted applications include feature phone, PDA, and hand-held games.

### 5.1.1 POWERVR SGX Main Features

- 2D graphics, 3D graphics, vector graphics, and programming support for GP-GPU functions
- Tile-based architecture
- Universal scalable shader engine ( USSE™) – multithreaded engine incorporating pixel and vertex shader functionality
- Advanced shader feature set – in excess of Microsoft VS3.0, PS3.0, and OpenGL2.0
- Industry-standard API support – Direct3D Mobile, OpenGL ES 1.1 and 2.0, OpenVG v1.0.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry direct memory access (DMA) driven operation for minimum CPU interaction
- Programmable high-quality image anti-aliasing
- POWERVR SGX core MMU for address translation from the core virtual address to the external physical address (up to 4GB address range)
- Fully virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations [e.g., vector graphics, BLTs (block level transfers), ROPs (raster operations)]
- 32K stride support

### 5.1.2 SGX 3D Features

- Deferred pixel shading
- On-chip tile floating point depth buffer
- 8-bit stencil with on-chip tile stencil buffer
- 8 parallel depth/stencil tests per clock
- Scissor test
- Texture support:
  - Cube map
  - Projected textures
  - 2D textures
  - Nonsquare textures
- Texture formats:
  - RGBA 8888, 565, 1555
  - Monochromatic 8, 16, 16f, 32f, 32int
  - Dual channel, 8:8, 16:16, 16f:16f

- Compressed textures PVR-TC1, PVR-TC2, ETC1
  - Programmable support for all YUV formats
  - Resolution support:
    - Frame buffer maximum size = 2048 x 2048
    - Texture maximum size = 2048 x 2048
  - Texture filtering:
    - Bilinear, trilinear, anisotropic
    - Independent minimum and maximum control
  - Antialiasing:
    - 4x multisampling
    - Up to 16x full scene anti-aliasing
    - Programmable sample positions
  - Indexed primitive list support
    - Bus mastered
  - Programmable vertex DMA
  - Render to texture:
    - Including twiddled formats
    - Auto MipMap generation
  - Multiple on-chip render targets (MRT).
- Note:** Performance is limited when the on-chip memory is not available.

### 5.1.3 Universal Scalable Shader Engine (USSE) – Key Features

The USSE is the engine core of the POWERVR SGX architecture and supports a broad range of instructions.

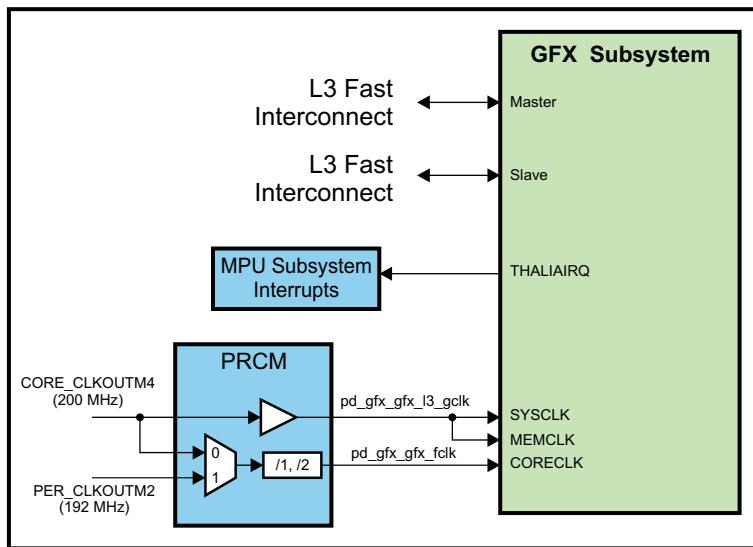

- Single programming model:
  - Multithreaded with 16 simultaneous execution threads and up to 64 simultaneous data instances
  - Zero-cost swapping in, and out, of threads
  - Cached program execution model
  - Dedicated pixel processing instructions
  - Dedicated video encode/decode instructions
- SIMD execution unit supporting operations in:
  - 32-bit IEEE float
  - 2-way 16-bit fixed point
  - 4-way 8-bit integer
  - 32-bit bit-wise (logical only)
- Static and dynamic flow control:
  - Subroutine calls
  - Loops
  - Conditional branches
  - Zero-cost instruction predication
- Procedural geometry:
  - Allows generation of primitives
  - Effective geometry compression
  - High-order surface support
- External data access:
  - Permits reads from main memory using cache

- Permits writes to main memory
- Data fence facility
- Dependent texture reads

#### **5.1.4 Unsupported Features**

There are no unsupported SGX530 features for this device.

## 5.2 Integration

**Figure 5-1. SGX530 Integration**

### 5.2.1 SGX530 Connectivity Attributes

The general connectivity attributes of the SGX530 are shown in the following table.

**Table 5-1. SGX530 Connectivity Attributes**

| Attributes          | Type                                |
|---------------------|-------------------------------------|
| Power domain        | GFX Domain                          |
| Clock domain        | SGX_CLK                             |
| Reset signals       | SGX_RST                             |
| Idle/Wakeup signals | Smart Idle Initiator Standby        |

### 5.2.2 SGX530 Clock and Reset Management

The SGX530 uses separate functional and interface clocks. The SYSCLK is the clock for the slave interface and runs at the L3F frequency. The MEMCLK is the clock for the memories and master interface and also runs at the L3F frequency. The CORECLK is the functional clock. It can be sourced from either the L3F clock (CORE\_CLKOUTM4) or from the 192 MHz PER\_CLKOUTM2 and can optionally be divided by 2.

**Table 5-2. SGX530 Clock Signals**

| Clock signal                | Max Freq | Reference / Source               | Comments                        |
|-----------------------------|----------|----------------------------------|---------------------------------|

### 5.2.3 SGX530 Pin List

The SGX530 module does not include any external interface pins.

## 5.3 Functional Description

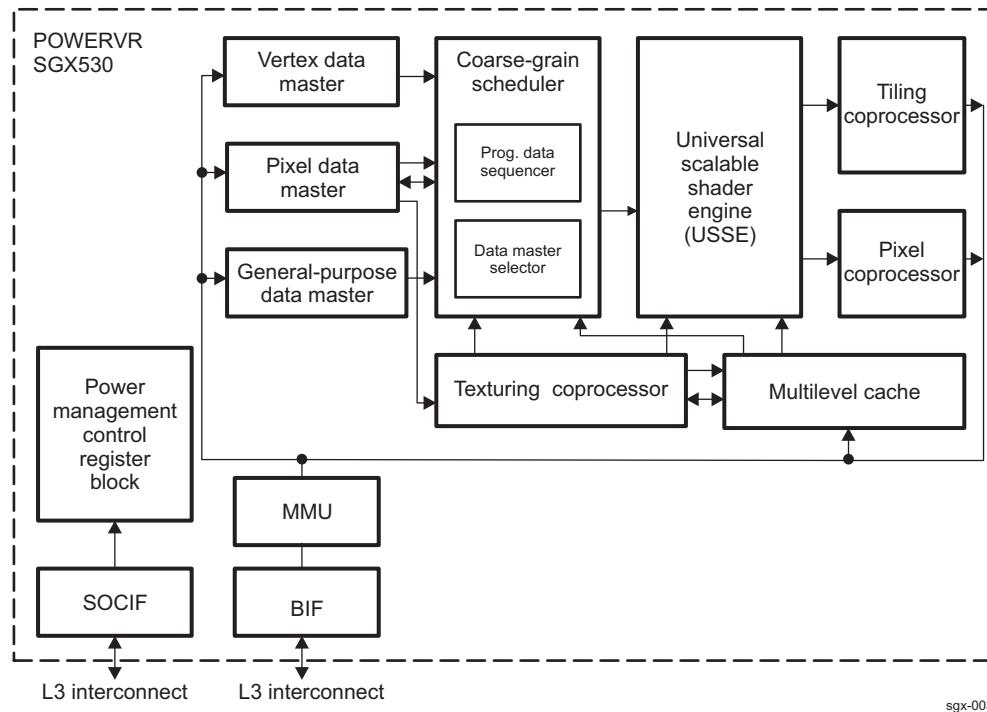

### 5.3.1 SGX Block Diagram

The SGX subsystem is based on the POWERVR® SGX530 core from Imagination Technologies. The architecture uses programmable and hard coded pipelines to perform various processing tasks required in 2D, 3D, and video processing. The SGX architecture comprises the following elements:

- Coarse grain scheduler
  - Programmable data sequencer (PDS)
  - Data master selector (DMS)
- Vertex data master (VDM)
- Pixel data master (PDM)
- General-purpose data master
- USSE
- Tiling coprocessor
- Pixel coprocessor
- Texturing coprocessor
- Multilevel cache

Figure 5-2 shows a block diagram of the SGX cores.

**Figure 5-2. SGX Block Diagram**

sgx-003

### 5.3.2 SGX Elements Description

The coarse grain scheduler (CGS) is the main system controller for the POWERVR SGX architecture. It consists of two stages, the DMS and the PDS. The DMS processes requests from the data masters and determines which tasks can be executed given the resource requirements. The PDS then controls the loading and processing of data on the USSE.

There are three data masters in the SGX core:

- The VDM is the initiator of transform and lighting processing within the system. The VDM reads an

input control stream, which contains triangle index data and state data. The state data indicates the PDS program, size of the vertices, and the amount of USSE output buffer resource available to the VDM. The triangle data is parsed to determine unique indices that must be processed by the USSE. These are grouped together according to the configuration provided by the driver and presented to the DMS.

- The PDM is the initiator of rasterization processing within the system. Each pixel pipeline processes pixels for a different half of a given tile, which allows for optimum efficiency within each pipe due to locality of data. It determines the amount of resource required within the USSE for each task. It merges this with the state address and issues a request to the DMS for execution on the USSE.
- The general-purpose data master responds to events within the system (such as end of a pass of triangles from the ISP, end of a tile from the ISP, end of render, or parameter stream breakpoint event). Each event causes either an interrupt to the host or synchronized execution of a program on the PDS. The program may, or may not cause a subsequent task to be executed on the USSE.

The USSE is a user-programmable processing unit. Although general in nature, its instructions and features are optimized for three types of task: processing vertices (vertex shading), processing pixels (pixel shading), and video/imaging processing.

The multilevel cache is a 2-level cache consisting of two modules: the main cache and the mux/arbitrator/demux/decompression unit (MADD). The MADD is a wrapper around the main cache module designed to manage and format requests to and from the cache, as well as providing Level 0 caching for texture and USSE requests. The MADD can accept requests from the PDS, USSE, and texture address generator modules. Arbitration, as well as any required texture decompression, are performed between the three data streams.

The texturing coprocessor performs texture address generation and formatting of texture data. It receives requests from either the iterators or USSE modules and translates these into requests in the multilevel cache. Data returned from the cache are then formatted according to the texture format selected, and sent to the USSE for pixel-shading operations.

To process pixels in a tiled manner, the screen is divided into tiles and arranged as groups of tiles by the tiling coprocessor. An inherent advantage of tiling architecture is that a large amount of vertex data can be rejected at this stage, thus reducing the memory storage requirements and the amount of pixel processing to be performed.

The pixel coprocessor is the final stage of the pixel-processing pipeline and controls the format of the final pixel data sent to the memory. It supplies the USSE with an address into the output buffer and then USSE returns the relevant pixel data. The address order is determined by the frame buffer mode. The pixel coprocessor contains a dithering and packing function.

## **Interrupts**

This section describes the interrupts for the device.

## 6.1 Functional Description

The interrupt controller processes incoming interrupts by masking and priority sorting to produce the interrupt signals for the processor to which it is attached. [Figure 6-1](#) shows the top-level view of interrupt processing.

**NOTE:** FIQ is not available on general-purpose (GP) devices.

**Figure 6-1. Interrupt Controller Block Diagram**

## 6.1.1 Interrupt Processing

### 6.1.1.1 Input Selection

The INTC supports only level-sensitive incoming interrupt detection. A peripheral asserting an interrupt maintains it until software has handled the interrupt and instructed the peripheral to deassert the interrupt. A software interrupt is generated if the corresponding bit in the MPU\_INTC.INTC\_ISR\_SETn register is set (register bank number: n = [0,1,2,3] for the MPU subsystem INTC, 128 incoming interrupt lines are supported). The software interrupt clears when the corresponding bit in the MPU\_INTC.INTC\_ISR\_CLEARn register is written. Typical use of this feature is software debugging.

### 6.1.1.2 Masking

#### 6.1.1.2.1 Individual Masking

Detection of interrupts on each incoming interrupt line can be enabled or disabled independently by the MPU\_INTC.INTC\_MIRn interrupt mask register. In response to an unmasked incoming interrupt, the INTC can generate one of two types of interrupt requests to the processor:

- IRQ: low-priority interrupt request
- FIQ: fast interrupt request (Not available on General Purpose (GP) devices)

The type of interrupt request is determined by the MPU\_INTC.INTC\_ILRm[0] FIQNIRQ bit (m= [0,127]). The current incoming interrupt status before masking is readable from the MPU\_INTC.INTC\_ITRn register. After masking and IRQ/FIQ selection, and before priority sorting is done, the interrupt status is readable from the MPU\_INTC.INTC\_PENDING\_IRQn and MPU\_INTC.INTC\_PENDING\_FIQn registers.

#### 6.1.1.2.2 Priority Masking

To enable faster processing of high-priority interrupts, a programmable priority masking threshold is provided (the MPU\_INTC.INTC\_THRESHOLD[7:0] PRIORITYTHRESHOLD field). This priority threshold allows preemption by higher priority interrupts; all interrupts of lower or equal priority than the threshold are masked. However, priority 0 can never be masked by this threshold; a priority threshold of 0 is treated the same way as priority 1. PRIORITY and PRIORITYTHRESHOLD fields values can be set between 0x0 and 0x7F; 0x0 is the highest priority and 0x7F is the lowest priority. When priority masking is not necessary, a priority threshold value of 0xFF disables the priority threshold mechanism. This value is also the reset default for backward compatibility with previous versions of the INTC.

### 6.1.1.3 Priority Sorting

A priority level (0 being the highest) is assigned to each incoming interrupt line. Both the priority level and the interrupt request type are configured by the MPU\_INTC.INTC\_ILRm register. If more than one incoming interrupt with the same priority level and interrupt request type occur simultaneously, the highest-numbered interrupt is serviced first. When one or more unmasked incoming interrupts are detected, the INTC separates between IRQ and FIQ using the corresponding MPU\_INTC.INTC\_ILRm[0] FIQNIRQ bit.

The result is placed in INTC\_PENDING\_IRQn or INTC\_PENDING\_FIQn. If no other interrupts are currently being processed, INTC asserts IRQ/FIQ and starts the priority computation. Priority sorting for IRQ and FIQ can execute in parallel. Each IRQ/FIQ priority sorter determines the highest priority interrupt number. Each priority number is placed in the corresponding MPU\_INTC.INTC\_SIR\_IRQ[6:0] ACTIVEIRQ field or MPU\_INTC.INTC\_SIR\_FIQ[6:0] ACTIVEFIQ field. The value is preserved until the corresponding MPU\_INTC.INTC\_CONTROL NEWIRQAGR or NEWFIQAGR bit is set. Once the interrupting peripheral device has been serviced and the incoming interrupt deasserted, the user must write to the appropriate NEWIRQAGR or NEWFIQAGR bit to indicate to the INTC the interrupt has been handled. If there are any pending unmasked incoming interrupts for this interrupt request type, the INTC restarts the appropriate priority sorter; otherwise, the IRQ or FIQ interrupt line is deasserted.

### 6.1.2 Register Protection

If the MPU\_INTC.INTC\_PROTECTION[0] PROTECTION bit is set, access to the INTC registers is restricted to the supervisor mode. Access to the MPU\_INTC.INTC\_PROTECTION register is always restricted to privileged mode. For more information, see [Section 6.6.1.7, INTC\\_PROTECTION Register \(offset = 4Ch\) \[reset = 0h\]](#).

### 6.1.3 Module Power Saving

The INTC provides an auto-idle function in its three clock domains:

- Interface clock
- Functional clock
- Synchronizer clock

The interface clock auto-idle power-saving mode is enabled if the MPU\_INTC.INTC\_SYSCONFIG[0] AUTOIDLE bit is set to 1. When this mode is enabled and there is no activity on the bus interface, the interface clock is disabled internally to the module, thus reducing power consumption. When there is new activity on the bus interface, the interface clock restarts without any latency penalty. After reset, this mode is disabled, by default. The functional clock auto-idle power-saving mode is enabled if the MPU\_INTC.INTC\_IDLE[0] FUNCIDLE bit is set to 0. When this mode is enabled and there is no active interrupt (IRQ or FIQ interrupt being processed or generated) or no pending incoming interrupt, the functional clock is disabled internally to the module, thus reducing power consumption.

When a new unmasked incoming interrupt is detected, the functional clock restarts and the INTC processes the interrupt. If this mode is disabled, the interrupt latency is reduced by one cycle. After reset, this mode is enabled, by default. The synchronizer clock allows external asynchronous interrupts to be resynchronized before they are masked. The synchronizer input clock has an auto-idle power-saving mode enabled if the MPU\_INTC.INTC\_IDLE[1] TURBO bit is set to 1. If the auto-idle mode is enabled, the standby power is reduced, but the IRQ or FIQ interrupt latency increases from four to six functional clock cycles. This feature can be enabled dynamically according to the requirements of the device. After reset, this mode is disabled, by default.

### 6.1.4 Error Handling

The following accesses will cause an error:

- Privilege violation (attempt to access PROTECTION register in user mode or any register in user mode if Protection bit is set)
- Unsupported commands

The following accesses will not cause any error response:

- Access to a non-decoded address
- Write to a read-only register

### 6.1.5 Interrupt Handling

The IRQ/FIQ interrupt generation takes four INTC functional clock cycles (plus or minus one cycle) if the MPU\_INTC.INTC\_IDLE[1] TURBO bit is set to 0. If the TURBO bit is set to 1, the interrupt generation takes six cycles, but power consumption is reduced while waiting for an interrupt. These latencies can be reduced by one cycle by disabling functional clock auto-idle (MPU\_INTC.INTC\_IDLE[0] FUNCIDLE bit set to 1), but power consumption is increased, so the benefit is minimal.

To minimize interrupt latency when an unmasked interrupt occurs, the IRQ or FIQ interrupt is generated before priority sorting completion. The priority sorting takes 10 functional clock cycles, which is less than the minimum number of cycles required for the MPU to switch to the interrupt context after reception of the IRQ or FIQ event.

Any read of the MPU\_INTC.INTC\_SIR\_IRQ or MPU\_INTC.INTC\_SIR\_FIQ register during the priority sorting process stalls until priority sorting is complete and the relevant register is updated. However, the delay between the interrupt request being generated and the interrupt service routine being executed is such that priority sorting always completes before the MPU\_INTC.INTC\_SIR\_IRQ or MPU\_INTC.INTC\_SIR\_FIQ register is read.

## 6.2 Basic Programming Model

### 6.2.1 Initialization Sequence

1. Program the MPU\_INTC.INTC\_SYSCONFIG register: If necessary, enable the interface clock autogating by setting the AUTOIDLE bit.
2. Program the MPU\_INTC.INTC\_IDLE register: If necessary, disable functional clock autogating or enable synchronizer autogating by setting the FUNCIDLE bit or TURBO bit accordingly.
3. Program the MPU\_INTC.INTC\_ILRm register for each interrupt line: Assign a priority level and set the FIQNIRQ bit for an FIQ interrupt (by default, interrupts are mapped to IRQ and priority is 0x0 [highest]).
4. Program the MPU\_INTC.INTC\_MIRn register: Enable interrupts (by default, all interrupt lines are masked). NOTE: To program the MPU\_INTC.INTC\_MIRn register, the MPU\_INTC.INTC\_MIR\_SETn and MPU\_INTC.INTC\_MIR\_CLEARn registers are provided to facilitate the masking, even if it is possible for backward-compatibility to write directly to the MPU\_INTC.INTC\_MIRn register.

### 6.2.2 INTC Processing Sequence

After the INTC\_MIRn and INTC\_ILRm registers are configured to enable and assign priorities to incoming interrupts, the interrupt is processed as explained in the following subsections. IRQ and FIQ processing sequences are quite similar, the differences for the FIQ sequence are shown after a '/' character in the code below.

1. One or more unmasked incoming interrupts (M\_IRQ\_n signals) are received and IRQ or FIQ outputs (IRQ/FIQ) are not currently asserted.
2. If the INTC\_ILRm[0] FIQNIRQ bit is cleared to 0, the MPU\_INTC\_IRQ output signal is generated. If the FIQNIRQ bit is set to 1, the MPU\_INTC\_FIQ output signal is generated.
3. The INTC performs the priority sorting and updates the INTC\_SIR\_IRQ[6:0] ACTIVEIRQ /INTC\_SIR\_FIQ[6:0] ACTIVEFIQ field with the current interrupt number.
4. During priority sorting, if the IRQ/FIQ is enabled at the host processor side, the host processor automatically saves the current context and executes the ISR as follows.

The ARM host processor automatically performs the following actions in pseudo code:

```

LR = PC + 4          /* return link */
SPSR = CPSR          /* Save CPSR before execution */
CPSR[5] = 0           /* Execute in ARM state */
CPSR[7] = 1           /* Disable IRQ */
CPSR[8] = 1           /* Disable Imprecise Data Aborts */
CPSR[9] = CP15_reg1_EEbit /* Endianness on exception entry */

if interrupt == IRQ then
  CPSR[4:0] = 0b10010 /* Enter IRQ mode */
  if high vectors configured then
    PC = 0xFFFF0018
  else
    PC = 0x00000018 /* execute interrupt vector */
  else if interrupt == FIQ then
    CPSR[4:0] = 0b10001 /* Enter FIQ mode */
    CPSR[6] = 1           /* Disable FIQ */
    if high vectors configured then
      PC = 0xFFFF001C
    else
      PC = 0x0000001C /* execute interrupt vector */
  endif
endif

```

5. The ISR saves the remaining context, identifies the interrupt source by reading the ACTIVEIRQ/ACTIVEFIQ field, and jumps to the relevant subroutine handler as follows:

**CAUTION**

The code in steps 5 and 7 is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```
; INTC_SIR_IRQ/INTC_SIR_FIQ register address
INTC_SIR_IRQ_ADDR/INTC_SIR_FIQ_ADDR .word 0x48200040/0x48200044
; ACTIVEIRQ bit field mask to get only the bit field
ACTIVEIRQ_MASK .equ 0x7F
 IRQ_ISR/_FIQ_ISR:
; Save the critical context
STMFD SP!, {R0-R12, LR} ; Save working registers and the Link register
MRS R11, SPSR ; Save the SPSR into R11
; Get the number of the highest priority active IRQ/FIQ
LDR R10, INTC_SIR_IRQ_ADDR/INTC_SIR_FIQ_ADDR
LDR R10, [R10] ; Get the INTC_SIR_IRQ/INTC_SIR_FIQ register
AND R10, R10, #ACTIVEIRQ_MASK ; Apply the mask to get the active IRQ number
; Jump to relevant subroutine handler
LDR PC, [PC, R10, lsl #2] ; PC base address points this instruction + 8
NOP ; To index the table by the PC
; Table of handler start addresses
.word IRQ0handler ;For IRQ0 of BANK0
.word IRQ1handler
.word IRQ2handler
```

6. The subroutine handler executes code specific to the peripheral generating the interrupt by handling the event and deasserting the interrupt condition at the peripheral side.

```
; IRQ0 subroutine
IRQ0handler:
; Save working registers
STMFD SP!, {R0-R1}
; Now read-modify-write the peripheral module status register
; to de-assert the M_IRQ_0 interrupt signal
; De-Assert the peripheral interrupt
MOV R0, #0x7 ; Mask for 3 flags
LDR R1, MODULE0_STATUS_REG_ADDR ; Get the address of the module Status Register
STR R0, [R1] ; Clear the 3 flags
; Restore working registers LDMFD SP!, {R0-R1}
; Jump to the end part of the ISR
B IRQ_ISR_end/FIQ_ISR_end
```

7. After the return of the subroutine, the ISR sets the NEWIRQAGR/NEWFIQAGR bit to enable the processing of subsequent pending IRQs/FIQs and to restore ARM context in the following code. Because the writes are posted on an Interconnect bus, to be sure that the preceding writes are done before enabling IRQs/FIQs, a Data Synchronization Barrier is used. This operation ensure that the IRQ/FIQ line is de-asserted before IRQ/FIQ enabling. After that, the INTC processes any other pending interrupts or deasserts the IRQ/FIQ signal if there is no interrupt.

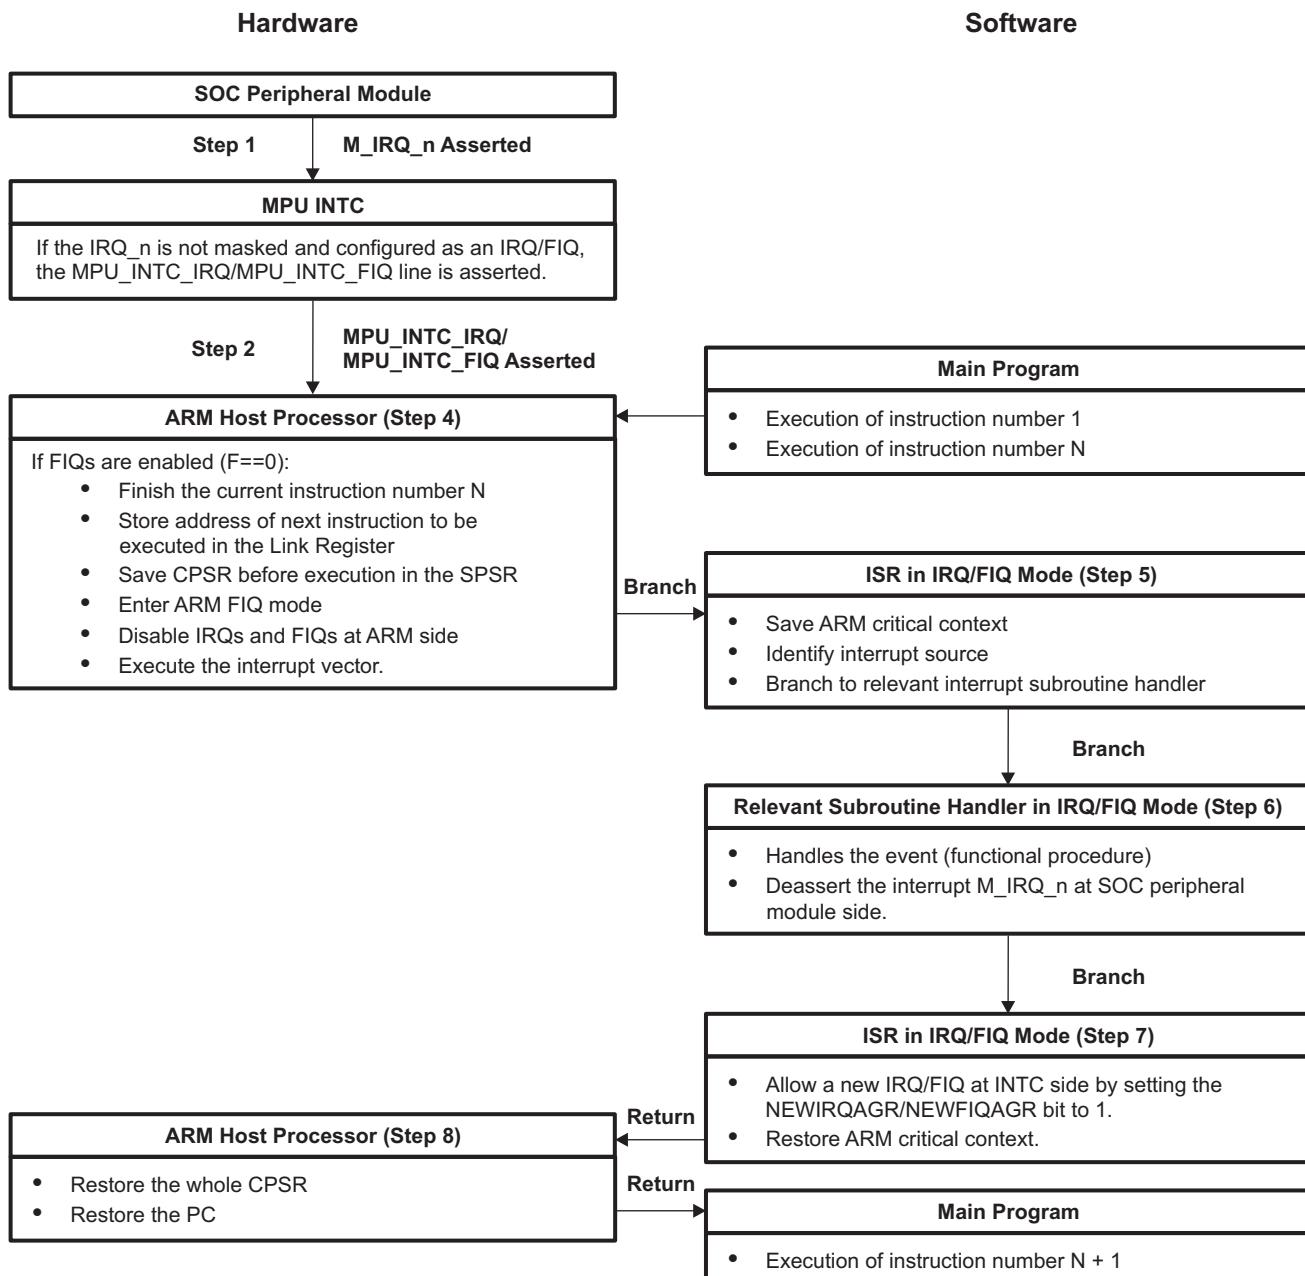

```

; INTC_CONTROL register address
INTC_CONTROL_ADDR .word 0x48200048;
NEWIRQAGR/NEWFIQAGR bit mask to set only the NEWIRQAGR/NEWFIQAGR bit
NEWIRQAGR_MASK/NEWFIQAGR_MASK .equ 0x01/0x02
IRQ_ISR_end/FIQ_ISR_end:
    ; Allow new IRQs/FIQs at INTC side
    ; The INTC_CONTROL register is a write only register so no need to write back others bits
    MOV R0, #NEWIRQAGR_MASK/NEWFIQAGR_MASK ; Get the NEWIRQAGR/NEWFIQAGR bit position
    LDR R1, INTC_CONTROL_ADDR
    STR R0, [R1] ; Write the NEWIRQAGR/NEWFIQAGR bit to allow new IRQs/FIQ
    ; Data Synchronization Barrier MOV R0, #0
    MCR P15, #0, R0, C7, C10, #4
    ; restore critical context
    MSR SPSR, R11 ; Restore the SPSR from R11
    LDMFD SP!, {R0-R12, LR} ; Restore working registers and Link register
    ; Return after handling the interrupt
    SUBS PC, LR, #4
8. After the ISR return, the ARM automatically restores its context as follows:
CPSR = SPSR
PC = LR

```

[Figure 6-2](#) shows the IRQ/FIQ processing sequence from the originating device peripheral module to the main program interruption.

The priority sorting mechanism is frozen during an interrupt processing sequence. If an interrupt condition occurs during this time, the interrupt is not lost. It is sorted when the NEWIRQAGR/NEWFIQAGR bit is set (priority sorting is reactivated).

**Figure 6-2. IRQ/FIQ Processing Sequence**

### 6.2.3 INTC Preemptive Processing Sequence

Preemptive interrupts, also called nested interrupts, can reduce the latencies for higher priority interrupts. A preemptive ISR can be suspended by a higher priority interrupt. Thus, the higher priority interrupt can be served immediately. Nested interrupts must be used carefully to avoid using corrupted data. Programmers must save corruptible registers and enable IRQ or FIQ at ARM side. IRQ and FIQ processing sequences are quite similar, the differences for the FIQ sequence are shown after a '/' character in the code below.

To enable IRQ/FIQ preemption by higher priority IRQs/FIQs, programmers can follow this procedure to write the ISR.

At the beginning of an IRQ/FIQ ISR:

1. Save the ARM critical context registers.
2. Save the INTC\_THRESHOLD PRIORITYTHRESHOLD field before modifying it.
3. Read the active interrupt priority in the INTC\_IRQ\_PRIORITY IRQPRIORITY/INTC\_FIQ\_PRIORITY FIQPRIORITY field and write it to the PRIORITYTHRESHOLD(1) field.
4. Read the active interrupt number in the INTC\_SIR\_IRQ[6:0] ACTIVEIRQ/INTC\_SIR\_FIQ[6:0] ACTIVEFIQ field to identify the interrupt source.
5. Write 1 to the appropriate INTC\_CONTROL NEWIRQAGR and (2) NEWFIQAGR bit while an interrupt is still processing to allow only higher priority interrupts to preempt.
6. Because the writes are posted on an Interconnect bus, to be sure that the preceding writes are done before enabling IRQs/FIQs, a Data Synchronization Barrier is used. This operation ensure that the IRQ line is de-asserted before IRQ/FIQ enabling.
7. Enable IRQ/FIQ at ARM side.
8. Jump to the relevant subroutine handler.

The following sample code shows the previous steps:

**CAUTION**

The following code is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```
; bit field mask to get only the bit field
ACTIVEPRI0_MASK .equ 0x7F
_IRQ_ISR:
; Step 1 : Save the critical context
STMFD SP!, {R0-R12, LR} ; Save working registers
MRS R11, SPSR ; Save the SPSR into R11
; Step 2 : Save the INTC_THRESHOLD register into R12
LDR R0, INTC_THRESHOLD_ADDR
LDR R12, [R0]
(1) The priority-
threshold mechanism is enabled automatically when writing a priority in the range of 0x00 to 0x7F. Writing a value of 0xFF (reset default) disables the priority-threshold mechanism. Values between 0x3F and 0xFF must not be used. When the hardware-priority threshold is in use, the priorities of interrupts selected as FIQ or IRQ become linked otherwise, they are independent. When they are linked, all FIQ priorities must be set higher than all IRQ priorities to maintain the relative priority of FIQ over IRQ.
(2) When handling FIQs using the priority-
threshold mechanism, both NEWFIQAGR and NEWIRQAGR bits must be written at the same time to ensure that the new priority threshold is applied while an IRQ sort is in progress. This IRQ will not have been seen by the ARM, as it will have been masked on entry to the FIQ ISR. However, the source of the IRQ remains active and it is finally processed when the priority threshold falls to a priority sufficiently low to allow it to be processed. The precaution of writing to New FIQ Agreement is not required during an IRQ ISR, as FIQ sorting is not affected (provided all FIQ priorities are higher than all IRQ priorities).
; Step 3 : Get the priority of the highest priority active IRQ
LDR R1, INTC_IRQ_PRIORITY_ADDR/INTC_FIQ_PRIORITY_ADDR
LDR R1, [R1] ; Get the INTC_IRQ_PRIORITY/INTC_FIQ_PRIORITY register
AND R1, R1, #ACTIVEPRI0_MASK ; Apply the mask to get the priority of the IRQ
STR R1, [R0] ; Write it to the INTC_THRESHOLD register
; Step 4 : Get the number of the highest priority active IRQ
LDR R10, INTC_SIR_IRQ_ADDR/INTC_SIR_FIQ_ADDR
LDR R10, [R10] ; Get the INTC_SIR_IRQ/INTC_SIR_FIQ register
AND R10, R10, #ACTIVEIRQ_MASK ; Apply the mask to get the active IRQ number
; Step 5 : Allow new IRQs and FIQs at INTC side
MOV R0, #0x1/0x3 ; Get the NEWIRQAGR and NEWFIQAGR bit position
LDR R1, INTC_CONTROL_ADDR
STR R0, [R1] ; Write the NEWIRQAGR and NEWFIQAGR bit
; Step 6 : Data Synchronization Barrier
MOV R0, #0 MCR P15, #0, R0, C7, C10, #4
; Step 7 : Read-modify-write the CPSR to enable IRQs/FIQs at ARM side
MRS R0, CPSR ; Read the status register
BIC R0, R0, #0x80/0x40 ; Clear the I/F bit
MSR CPSR, R0 ; Write it back to enable IRQs
; Step 8 : Jump to relevant subroutine handler
LDR PC, [PC, R10, lsl #2] ; PC base address points this instruction + 8
NOP ; To index the table by the PC
; Table of handler start addresses
.word IRQ0handler ;IRQ0 BANK0
.word IRQ1handler
.word IRQ2handler
```

After the return of the relevant IRQ/FIQ subroutine handle:

1. Disable IRQs/FIQs at ARM side.
2. Restore the INTC\_THRESHOLD PRIORITYTHRESHOLD field.
3. Restore the ARM critical context registers.

The following sample code shows the three previous steps:

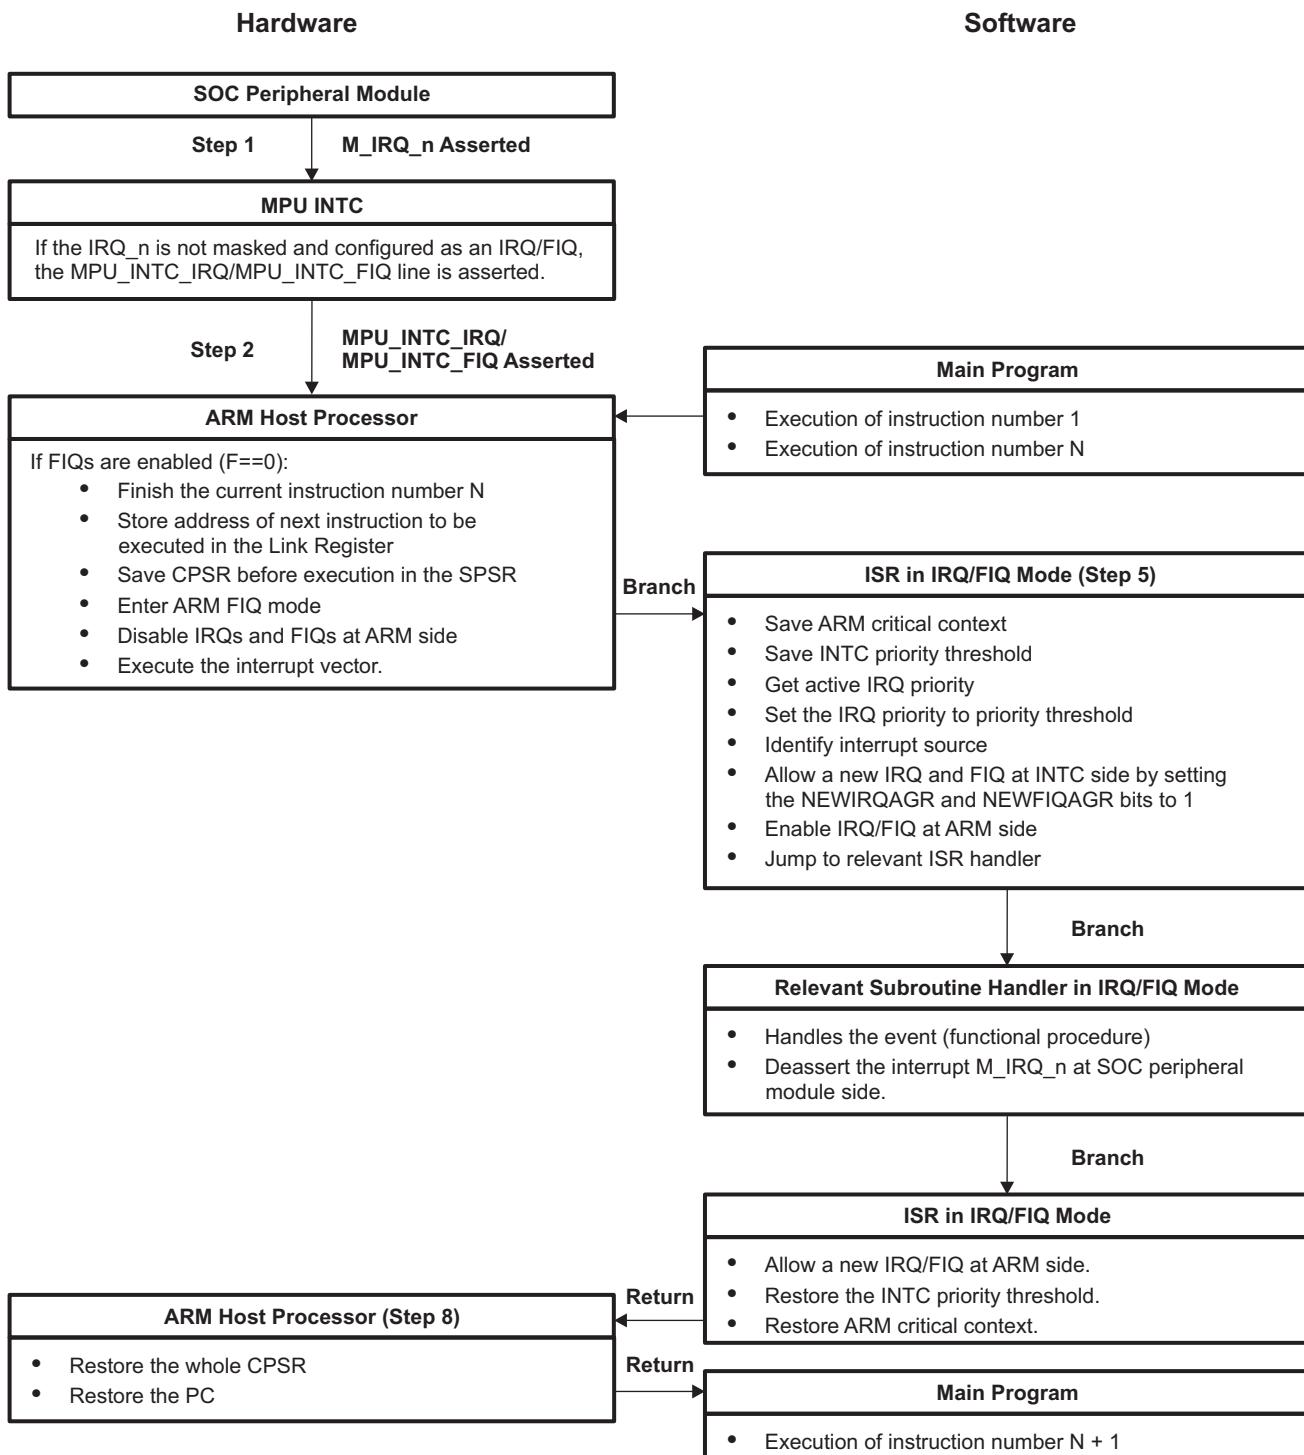

**CAUTION**

The following code is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```
IRQ_ISR_end:  
    ; Step 1 : Read-modify-write the CPSR to disable IRQs/FIQs at ARM side  
    MRS R0, CPSR ; Read the CPSR  
    ORR R0, R0, #0x80/0x40 ; Set the I/F bit  
    MSR CPSR, R0 ; Write it back to disable IRQs  
    ; Step 2 : Restore the INTC_THRESHOLD register from R12  
    LDR R0, INTC_THRESHOLD_ADDR  
    STR R12, [R0]  
    ; Step 3 : Restore critical context  
    MSR SPSR, R11 ; Restore the SPSR from R11  
    LDMFD SP!, {R0-R12, LR} ; Restore working registers and Link register  
    ; Return after handling the interrupt  
    SUBS PC, LR, #4
```

Figure 6-3 shows the nested IRQ/FIQ processing sequence from the originating device peripheral module to the main program interruption.

Figure 6-3. Nested IRQ/FIQ Processing Sequence

### **6.2.4 Interrupt Preemption**

If wanting to enable pre-emption by higher priority interrupts, the ISR should read the active interrupt priority and write it to the priority threshold register. Writing a '1' to the appropriate NEW\_IRQ\_AGR or NEW\_FIQ\_AGR bits of the CONTROL register while still processing the interrupt will now allow only higher priority interrupts to pre-empt.

For each level of pre-emption, the programmer must save the threshold value before modifying it and restore it at the end of that ISR level.

The priority threshold mechanism is enabled automatically when writing a priority in the range of 0 to 7Fh as will be read from the IRQ\_PRIORITY and FIQ\_PRIORITY registers. Writing a value of FFh (reset default) disables the priority threshold mechanism.

When the hardware priority threshold is in use the priorities of interrupts selected as FIQ or IRQ become linked, otherwise they are independent. When linked, it is required that all FIQ priorities be set higher than all IRQ priorities to maintain the relative priority of FIQ over IRQ.

When handling FIQs using the priority threshold mechanism, it is required to write both New FIQ Agreement and New IRQ Agreement bits at the same time to cover the case that the new priority threshold is applied while an IRQ sorting is in progress. This IRQ will not have been seen by the ARM as it will have been masked on entry to the FIQ ISR. However, the source of the IRQ will remain active and it will be finally processed when the priority threshold falls to a low enough priority. The precaution of writing to New FIQ Agreement (as well as New IRQ Agreement) is not required during an IRQ ISR as FIQ sorting will not be affected (provided all FIQ priorities are higher than all IRQ priorities).

### **6.2.5 ARM A8 INTC Spurious Interrupt Handling**

The spurious flag indicates whether the result of the sorting (a window of 10 INTC functional clock cycles after the interrupt assertion) is invalid. The sorting is invalid if:

- The interrupt that triggered the sorting is no longer active during the sorting.
- A change in the mask has affected the result during the sorting time.

As a result, the values in the INTC\_MIRn, INTC\_ILRm, or INTC\_MIR\_SETn registers must not be changed while the corresponding interrupt is asserted. Only the active interrupt input that triggered the sort can be masked before it turns on the sort. If these registers are changed within the 10-cycle window after the interrupt assertion. The resulting values of the following registers become invalid:

- INTC\_SIR\_IRQ
- INTC\_SIR\_FIQ
- INTC\_IRQ\_PRIORITY
- INTC\_FIQ\_PRIORITY

This condition is detected for both IRQ and FIQ, and the invalid status is flagged across the SPURIOUSIRQFLAG (see NOTE 1) and SPURIOUSFIQFLAG (see NOTE 2) bit fields in the SIR and PRIORITY registers. A 0 indicates valid and a 1 indicates invalid interrupt number and priority. The invalid indication can be tested in software as a false register value.

**NOTE:**

1. The INTC\_SIR\_IRQ[31:7] SPURIOUSIRQFLAG bit field is a copy of the INTC\_IRQ\_PRIORITY[31:7] SPURIOUSIRQFLAG bit field.
2. The INTC\_SIR\_FIQ[31:7] SPURIOUSFIQFLAG bit field is a copy of the INTC\_FIQ\_PRIORITY[31:7] SPURIOUSFIQFLAG bit field.

## 6.3 ARM Cortex-A8 Interrupts

**Table 6-1. ARM Cortex-A8 Interrupts**

| Int Number | Acronym/name     | Source  | Signal Name                                    |
|------------|------------------|---|--|
| 0          | EMUINT           | MPU Subsystem Internal  | Emulation interrupt (EMUICINTR)                |
| 1          | COMMTX           | MPU Subsystem Internal  | CortexA8 COMMTX                                |
| 2          | COMMRX           | MPU Subsystem Internal  | CortexA8 COMMRX                                |
| 3          | BENCH            | MPU Subsystem Internal  | CortexA8 NPMUIRQ                               |
| 4          | ELM_IRQ          | ELM   | Sinterrupt (Error location process completion) |
| 5          | Reserved         |   |  |
| 6          | Reserved         |   |  |
| 7          | NMI              | External Pin (Primary Input)                                    | nmi_int  |

## 6.6 Interrupt Controller Registers

**NOTE:** FIQ is not available on general-purpose (GP) devices.

### 6.6.1 INTC Registers

Table 6-4 lists the memory-mapped registers for the INTC. All register offset addresses not listed in Table 6-4 should be considered as reserved locations and the register contents should not be modified.

**Table 6-4. INTC REGISTERS**

| Offset | Acronym           | Register Name | Section          |
|--------|-------------------|---------------|------------------|
| 0h     | INTC_REVISION     |               | Section 6.6.1.1  |
| 10h    | INTC_SYSCONFIG    |               | Section 6.6.1.2  |
| 14h    | INTC_SYSSTATUS    |               | Section 6.6.1.3  |

| FC <sub>h</sub> | INTC_PENDING_FIQ3        |               | <a href="#">Section 6.6.1.43</a> |
| 100h to 2FCh    | INTC_ILR0 to INTC_ILR127 |               | <a href="#">Section 6.6.1.44</a> |

### 6.6.1.1 INTC\_REVISION Register (offset = 0h) [reset = 50h]

INTC\_REVISION is shown in [Figure 6-4](#) and described in [Table 6-5](#).

This register contains the IP revision code

**Figure 6-4. INTC\_REVISION Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-5. INTC\_REVISION Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    | Reads returns 0  |
| 7-0  | Rev      | R    | 50h   | IP revision<br>[7:4] Major revision<br>[3:0] Minor revision Examples: 0x10 for 1.0, 0x21 for 2.1 |

### 6.6.1.2 INTC\_SYSCONFIG Register (offset = 10h) [reset = 0h]

INTC\_SYSCONFIG is shown in [Figure 6-5](#) and described in [Table 6-6](#).

This register controls the various parameters of the OCP interface

**Figure 6-5. INTC\_SYSCONFIG Register**

|          |    |    |          |          |          |           |          |
|----------|----|----|----------|----------|----------|-----------|----------|
| 31       | 30 | 29 | 28       | 27       | 26       | 25        | 24       |
| Reserved |    |    |          |          |          |           |          |
| 23       | 22 | 21 | 20       | 19       | 18       | 17        | 16       |
| Reserved |    |    |          |          |          |           |          |
| 15       | 14 | 13 | 12       | 11       | 10       | 9         | 8        |
| Reserved |    |    |          |          |          |           |          |
| 7        | 6  | 5  | 4        | 3        | 2        | 1         | 0        |
| Reserved |    |    | Reserved | Reserved | Reserved | SoftReset | Autoidle |
|          |    |    | R-0h     |          | R/W-0h   |           | R/W-0h   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-6. INTC\_SYSCONFIG Register Field Descriptions**

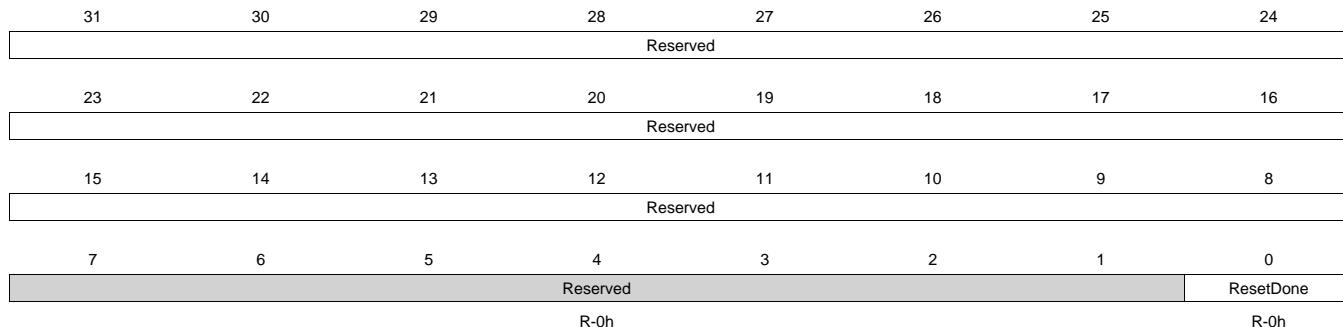

| Bit | Field     | Type | Reset | Description   |
|-----|-----------|------|-------|---|
| 4-3 | Reserved  | R    | 0h    | Write 0's for future compatibility.<br>Reads returns 0  |
| 1   | SoftReset | R/W  | 0h    | Software reset.<br>Set this bit to trigger a module reset.<br>The bit is automatically reset by the hardware.<br>During reads, it always returns 0.<br>0x0(Read) = always_Always returns 0<br>0x1(Read) = never_never happens |
| 0   | Autoidle  | R/W  | 0h    | Internal OCP clock gating strategy<br>0x0 = clkfree : OCP clock is free running<br>0x1 = autoClkGate : Automatic OCP clock gating strategy is applied, based on the OCP interface activity                                    |

### 6.6.1.3 INTC\_SYSSTATUS Register (offset = 14h) [reset = 0h]

INTC\_SYSSTATUS is shown in [Figure 6-6](#) and described in [Table 6-7](#).

This register provides status information about the module

**Figure 6-6. INTC\_SYSSTATUS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-7. INTC\_SYSSTATUS Register Field Descriptions**

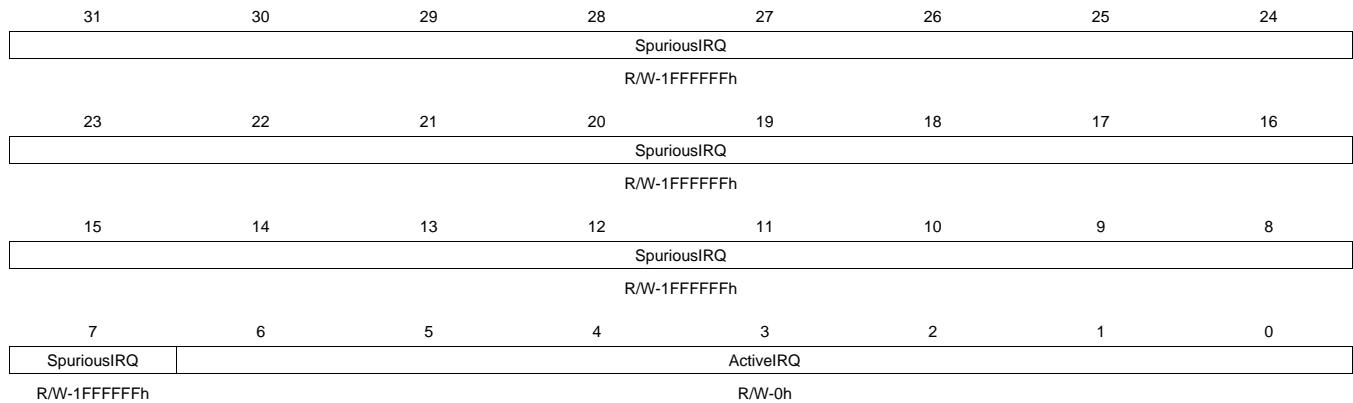

| Bit | Field     | Type | Reset | Description  |
|-----|-----------|------|-------|--|
| 7-1 | Reserved  | R    | 0h    | Reserved for OCP socket status information Read returns 0  |
| 0   | ResetDone | R    | 0h    | Internal reset monitoring<br>0x0 = rstOngoing : Internal module reset is on-going<br>0x1 = rstComp : Reset completed |

#### 6.6.1.4 INTC\_SIR\_IRQ Register (offset = 40h) [reset = FFFFFFF80h]

INTC\_SIR\_IRQ is shown in [Figure 6-7](#) and described in [Table 6-8](#).

This register supplies the currently active IRQ interrupt number.

**Figure 6-7. INTC\_SIR\_IRQ Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-8. INTC\_SIR\_IRQ Register Field Descriptions**

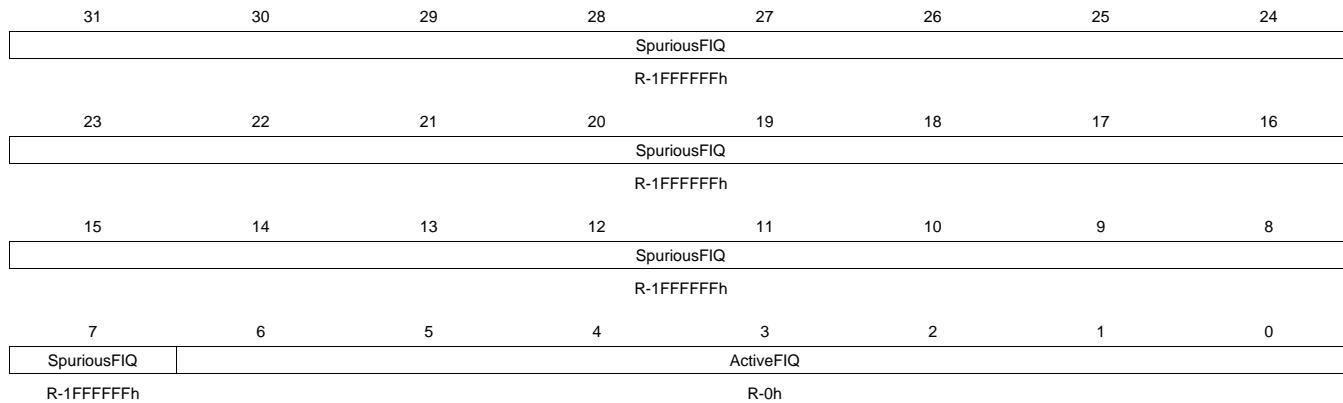

| Bit  | Field       | Type | Reset    | Description       |
|------|-------------|------|----------|-------------------|
| 31-7 | SpuriousIRQ | R/W  | 1FFFFFFh | Spurious IRQ flag |
| 6-0  | ActiveIRQ   | R/W  | 0h       | Active IRQ number |

### 6.6.1.5 INTC\_SIR\_FIQ Register (offset = 44h) [reset = FFFFFFF80h]

INTC\_SIR\_FIQ is shown in [Figure 6-8](#) and described in [Table 6-9](#).

This register supplies the currently active FIQ interrupt number

**Figure 6-8. INTC\_SIR\_FIQ Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-9. INTC\_SIR\_FIQ Register Field Descriptions**

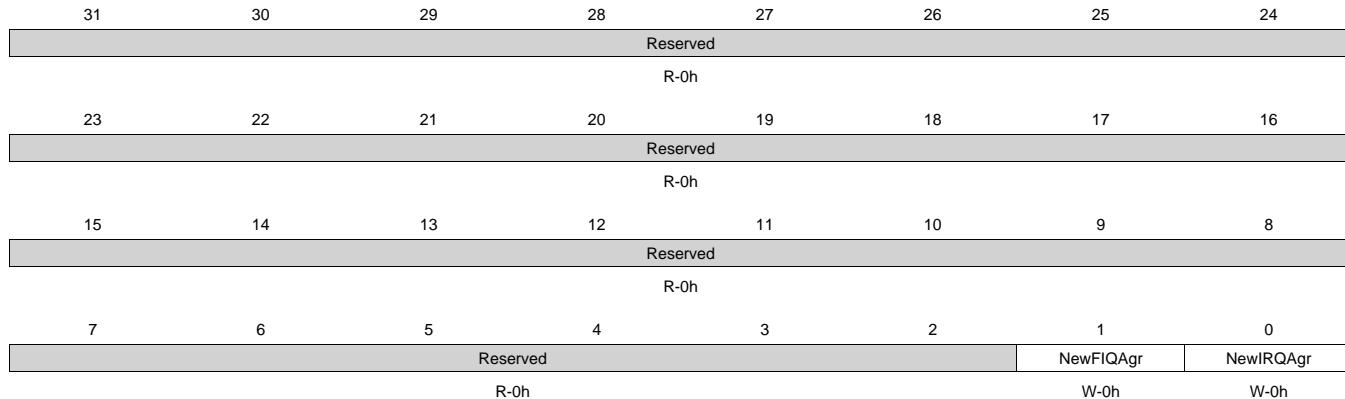

| Bit  | Field       | Type | Reset    | Description       |
|------|-------------|------|----------|-------------------|
| 31-7 | SpuriousFIQ | R    | 1FFFFFFh | Spurious FIQ flag |
| 6-0  | ActiveFIQ   | R    | 0h       | Active FIQ number |

### 6.6.1.6 INTC\_CONTROL Register (offset = 48h) [reset = 0h]

INTC\_CONTROL is shown in [Figure 6-9](#) and described in [Table 6-10](#).

This register contains the new interrupt agreement bits

**Figure 6-9. INTC\_CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-10. INTC\_CONTROL Register Field Descriptions**

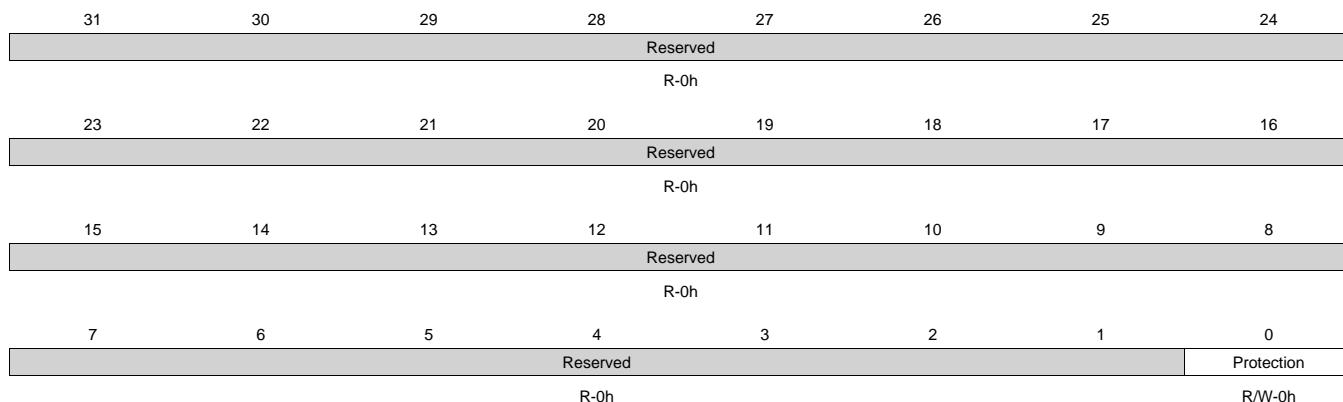

| Bit  | Field     | Type | Reset | Description   |
|------|-----------|------|-------|---|
| 31-2 | Reserved  | R    | 0h    | Write 0's for future compatibility.<br>Reads returns 0  |
| 1    | NewFIQAgr | W    | 0h    | Reset FIQ output and enable new FIQ generation<br>0x0(Write) = nofun_no function effect<br>0x1(Write) = NewFIQ_Reset FIQ output and enable new FIQ generation |
| 0    | NewIRQAgr | W    | 0h    | New IRQ generation<br>0x0(Write) = nofun_no function effect<br>0x1(Write) = NewIRQ_Reset IRQ output and enable new IRQ generation                             |

### 6.6.1.7 INTC\_PROTECTION Register (offset = 4Ch) [reset = 0h]

INTC\_PROTECTION is shown in [Figure 6-10](#) and described in [Table 6-11](#).

This register controls protection of the other registers. This register can only be accessed in privileged mode, regardless of the current value of the protection bit.

**Figure 6-10. INTC\_PROTECTION Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-11. INTC\_PROTECTION Register Field Descriptions**

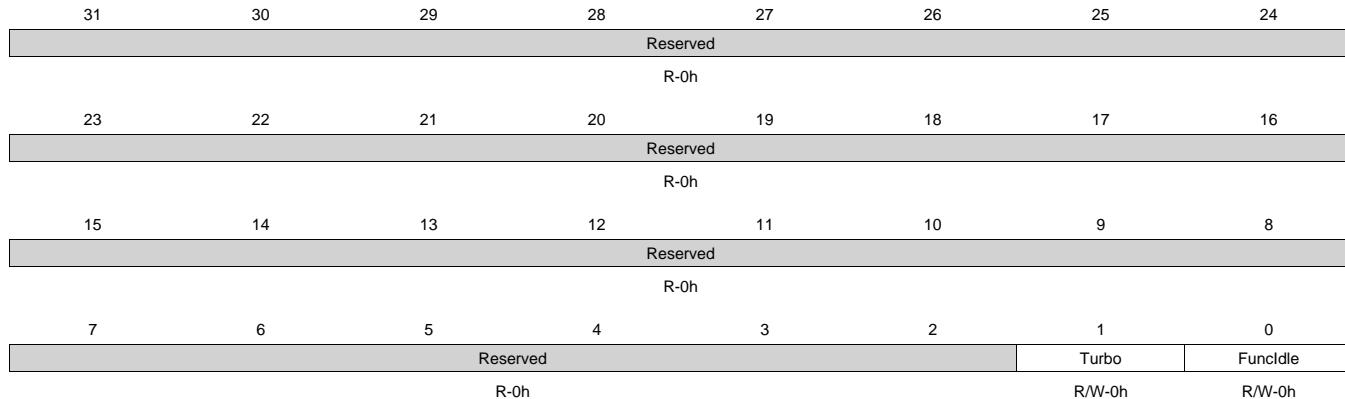

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-1 | Reserved   | R    | 0h    | Write 0's for future compatibility.<br>Reads returns 0   |
| 0    | Protection | R/W  | 0h    | Protection mode<br>0x0 = ProtMDis : Protection mode disabled (default)<br>0x1 = ProtMEnb : Protection mode enabled. When enabled, only privileged mode can access registers. |

### 6.6.1.8 INTC\_IDLE Register (offset = 50h) [reset = 0h]

INTC\_IDLE is shown in [Figure 6-11](#) and described in [Table 6-12](#).

This register controls the clock auto-idle for the functional clock and the input synchronisers

**Figure 6-11. INTC\_IDLE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-12. INTC\_IDLE Register Field Descriptions**

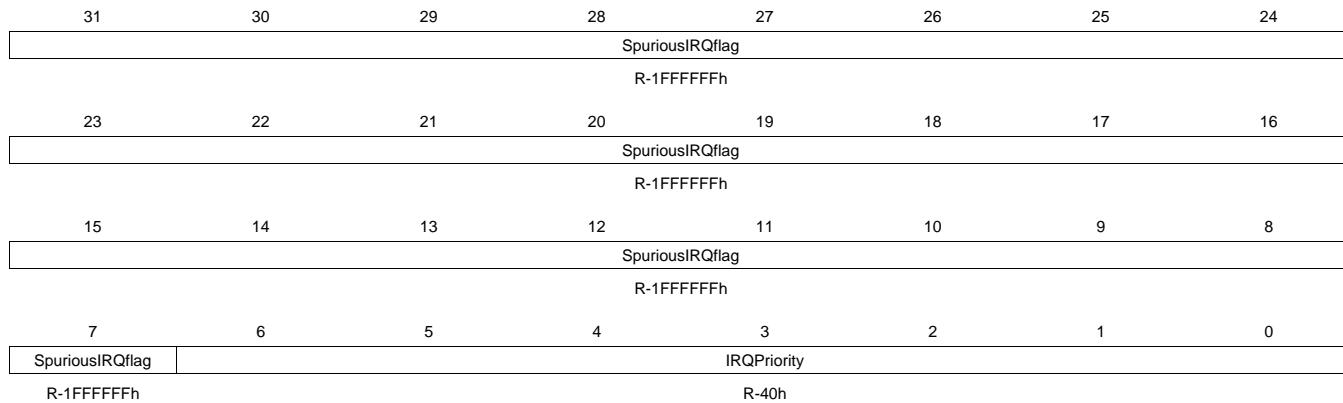

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    | Write 0's for future compatibility.<br>Reads returns 0   |
| 1    | Turbo    | R/W  | 0h    | Input synchroniser clock auto-gating<br>0x0 = SyncFree : Input synchroniser clock is free running (default)<br>0x1 = SyncAuto : Input synchroniser clock is auto-gated based on interrupt input activity |
| 0    | Funcidle | R/W  | 0h    | Functional clock auto-idle mode<br>0x0 = FuncAuto : Functional clock gating strategy is applied (default)<br>0x1 = FuncFree : Functional clock is free-running   |

### 6.6.1.9 INTC\_IRQ\_PRIORITY Register (offset = 60h) [reset = FFFFFFFC0h]

INTC\_IRQ\_PRIORITY is shown in [Figure 6-12](#) and described in [Table 6-13](#).

This register supplies the currently active IRQ priority level

**Figure 6-12. INTC\_IRQ\_PRIORITY Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-13. INTC\_IRQ\_PRIORITY Register Field Descriptions**

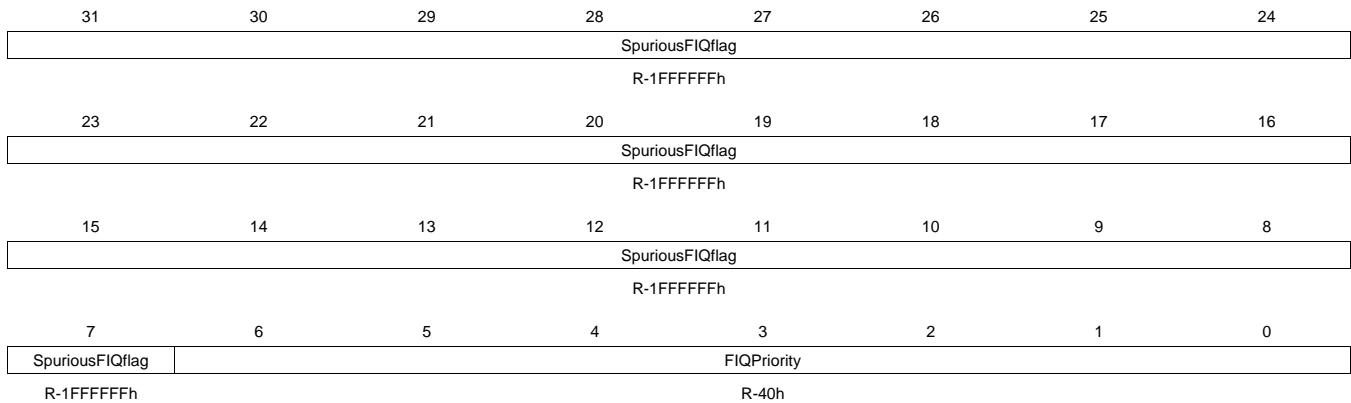

| Bit  | Field           | Type | Reset    | Description          |
|------|-----------------|------|----------|----------------------|
| 31-7 | SpuriousIRQflag | R    | 1FFFFFFh | Spurious IRQ flag    |
| 6-0  | IRQPriority     | R    | 40h      | Current IRQ priority |

### 6.6.1.10 INTC\_FIQ\_PRIORITY Register (offset = 64h) [reset = FFFFFFFC0h]

INTC\_FIQ\_PRIORITY is shown in [Figure 6-13](#) and described in [Table 6-14](#).

This register supplies the currently active FIQ priority level

**Figure 6-13. INTC\_FIQ\_PRIORITY Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-14. INTC\_FIQ\_PRIORITY Register Field Descriptions**

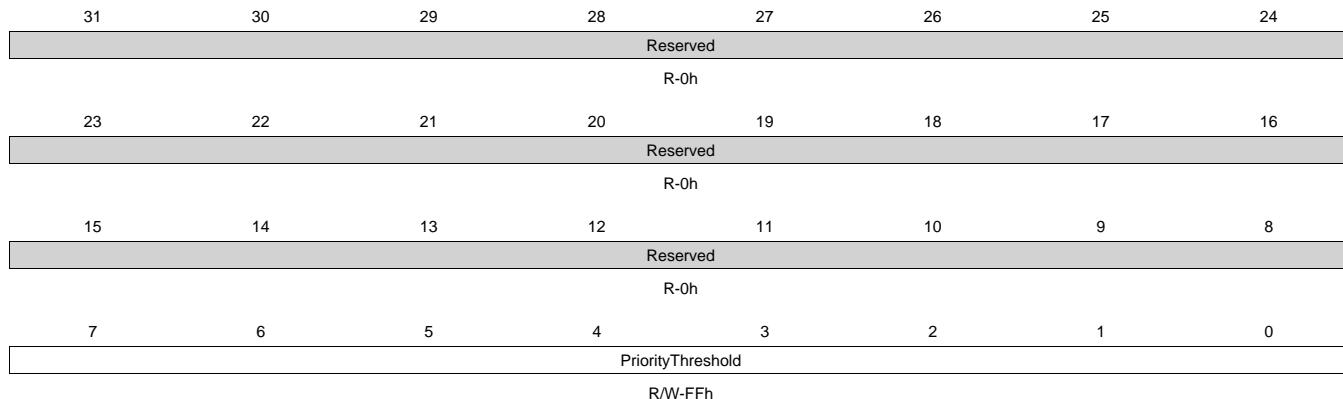

| Bit  | Field           | Type | Reset    | Description          |
|------|-----------------|------|----------|----------------------|
| 31-7 | SpuriousFIQflag | R    | 1FFFFFFh | Spurious FIQ flag    |
| 6-0  | FIQPriority     | R    | 40h      | Current FIQ priority |

### 6.6.1.11 INTC\_THRESHOLD Register (offset = 68h) [reset = FFh]

INTC\_THRESHOLD is shown in [Figure 6-14](#) and described in [Table 6-15](#).

This register sets the priority threshold

**Figure 6-14. INTC\_THRESHOLD Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-15. INTC\_THRESHOLD Register Field Descriptions**

| Bit  | Field             | Type | Reset | Description   |
|------|-------------------|------|-------|---|
| 31-8 | Reserved          | R    | 0h    | Reads returns 0   |
| 7-0  | PriorityThreshold | R/W  | FFh   | Priority threshold (used values 0x00-0x1f or 0x00-0x3f, 0xff disables the threshold). |

### 6.6.1.12 INTC\_ITR0 Register (offset = 80h) [reset = 0h]

INTC\_ITR0 is shown in [Figure 6-15](#) and described in [Table 6-16](#).

This register shows the raw interrupt input status before masking

**Figure 6-15. INTC\_ITR0 Register**

| 31   | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Itr  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-16. INTC\_ITR0 Register Field Descriptions**

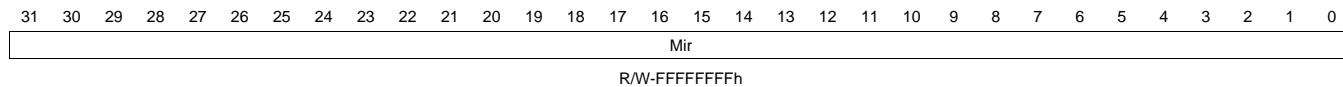

| Bit  | Field | Type | Reset | Description                     |
|------|-------|------|-------|---------------------------------|
| 31-0 | Itr   | R    | 0h    | Interrupt status before masking |

### 6.6.1.13 INTC\_MIR0 Register (offset = 84h) [reset = FFFFFFFFh]

INTC\_MIR0 is shown in [Figure 6-16](#) and described in [Table 6-17](#).

This register contains the interrupt mask

**Figure 6-16. INTC\_MIR0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-17. INTC\_MIR0 Register Field Descriptions**

| Bit  | Field | Type | Reset    | Description    |
|------|-------|------|----------|----------------|
| 31-0 | Mir   | R/W  | FFFFFFFh | Interrupt mask |

### 6.6.1.14 INTC\_MIR\_CLEAR0 Register (offset = 88h) [reset = 0h]

INTC\_MIR\_CLEAR0 is shown in [Figure 6-17](#) and described in [Table 6-18](#).

This register is used to clear the interrupt mask bits.

**Figure 6-17. INTC\_MIR\_CLEAR0 Register**

| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| MirClear |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| W-0h     |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-18. INTC\_MIR\_CLEAR0 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description                                      |
|------|----------|------|-------|--|
| 31-0 | MirClear | W    | 0h    | Write 1 clears the mask bit to 0, reads return 0 |

### 6.6.1.15 INTC\_MIR\_SET0 Register (offset = 8Ch) [reset = 0h]

INTC\_MIR\_SET0 is shown in [Figure 6-18](#) and described in [Table 6-19](#).

This register is used to set the interrupt mask bits.

**Figure 6-18. INTC\_MIR\_SET0 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-19. INTC\_MIR\_SET0 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description                                    |
|------|--------|------|-------|--|
| 31-0 | MirSet | W    | 0h    | Write 1 sets the mask bit to 1, reads return 0 |

### 6.6.1.16 INTC\_ISR\_SET0 Register (offset = 90h) [reset = 0h]

INTC\_ISR\_SET0 is shown in [Figure 6-19](#) and described in [Table 6-20](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-19. INTC\_ISR\_SET0 Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31     | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-20. INTC\_ISR\_SET0 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description   |
|------|--------|------|-------|---|
| 31-0 | IsrSet | R/W  | 0h    | Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1 |

### 6.6.1.17 INTC\_ISR\_CLEAR0 Register (offset = 94h) [reset = 0h]

INTC\_ISR\_CLEAR0 is shown in [Figure 6-20](#) and described in [Table 6-21](#).

This register is used to clear the software interrupt bits

**Figure 6-20. INTC\_ISR\_CLEAR0 Register**

|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IsrClear |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| W-0h     |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-21. INTC\_ISR\_CLEAR0 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-0 | IsrClear | W    | 0h    | Write 1 clears the software interrupt bits to 0, reads return 0 |

### 6.6.1.18 INTC\_PENDING\_IRQ0 Register (offset = 98h) [reset = 0h]

INTC\_PENDING\_IRQ0 is shown in [Figure 6-21](#) and described in [Table 6-22](#).

This register contains the IRQ status after masking

**Figure 6-21. INTC\_PENDING\_IRQ0 Register**

| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| PendingFIQ |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R-0h       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-23. INTC\_PENDING\_FIQ0 Register Field Descriptions**

| Bit  | Field      | Type | Reset | Description              |
|------|------------|------|-------|--------------------------|
| 31-0 | PendingFIQ | R    | 0h    | FIQ status after masking |

### 6.6.1.20 INTC\_ITR1 Register (offset = A0h) [reset = 0h]

INTC\_ITR1 is shown in [Figure 6-23](#) and described in [Table 6-24](#).

This register shows the raw interrupt input status before masking

**Figure 6-23. INTC\_ITR1 Register**

| 31   | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Itr  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-24. INTC\_ITR1 Register Field Descriptions**

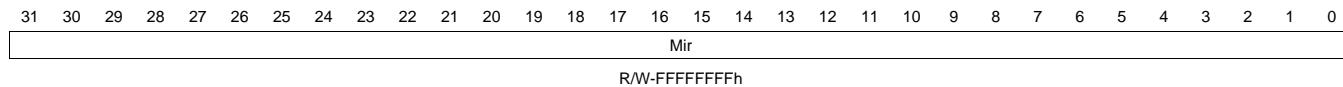

| Bit  | Field | Type | Reset | Description                     |
|------|-------|------|-------|---------------------------------|
| 31-0 | Itr   | R    | 0h    | Interrupt status before masking |

### 6.6.1.21 INTC\_MIR1 Register (offset = A4h) [reset = FFFFFFFFh]

INTC\_MIR1 is shown in [Figure 6-24](#) and described in [Table 6-25](#).

This register contains the interrupt mask

**Figure 6-24. INTC\_MIR1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-25. INTC\_MIR1 Register Field Descriptions**

| Bit  | Field | Type | Reset       | Description    |
|------|-------|------|-------------|----------------|
| 31-0 | Mir   | R/W  | FFFFFFFFFFh | Interrupt mask |

### 6.6.1.22 INTC\_MIR\_CLEAR1 Register (offset = A8h) [reset = 0h]

INTC\_MIR\_CLEAR1 is shown in [Figure 6-25](#) and described in [Table 6-26](#).

This register is used to clear the interrupt mask bits.

**Figure 6-25. INTC\_MIR\_CLEAR1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-26. INTC\_MIR\_CLEAR1 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description                                      |
|------|----------|------|-------|--|
| 31-0 | MirClear | W    | 0h    | Write 1 clears the mask bit to 0, reads return 0 |

### 6.6.1.23 INTC\_MIR\_SET1 Register (offset = ACh) [reset = 0h]

INTC\_MIR\_SET1 is shown in [Figure 6-26](#) and described in [Table 6-27](#).

This register is used to set the interrupt mask bits.

**Figure 6-26. INTC\_MIR\_SET1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-27. INTC\_MIR\_SET1 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description                                    |
|------|--------|------|-------|--|
| 31-0 | MirSet | W    | 0h    | Write 1 sets the mask bit to 1, reads return 0 |

### 6.6.1.24 INTC\_ISR\_SET1 Register (offset = B0h) [reset = 0h]

INTC\_ISR\_SET1 is shown in [Figure 6-27](#) and described in [Table 6-28](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-27. INTC\_ISR\_SET1 Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31     | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IsrSet |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-28. INTC\_ISR\_SET1 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description   |
|------|--------|------|-------|---|
| 31-0 | IsrSet | R/W  | 0h    | Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1 |

### 6.6.1.25 INTC\_ISR\_CLEAR1 Register (offset = B4h) [reset = 0h]

INTC\_ISR\_CLEAR1 is shown in [Figure 6-28](#) and described in [Table 6-29](#).

This register is used to clear the software interrupt bits

**Figure 6-28. INTC\_ISR\_CLEAR1 Register**

| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| IsrClear |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| W-0h     |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-29. INTC\_ISR\_CLEAR1 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-0 | IsrClear | W    | 0h    | Write 1 clears the software interrupt bits to 0, reads return 0 |

### 6.6.1.26 INTC\_PENDING\_IRQ1 Register (offset = B8h) [reset = 0h]

INTC\_PENDING\_IRQ1 is shown in [Figure 6-29](#) and described in [Table 6-30](#).

This register contains the IRQ status after masking

**Figure 6-29. INTC\_PENDING\_IRQ1 Register**

| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| R-0h       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-30. INTC\_PENDING\_IRQ1 Register Field Descriptions**

| Bit  | Field      | Type | Reset | Description              |
|------|------------|------|-------|--------------------------|
| 31-0 | PendingIRQ | R    | 0h    | IRQ status after masking |

### 6.6.1.27 INTC\_PENDING\_FIQ1 Register (offset = BCh) [reset = 0h]

INTC\_PENDING\_FIQ1 is shown in [Figure 6-30](#) and described in [Table 6-31](#).

This register contains the FIQ status after masking

**Figure 6-30. INTC\_PENDING\_FIQ1 Register**

| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| PendingFIQ |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R-0h       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-31. INTC\_PENDING\_FIQ1 Register Field Descriptions**

| Bit  | Field      | Type | Reset | Description              |
|------|------------|------|-------|--------------------------|
| 31-0 | PendingFIQ | R    | 0h    | FIQ status after masking |

### 6.6.1.28 INTC\_ITR2 Register (offset = C0h) [reset = 0h]

INTC\_ITR2 is shown in [Figure 6-31](#) and described in [Table 6-32](#).

This register shows the raw interrupt input status before masking

**Figure 6-31. INTC\_ITR2 Register**

| 31   | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Itr  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-32. INTC\_ITR2 Register Field Descriptions**

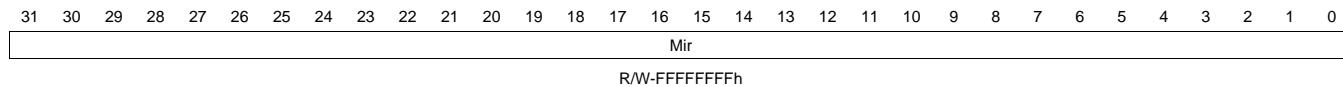

| Bit  | Field | Type | Reset | Description                     |
|------|-------|------|-------|---------------------------------|
| 31-0 | Itr   | R    | 0h    | Interrupt status before masking |

### 6.6.1.29 INTC\_MIR2 Register (offset = C4h) [reset = FFFFFFFFh]

INTC\_MIR2 is shown in [Figure 6-32](#) and described in [Table 6-33](#).

This register contains the interrupt mask

**Figure 6-32. INTC\_MIR2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-33. INTC\_MIR2 Register Field Descriptions**

| Bit  | Field | Type | Reset    | Description    |
|------|-------|------|----------|----------------|
| 31-0 | Mir   | R/W  | FFFFFFFh | Interrupt mask |

### 6.6.1.30 INTC\_MIR\_CLEAR2 Register (offset = C8h) [reset = 0h]

INTC\_MIR\_CLEAR2 is shown in [Figure 6-33](#) and described in [Table 6-34](#).

This register is used to clear the interrupt mask bits.

**Figure 6-33. INTC\_MIR\_CLEAR2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-34. INTC\_MIR\_CLEAR2 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description                                      |
|------|----------|------|-------|--|
| 31-0 | MirClear | W    | 0h    | Write 1 clears the mask bit to 0, reads return 0 |

### 6.6.1.31 INTC\_MIR\_SET2 Register (offset = CCh) [reset = 0h]

INTC\_MIR\_SET2 is shown in [Figure 6-34](#) and described in [Table 6-35](#).

This register is used to set the interrupt mask bits.

**Figure 6-34. INTC\_MIR\_SET2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-35. INTC\_MIR\_SET2 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description                                    |
|------|--------|------|-------|--|
| 31-0 | MirSet | W    | 0h    | Write 1 sets the mask bit to 1, reads return 0 |

### 6.6.1.32 INTC\_ISR\_SET2 Register (offset = D0h) [reset = 0h]

INTC\_ISR\_SET2 is shown in [Figure 6-35](#) and described in [Table 6-36](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-35. INTC\_ISR\_SET2 Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-36. INTC\_ISR\_SET2 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description   |
|------|--------|------|-------|---|
| 31-0 | IsrSet | R/W  | 0h    | Reads returns the currently active software interrupts, Write 1 sets the software interrupt bits to 1 |

### 6.6.1.33 INTC\_ISR\_CLEAR2 Register (offset = D4h) [reset = 0h]

INTC\_ISR\_CLEAR2 is shown in [Figure 6-36](#) and described in [Table 6-37](#).

This register is used to clear the software interrupt bits

**Figure 6-36. INTC\_ISR\_CLEAR2 Register**

|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| R-0h       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-39. INTC\_PENDING\_FIQ2 Register Field Descriptions**

| Bit  | Field      | Type | Reset | Description              |
|------|------------|------|-------|--------------------------|
| 31-0 | PendingFIQ | R    | 0h    | FIQ status after masking |

### 6.6.1.36 INTC\_ITR3 Register (offset = E0h) [reset = 0h]

INTC\_ITR3 is shown in [Figure 6-39](#) and described in [Table 6-40](#).

This register shows the raw interrupt input status before masking

**Figure 6-39. INTC\_ITR3 Register**

| 31   | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| R-0h |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-40. INTC\_ITR3 Register Field Descriptions**

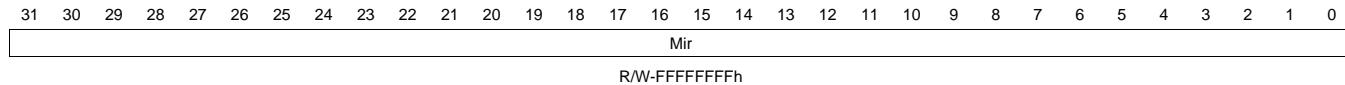

| Bit  | Field | Type | Reset | Description                     |
|------|-------|------|-------|---------------------------------|
| 31-0 | Itr   | R    | 0h    | Interrupt status before masking |

### 6.6.1.37 INTC\_MIR3 Register (offset = E4h) [reset = FFFFFFFFh]

INTC\_MIR3 is shown in [Figure 6-40](#) and described in [Table 6-41](#).

This register contains the interrupt mask

**Figure 6-40. INTC\_MIR3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-41. INTC\_MIR3 Register Field Descriptions**

| Bit  | Field | Type | Reset    | Description    |
|------|-------|------|----------|----------------|
| 31-0 | Mir   | R/W  | FFFFFFFh | Interrupt mask |

### 6.6.1.38 INTC\_MIR\_CLEAR3 Register (offset = E8h) [reset = 0h]

INTC\_MIR\_CLEAR3 is shown in [Figure 6-41](#) and described in [Table 6-42](#).

This register is used to clear the interrupt mask bits.

**Figure 6-41. INTC\_MIR\_CLEAR3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-42. INTC\_MIR\_CLEAR3 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description                                      |
|------|----------|------|-------|--|
| 31-0 | MirClear | W    | 0h    | Write 1 clears the mask bit to 0, reads return 0 |

### 6.6.1.39 INTC\_MIR\_SET3 Register (offset = ECh) [reset = 0h]

INTC\_MIR\_SET3 is shown in [Figure 6-42](#) and described in [Table 6-43](#).

This register is used to set the interrupt mask bits.

**Figure 6-42. INTC\_MIR\_SET3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-43. INTC\_MIR\_SET3 Register Field Descriptions**

| Bit  | Field  | Type | Reset | Description                                    |
|------|--------|------|-------|--|
| 31-0 | MirSet | W    | 0h    | Write 1 sets the mask bit to 1, reads return 0 |

#### 6.6.1.40 INTC\_ISR\_SET3 Register (offset = F0h) [reset = 0h]

INTC\_ISR\_SET3 is shown in [Figure 6-43](#) and described in [Table 6-44](#).

This register is used to set the software interrupt bits. It is also used to read the currently active software interrupts.

**Figure 6-43. INTC\_ISR\_SET3 Register**

|        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| Bit  | Field      | Type | Reset | Description              |
|------|------------|------|-------|--------------------------|
| 31-0 | PendingFIQ | R    | 0h    | FIQ status after masking |

#### 6.6.1.44 INTC\_ILR Register (offset = 100h to 2FCh) [reset = 0h]

INTC\_ILR0 to INTC\_ILR127 is shown in [Figure 6-47](#) and described in [Table 6-48](#).

The INTC\_ILRx registers contain the priority for the interrupts and the FIQ/IRQ steering.

**Figure 6-47. INTC\_ILR0 to INTC\_ILR127 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 6-48. INTC\_ILR0 to INTC\_ILR127 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    | Write 0's for future compatibility.<br>Reads returns 0   |
| 7-2  | Priority | R/W  | 0h    | Interrupt priority   |
| 0    | FIQnIRQ  | R/W  | 0h    | Interrupt IRQ/FIQ mapping<br>0x0 = IntIRQ : Interrupt is routed to IRQ.<br>0x1 = IntFIQ : Interrupt is routed to FIQ (this selection is reserved on GP devices). |

## **Memory Subsystem**

This chapter describes the memory subsystem of the device.

| Topic              | Page |
|--------------------|------|
| 7.1 GPMC .....     | 250  |
| 7.2 OCMC-RAM ..... | 397  |
| 7.3 EMIF .....     | 399  |
| 7.4 ELM .....      | 475  |

## 7.1 GPMC

### 7.1.1 Introduction

The general-purpose memory controller (GPMC) is an unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (only available in non-multiplexed mode) burst NOR flash devices
- NAND Flash
- Pseudo-SRAM devices

#### 7.1.1.1 GPMC Features

The general features of the GPMC module include:

- Data path to external memory device can be 16- or 8-bit wide
- 32-bit OCPIP 2.0 compliant core, single slave interface. Support non-wrapping and wrapping burst up to 16x32bits.
- Up to 100 MHz external memory clock performance (single device)
- Support for the following memory types:
  - External asynchronous or synchronous 8-bit width memory or device (non burst device)
  - External asynchronous or synchronous 16-bit width memory or device
  - External 16-bit non-multiplexed NOR Flash device
  - External 16-bit address and data multiplexed NOR Flash device
  - External 8-bit and 16-bit NAND flash device
  - External 16-bit pSRAM device
- Up to 16-bit ECC support for NAND flash using BCH code ( $t=4, 8$  or  $16$ ) or Hamming code for 8-bit or 16-bit NAND-flash, organized with page size of 512 bytes, 1K bytes, or more.
- Support 512M Bytes maximum addressing capability which can be divided into seven independent chip-select with programmable bank size and base address on 16M Bytes, 32M Bytes, 64M Bytes, or 128M Bytes boundary
- Fully pipelined operation for optimal memory bandwidth usage
- Support external device clock frequency of 1, 2, 3 and 4 divider from L3 clock.
- Support programmable auto-clock gating when there is no access.
- Support Midlereq/SidleAck protocol
- Support the following interface protocols when communicating with external memory or external devices.
  - Asynchronous read/write access
  - Asynchronous read page access (4-8-16 Word16)
  - Synchronous read/write access
  - Synchronous read burst access without wrap capability (4-8-16 Word16)
  - Synchronous read burst access with wrap capability (4-8-16 Word16)
- Address and Data multiplexed access
- Each chip-select as independent and programmable control signal timing parameters for Setup and Hold time. Parameters are set according to the memory device timing parameters, with one L3 clock cycle timing granularity.
- Flexible internal access time control (wait state) and flexible handshake mode using external WAIT pins monitoring (up to two WAIT pins)
- Support bus keeping
- Support bus turn around

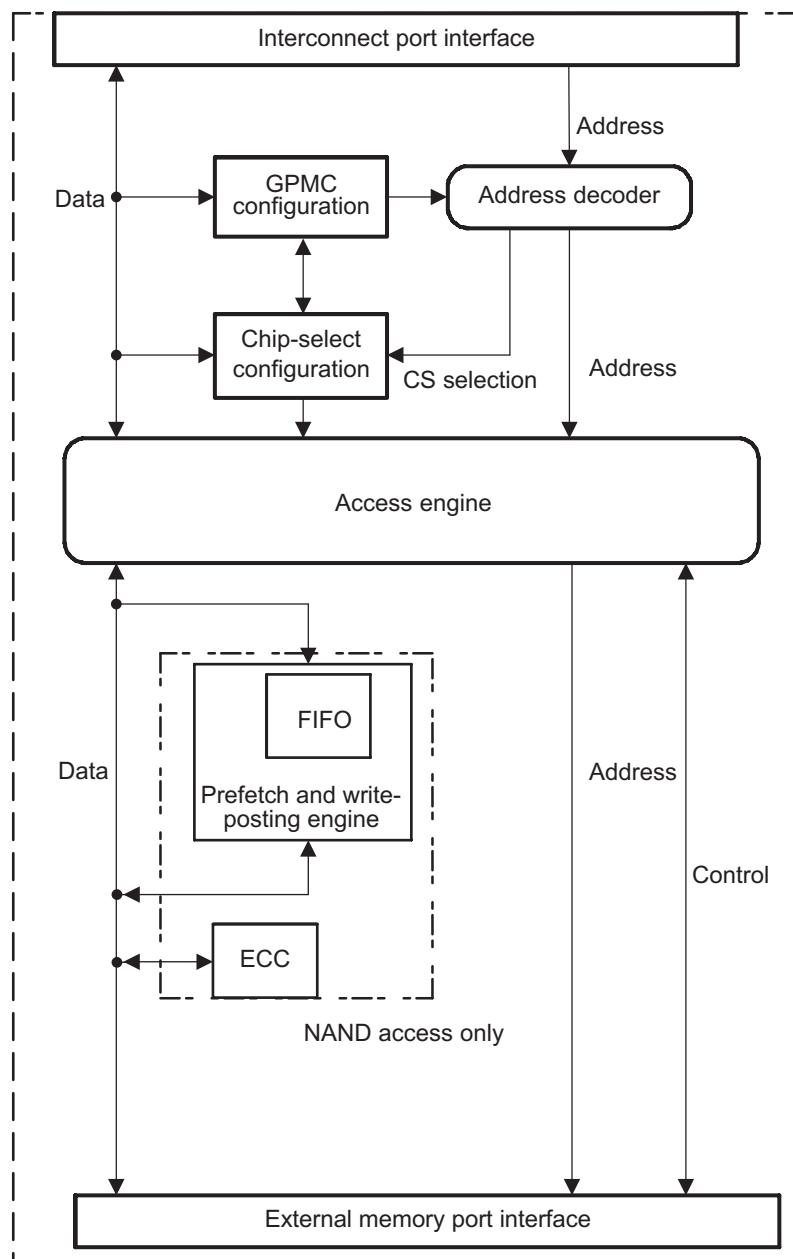

- Pre-fetch and write posting engine associated with system DMA to get full performance from NAND device with minimum impact on NOR/SRAM concurrent access.
- On the fly ECC Hamming Code calculation to improve NAND usage reliability with minimum impact on SW

### 7.1.1.2 Block Diagram

The GPMC can access various external devices through the L3 Slow Interconnect. The flexible programming model allows a wide range of attached device types and access schemes. Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC is able to generate all control signals timing depending on the attached device and access type. Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate device type control signals timing.

Figure 7-1 shows the GPMC functional block diagram. The GPMC consists of six blocks:

- Interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

**Figure 7-1. GPMC Block Diagram**

### 7.1.1.3 Unsupported GPMC Features

The following module features are not supported in this device.

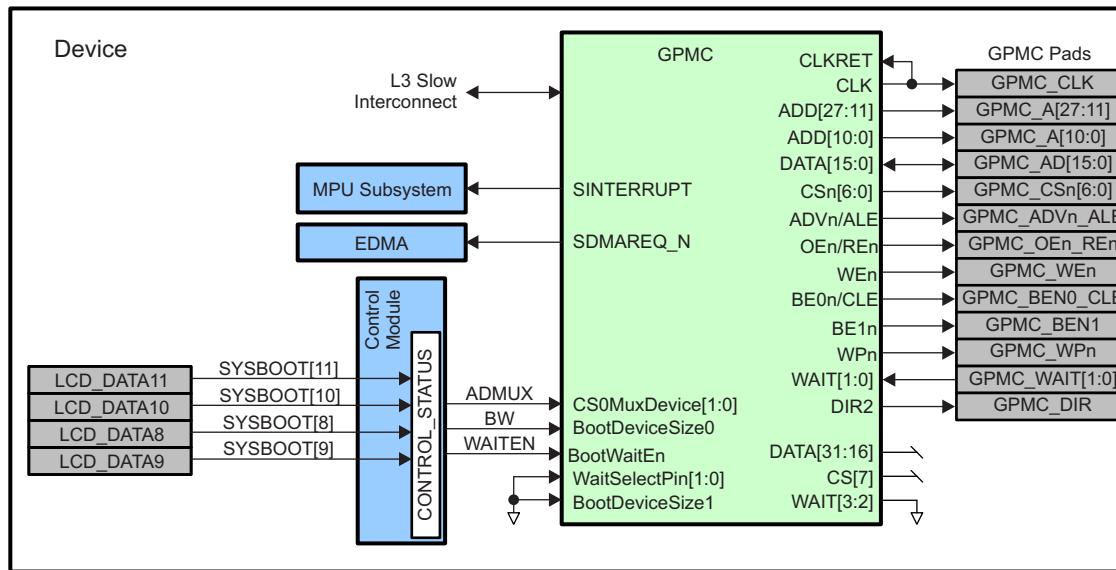

**Table 7-1. Unsupported GPMC Features**

| Feature        | Reason   |
|----------------|--|
| Chip Select 7  | Not pinned out   |
| 32-bit devices | Only 16 data lines pinned out                          |
| WAIT[3:2]      | Not pinned out. All CS regions must use WAIT0 or WAIT1 |

## 7.1.2 Integration

An instantiation of GPMC provides this device with access to NAND Flash, NOR Flash, and other asynchronous and synchronous interface peripherals. [Figure 7-2](#) shows the integration of the GPMC module in this device.

**Figure 7-2. GPMC Integration**

### 7.1.2.1 GPMC Connectivity Attributes

The general connectivity attributes for the GPMC module are shown in [Table 7-2](#).

**Table 7-2. GPMC Connectivity Attributes**

| Attributes          | Type   |
|---------------------|--|
| Power Domain        | Peripheral Domain  |
| Clock Domain        | PD_PER_L3S_GCLK  |
| Reset Signals       | PER_DOM_RST_N  |
| Idle/Wakeup Signals | Smart Idle   |
| Interrupt Requests  | 1 interrupt to MPU Subsystem (GPMCIINT)  |
| DMA Requests        | 1 DMA request to EDMA (GPMCEVT)  |
| Physical Address    | L3 Slow Slave Port<br>Memory and control register regions qualified with MAddressSpace bit |

### 7.1.2.2 GPMC Clock and Reset Management

The GPMC is a synchronous design and operates from the same clock as the Slow L3. All timings use this clock as a reference.

**Table 7-3. GPMC Clock Signals**

| Clock Signal                                  | Max Freq | Reference / Source | Comments                     |
|---|----------|--------------------|------------------------------|
| prcm_gpmc_clk<br>Interface / Functional clock | 100 MHz  | CORE_CLKOUTM4 / 2  | pd_per_l3s_gclk<br>From PRCM |

### 7.1.2.3 GPMC Signal List

The GPMC external interface signals are shown in [Table 7-4](#).

**Table 7-4. GPMC Signal List**

| Signal         | Type | Description   |
|----------------|------|---|
| GPMC_A[27:0]   | O    | Address outputs   |
| GPMC_AD[15:0]  | I/O  | Data - multiplexed with Address[16:1] and Address[27:12]  |
| GPMC_CSn[6:0]  | O    | Chip selects (active low)   |
| GPMC_CLK       | O    | Synchronous mode clock  |
| GPMC_ADVn_ALE  | O    | Address Valid or Address Latch Enable depending if NOR or NAND protocol memories are selected.  |
| GPMC_OEn_REn   | O    | Output Enable (active low). Also used as Read Enable (active low) for NAND protocol memories  |
| GPMC_WEn       | O    | Write Enable (active low)   |
| GPMC_BE0n_CLE  | O    | Lower Byte Enable (active low). Also used as Command Latch Enable for NAND protocol memories  |
| GPMC_BE1n      | O    | Upper Byte Enable (active low)  |
| GPMC_WPn       | O    | Write Protect (active low)  |
| GPMC_WAIT[1:0] | I    | External wait signal for NOR and NAND protocol memories.  |
| GPMC_DIR       | O    | GPMC.D[15:0] signal direction control<br>Low during transmit (for write access: data OUT from GPMC to memory)<br>High during receive (for read access: data IN from memory to GPMC) |

### 7.1.3 Functional Description

#### 7.1.3.1 GPMC Signals

Table 7-5 shows the use of address and data GPMC controller pins based on the type of external device.

**Table 7-5. GPMC Pin Multiplexing Options**

| GPMC Signal | Non Multiplexed Address Data 16-Bit Device | Non Multiplexed Address Data 8-Bit Device | Multiplexed Address Data 16-Bit Device | 16-Bit NAND Device | 8-Bit NAND Device |
|-------------|--|---|--|--------------------|-------------------|
| GPMC_A[27]  | A26  | A27                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[26]  | A25  | A26                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[25]  | A24  | A25                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[24]  | A23  | A24                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[23]  | A22  | A23                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[22]  | A21  | A22                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[21]  | A20  | A21                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[20]  | A19  | A20                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[19]  | A18  | A19                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[18]  | A17  | A18                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[17]  | A16  | A17                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[16]  | A15  | A16                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[15]  | A14  | A15                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[14]  | A13  | A14                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[13]  | A12  | A13                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[12]  | A11  | A12                                       | Not Used                               | Not Used           | Not Used          |
| GPMC_A[11]  | A10  | A11                                       | A26                                    | Not Used           | Not Used          |
| GPMC_A[10]  | A9   | A10                                       | A25                                    | Not Used           | Not Used          |
| GPMC_A[9]   | A8   | A9  | A24                                    | Not Used           | Not Used          |
| GPMC_A[8]   | A7   | A8  | A23                                    | Not Used           | Not Used          |
| GPMC_A[7]   | A6   | A7  | A22                                    | Not Used           | Not Used          |
| GPMC_A[6]   | A5   | A6  | A21                                    | Not Used           | Not Used          |

| GPMC_CS[5]n   | CS5n                                       | CS5n                                      | CS5n                                   | CE5n                       | CE5n                       |
| GPMC_CS[6]n   | CS6n                                       | CS6n                                      | CS6n                                   | CE6n                       | CE6n                       |
| GPMC_ADVn_ALE | ADVn (Address Value)                       | ADVn (Address Value)                      | ADVn (Address Value)                   | ALE (address latch enable) | ALE (address latch enable) |
| GPMC_BE0n_CLE | BE0n (Byte Enable)                         | BE0n (Byte Enable)                        | BE0n (Byte Enable)                     | CLE (command latch enable) | CLE (command latch enable) |
| GPMC_BE1n     | BE1n                                       | BE1n                                      | BE1n                                   |                            |                            |
| GPMC_CLK      | CLK  | CLK                                       | CLK                                    |                            |                            |
| GPMC_OE_REn   | OEn (Output Enable)                        | OEn (Output Enable)                       | OEn (Output Enable)                    | REn (read enable)          | REn (read enable)          |
| GPMC_WAIT0    | WAIT0                                      | WAIT0                                     | WAIT0                                  | R/B0n (ready/busy)         | R/B0n (ready/busy)         |
| GPMC_WAIT1    | WAIT1                                      | WAIT1                                     | WAIT1                                  | R/B1n (ready/busy)         | R/B1n (ready/busy)         |
| GPMC_WEn      | WEn (Write Enable)                         | WEn (Write Enable)                        | WEn (Write Enable)                     | WEn (write enable)         | WEn (write enable)         |
| GPMC_WPn      | WPn (Write Protect)                        | WPn (Write Protect)                       | WPn (Write Protect)                    | WPn (write protect)        | WPn (write protect)        |

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 00.

Address mapping supports address/data-multiplexed 16-bit wide devices:

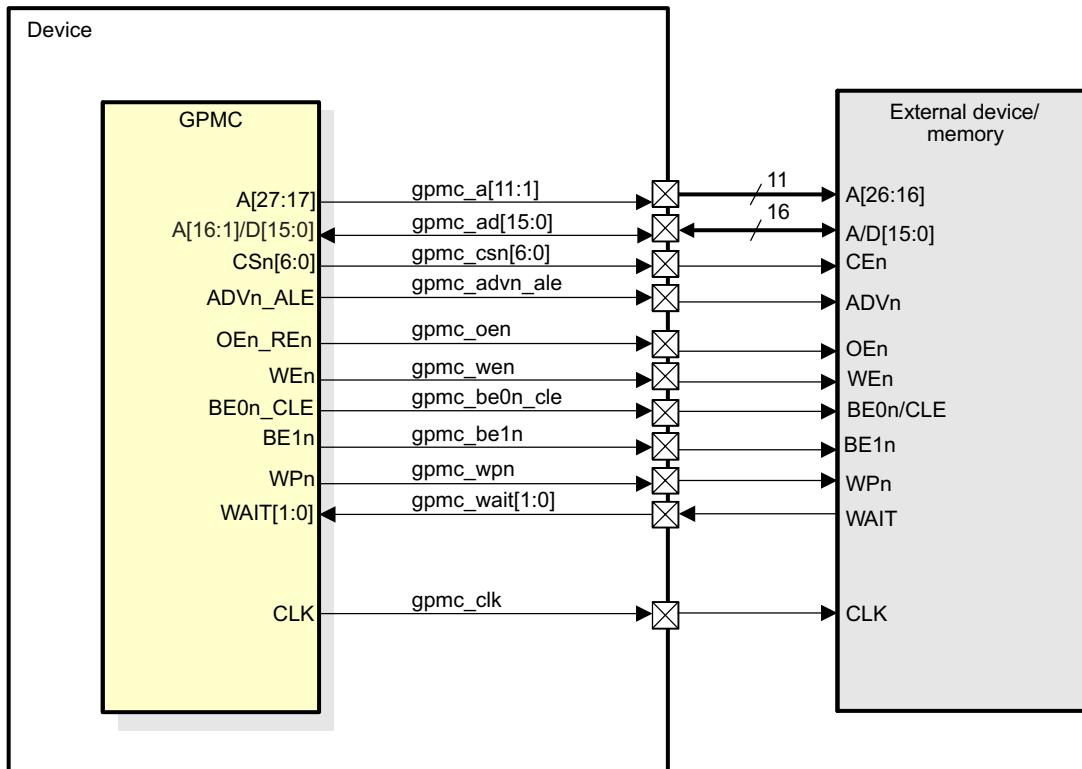

- The NOR flash memory controller still supports non-multiplexed address and data memory devices.
- Multiplexing mode can be selected through the GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit field.
- Asynchronous page mode is not supported for multiplexed address and data devices.

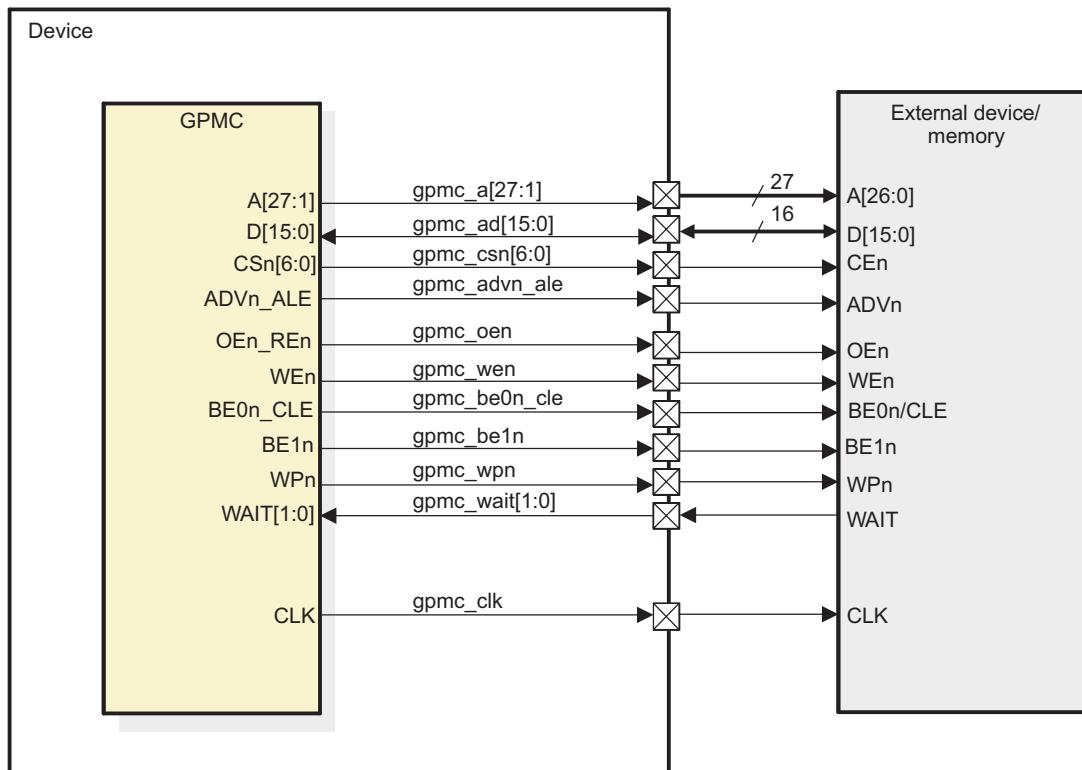

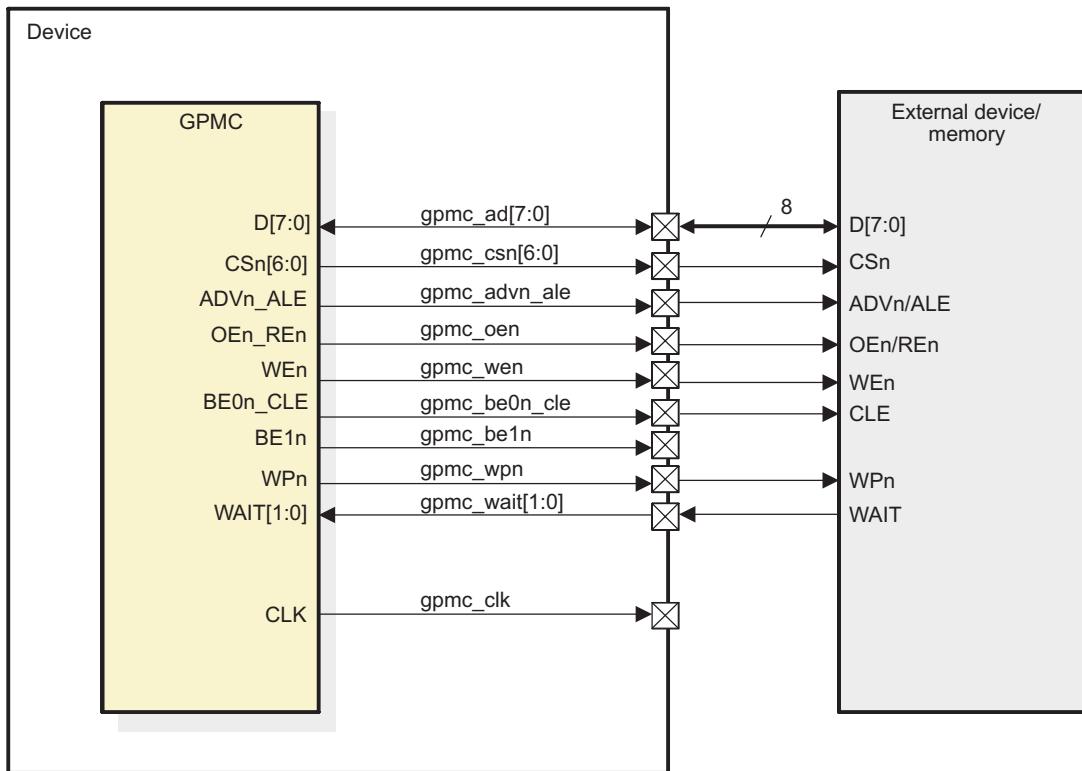

### 7.1.3.2 GPMC Modes

This section shows three GPMC external connections options:

- [Figure 7-3](#) shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol use less address pins) external memory device.
- [Figure 7-4](#) shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device .
- [Figure 7-5](#) shows a connection between the GPMC and a 8-bit NAND device

**Figure 7-3. GPMC to 16-Bit Address/Data-Multiplexed Memory**

**Figure 7-4. GPMC to 16-Bit Non-multiplexed Memory**

**Figure 7-5. GPMC to 8-Bit NAND Device**

### 7.1.3.3 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and the data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC\_FCLK) is used as a time reference to specify the following:

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

### 7.1.3.3.1 GPMC Clock Configuration

Table 7-6 describes the GPMC clocks.

**Table 7-6. GPMC Clocks**

| Signal    | I/O | Description   |
|-----------|-----|---|
| GPMC_FCLK | I   | Functional and interface clock                                  |
| GPMC_CLK  | O   | External clock provided to synchronous external memory devices. |

The GPMC\_CLK is generated by the GPMC from the internal GPMC\_FCLK clock. The source of the GPMC\_FCLK is described in [Table 7-3](#). The GPMC\_CLK is configured via the GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER field (for  $i = 0$  to 3) as shown in [Table 7-7](#).

**Table 7-7. GPMC\_CONFIG1\_i Configuration**

| Source Clock | GPMC_CONFIG1_i[1-0]<br>GPMCFCLKDIVIDER | GPMC_CLK Generated Clock<br>Provided to External Memory Device |
|--------------|--|--|
| GPMC_FCLK    | 00                                     | GPMC_FCLK  |
|              | 01                                     | GPMC_FCLK/2  |
|              | 10                                     | GPMC_FCLK/3  |
|              | 11                                     | GPMC_FCLK/4  |

### 7.1.3.3.2 GPMC Software Reset

The GPMC can be reset by software through the GPMC\_SYSCONFIG[1] SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The GPMC\_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. The software must ensure that the software reset completes before doing GPMC operations.

### 7.1.3.3.3 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines. [Table 7-8](#) describes power-management features available for the GPMC module.

**Table 7-8. GPMC Local Power Management Features**

| Feature                | Registers                                  | Description   |
|------------------------|--|---|
| Clock Auto Gating      | GPMC_SYSCONFIG[0]<br>AUTOIDLE bit          | This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity. |
| Slave Idle Modes       | GPMC_SYSCONFIG[4-3]<br>SIDLEMODE bit field | Force-idle, No-idle and Smart-idle wakeup modes are available   |
| Clock Activity         | N/A  | Feature not available   |
| Master Standby Modes   | N/A  | Feature not available   |
| Global Wake-up Enable  | N/A  | Feature not available   |
| Wake-up Sources Enable | N/A  | Feature not available   |

#### 7.1.3.3.4 GPMC Interrupt Requests

The GPMC generates one interrupt event as shown in [Figure 7-2](#).

- The interrupt request goes from GPMC (GPMC\_IRQ) to the Cortex-A8 MPU subsystem: A\_IRQ\_100

[Table 7-9](#) lists the event flags, and their mask, that can cause module interrupts.

**Table 7-9. GPMC Interrupt Events**

| Event Flag  | Event Mask  | Sensitivity | Map to    | Description  |
|---|---|-------------|-----------|--|
| GPMC IRQSTATUS[9]<br>WAIT1EDGEDETECTIO<br>NSTATUS | GPMC IRQENABLE[9]<br>WAIT1EDGEDETECTIO<br>NENABLE | Edge        | A_IRQ_100 | Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the GPMC_WAIT1 signal. The rising or falling edge detection of Wait1 is selected through GPMC_CONFIG[9] WAIT1PINPOLARITY bit. |
| GPMC IRQSTATUS[8]<br>WAIT0EDGEDETECTIO<br>NSTATUS | GPMC IRQENABLE[8]<br>WAIT0EDGEDETECTIO<br>NENABLE | Edge        | A_IRQ_100 | Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the GPMC_WAIT0 signal. The rising or falling edge detection of Wait0 is selected through GPMC_CONFIG[8] WAIT0PINPOLARITY bit. |
| GPMC IRQSTATUS[1]<br>TERMINALCOUNTSTAT<br>US      | GPMC IRQENABLE[1]<br>TERMINALCOUNTENA<br>BLE      | Level       | A_IRQ_100 | Terminal count event: Triggered on prefetch process completion, that is when the number of currently remaining data to be requested reaches 0.   |
| GPMC IRQSTATUS[0]<br>FIFOEVENTSTATUS              | GPMC IRQENABLE[0]<br>FIFOEVENTENABLE              | Level       | A_IRQ_100 | FIFO event interrupt: Indicates FIFO levels availability for in Write-Posting mode and prefetch mode. GPMC_PREFETCH_CONFIG[2] DMAMODE bit shall be cleared to 0.   |

#### 7.1.3.3.5 GPMC DMA Requests

The GPMC generates one DMA event, from GPMC (GPMC\_DMA\_REQ) to the eDMA: e\_DMA\_53

#### 7.1.3.3.6 L3 Slow Interconnect Interface

The GPMC L3 Slow interconnect interface is a pipelined interface including an  $16 \times 32$ -bit word write buffer. Any system host can issue external access requests through the GPMC. The device system can issue the following requests through this interface:

- One 8-bit / 16-bit / 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts  $2 \times 32$ ,  $4 \times 32$ ,  $8 \times 32$  or  $16 \times 32$  with the burst base address aligned on the total burst size are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line, for specific event control.

It is recommended to program the GPMC\_CONFIG1\_i ATTACHEDDEVICEPAGELENGTH field ([24-23]) according to the effective attached device page length and to enable the GPMC\_CONFIG1\_i WRAPBURST bit ([31]) if the attached device supports wrapping burst. However, it is possible to emulate wrapping burst on a non-wrapping memory by providing relevant addresses within the page or splitting transactions. Bursts larger than the memory page length are chopped into multiple bursts transactions. Due to the alignment requirements, a page boundary is never crossed.

### 7.1.3.3.7 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit wide NOR devices do not use GPMC I/O: GPMC\_AD[15-8] for data (they are used for address if needed).
- 16-bit wide NAND devices do not use GPMC I/O: GPMC\_A[27-0].
- 8-bit wide NAND devices do not use GPMC I/O: GPMC\_A[27-0] and GPMC I/O: GPMC\_AD[15-8].

#### 7.1.3.3.7.1 GPMC I/O Configuration Setting

---

**NOTE:** In this section and next sections, the i in GPMC\_CONFIGx\_i stands for the GPMC chip-select i where i = 0 to 6.

---

To select a NAND device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 10b
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 00

To select an address/data-multiplexed device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 00
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 10b

To select an address/address/data-multiplexed device, program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 00
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 01b

To select an address/data-nonmultiplexed device , program the following register fields:

- GPMC\_CONFIG1\_i[11-10] DEVICETYPE field = 00
- GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit = 00

#### 7.1.3.3.8 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file should be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 7.1.5](#) provides the GPMC register locations. For the map of GPMC memory locations, see [Table 7-54](#).

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

### 7.1.3.3.8.1 Chip-Select Base Address and Region Size

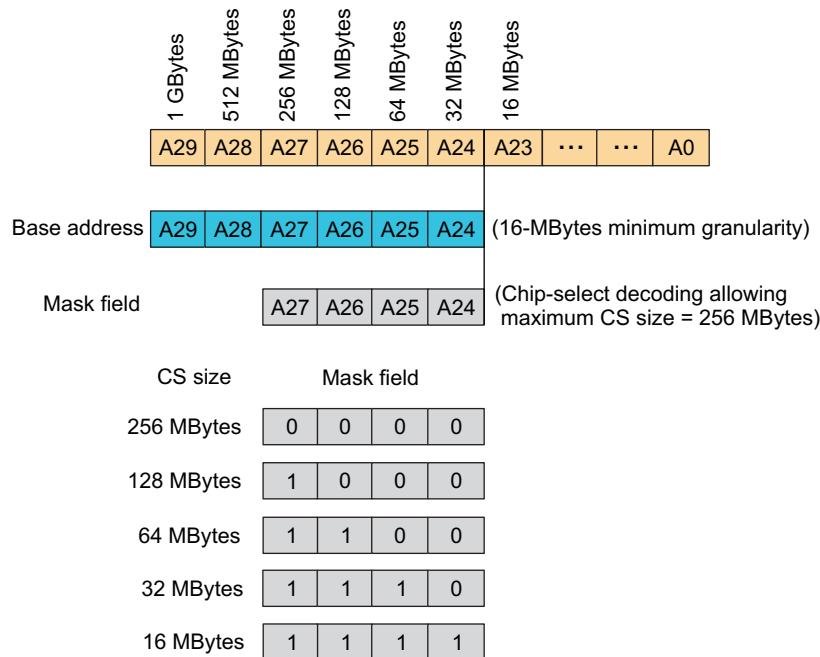

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 512-Mbyte contiguous address space. For details, see [Table 7-54](#).

The GPMC 512 Mbyte address space can be divided into a maximum of seven chip-select regions with programmable base address and programmable CS size. The CS size is programmable from 16 Mbytes to 256 Mbytes (must be a power-of-2) and is defined by the mask field. Attached memory smaller than the programmed CS region size is accessed through the entire CS region (aliasing).

Each chip-select has a 6-bit base address encoding and a 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-2 address value. During access decoding, the register base address value is used for address comparison with the address-bit line mapping as described in [Figure 7-6](#) (with A0 as the device system byte-address line). Base address is programmed through the GPMC\_CONFIG7\_i[5:0] BASEADDRESS bit field.
- The register mask is used to exclude some address lines from the decoding. A register mask bit field cleared to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The register mask value must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the GPMC\_CONFIG7\_i[11:8] MASKADDRESS bit field.

**Figure 7-6. Chip-Select Address Mapping and Decoding Mask**

A mask value of 0010 or 1001 must be avoided because it will create holes in the chip-select address space.

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the GPMC\_CONFIG7\_i[6] CSVALID bit. In addition, a chip-select configuration can only be disabled if there is no ongoing access to that chip-select. This requires activity monitoring of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of chip-selects overlapping, an error is generated and no access will occur on either chip-select. Chip-select 0 is the only chip-select region enabled after either a power-up or a GPMC reset.

Although the GPMC interface can drive up to seven chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers, to allow the slowest device to maintain the total load on the lines.

#### **7.1.3.3.8.2 Access Protocol**

##### **7.1.3.3.8.2.1 Supported Devices**

The access protocol of each chip-select can be independently specified through the GPMC\_CONFIG1\_i[11-10] DEVICETYPE parameter for:

- Random-access synchronous or asynchronous memory like NOR flash, SRAM
- NAND flash asynchronous devices

For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 7.1.3.3.12](#) and [Section 7.1.3.3.12.1](#).

##### **7.1.3.3.8.2.2 Access Size Adaptation and Device Width**

Each chip-select can be independently configured through the GPMC\_CONFIG1\_i[13-12] DEVICESIZE field to interface with a 16-bit wide device or an 8-bit wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to both the external device data-bus width and little-endian data organization.

An 8-bit wide device must be interfaced to the D0-D7 external interface bus lane. GPMC data accesses only use this bus lane when the associated chip-select is attached to an 8-bit wide device.

The 8-bit wide device can be interfaced in asynchronous or synchronous mode in single data phase (no 8-bit wide device burst mode). If the 8-bit wide device is set in the chip-select configuration register, ReadMultiple and WriteMultiple bit fields are considered “don’t care” and only single accesses are performed.

A 16-bit wide device can be interfaced in asynchronous or synchronous mode, with single or multiple data phases for an access, and with native or emulated wrap mode support.

##### **7.1.3.3.8.2.3 Address/Data-Multiplexing Interface**

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the GPMC\_CONFIG1\_i[9-8] MUXADDDATA bit field. The ADVn signal must be used as the external device address latch control signal. For the associated chip-select configuration, ADVn assertion and deassertion time and OEn assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device (see [Section 7.1.2](#)).

This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data multiplexing protocol (see [Section 7.1.3.3.12](#)).

#### **7.1.3.3.8.3 External Signals**

##### **7.1.3.3.8.3.1 WAIT Pin Monitoring Control**

GPMC access time can be dynamically controlled using an external gpmc\_wait pin when the external device access time is not deterministic and cannot be defined and controlled only using the GPMC internal RDACCESSTIME, WRACCESSTIME and PAGEBURSTACCESSTIME wait state generator.

The GPMC features two input wait pin:gpmc\_wait1, and gpmc\_wait0. This pin allow control of external devices with different wait-pin polarity. They also allow the overlap of wait-pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The GPMC\_CONFIG1\_i[17-16] WAITPINSELECT bit field (where i = 0 to 6) selects which input gpmc\_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the GPMC\_CONFIG register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When WAIT is inactive, data is valid.

The GPMC access engine can be configured per CS to monitor the wait pin of the external memory device or not, based on the access type: read or write.

- The GPMC\_CONFIG1\_i[22] WAITREADMONITORING bit defines whether the wait pin should be monitored during read accesses or not.
- The GPMC\_CONFIG1\_i[21] WAITWRITEMONITORING bit defines whether the wait pin should be monitored during write accesses or not.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC\_CLK clock, depending on the access type: synchronous or asynchronous (the GPMC\_CONFIG1\_i[29] READTYPE and GPMC\_CONFIG1\_i[27] WRITETYPE bits).

#### **7.1.3.3.8.3.2 Wait Monitoring During an Asynchronous Read Access**

When wait-pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait-pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait-pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a WAIT invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait-monitoring pipelining is also applicable to multiple accesses (access within a page).

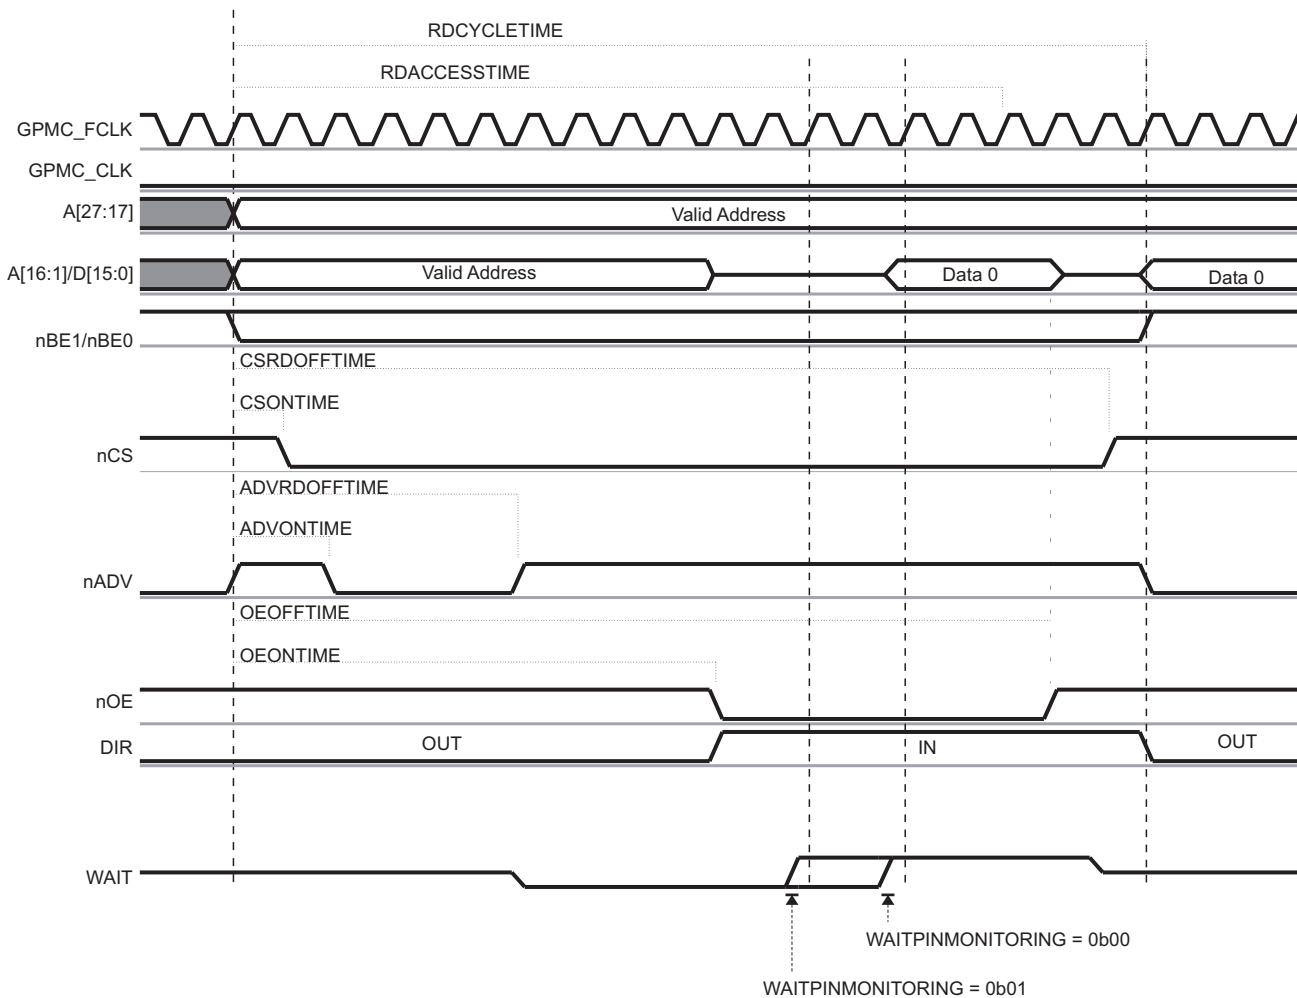

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME field.

- The WAITMONITORINGTIME parameter does not delay the wait-pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
- This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC\_CLK clock is provided to the external device. Still, GPMCFCLKDIVIDER is used as a divider for the GPMC clock, so it must be programmed to define the correct WAITMONITORINGTIME delay.

Figure 7-7 shows wait behavior during an asynchronous single read access.

**Figure 7-7. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)**

The WAIT signal is active low. GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME = 00b or 01b.

#### 7.1.3.3.8.3.3 Wait Monitoring During an Asynchronous Write Access

When wait-pin monitoring is enabled for write accesses (GPMC\_CONFIG1\_i[21] WAITWRITEMONITORING bit = 1), the WAIT-invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- WAIT monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME fields.

- The WAITMONITORINGTIME parameter does not delay the wait-pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
- This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER is used as a divider for the GPMC clock and so it must be programmed to define the correct WAITMONITORINGTIME delay.

#### **7.1.3.3.8.3.4 Wait Monitoring During a Synchronous Read Access**

During synchronous accesses with wait-pin monitoring enabled, the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle it is captured in. Alternatively, it can be sampled one or two GPMC\_CLK cycles ahead of the clock cycle it applies to. This pipelining is applicable to the entire burst access, and to all data phase in the burst access. This WAIT pipelining depth is programmed in the GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME field, and is expressed as a number of GPMC\_CLK clock cycles.

In synchronous mode, when wait-pin monitoring is enabled (GPMC\_CONFIG1\_i[22] WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the WAIT deasserted-state detection.

Depending on the programmed WAITMONITORINGTIME value, the wait pin should be at a valid level, either asserted or deasserted:

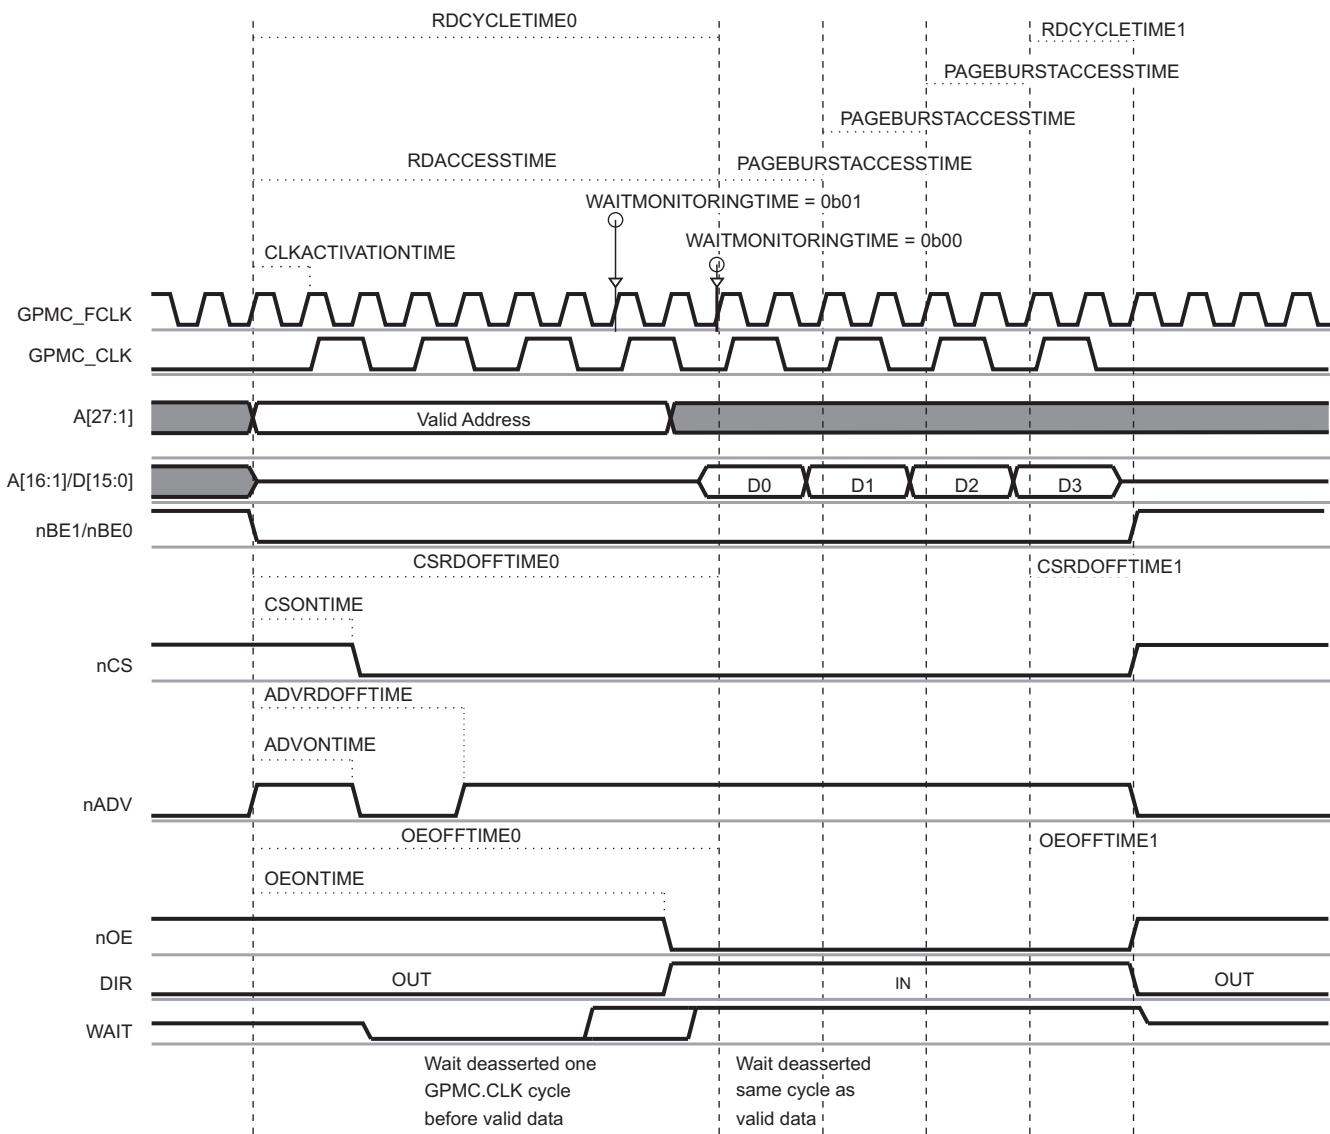

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 (at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-inactive state. The Wait pipelining depth programming applies to the whole burst access.

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), WAIT monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), WAIT monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

Figure 7-8 shows wait behavior during a synchronous read burst access.

**Figure 7-8. Wait Behavior During a Synchronous Read Burst Access**

The WAIT signal is active low. WAITMONITORINGTIME = 00b or 01b.

### **7.1.3.3.8.3.5 Wait Monitoring During a Synchronous Write Access**

During synchronous accesses with wait-pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

If enabled, external wait-pin monitoring can be used in combination with WRACCESSTIME to delay the effective memory device GPMC\_CLK capture edge.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
  - In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME not equal to 0.

Wait-monitoring pipelining definition applies to whole burst accesses:

- WAIT monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as active indicates that the data bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

Wait monitoring is supported for all configurations except for GPMC\_CONFIG1\_i[19-18] WAITMONITORINGTIME = 0 for write bursts with a clock divider of 1 or 2 (GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER field equal to 0 or 1, respectively).

#### **7.1.3.3.8.3.6 WAIT With NAND Device**

For details about the use of the wait pin for communication with a NAND flash external device, see [Section 7.1.3.3.12.2](#).

#### **7.1.3.3.8.3.7 Idle Cycle Control Between Successive Accesses**

##### **7.1.3.3.8.3.7.1 Bus Turnaround (BUSTURNAROUND)**

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the CSn/OEn de-assertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after CSn or OEn de-assertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the GPMC\_CONFIG6\_i[3-0] BUSTURNAROUND bit field.

After a read access to a chip-select with a non zero BUSTURNAROUND, the next access is delayed until the BUSTURNAROUND delay completes, if the next access is one of the following:

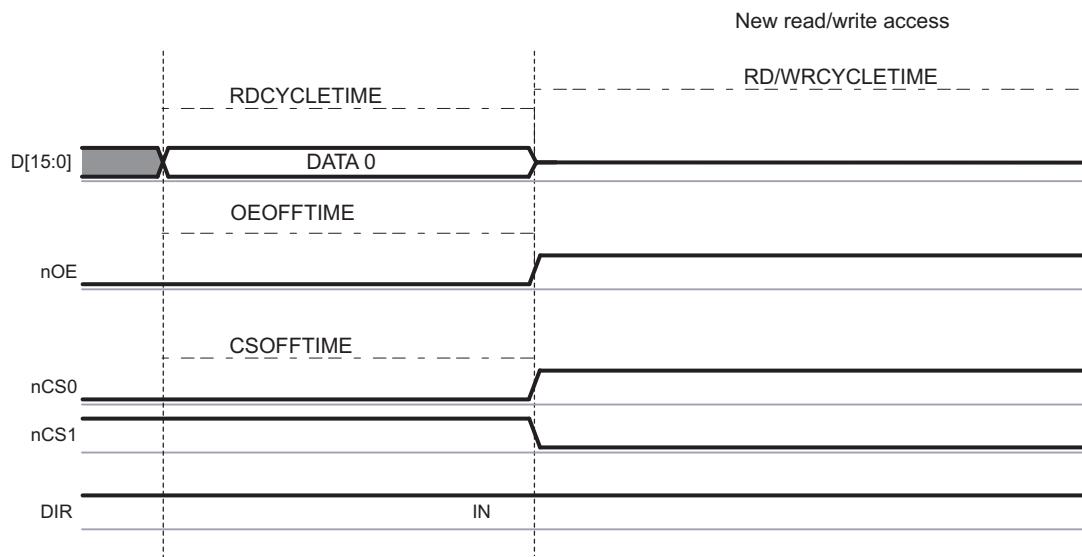

- A write access to any chip-select (same or different from the chip-select data was read from)
- A read access to a different chip-select from the chip-select data was read access from
- A read or write access to a chip-select associated with an address/data-multiplexed device

Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus will not have enough time to go into high-impedance even though it could be driven with the same value before bus turnaround timing.

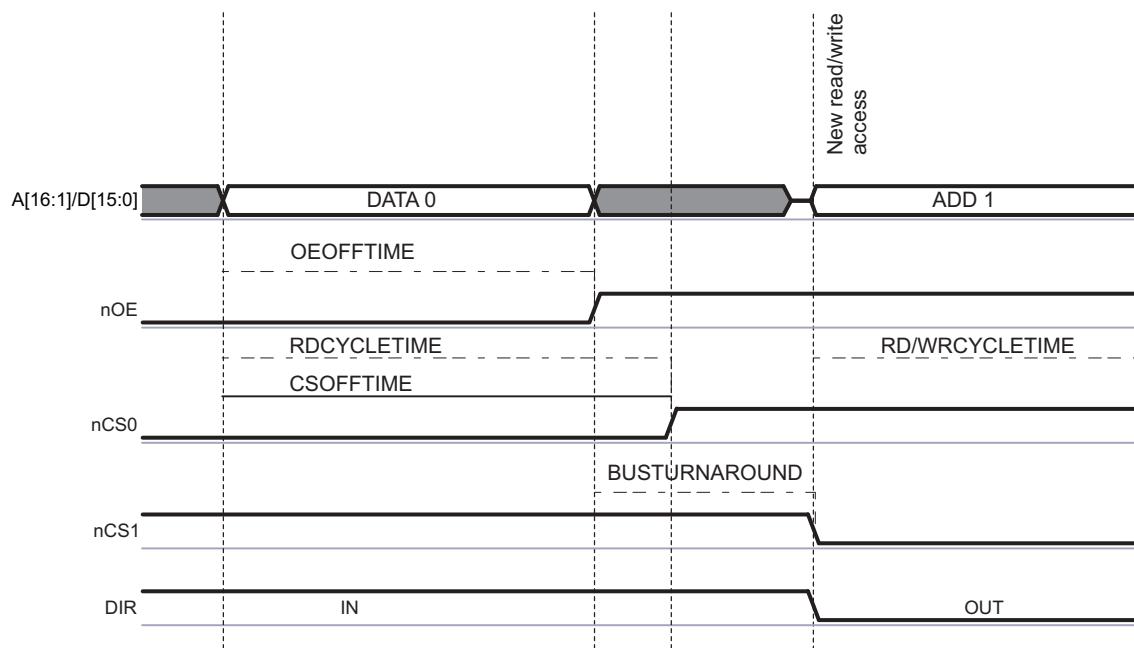

BUSTURNAROUND delay runs in parallel with GPMC\_CONFIG6\_i[3-0] CYCLE2CYCLEDELAY delays. It should be noted that BUSTURNAROUND is a timing parameter for the ending chip-select access while CYCLE2CYCLEDELAY is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access. See [Figure 7-9](#) to [Figure 7-11](#).

Another way to prevent bus contention is to define an earlier CSn or OEn deassertion time for slow devices or to extend the value of RDCYCLETIME. Doing this prevents bus contention, but affects all accesses of this specific chip-select.

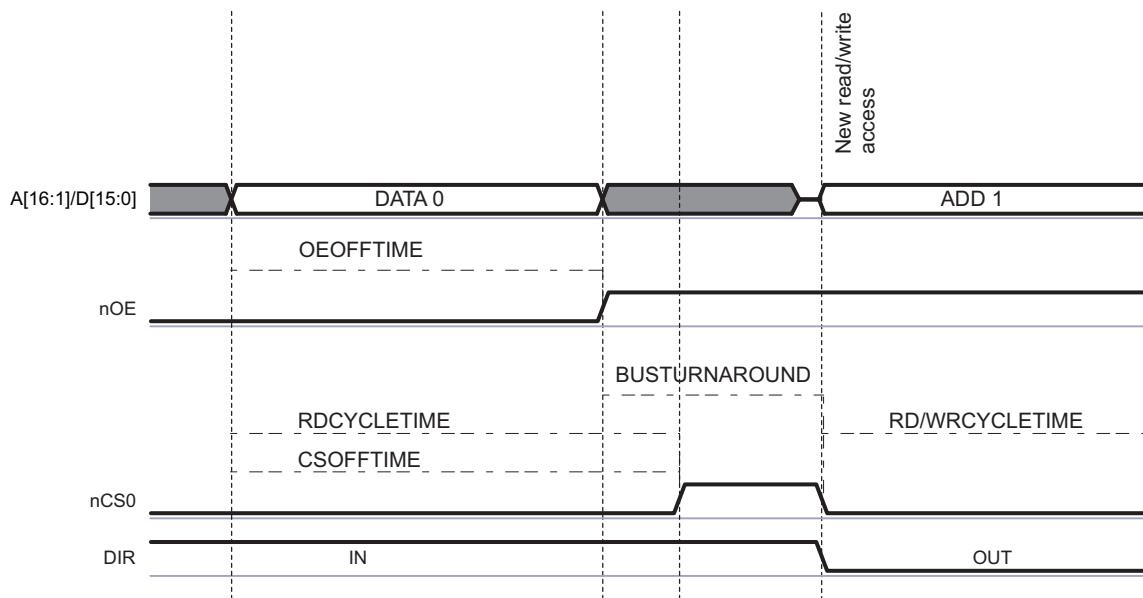

**Figure 7-9. Read to Read for an Address-Data Multiplexed Device, On Different CS, Without Bus Turnaround (CS0n Attached to Fast Device)**

**Figure 7-10. Read to Read / Write for an Address-Data Multiplexed Device, On Different CS, With Bus Turnaround**

**Figure 7-11. Read to Read / Write for a Address-Data or AAD-Multiplexed Device, On Same CS, With Bus Turnaround**

#### 7.1.3.3.8.3.7.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMECSEN, CYCLE2CYCLEDELAY)

Some devices require a minimum chip-select signal inactive time between accesses. The GPMC\_CONFIG6\_i[7] CYCLE2CYCLESAMECSEN bit enables insertion of a minimum number of GPMC\_FCLK cycles, defined by the GPMC\_CONFIG6\_i[11-8] CYCLE2CYCLEDELAY field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used (GPMC\_CONFIG1\_i[30] READMULTIPLE = 0 or GPMC\_CONFIG1\_i[28] WRITEMULTIPLE = 0).

All control signals are kept in their default states during these idle GPMC\_FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

#### 7.1.3.3.8.3.7.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFCSEN, CYCLE2CYCLEDELAY)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (CSn, ADV\_ALEn, BE0\_CLEN, OE\_REn, WEn) assertion and de-assertion timing parameters and on the IC timing parameters, some control signals assertion times may overlap between the successive accesses to different CS. Similarly, some control signals (WEn, OE\_REn) may not respect required transition times.

To work around the overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If GPMC\_CONFIG6\_i[6] CYCLE2CYCLEDIFFCSEN is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC\_FCLK cycles.

CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN should be set in registers to respectively get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. It should be noted that BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, since bus turnaround does not apply to all access types. See [Section 7.1.3.3.8.3.7.1](#) for more details on bus turnaround.

[Table 7-10](#) describes the configuration required for idle cycle insertion.

**Table 7-10. Idle Cycle Insertion Configuration**

| First Access Type | BUSTURN AROUND Timing Parameter | Second Access Type | Chip-Select | Addr/Data Multiplexed | CYCLE2 CYCLE SAMECSEN Parameter | CYCLE2 CYCLE DIFFCSEN Parameter | Idle Cycle Insertion Between the Two Accesses  |
|-------------------|---------------------------------|--------------------|-------------|-----------------------|---------------------------------|---------------------------------|--|
| R/W               | 0                               | R/W                | Any         | Any                   | 0                               | x                               | No idle cycles are inserted if the two accesses are well pipelined.  |
| R                 | >0                              | R                  | Same        | Nonmuxed              | x                               | 0                               | No idle cycles are inserted if the two accesses are well pipelined.  |
| R                 | >0                              | R                  | Different   | Nonmuxed              | 0                               | 0                               | BUSTURNAROUND cycles are inserted.   |
| R                 | >0                              | R/W                | Any         | Muxed                 | 0                               | 0                               | BUSTURNAROUND cycles are inserted.   |
| R                 | >0                              | W                  | Any         | Any                   | 0                               | 0                               | BUSTURNAROUND cycles are inserted.   |
| W                 | >0                              | R/W                | Any         | Any                   | 0                               | 0                               | No idle cycles are inserted if the two accesses are well pipelined.  |
| R/W               | 0                               | R/W                | Same        | Any                   | 1                               | x                               | CYCLE2CYCLEDELAY cycles are inserted.  |
| R/W               | 0                               | R/W                | Different   | Any                   | x                               | 1                               | CYCLE2CYCLEDELAY cycles are inserted.  |
| R/W               | >0                              | R/W                | Same        | Any                   | 1                               | x                               | CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).     |
| R/W               | >0                              | R/W                | Different   | Any                   | x                               | 1                               | CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY). |

#### **7.1.3.3.8.3.8 Slow Device Support (*TIMEPARAGRANULARITY* Parameter)**

All access-timing parameters can be multiplied by 2 by setting the GPMC\_CONFIG1\_i[4] TIMEPARAGRANULARITY bit. Increasing all access timing parameters allows support of slow devices.

#### **7.1.3.3.8.3.9 GPMC\_DIR Pin**

The GPMC\_DIR pin is used to control I/O direction on the GPMC data bus GPMC\_D[15-0]. Depending on top-level pad multiplexing, this signal can be output and used externally to the device, if required. The GPMC\_DIR pin is low during transmit (OUT) and high during receive (IN).

For write accesses, the GPMC\_DIR pin stays OUT from start-cycle time to end-cycle time.

For read accesses, the GPMC\_DIR pin goes from OUT to IN at OEn assertion time and stays IN until:

- BUSTURNAROUND is enabled
  - The GPMC\_DIR pin goes from IN to OUT at end-cycle time plus programmable bus turnaround time.
- BUSTURNAROUND is disabled
  - After an asynchronous read access, the GPMC\_DIR pin goes from IN to OUT at RDACCESSTIME + 1 GPMC\_FCLK cycle or when RDCYCLETIME completes, whichever occurs last.
  - After a synchronous read access, the GPMC\_DIR pin goes from IN to OUT at RDACCESSTIME + 2 GPMC\_FCLK cycles or when RDCYCLETIME completes, whichever occurs last.

Because of the bus-keeping feature of the GPMC, after a read or write access and with no other accesses pending, the default value of the GPMC\_DIR pin is OUT (see [Section 7.1.3.3.9.10](#)). In nonmultiplexed devices, the GPMC\_DIR pin stays IN between two successive read accesses to prevent unnecessary toggling.

#### **7.1.3.3.8.3.10 Reset**

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 8, Power, Reset, and Clock Management \(PRCM\)](#).

The PRCM module provides an input pin, global\_rst\_n, to the GPMC:

- The global\_rst\_n pin is activated during device warm reset and cold reset.
- The global\_rst\_n pin initializes the internal state-machine and the internal configuration registers.

#### **7.1.3.3.8.3.11 Write Protect Signal (WPn)**

When connected to the attached memory device, the write protect signal can enable or disable the lockdown function of the attached memory. The GPMC\_WPn output pin value is controlled through the GPMC\_CONFIG[4] WRITEPROTECT bit, which is common to all CS.

#### **7.1.3.3.8.3.12 Byte Enable (BE1n/BE0n)**

Byte enable signals (BE1n/BE0n) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

#### **7.1.3.3.8.4 Error Handling**

When an error occurs in the GPMC, the error information is stored in the GPMC\_ERR\_TYPE register and the address of the illegal access is stored in the GPMC\_ERR\_ADDRESS register. The GPMC keeps only the first error abort information until the GPMC\_ERR\_TYPE register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the GPMC\_ERR\_TYPE[0]ERRORVALID bit.

- ERRORNOTSUPPADD occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1KB.
- ERRORNOTSUPPMCMD occurs when an unsupported command request is decoded at the L3 Slow interconnect interface
- ERRORTIMEOUT: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the GPMC\_TIMEOUT\_CONTROL register and enabled with the GPMC\_TIMEOUT\_CONTROL[0] TIMEOUTENABLE bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, and then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at the interconnect level.

#### 7.1.3.3.9 Timing Setting

The GPMC offers the maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information on GPMC\_CLK and GPMC\_FCLK see [Section 7.1.3.3.9.6](#).

In the following sections, the start access time refer to the time at which the access begins.

##### 7.1.3.3.9.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The GPMC\_CONFIG5\_i[4-0] RDCYCLETIME and GPMC\_CONFIG5\_i[12-8] WRCYCLETIME fields define the address bus and byte enables valid times for read and write accesses. To ensure a correct duty cycle of GPMC\_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC\_FCLK cycles and must be multiples of the GPMC\_CLK cycle. RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through GPMC\_CONFIG1\_i[4] TIMEPARAGRANULARITY.

When either RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (CSn, ADV\_ALEn, OE\_REn, WEn, and BE0\_CLEN) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

If no inactive cycles are required between successive accesses to the same or to a different chip-select (GPMC\_CONFIG6\_i[7] CYCLE2CYCLESAMECSEN = 0 or GPMC\_CONFIG6\_i[6] CYCLE2CYCLEDIFFCSEN = 0, where i = 0 to 3), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (CSn, ADV\_ALEn, BE0\_CLEN, WEn, and OE\_REn) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses, that is, CYCLE2CYCLESAMECSEN = 1 or CYCLE2CYCLEDIFFCSEN = 1, the control signals are forced to their respective default reset values for the number of GPMC\_FCLK cycles defined in CYCLE2CYCLEDELAY.

##### 7.1.3.3.9.2 CSn: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The GPMC\_CONFIG2\_i[3-0] CSONTIME field defines the CSn signal-assertion time relative to the start access time. It is common for read and write accesses.

The GPMC\_CONFIG2\_i[12-8] CSRDOFFTIME (read access) and GPMC\_CONFIG2\_i[20-16] CSWROFFTIME (write access) bit fields define the CSn signal deassertion time relative to start access time.

CSONTIME, CSRDOFFTIME and CSWROFFTIME parameters are applicable to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte enable hold time after chip-select deassertion.

CSn signal transitions as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG2\_i[7] CSEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on the CSn assertion and deassertion time to guarantee proper setup and hold time relative to GPMC\_CLK. CSEXTRADELAY is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters controlling CSn transitions.

The CSEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the CSn signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

#### **7.1.3.3.9.3 ADV<sub>n</sub>/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME / ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME )**

The GPMC\_CONFIG3\_i[3-0] ADVONTIME field defines the ADV<sub>n</sub>\_ALE signal-assertion time relative to start access time. It is common to read and write accesses.

The GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME (read access) and GPMC\_CONFIG3\_i[20-16] ADVWROFFTIME (write access) bit fields define the ADV<sub>n</sub>\_ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte enable valid setup time control before ADV<sub>n</sub>\_ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte enable valid hold time control after ADV<sub>n</sub>\_ALE de-assertion. ADVRDOFFTIME and ADVWROFFTIME are applicable to both synchronous and asynchronous modes.

ADV<sub>n</sub>\_ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG3\_i[7] ADVEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on ADV<sub>n</sub>\_ALE assertion and deassertion time to assure proper setup and hold time relative to GPMC\_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling ADV<sub>n</sub>\_ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than ADV<sub>n</sub>\_ALE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

The GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME, GPMC\_CONFIG3\_i[26-24] ADVAADMUXRDOFFTIME, and GPMC\_CONFIG3\_i[30-28] ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. It is the user responsibility to make sure ADVAADMUXxxOFFTIME is programmed to a value lower than or equal to ADVxxOFFTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high ADV<sub>n</sub> pulse is needed between the two AAD-mux address phases, which is the typical case in synchronous mode. In this configuration, ADV<sub>n</sub> is kept low until it reaches the correct ADVxxOFFTIME.

See [Section 7.1.3.3.12](#) for more details on ADVONTIME, ADVRDOFFTIME, ADVWROFFTIME, and ADVAADMUXRDOFFTIME, ADVAADMUXWROFFTIME usage for CLE and ALE (Command / Address Latch Enable) usage for a NAND Flash interface.

#### **7.1.3.3.9.4 OEn/REn: Output Enable / Read Enable Signal Control Assertion / Deassertion Time (OEONTIME / OEOFETIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)**

The GPMC\_CONFIG4\_i[3-0] OEONTIME field defines the OEn\_REn signal assertion time relative to start access time. It is applicable only to read accesses.

The GPMC\_CONFIG4\_i[12-8] OEOFETIME field defines the OEn\_REn signal deassertion time relative to start access time. It is applicable only to read accesses. OEn\_REn is not asserted during a write cycle.

OEONTIME, OEOFETIME, OEAADMUXONTIME and OEAADMUXOFFTIME parameters are applicable to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before OEn\_REn assertion. OEOFETIME can be used to control an address and byte enable valid hold time control after OEn\_REn assertion.

OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFETIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. It is the user responsibility to make sure OEAADMUXOFFTIME is programmed to a value lower than OEONTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME shall never be equal to OEONTIME because the AAD-mux protocol requires a second address phase with the OEn signal de-asserted before OEn can be asserted again to define a read command.

The OEn\_REn signal transitions as controlled through OEONTIME, OEOFETIME, OEAADMUXONTIME and OEAADMUXOFFTIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG4\_i[7] OEEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on OEn\_REn assertion and deassertion time to assure proper setup and hold time relative to GPMC\_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling OEn\_REn transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than OEn\_REn signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until OEn assertion time.

#### **7.1.3.3.9.5 WEn: Write Enable Signal Control Assertion / Deassertion Time (WEONTIME / WEOFETIME / WEEXTRADELAY)**

The GPMC\_CONFIG4\_i[19-16] WEONTIME field (where i = 0 to 3) defines the WEn signal-assertion time relative to start access time. The GPMC\_CONFIG4\_i[28-24] WEOFETIME field defines the WEn signal-deassertion time relative to start access time. These bit fields only apply to write accesses. WEn is not asserted during a read cycle.

WEONTIME can be used to control an address and byte enable valid setup time control before WEn assertion. WEOFETIME can be used to control an address and byte enable valid hold time control after WEn assertion.

WEn signal transitions as controlled through WEONTIME, and WEOFETIME can be delayed by half a GPMC\_FCLK period by enabling the GPMC\_CONFIG4\_i[23] WEEXTRADELAY bit. This half of a GPMC\_FCLK period provides more granularity on WEn assertion and deassertion time to guaranty proper setup and hold time relative to GPMC\_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling WEn transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the WEn signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

### 7.1.3.3.9.6 GPMC\_CLK

GPMC\_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC\_CLK clock frequency is the GPMC\_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER bit field, with a guaranteed 50-percent duty cycle.
- The GPMC\_CLK clock is only activated when the access in progress is defined as synchronous (read or write access).
- The GPMC\_CONFIG1\_i[26-25] CLKACTIVATIONTIME field defines the number of GPMC\_FCLK cycles from start access time to GPMC\_CLK activation.
- The GPMC\_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC\_CLK clock is kept low when access is defined as asynchronous.
- When the GPMC is configured for synchronous mode, the GPMC\_CLK signal (which is an output) must also be set as an input in the Pin Mux configuration for the pin. GPMC\_CLK is looped back through the output and input buffers of the corresponding GPMC\_CLK pad at the device boundary. The looped-back clock is used to synchronize the sampling of the memory signals.

When cycle time completes, the GPMC\_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC\_CLK clock within the 50-percent required duty cycle, it is the user's responsibility to extend the RDCYCLETIME or WRCYCLETIME value.

To ensure a correct external clock cycle, the following rules must be applied:

- (RDCYCLETIME - CLKACTIVATIONTIME) must be a multiple of (GPMCFCLKDIVIDER + 1).
- The PAGEBURSTACCESSTIME value must be a multiple of (GPMCFCLKDIVIDER + 1).

### 7.1.3.3.9.7 GPMC\_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC\_CLK edge can be controlled in the following ways:

- For the GPMC\_CLK signal, the GPMC\_CONFIG1\_i[26-25] CLKACTIVATIONTIME field allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC\_CLK allows setup and hold control of control-signal assertion and deassertion times.
- When GPMC\_CLK runs at the GPMC\_FCLK frequency so that GPMC\_CLK edge and control-signal transitions refer to the same GPMC\_FCLK edge, the control-signal transitions can be delayed by half of a GPMC\_FCLK period to provide minimum setup and hold times. This half-GPMC\_FCLK delay is enabled with the CSEXTRADELAY, ADVEXTRADELAY, OEXTRADELAY, or WEEEXTRADELAY parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC\_FCLK cycle.

### 7.1.3.3.9.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read access time and write access time durations can be programmed independently through GPMC\_CONFIG5\_i[20-16] RDACCESSTIME and GPMC\_CONFIG6\_i[28-24] WRACCESSTIME. This allows OE<sub>n</sub> and GPMC data capture timing parameters to be independent of WE<sub>n</sub> and memory device data capture timing parameters. RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through GPMC\_CONFIG1\_i[4] TIMEPARAGRANULARITY.

#### 7.1.3.3.9.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, GPMC\_CONFIG5\_i[20-16] RDACCESSTIME field defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge corresponding to the GPMC\_CLK rising edge used for the first data capture.

GPMC\_CLK which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. GPMC\_CONFIG5\_i[4-0] RDCYCLETIME must be greater than RDACCESSTIME in order to let the GPMC latch the last return data using the internally retimed GPMC\_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC\_FCLK edge on read access in both asynchronous mode and synchronous mode. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### 7.1.3.3.9.8.2 Access Time on Write Access

In asynchronous write mode, the GPMC\_CONFIG6\_i[[28-24] WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a WAIT invalid timing window, and must be set to a correct value so that the gpmc\_wait pin is at a valid state two GPMC\_CLK cycles before WRACCESSTIME completes. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data capture GPMC\_CLK edge for a synchronous write access. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### 7.1.3.3.9.9 Page Burst Access Time (PAGEBURSTACCESSTIME)

GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME bit field can be set with a granularity of 1 or 2 through the GPMC\_CONFIG1\_i[[4] TIMEPARAGRANULARITY.

#### 7.1.3.3.9.9.1 Page Burst Access Time on Read Access

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data capture GPMC\_FCLK edge on read access. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### 7.1.3.3.9.9.2 Page Burst Access Time on Write Access

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory-device data capture GPMC\_CLK edge in synchronous write mode. For details about wait monitoring, see [Section 7.1.3.3.8.1](#).

#### 7.1.3.3.9.10 Bus Keeping Support

At the end-cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completion time to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

### 7.1.3.3.10 NOR Access Description

For each chip-select configuration, the read access can be specified as either asynchronous or synchronous access through the GPMC\_CONFIG1\_i[29] READTYPE bit. For each chip-select configuration, the write access can be specified as either synchronous or asynchronous access through the GPMC\_CONFIG1\_i[27] WRITETYPE bit.

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to GPMC\_FCLK. The primary difference of synchronous mode is the availability of a configurable clock interface (GPMC\_CLK) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For details about asynchronous and synchronous access, see the descriptions of GPMC\_CLK, RdAccessTime, WrAccessTime, and wait-pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

The address bus and BE[1:0]n are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

#### 7.1.3.3.10.1 Asynchronous Access Description

This section describes:

- Asynchronous single read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

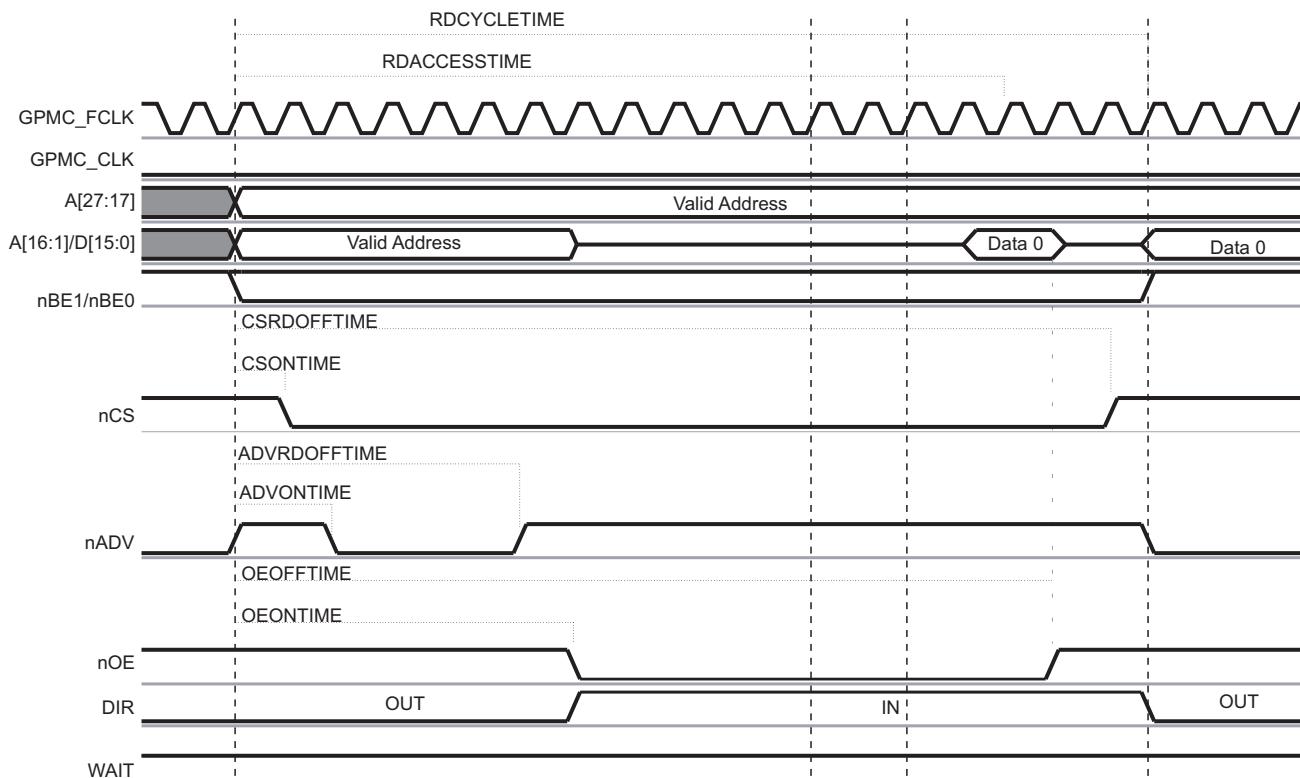

In asynchronous operations GPMC\_CLK is not provided outside the GPMC and is kept low.

### 7.1.3.3.10.1.1 Access on Address/Data Multiplexed Devices

#### 7.1.3.3.10.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 7-12 shows an asynchronous single read operation on an address/data-multiplexed device.

**Figure 7-12. Asynchronous Single Read Operation on an Address/Data Multiplexed Device**

#### 7.1.3.3.10.1.1.2 Asynchronous Single Read on an Address/Data-Multiplexed Device

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until OEn assertion time. For details, see [Section 7.1.3.3.8.2.3](#).

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits GPMC\_A[25:16] are placed on the address bus. The address phase ends at OEn assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal CSn
  - CSn assertion time is controlled by the GPMC\_CONFIG2\_i[3-0] CSONTIME field. It controls the address setup time to CSn assertion.
  - CSn deassertion time is controlled by the GPMC\_CONFIG2\_i[12-8] CSRDOFFTIME field. It controls the address hold time from CSn deassertion
- Address valid signal ADVn
  - ADVn assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.

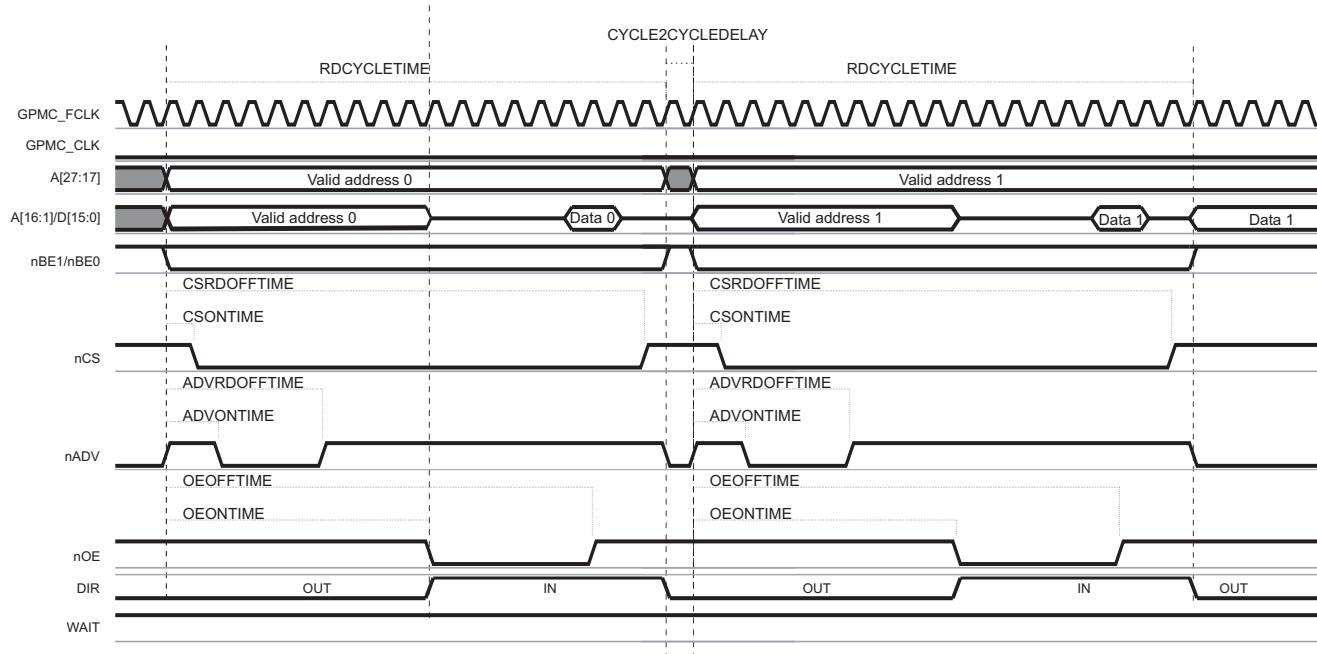

- Output enable signal OEn
  - OEn assertion indicates a read cycle.
  - OEn assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFETIME field.
- Read data is latched when RDACCESSTIME completes. Access time is defined in the GPMC\_CONFIG5\_i[20-16] RDACCESSTIME field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that OEn is asserted.
- The end of the access is defined by the GPMC\_CONFIG5\_i[4-0] RDCYCLETIME parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 7.1.3.3.10.5](#). Between two successive accesses, if a OEn pulse is needed:

- The GPMC\_CONFIG6\_i[11-8] CYCLE2CYCLEDELAY field can be programmed with GPMC\_CONFIG6\_i[7] CYCLE2CYCLESAMECSEN enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

[Figure 7-13](#) shows two asynchronous single-read accesses on an address/data-multiplexed device.

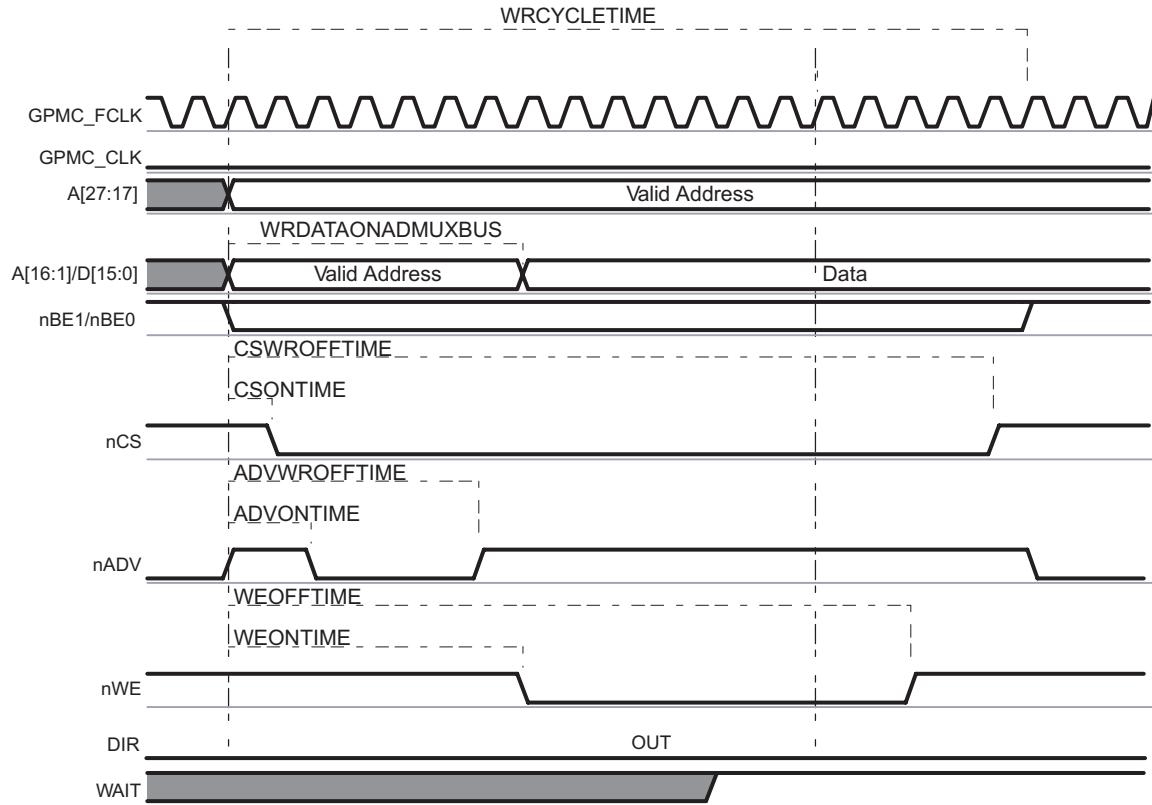

**Figure 7-13. Two Asynchronous Single Read Accesses on an Address/Data Multiplexed Device (32-Bit Read Split Into 2 × 16-Bit Read)**

### 7.1.3.3.10.1.1.3 Asynchronous Single Write Operation on an Address/Data-Multiplexed Device

Figure 7-14 shows an asynchronous single write operation on an address/data-multiplexed device.

**Figure 7-14. Asynchronous Single Write on an Address/Data-Multiplexed Device**

### 7.1.3.3.10.1.1.4 Asynchronous Single Write on an Address/Data-Multiplexed Device

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode. When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until WEn assertion time. For more information, see [Section 7.1.3.3.8.2.3](#).

The CSn and ADVn signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Write enable signal WEn
  - WEn assertion indicates a write cycle.
  - WEn assertion time is controlled by the GPMC\_CONFIG4\_i[19-16] WEONTIME field.
  - WEn deassertion time is controlled by the GPMC\_CONFIG4\_i[28-24] WEOFETIME field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the GPMC\_CONFIG5\_i[12-8] WRCYCLETIME parameter.

Address bits A[16:1] (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits A[26:17] are placed on the address bus.

Data is driven on the address/data bus at a GPMC\_CONFIG6\_i[19-16] WRDATAONADMUXBUS time.

Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 7.1.3.3.9.10](#).

#### **7.1.3.3.10.1.1.5 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device**

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices. If GPMC\_CONFIG1\_i[28] WRITEMULTIPLE is enabled (1) with GPMC\_CONFIG1\_i[27] WRITETYPE as asynchronous (0), the GPMC processes single asynchronous accesses.

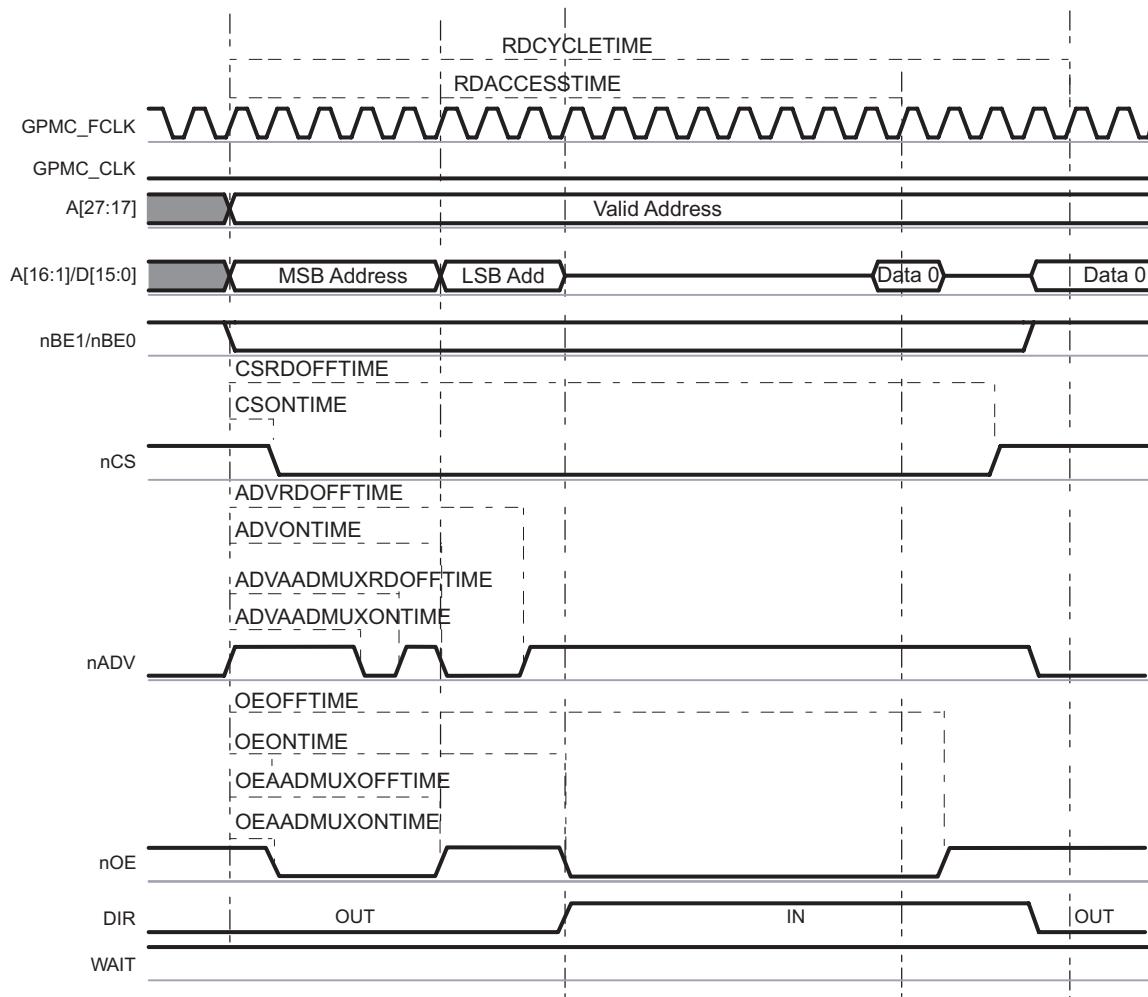

For accesses on non-multiplexed devices, see [Section 7.1.3.3.10.3](#).

#### **7.1.3.3.10.1.2 Access on Address/Address/Data (AAD) Multiplexed Devices**

##### **7.1.3.3.10.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device**

[Figure 7-15](#) shows an asynchronous single read operation on an AAD-multiplexed device.

**Figure 7-15. Asynchronous Single-Read on an AAD-Multiplexed Device**

### 7.1.3.3.10.1.2.2 Asynchronous Single Read on an AAD-Multiplexed Device

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The first address phase ends at the first OEn deassertion time. The second phase for LSB address is qualified with OEn driven high. The second address phase ends at the second OEn assertion time, when the DIR signal goes from OUT to IN.

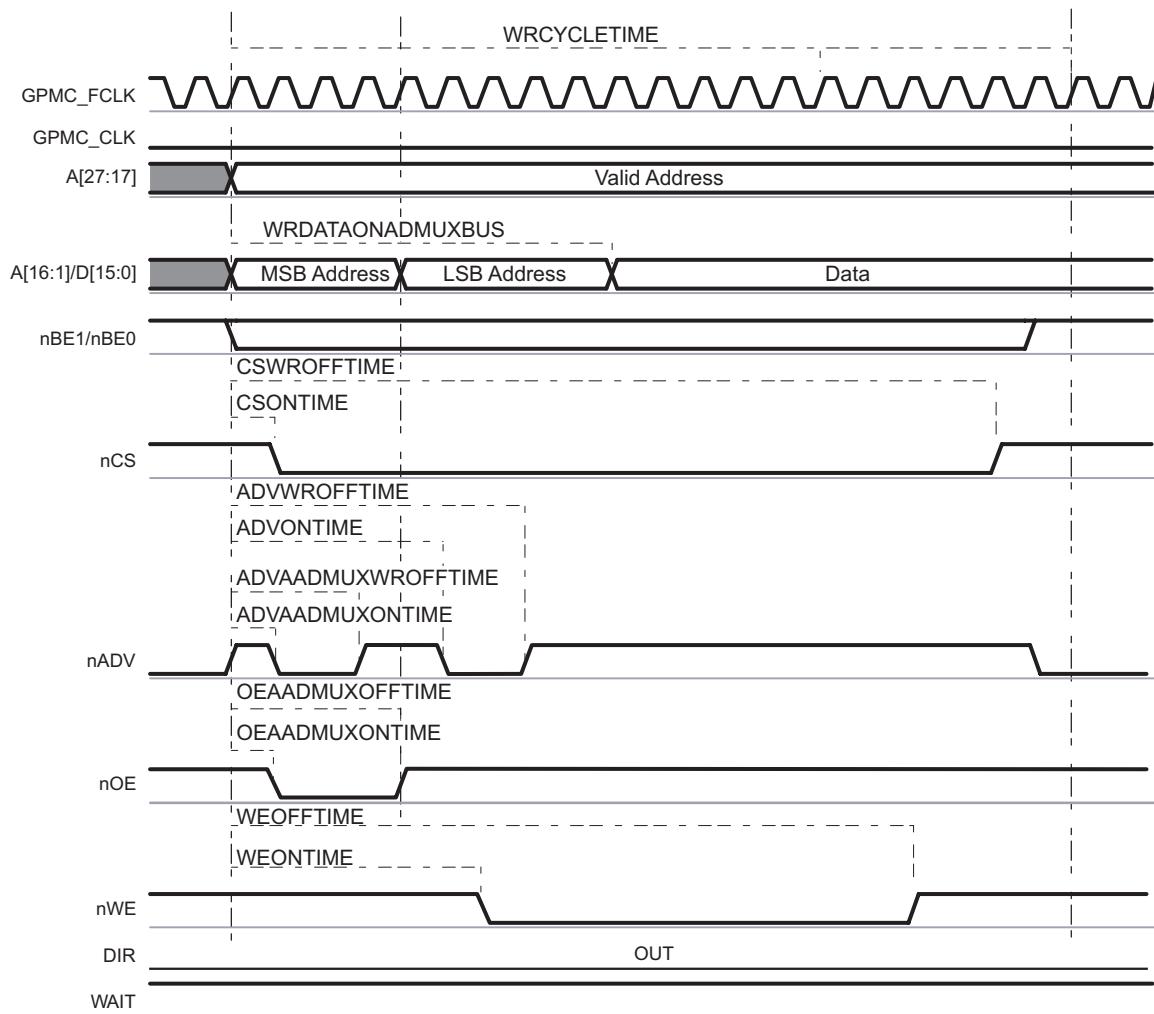

The CSn and DIR signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Address valid signal ADVn. ADVn is asserted and deasserted twice during a read transaction:
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[26-24] ADVAADMUXRDOFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.
- Output Enable signal OEn. OEn is asserted and deasserted twice during a read transaction (OEn second assertion indicates a read cycle):
  - OEn first assertion time is controlled by the GPMC\_CONFIG4\_i[6-4] OEAADMUXONTIME field.
  - OEn first deassertion time is controlled by the GPMC\_CONFIG3\_i[15-13] OEAADMUXOFFTIME field.
  - OEn second assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn second deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFETIME field.

### 7.1.3.3.10.1.2.3 Asynchronous Single Write Operation on an AAD-Multiplexed Device

Figure 7-16 shows an asynchronous single write operation on an AAD-multiplexed device.

**Figure 7-16. Asynchronous Single Write on an AAD-Multiplexed Device**

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The second phase for LSB address is qualified with OEn driven high. The address phase ends at WEn assertion time.

The CSn, WEn, and DIR signals are controlled in the same way as for asynchronous single write operation on an address/data-multiplexed device.

- Address valid signal ADVn is asserted and deasserted twice during a write transaction
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[30-28] ADVAADMUXWROFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[20-16] ADVWROFFTIME field.
- Output Enable signal OEn is asserted during the address phase of a write transaction
  - OEn assertion time is controlled by the GPMC\_CONFIG4\_i[6-4] OEAADMUXONTIME field.
  - OEn deassertion time is controlled by the GPMC\_CONFIG3\_i[15-13] OEAADMUXOFFTIME field.

The address bits for the first address phase are driven onto the data bus until OEn deassertion. Data is driven onto the address/data bus at the clock edge defined by the GPMC\_CONFIG6\_i[19-16] WRDATAONADMUXBUS parameter.

#### 7.1.3.3.10.1.2.4 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If GPMC\_CONFIG1\_i[28] WRITEMULTIPLE is enabled (1) with GPMC\_CONFIG1\_i[27] WRITETYPE as asynchronous (0), the GPMC processes single asynchronous accesses.

For accesses on non-multiplexed devices, see [Section 7.1.3.3.10.3](#).

#### 7.1.3.3.10.2 Synchronous Access Description

This section details read and write synchronous accesses on address/data multiplexed. All information in this section can be applied to any type of memory - non-multiplexed, address and data multiplexed or AAD-multiplexed - with a difference limited to the address phase. For accesses on non-multiplexed devices, see [Section 7.1.3.3.10.3](#).

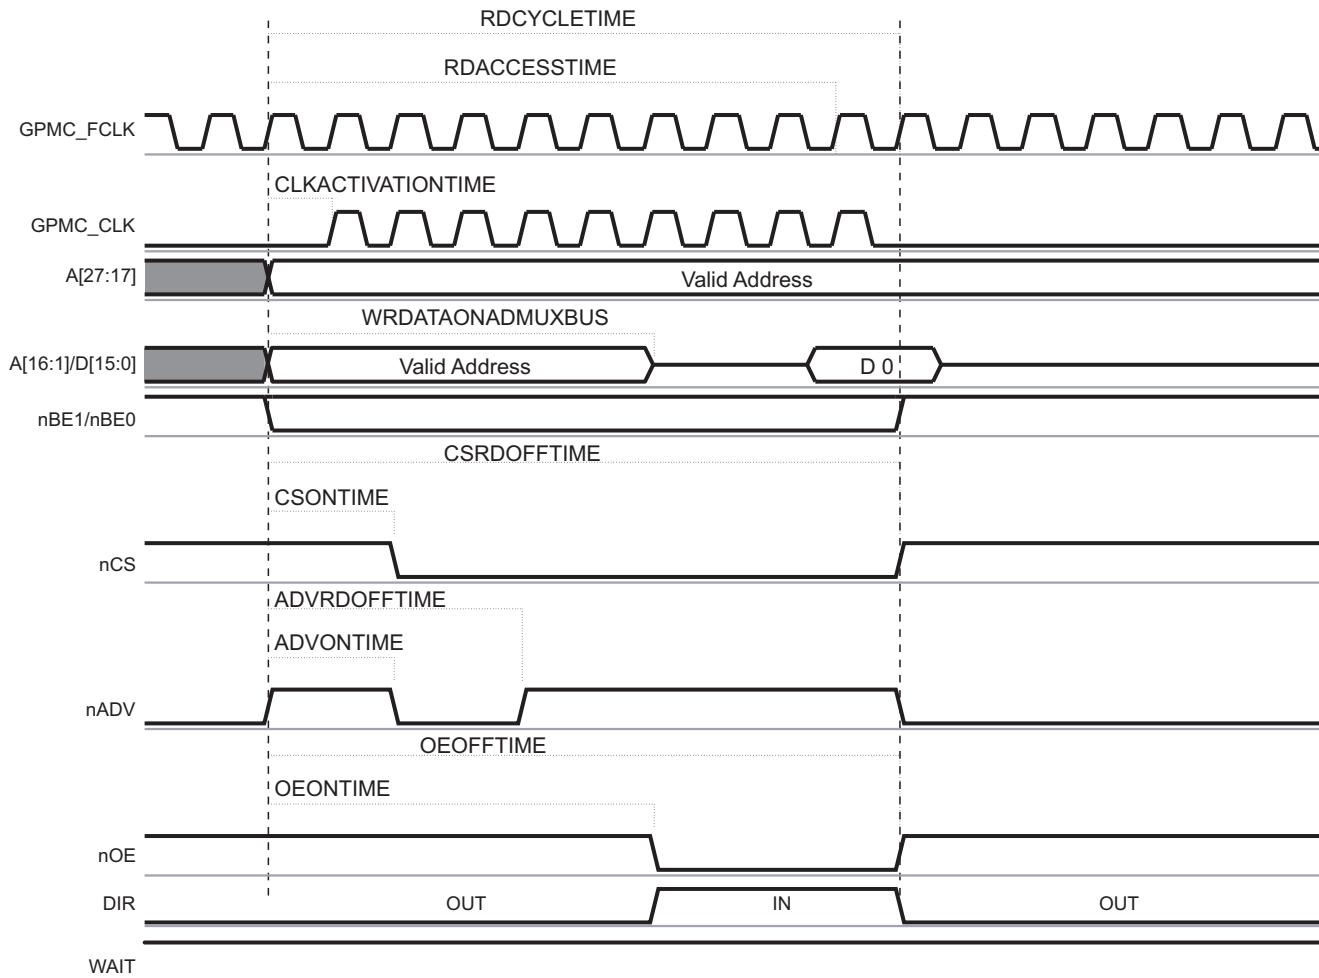

In synchronous operations:

- The GPMC\_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC\_CLK clock is derived from the GPMC\_FCLK clock using the GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER field. In the following section, i stands for the chip-select number, i = 0 to 3.
- The GPMC\_CONFIG1\_i[26-25] CLKACTIVATIONTIME field specifies that the GPMC\_CLK is provided outside the GPMC 0, 1, or 2 GPMC\_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completion.

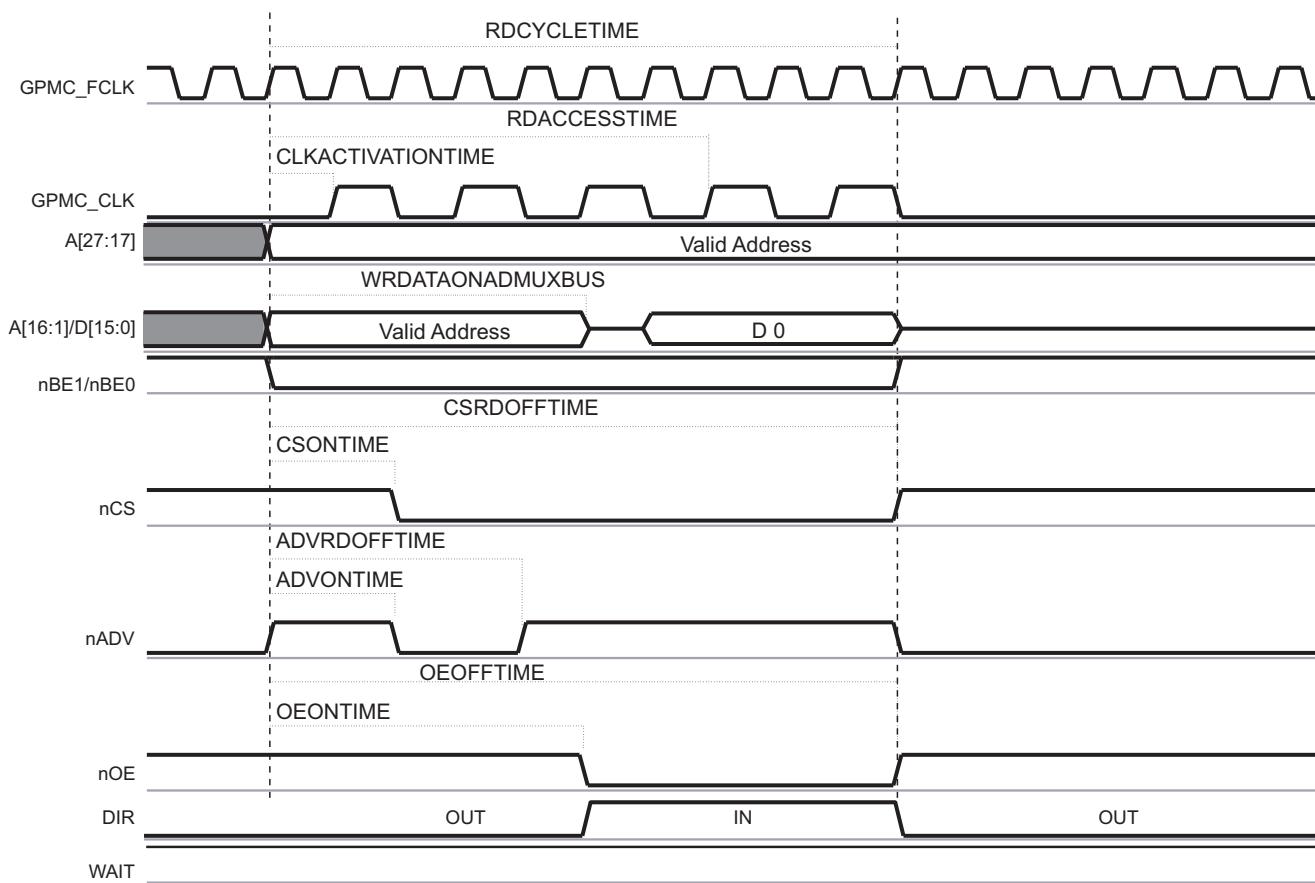

### 7.1.3.3.10.2.1 Synchronous Single Read

Figure 7-17 and Figure 7-18 show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

**Figure 7-17. Synchronous Single Read (GPMCFCLKDIVIDER = 0)**

**Figure 7-18. Synchronous Single Read (GPMCFCLKDIVIDER = 1)**

See [Section 7.1.3.9.1](#) for formulas to calculate timing parameters.

[Table 7-41](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until OEn assertion time. For details, see [Section 7.1.3.3.8.2.3](#).

- Chip-select signal CSn
  - CSn assertion time is controlled by the GPMC\_CONFIG2\_i[3-0] CSONTIME field and ensures address setup time to CSn assertion.
  - CSn deassertion time is controlled by the GPMC\_CONFIG2\_i[12-8] CSRDOFFTIME field and ensures address hold time to CSn deassertion.
- Address valid signal ADVn
  - ADVn assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.
- Output enable signal OEn
  - OEn assertion indicates a read cycle.
  - OEn assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFETIME field.
- Initial latency for the first read data is controlled by GPMC\_CONFIG5\_i[20-16] RDACCESSTIME or by monitoring the WAIT signal.
- Total access time (GPMC\_CONFIG5\_i[4-0] RDCYCLETIME) corresponds to RDACCESSTIME plus the address hold time from CSn deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.

- Direction signal DIR: DIR goes from OUT to IN at the same time as OEn assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The second phase for LSB address is qualified with OEn driven high. The address phase ends at WEn assertion time.

The CSn and DIR signals are controlled in the same way as for synchronous single read operation on an address/data-multiplexed device.

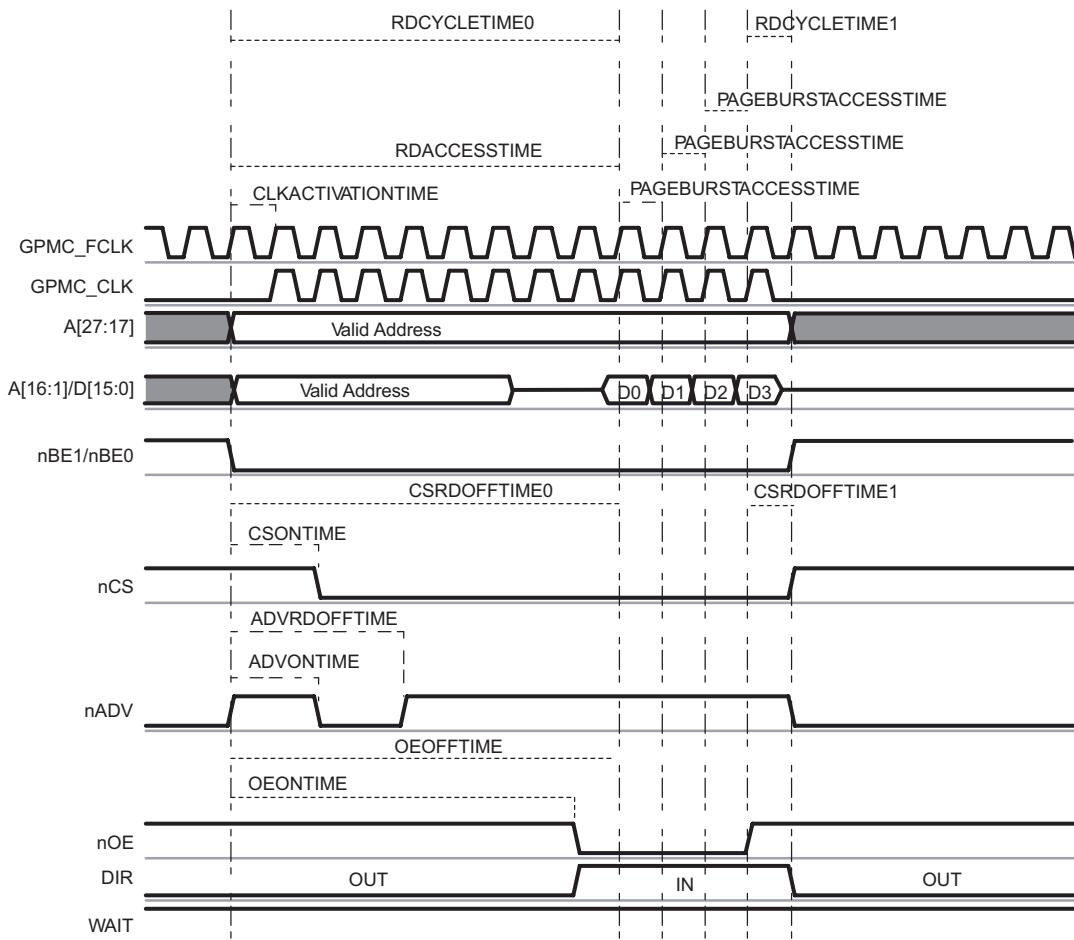

- Address valid signal ADVn is asserted and deasserted twice during a read transaction
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[26-24] ADVAADMUXRDOFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[12-8] ADVRDOFFTIME field.
- Output Enable signal OEn is asserted and deasserted twice during a read transaction (OEn second assertion indicates a read cycle)
  - OEn first assertion time is controlled by the GPMC\_CONFIG4\_i[6-4] OEAADMUXONTIME field.
  - OEn first deassertion time is controlled by the GPMC\_CONFIG3\_i[15-13] OEAADMUXOFFTIME field.
  - OEn second assertion time is controlled by the GPMC\_CONFIG4\_i[3-0] OEONTIME field.
  - OEn second deassertion time is controlled by the GPMC\_CONFIG4\_i[12-8] OEOFETIME field.

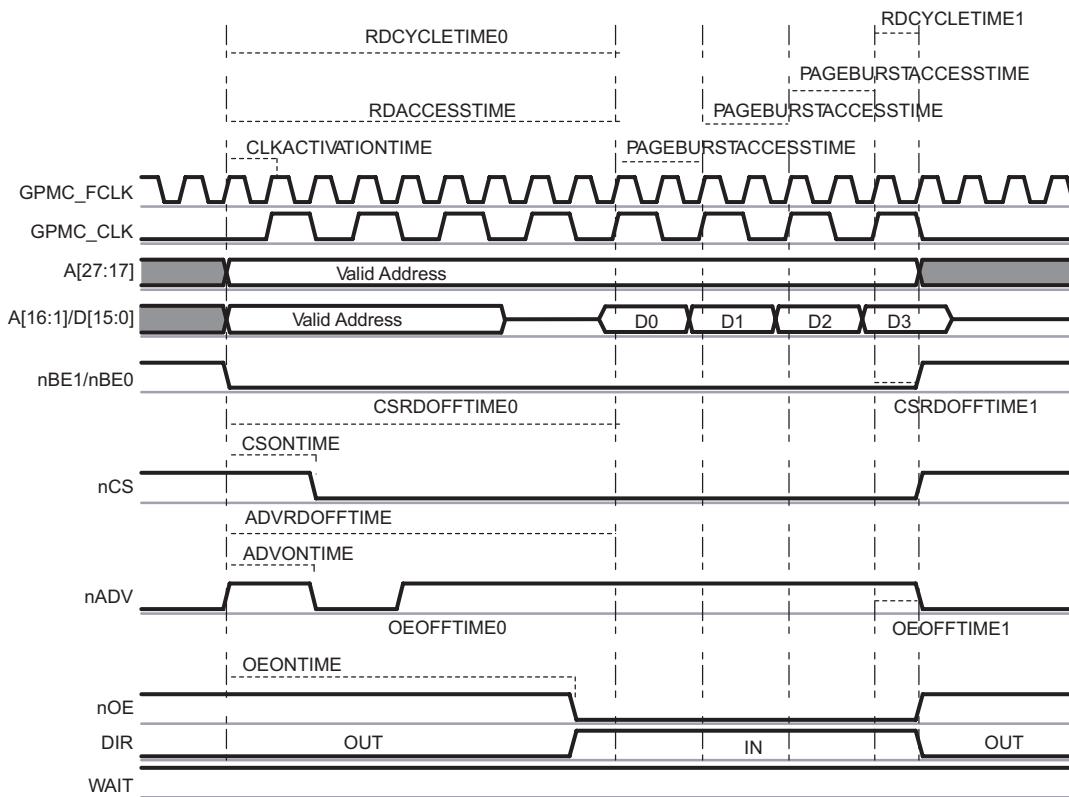

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 7.1.3.3.9.10](#).

### 7.1.3.3.10.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word16 Burst With Wraparound Capability)

Figure 7-19 and Figure 7-20 show a synchronous multiple read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

**Figure 7-19. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 0)**

**Figure 7-20. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)**

When GPMC\_CONFIG5\_i[20-16] RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

The CSn, ADVn, OEn and DIR signals are controlled in the same way as for synchronous single read operation. See [Section 7.1.3.3.10.2.1](#).

Initial latency for the first read data is controlled by RDACCESSTIME or by monitoring the WAIT signal. Successive read data are provided by the memory device each one or two GPMC\_CLK cycles. The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER and the memory-device internal configuration. Depending on the device page length, the GPMC checks device page crossing during a new burst request and purposely insert initial latency (of RDACCESSTIME) when required.

Total access time GPMC\_CONFIG5\_i[4-0] RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time from CSn deassertion. In [Figure 7-19](#), RDCYCLETIME programmed value equals to RDCYCLETIME0 + RDCYCLETIME1.

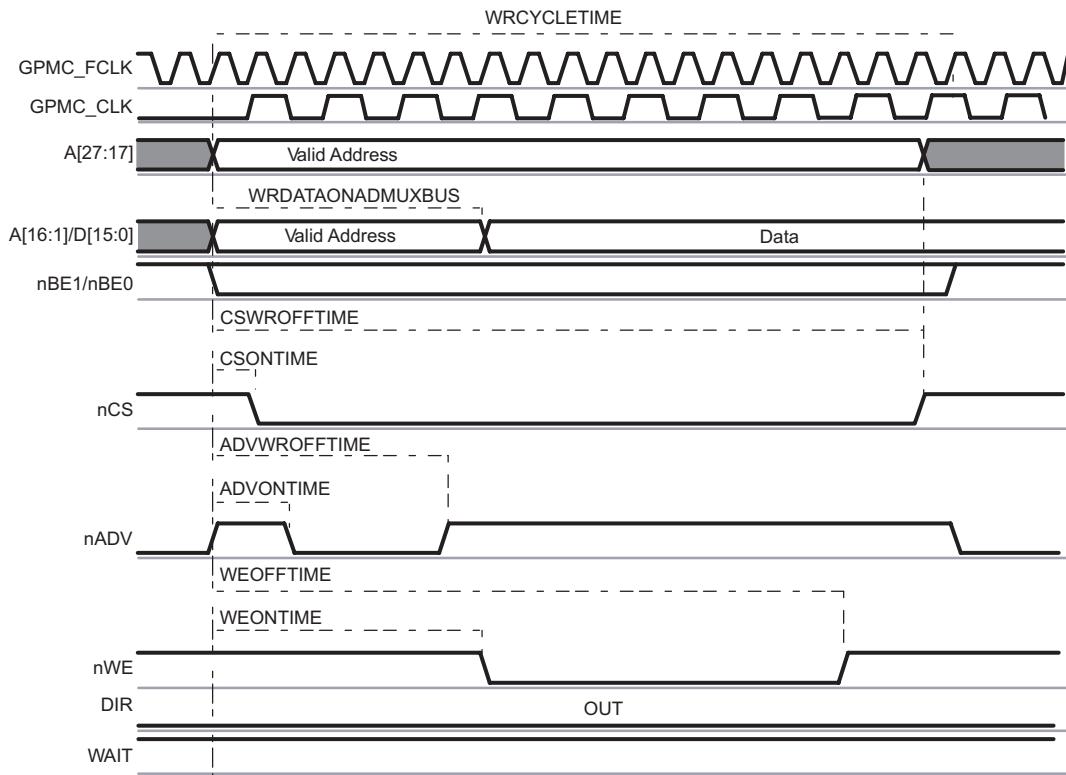

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 7.1.3.3.9.10](#).

Burst wraparound is enabled through the GPMC\_CONFIG1\_i[31] WRAPBURST bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through GPMC\_CONFIG1\_i[24-23] ATTACHEDDEVICEPAGELENGTH.

### 7.1.3.3.10.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses (see [Figure 7-21](#)).

**Figure 7-21. Synchronous Single Write on an Address/Data-Multiplexed Device**

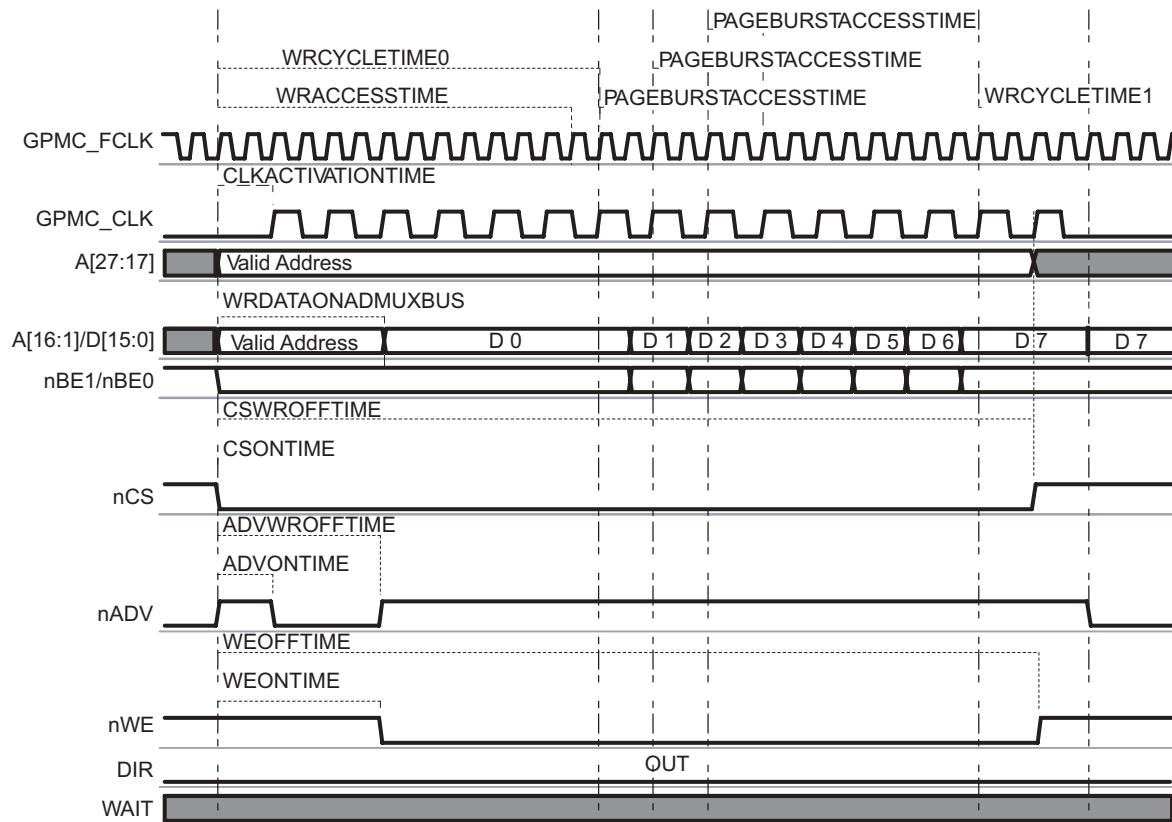

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until [19:16] WRDATAONADMUXBUS time. First data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

#### 7.1.3.3.10.2.4 Synchronous Multiple (Burst) Write

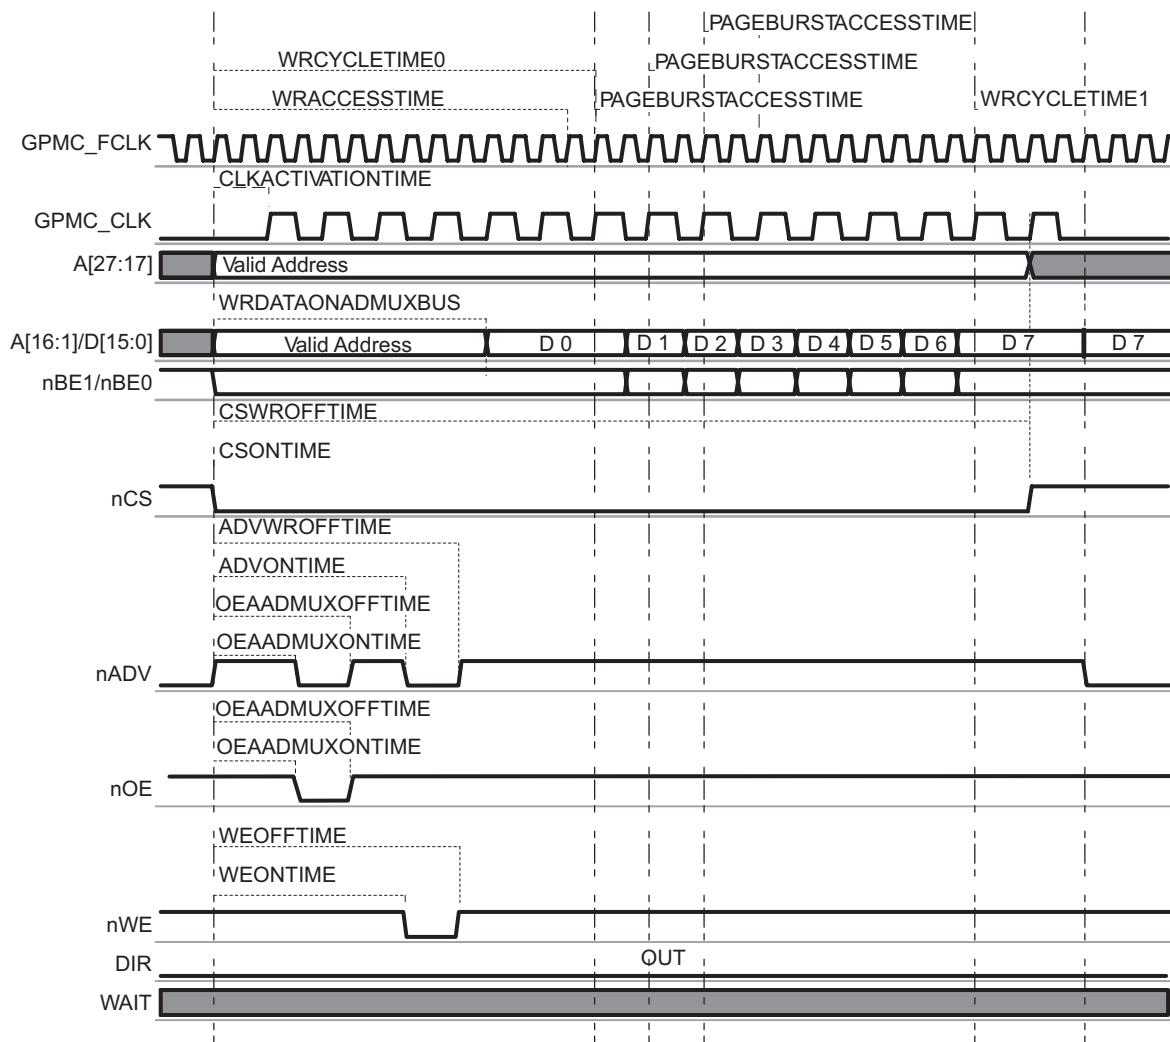

Synchronous burst write mode provides synchronous single or consecutive accesses. [Figure 7-22](#) shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

**Figure 7-22. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode**

[Figure 7-23](#) shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

**Figure 7-23. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode**

The first data of the burst is driven on the A/D bus at GPMC\_CONFIG6\_i[19:16] WRDATAONADMUXBUS.

When WRACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to the GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until OE<sub>n</sub> assertion time. For details, see [Section 7.1.3.3.8.2.3](#).

- Chip-select signal CS<sub>n</sub>
  - CS<sub>n</sub> assertion time is controlled by the GPMC\_CONFIG2\_i[3-0] CSONTIME field and ensures address setup time to CS<sub>n</sub> assertion.
  - CS<sub>n</sub> deassertion time controlled by the GPMC\_CONFIG2\_i[20-16] CSWROFFTIME field and ensures address hold time to CS<sub>n</sub> deassertion.
- Address valid signal ADV<sub>n</sub>
  - ADV<sub>n</sub> assertion time is controlled by the GPMC\_CONFIG3\_i[3-0] ADVONTIME field.
  - ADV<sub>n</sub> deassertion time is controlled by the GPMC\_CONFIG3\_i[20-16] ADVWROFFTIME field.

- Write enable signal WEn
  - WEn assertion indicates a read cycle.
  - WEn assertion time is controlled by the GPMC\_CONFIG4\_i[19-16] WEONTIME field.
  - WEn deassertion time is controlled by the GPMC\_CONFIG4\_i[28-24] WEOFETIME field.

The WEn falling edge must not be used to control the time when the burst first data is driven in the address/data bus because some new devices require the WEn signal at low during the address phase.

- Direction signal DIR is OUT during the entire access.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with OEn driven low. The second phase for LSB address is qualified with OEn driven high. The address phase ends at WEn assertion time.

The CSn and DIR signals are controlled as detailed above.

- Address valid signal ADVn is asserted and deasserted twice during a read transaction
  - ADVn first assertion time is controlled by the GPMC\_CONFIG3\_i[[6-4] ADVAADMUXONTIME field.
  - ADVn first deassertion time is controlled by the GPMC\_CONFIG3\_i[[26-24] ADVAADMUXRDOFFTIME field.
  - ADVn second assertion time is controlled by the GPMC\_CONFIG3\_i[[3-0] ADVONTIME field.
  - ADVn second deassertion time is controlled by the GPMC\_CONFIG3\_i[[12-8] ADVRDOFFTIME field.
- Output Enable signal OEn is asserted and deasserted twice during a read transaction (OEn second assertion indicates a read cycle)
  - OEn first assertion time is controlled by the GPMC\_CONFIG4\_i[[6-4] OEAADMUXONTIME field.
  - OEn first deassertion time is controlled by the GPMC\_CONFIG4\_i[[15-13] OEAADMUXOFFTIME field.
  - OEn second assertion time is controlled by the GPMC\_CONFIG4\_i[[3-0] OEONTIME field.
  - OEn second deassertion time is controlled by the GPMC\_CONFIG4\_i[[12-8] OEOFETIME field.

First write data is driven by the GPMC at GPMC\_CONFIG6\_i[19-16] WRDATAONADMUXBUS, when in address/data mux configuration. The next write data of the burst is driven on the bus at WRACCESSTIME + 1 during GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME GPMC\_FCLK cycles. The last data of the synchronous burst write is driven until GPMC\_CONFIG5\_i[12-8] WRCYCLETIME completes.

- WRACCESSTIME is defined in the GPMC\_CONFIG6\_i[28-24] register.
- The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMCFCLKDIVIDER and the memory-device internal configuration.

Total access time GPMC\_CONFIG5\_i[12-8] WRCYCLETIME corresponds to WRACCESSTIME plus the address hold time from CSn deassertion. In [Figure 7-23](#) the WRCYCLETIME programmed value equals WRCYCLETIME0 + WRCYCLETIME1. WRCYCLETIME0 and WRCYCLETIME1 delays are not actual parameters and are only a graphical representation of the full WRCYCLETIME value.

After a write operation, if no other access (read or write) is pending, the data bus keeps the previous value. See [Section 7.1.3.3.9.10](#).

#### **7.1.3.3.10.3 Asynchronous and Synchronous Accesses in Nonmultiplexed Mode**

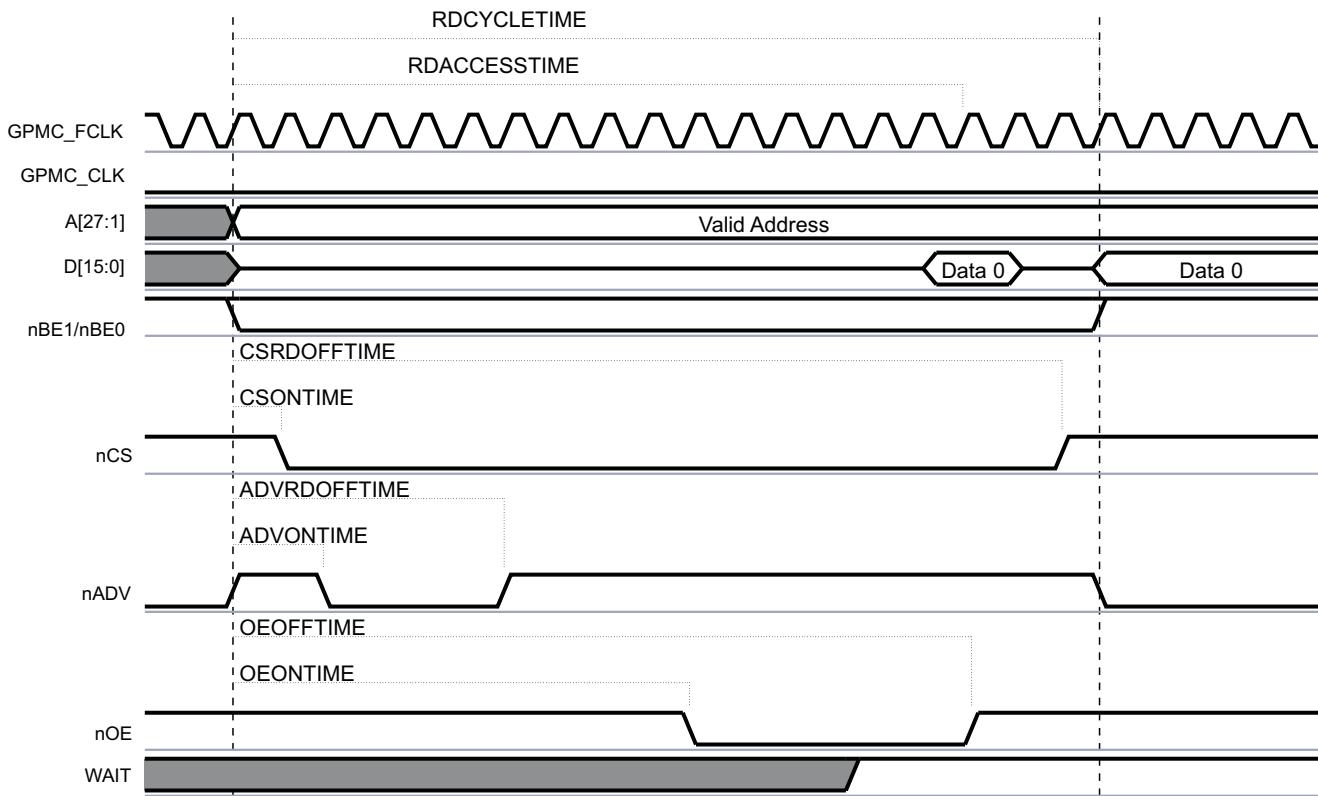

Page mode is only available in non-multiplexed mode.

- Asynchronous single read operation on a nonmultiplexed device
- Asynchronous single write operation on a nonmultiplexed device
- Asynchronous multiple (page mode) read operation on a nonmultiplexed device
- Synchronous operations on a nonmultiplexed device

### 7.1.3.3.10.3.1 Asynchronous Single Read Operation on a Nonmultiplexed Device

Figure 7-24 shows an asynchronous single read operation on a nonmultiplexed device.

**Figure 7-24. Asynchronous Single Read on an Address/Data-Nonmultiplexed Device**

The 27-bit address is driven onto the address bus A[27:1] and the 16-bit data is driven onto the data bus D[15:0].

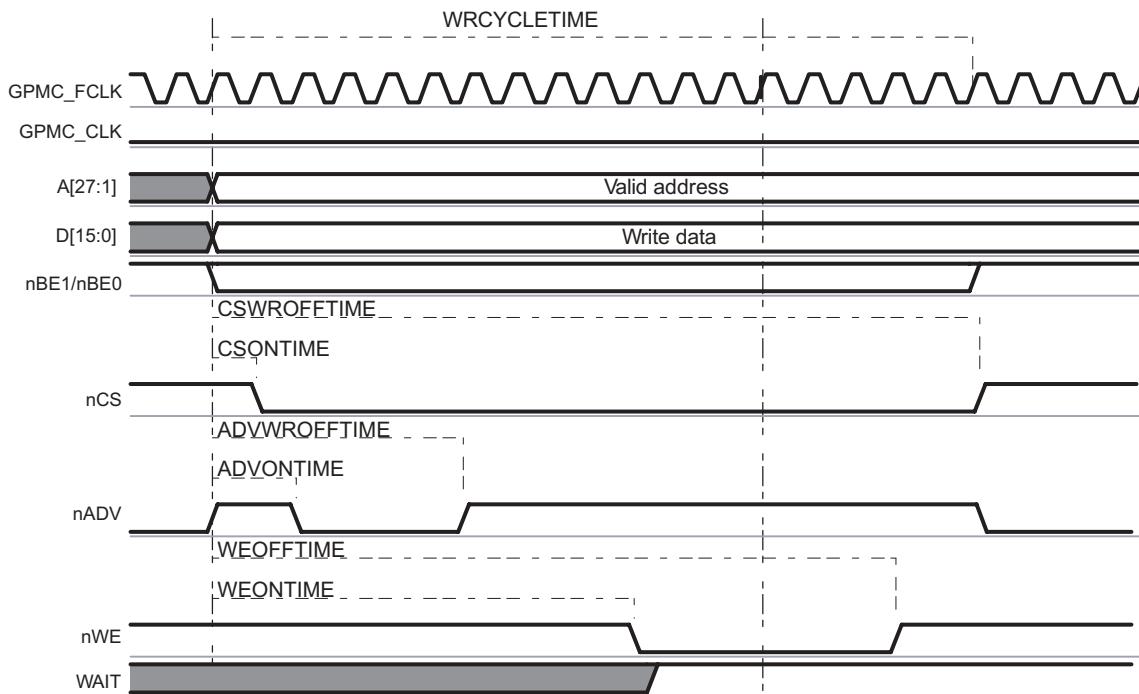

Read data is latched at GPMC\_CONFIG1\_5[20-16] RDACCESSTIME completion time. The end of the access is defined by the GPMC\_CONFIG1\_5[4-0] RDCYCLETIME parameter.

CSn, ADVn, OEn and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Section 7.1.3.3.10.1.1.2](#).

### 7.1.3.3.10.3.2 Asynchronous Single Write Operation on a Nonmultiplexed Device

Figure 7-25 shows an asynchronous single write operation on a nonmultiplexed device.

**Figure 7-25. Asynchronous Single Write on an Address/Data-Nonmultiplexed Device**

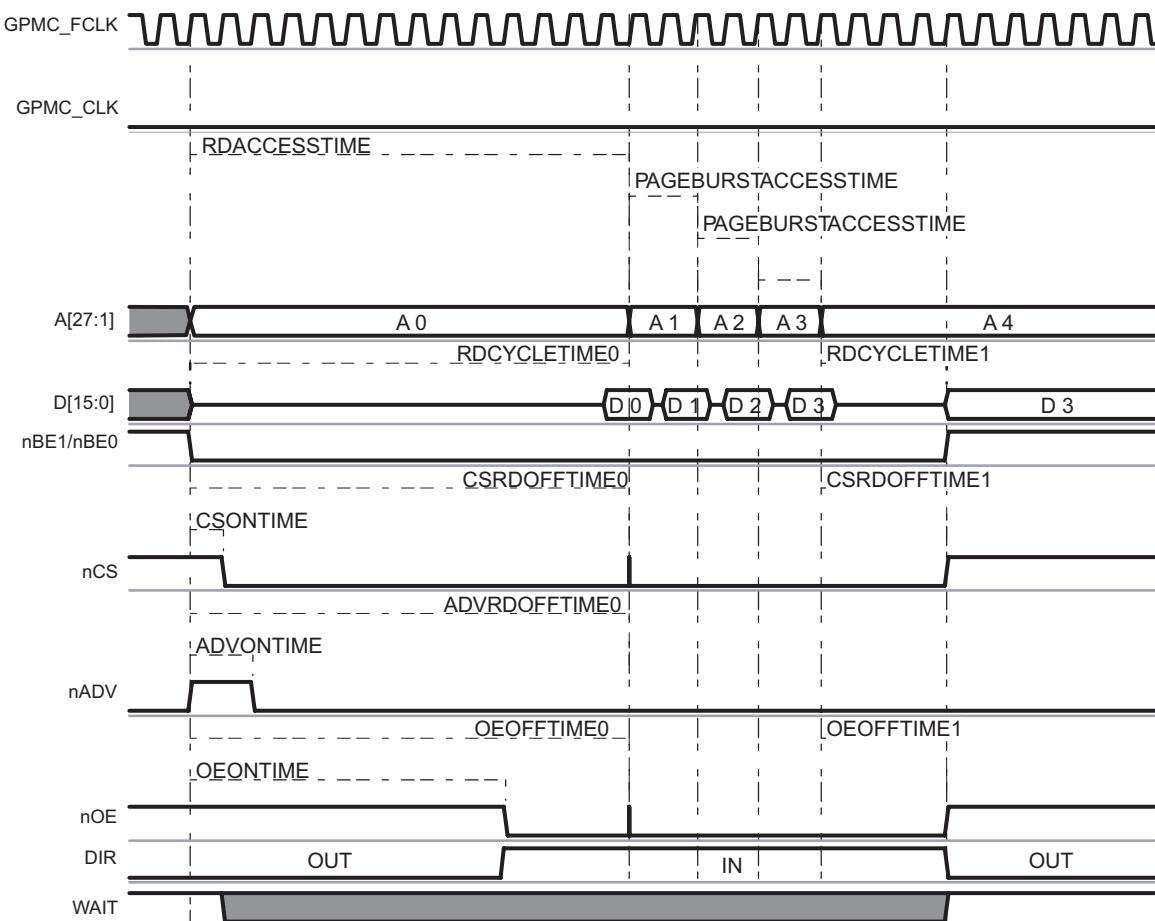

The 27-bit address is driven onto the address bus A[27:1] and the 16-bit data is driven onto the data bus D[15:0].

CSn, ADVn, WEn and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Section 7.1.3.3.10.1.1.3](#).

### 7.1.3.3.10.3.3 Asynchronous Multiple (Page Mode) Read Operation on a Nonmultiplexed Device

Figure 7-26 shows an asynchronous multiple read operation on a Nonmultiplexed Device, in which two word32 host read accesses to the GPMC are split into one multiple (page mode of 4 word16) read access to the attached device.

**Figure 7-26. Asynchronous Multiple (Page Mode) Read**

The WAIT signal is active low.

CSn, ADVn, OEn and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Section 7.1.3.3.10.1.1.2](#).

When RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

Read data is latched at GPMC\_CONFIG5\_i[20-16] RDACCESSTIME completion time. The end of the access is defined by the GPMC\_CONFIG5\_i[4-0] RDCYCLETIME parameter.

During consecutive accesses, the GPMC increments the address after each data read completes.

Delay between successive read data in the page is controlled by the GPMC\_CONFIG5\_i[27-24] PAGEBURSTACCESSTIME parameter. Depending on the device page length, the GPMC can control device page crossing during a burst request and insert initial RDACCESSTIME latency. Note that page crossing is only possible with a new burst access, meaning a new initial access phase is initiated.

Total access time RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time starting from the CSn deassertion.

- The read cycle time is defined in the GPMC\_CONFIG5\_i[4-0] RDCYCLETIME field.
- In [Figure 7-26](#), the RDCYCLETIME programmed value equals RDCYCLETIME0 (before paged accesses) + RDCYCLETIME1 (after paged accesses).

#### **7.1.3.3.10.3.4 Synchronous Operations on a Nonmultiplexed Device**

All information for this section is equivalent to similar operations for address/data- or AAD-multiplexed accesses. The only difference resides in the address phase. See [Section 7.1.3.6](#).

#### **7.1.3.3.10.4 Page and Burst Support**

Each chip-select can be configured to process system single or burst requests into successive single accesses or asynchronous page/synchronous burst accesses, with appropriate access size adaptation.

Depending on the external device page or burst capability, read and write accesses can be independently configured through the GPMC. The GPMC\_CONFIG1\_i[30] READMULTIPLE and GPMC\_CONFIG1\_i[28] WRITMULTIPLE bits are associated with the READTYPE and WRITETYPE parameters.

- Asynchronous write page mode is not supported.
- 8-bit wide device support is limited to nonburstable devices (READMULTIPLE and WRITEMULTIPLE are ignored).
- Not applicable to NAND device interfacing.

#### **7.1.3.3.10.5 System Burst Versus External Device Burst Support**

The device system can issue the following requests to the GPMC:

- Byte, 16-bit word, 32-bit word requests (byte enable controlled). This is always a single request from the interconnect point of view.
- Incrementing fixed-length bursts of two words, four words, and eight words
- Wrapped (critical word access first) fixed-length burst of two, four, or eight words

To process a system request with the optimal protocol, the READMULTIPLE (and READTYPE) and WRITEMULTIPLE (and WRITETYPE) parameters must be set according to the burstable capability (synchronous or asynchronous) of the attached device.

The GPMC access engine issues only fixed-length burst. The maximum length that can be issued is defined per CS by the GPMC\_CONFIG1\_i[24-23] ATTACHEDDEVICEPAGELENGTH field. When the ATTACHEDDEVICEPAGELENGTH value is less than the system burst request length (including the appropriate access size adaptation according to the device width), the GPMC splits the system burst request into multiple bursts. Within the specified 4-, 8-, or 16-word value, the ATTACHEDDEVICEPAGELENGTH field value must correspond to the maximum-length burst supported by the memory device configured in fixed-length burst mode (as opposed to continuous burst mode).

To get optimal performance from memory devices that natively support 16 Word16-length-wrapping burst capability (critical word access first), the ATTACHEDDEVICEPAGELENGTH parameter must be set to 16 words and the GPMC\_CONFIG1\_i[31] WRAPBURST bit must be set to 1. Similarly DEVICEPAGELENGTH is set to 4 and 8 for memories supporting respectively 4 and 8 Word16-length-wrapping burst.

When the memory device does not offer (or is not configured to offer) native 16 Word16-length-wrapping burst, the WRAPBURST parameter must be cleared, and the GPMC access engine emulates the wrapping burst by issuing the appropriate burst sequences according to the ATTACHEDDEVICEPAGELENGTH value.

When the memory device does not support native-wrapping burst, there is usually no difference in behavior between a fixed burst length mode and a continuous burst mode configuration (except for a potential power increase from a memory-speculative data prefetch in a continuous burst read). However, even though continuous burst mode is compatible with GPMC behavior, because the GPMC access engine issues only fixed-length burst and does not benefit from continuous burst mode, it is best to configure the memory device in fixed-length burst mode.

The memory device maximum-length burst (configured in fixed-length burst wrap or nonwrap mode) usually corresponds to the memory device data buffer size. Memory devices with a minimum of 16 half-word buffers are the most appropriate (especially with wrap support), but memory devices with smaller buffer size (4 or 8) are also supported, assuming that the GPMC\_CONFIG1\_i[24-23] ATTACHEDDEVICEPAGELENGTH field is set accordingly to 4 or 8 words.

The device system issues only requests with addresses or starting addresses for nonwrapping burst requests; that is, the request size boundary is aligned. In case of an eight-word-wrapping burst, the wrapping address always occurs on the eight-words boundary. As a consequence, all words requested must be available from the memory data buffer when the buffer size is equal to or greater than the ATTACHEDDEVICEPAGELENGTH value. This usually means that data can be read from or written to the buffer at a constant rate (number of cycles between data) without wait states between data accesses. If the memory does not behave this way (nonzero wait state burstable memory), wait-pin monitoring must be enabled to dynamically control data-access completion within the burst.

When the system burst request length is less than the ATTACHEDDEVICEPAGELENGTH value, the GPMC proceeds with the required accesses.

#### **7.1.3.3.11 pSRAM Access Specificities**

pSRAM devices are SRAM-pin-compatible low-power memories that contain a self-refreshed DRAM memory array. The GPMC\_CONFIG1\_i[[11-10] DEVICETYPE field shall be cleared to 0b00.

The pSRAM devices uses the NOR protocol. It support the following operations:

- Asynchronous single read
- Asynchronous page read
- Asynchronous single write
- Synchronous single read and write
- Synchronous burst read
- Synchronous burst write (not supported by NOR Flash memory)

pSRAM devices must be powered up and initialized in a predefined manner according to the specifications of the attached device.

pSRAM devices can be programmed to use either mode: fixed or variable latency. pSRAM devices can either automatically schedule autorefresh operations, which force the GPMC to use its WAIT signal capability when read or write operations occur during an internal self-refresh operation, or pSRAM devices automatically include the autorefresh operation in the access time. These devices do not require additional WAIT signal capability or a minimum CSn high pulse width between consecutive accesses to ensure that the correct internal refresh operation is scheduled.

#### **7.1.3.3.12 NAND Access Description**

NAND (8-bit and 16-bit) memory devices using a standard NAND asynchronous address/data-multiplexing scheme can be supported on any chip-select with the appropriate asynchronous configuration settings

As for any other type of memory compatible with the GPMC interface, accesses to a chip-select allocated to a NAND device can be interleaved with accesses to chip-selects allocated to other external devices. This interleaved capability limits the system to *chip enable don't care* NAND devices, because the chip-select allocated to the NAND device must be de-asserted if accesses to other chip-selects are requested.

##### **7.1.3.3.12.1 NAND Memory Device in Byte or 16-Bit Word Stream Mode**

NAND devices require correct command and address programming before data array read or write accesses. The GPMC does not include specific hardware to translate a random address system request into a NAND-specific multiphase access. In that sense, GPMC NAND support, as opposed to random memory-map device support, is data-stream-oriented (byte or 16-bit word).

The GPMC NAND programming model relies on a software driver for address and command formatting with the correct data address pointer value according to the block and page structure. Because of NAND structure and protocol interface diversity, the GPMC does not support automatic command and address phase programming, and software drivers must access the NAND device ID to ensure that correct command and address formatting are used for the identified device.

NAND device data read and write accesses are achieved through an asynchronous read or write access. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Any chip-select region can be qualified as a NAND region to constrain the ADVn\_ALE signal as Address Latch Enable (ALE active high, default state value at low) during address program access, and the BE0n\_CLE signal as Command Latch Enable (CLE active high, default state value at low) during command program access. GPMC address lines are not used (the previous value is not changed) during NAND access.

#### **7.1.3.3.12.1.1 Chip-Select Configuration for NAND Interfacing in Byte or Word Stream Mode**

The GPMC\_CONFIG7\_i register associated with a NAND device region interfaced in byte or word stream mode can be initialized with a minimum size of 16 Mbytes, because any address location in the chip-select memory region can be used to access a NAND data array. The NAND Flash protocol specifies an address sequence where address bits are passed through the data bus in a series of write accesses with the ALE pin asserted. After this address phase, all operations are streamed and the system requests address is irrelevant.

To allow correct command, address, and data-access controls, the GPMC\_CONFIG1\_i register associated with a NAND device region must be initialized in asynchronous read and write modes with the parameters shown in [Table 7-11](#). Failure to comply with these settings corrupts the NAND interface protocol.

The GPMC\_CONFIG1\_i to GPMC\_CONFIG4\_i register associated with a NAND device region must be initialized with the correct control-signal timing value according to the NAND device timing parameters.

**Table 7-11. Chip-Select Configuration for NAND Interfacing**

| Bit Field                | Register       | Value        | Comments   |
|--------------------------|----------------|--------------|--|
| WRAPBURST                | GPMC_CONFIG1_i | 0            | No wrap  |
| READMULTIPLE             | GPMC_CONFIG1_i | 0            | Single access                                    |
| READTYPE                 | GPMC_CONFIG1_i | 0            | Asynchronous mode                                |
| WRITEMULTIPLE            | GPMC_CONFIG1_i | 0            | Single access                                    |
| WRITETYPE                | GPMC_CONFIG1_i | 0            | Asynchronous mode                                |
| CLKACTIVATIONTIME        | GPMC_CONFIG1_i | 0b00         |  |
| ATTACHEDDEVICEPAGELENGTH | GPMC_CONFIG1_i | Don't care   | Single-access mode                               |
| WAITREADMONITORING       | GPMC_CONFIG1_i | 0            | Wait not monitored by GPMC access engine         |
| WAITWRITEMONITORING      | GPMC_CONFIG1_i | 0            | Wait not monitored by GPMC access engine         |
| WAITMONITORINGTIME       | GPMC_CONFIG1_i | Don't care   | Wait not monitored by GPMC access engine         |
| WAITPINSELECT            | GPMC_CONFIG1_i |              | Select which wait is monitored by edge detectors |
| DEVICESIZE               | GPMC_CONFIG1_i | 0b00 or 0b01 | 8- or 16-bit interface                           |
| DEVICETYPE               | GPMC_CONFIG1_i | 0b10         | NAND device in stream mode                       |
| MUXADDDATA               | GPMC_CONFIG1_i | 0b00         | Nonmultiplexed mode                              |
| TIMEPARAGRANULARITY      | GPMC_CONFIG1_i | 0            | Timing achieved with best GPMC clock granularity |
| GPMCFCLKDIVIDER          | GPMC_CONFIG1_i | Don't care   | Asynchronous mode                                |

#### **7.1.3.3.12.1.2 NAND Device Command and Address Phase Control**

NAND devices require multiple address programming phases. The MPU software driver is responsible for issuing the correct number of command and address program accesses, according to the device command set and the device address-mapping scheme.

NAND device-command and address-phase programming is achieved through write requests to the GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i register locations with the correct command and address values. These locations are mapped in the associated chip-select register region. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Command and address values are not latched during the access and cannot be read back at the register location.

- Only write accesses must be issued to these locations, but the GPMC does not discard any read access. Accessing a NAND device with OEn and CLE or ALE asserted (read access) can produce undefined results.
- Write accesses to the GPMC\_NAND\_COMMAND\_i register location and to the GPMC\_NAND\_ADDRESS\_i register location must be posted for faster operations. The GPMC\_CONFIG[0] NANDFORCEPOSTEDWRITE bit enables write accesses to these locations as posted, even if they are defined as nonposted.

A write buffer is used to store write transaction information before the external device is accessed:

- Up to eight consecutive posted write accesses can be accepted and stored in the write buffer.
- For nonposted write, the pipeline is one deep.
- A GPMC\_STATUS[0] EMPTYWRITEBUFFERSTATUS bit stores the empty status of the write buffer.

The GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i registers are 32-bit word locations, which means any 32-bit word or 16-bit word access is split into 4- or 2-byte accesses if an 8-bit wide NAND device is attached. For multiple-command phase or multiple-address phase, the software driver can use 32-bit word or 16-bit word access to these registers, but it must account for the splitting and little-endian ordering scheme. When only one byte command or address phase is required, only byte write access to a GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i can be used, and any of the four byte locations of the registers are valid.

The same applies to GPMC\_NAND\_COMMAND\_i and GPMC\_NAND\_ADDRESS\_i 32-bit word write access to a 16-bit wide NAND device (split into two 16-bit word accesses). In the case of a 16-bit word write access, the MSByte of the 16-bit word value must be set according to the NAND device requirement (usually 0). Either 16-bit word location or any one of the four byte locations of the registers is valid

### 7.1.3.3.12.1.3 Command Latch Cycle

Writing data at the GPMC\_NAND\_COMMAND\_i location places the data as the NAND command value on the bus, using a regular asynchronous write access.

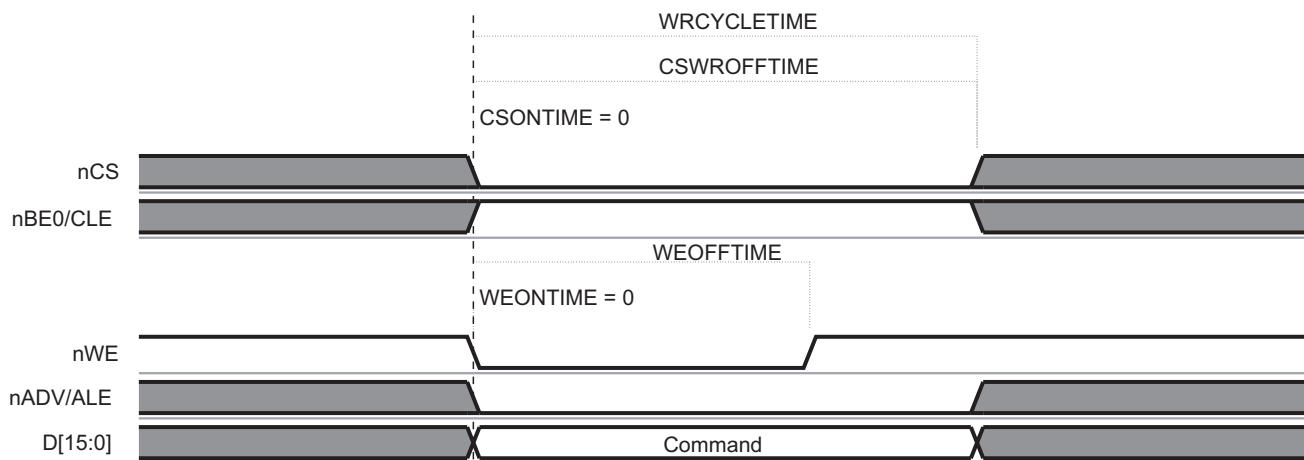

- CSn[i] is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- CLE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- WE is controlled by the WEONTIME and WEOFETIME timing parameters.
- ALE and REn (OEn) are maintained inactive.

[Figure 7-27](#) shows the NAND command latch cycle.

CLE is shared with the BE0n output signal and has an inverted polarity from BE0n. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, BE0n (also BE1n) must not toggle, because it is shared with CLE.

NAND Flash memories do not use byte enable signals at all.

**Figure 7-27. NAND Command Latch Cycle**

#### 7.1.3.3.12.1.4 Address Latch Cycle

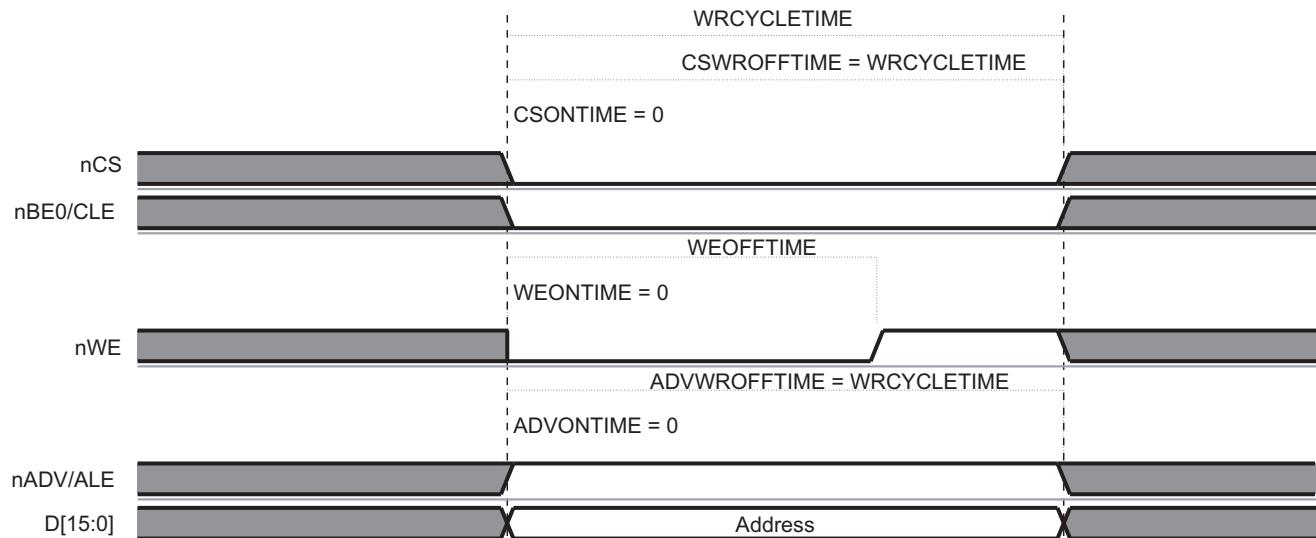

Writing data at the GPMC\_NAND\_ADDRESS\_i location places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

- CSn is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- ALE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- WEn is controlled by the WEONTIME and WEOFETIME timing parameters.
- CLE and REn (OEn) are maintained inactive.

Figure 7-28 shows the NAND address latch cycle.

ALE is shared with the ADVn output signal and has an inverted polarity from ADVn. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, ALE is kept stable.

**Figure 7-28. NAND Address Latch Cycle**

### 7.1.3.3.12.1.5 NAND Device Data Read and Write Phase Control in Stream Mode

NAND device data read and write accesses are achieved through a read or write request to the chip-select-associated memory region at any address location in the region or through a read or write request to the GPMC\_NAND\_DATA\_i location mapped in the chip-select-associated control register region.

GPMC\_NAND\_DATA\_i is not a true register, but an address location to enable REn or WEn signal control. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

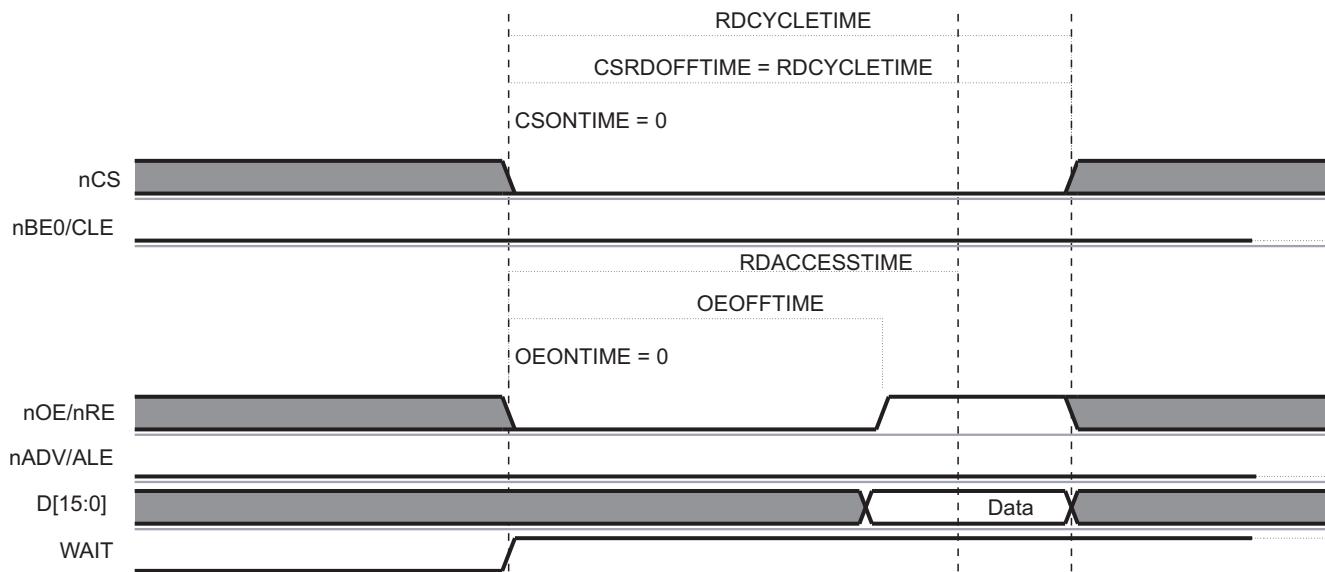

Reading data from the GPMC\_NAND\_DATA\_i location or from any location in the associated chip-select memory region activates an asynchronous read access.

- CSn is controlled by the CSONTIME and CSRDOFFTIME timing parameters.
- REn is controlled by the OEONTIME and OEOFETIME timing parameters.
- To take advantage of REn high-to-data invalid minimum timing value, the RDACCESSTIME can be set so that data are effectively captured after REn deassertion. This allows optimization of NAND read access cycle time completion. For optimal timing parameter settings, see the NAND device and the device IC timing parameters.

ALE, CLE, and WEn are maintained inactive.

Figure 7-29 shows the NAND data read cycle.

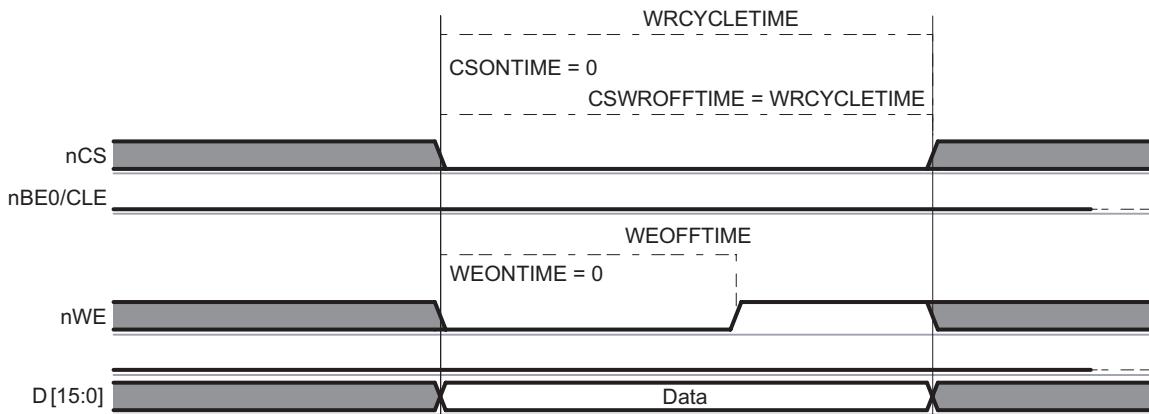

**Figure 7-29. NAND Data Read Cycle**

Writing data to the GPMC\_NAND\_DATA\_i location or to any location in the associated chip-select memory region activates an asynchronous write access.

- CSn is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- WEn is controlled by the WEONTIME and WEOFETIME timing parameters.
- ALE, CLE, and REn (OEn) are maintained inactive.

Figure 7-30 shows the NAND data write cycle.

**Figure 7-30. NAND Data Write Cycle**

#### 7.1.3.3.12.1.6 NAND Device General Chip-Select Timing Control Requirement

For most NAND devices, read data access time is dominated by CSn-to-data-valid timing and has faster REn-to-data-valid timing. Successive accesses with CSn deassertions between accesses are affected by this timing constraint. Because accesses to a NAND device can be interleaved with other chip-select accesses, there is no certainty that CSn always stays low between two accesses to the same chip-select. Moreover, an CSn deassertion time between the same chip-select NAND accesses is likely to be required as follows: the CSn deassertion requires programming CYCLETIME and RDACCESSTIME according to the CSn-to-data-valid critical timing.

To get full performance from NAND read and write accesses, the prefetch engine can dynamically reduce RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSRDOFFTIME, CSWROFFTIME, ADVRDOFFTIME, ADVWROFFTIME, OEOFETIME, and WEOFFTIME on back-to-back NAND accesses (to the same memory) and suppress the minimum CSn high pulse width between accesses. For more information about optimal prefetch engine access, see [Section 7.1.3.3.12.4](#).

Some NAND devices require minimum write-to-read idle time, especially for device-status read accesses following status-read command programming (write access). If such write-to-read transactions are used, a minimum CSn high pulse width must be set. For this, CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDELAY must be set according to the appropriate timing requirement to prevent any timing violation.

NAND devices usually have an important REn high to data bus in tristate mode. This requires a bus turnaround setting (BUSTURNAROUND = 1), so that the next access to a different chip-select is delayed until the BUSTURNAROUND delay completes. Back-to-back NAND read accesses to the same NAND Flash are not affected by the programmed bus turnaround delay.

#### 7.1.3.3.12.1.7 Read and Write Access Size Adaptation

##### 7.1.3.3.12.1.7.1 8-Bit Wide NAND Device

Host 16-bit word and 32-bit word read and write access requests to a chip-select associated with an 8-bit wide NAND device are split into successive read and write byte accesses to the NAND memory device. Byte access is ordered according to little-endian organization. A NAND 8-bit wide device must be interfaced on the D0D7 interface bus lane. GPMC data accesses are justified on this bus lane when the chip-select is associated with an 8-bit wide NAND device.

##### 7.1.3.3.12.1.7.2 16-Bit Wide NAND Device

Host 32-bit word read and write access requests to a chip-select associated with a 16-bit wide NAND device are split into successive read and write 16-bit word accesses to the NAND memory device. 16-bit word access is ordered according to little-endian organization.

Host byte read and write access requests to a 16-bit wide NAND device are completed as 16-bit accesses on the device itself, because there is no byte-addressing capability on 16-bit wide NAND devices. This means that the NAND device address pointer is incremented on a 16-bit word basis and not on a byte basis. For a read access, only the requested byte is given back to the host, but the remaining byte is not stored or saved by the GPMC, and the next byte or 16-bit word read access gets the next 16-bit word NAND location. For a write access, the invalid byte part of the 16-bit word is driven to FF, and the next byte or 16-bit word write access programs the next 16-bit word NAND location.

Generally, byte access to a 16-bit wide NAND device should be avoided, especially when ECC calculation is enabled. 8-bit or 16-bit ECC-based computations are corrupted by a byte read to a 16-bit wide NAND device, because the nonrequested byte is considered invalid on a read access (not captured on the external data bus; FF is fed to the ECC engine) and is set to FF on a write access.

Host requests (read/write) issued in the chip-select memory region are translated in successive single or split accesses (read/write) to the attached device. Therefore, incrementing 32-bit burst requests are translated in multiple 32-bit sequential accesses following the access adaptation of the 32-bit to 8- or 16-bit device.

#### **7.1.3.12.2 NAND Device-Ready Pin**

The NAND memory device provides a ready pin to indicate data availability after a block/page opening and to indicate that data programming is complete. The ready pin can be connected to one of the WAIT GPMC input pins; data read accesses must not be tried when the ready pin is sampled inactive (device is not ready) even if the associated chip-select WAITREADMONITORING bit field is set. The duration of the NAND device busy state after the block/page opening is so long (up to 50  $\mu$ s) that accesses occurring when the ready pin is sampled inactive can stall GPMC access and eventually cause a system time-out.

If a read access to a NAND flash is done using the wait monitoring mode, the device is blocked during a page opening, and so is the GPMC. If the correct settings are used, other chip-selects can be used while the memory processes the page opening command.

To avoid a time-out caused by a block/page opening delay in NAND flash, disable the wait pin monitoring for read and write accesses (that is, set the GPMC\_CONFIG1\_i[21] WAITWRITEMONITORING and GPMC\_CONFIG1\_i[22] WAITREADMONITORING bits to 0 and use one of the following methods instead:

- Use software to poll the WAITnSTATUS bit ( $n = 0$  to 1) of the GPMC\_STATUS register.
- Configure an interrupt that is generated on the WAIT signal change (through the GPMC\_IRQENABLE [11-8]bits).

Even if the READWAITMONITORING bit is not set, the external memory nR/B pin status is captured in the programmed WAIT bit in the GPMC\_STATUS register.

The READWAITMONITORING bit method must be used for other memories than NAND flash, if they require the use of a WAIT signal.

#### **7.1.3.12.2.1 Ready Pin Monitored by Software Polling**

The ready signal state can be monitored through the GPMC\_STATUS WAITxSTATUS bit ( $x = 0$  or 1). The software must monitor the ready pin only when the signal is declared valid. Refer to the NAND device timing parameters to set the correct software temporization to monitor ready only after the invalid window is complete from the last read command written to the NAND device.

#### **7.1.3.12.2.2 Ready Pin Monitored by Hardware Interrupt**

Each gpmc\_wait input pin can generate an interrupt when a wait-to-no-wait transition is detected. Depending on whether the GPMC\_CONFIG WAITxPINPOLARITY bits ( $x = 0$  or 1) is active low or active high, the wait-to-no-wait transition is a low-to-high external WAIT signal transition or a high-to-low external WAIT signal transition, respectively.

The wait transition pin detector must be cleared before any transition detection. This is done by writing 1 to the WAITxEDGEDETECTIONSTATUS bit ( $x = 0$  or  $1$ ) of the GPMC\_IRQSTATUS register according to the gpmc\_wait pin used for the NAND device-ready signal monitoring. To detect a wait-to-no-wait transition, the transition detector requires a wait active time detection of a minimum of two GPMC\_FCLK cycles. Software must incorporate precautions to clear the wait transition pin detector before wait (busy) time completes.

A wait-to-no-wait transition detection can issue a GPMC interrupt if the WAITxEDGEDETECTIONENABLE bit in the GPMC\_IRQENABLE register is set and if the WAITxEDGEDETECTIONSTATUS bit field in the GPMC\_IRQSTATUS register is set.

The WAITMONITORINGTIME field does not affect wait-to-no-wait transition time detection.

It is also possible to poll the WAITxEDGEDETECTIONSTATUS bit field in the GPMC\_IRQSTATUS register according to the gpmc\_wait pin used for the NAND device ready signal monitoring.

#### **7.1.3.3.12.3 ECC Calculator**

The General Purpose Memory Controller includes an Error Code Correction (ECC) calculator circuitry that enables on the fly ECC calculation during data read or data program (that is, write) operations. The page size supported by the ECC calculator in one calculation/context is 512 bytes.

The user can choose from two different algorithms with different error correction capabilities through the GPMC\_ECC\_CONFIG[16] ECCALGORITHM bit:

- Hamming code for 1-bit error code correction on 8- or 16-bit NAND Flash organized with page size greater than 512 bytes
- BCH (Bose-Chaudhuri-Hocquenghem) code for 4- to 16-bit error correction

The GPMC does not directly handle the error code correction itself. During writes, the GPMC computes parity bits. During reads, the GPMC provides enough information for the processor to correct errors without reading the data buffer all over again.

The Hamming code ECC is based on a 2-dimensional (row and column) bit parity accumulation. This parity accumulation is either accomplished on the programmed number of bytes or 16-bit words read from the memory device, or written to the memory device in stream mode.

Because the ECC engine includes only one accumulation context, it can be allocated to only one chip-select at a time through the GPMC\_ECC\_CONFIG[3-1] ECCCS bit field. Even if two CS use different ECC algorithms, one the Hamming code and the other a BCH code, they must define separate ECC contexts because some of the ECC registers are common to all types of algorithms.

#### **7.1.3.3.12.3.1 Hamming Code**

All references to Error Code Correction (ECC) in this subsection refer to the 1-bit error correction Hamming code.

The ECC is based on a two-dimensional (row and column) bit parity accumulation known as Hamming Code. The parity accumulation is done for a programmed number of bytes or 16-bit word read from the memory device or written to the memory device in stream mode.

There is no automatic error detection or correction, and it is the software NAND driver responsibility to read the multiple ECC calculation results, compare them to the expected code value, and take the appropriate corrective actions according to the error handling strategy (ECC storage in spare byte, error correction on read, block invalidation).

The ECC engine includes a single accumulation context. It can be allocated to a single designated chip-select at a time and parallel computations on different chip-selects are not possible. Since it is allocated to a single chip-select, the ECC computation is not affected by interleaved GPMC accesses to other chip-selects and devices. The ECC accumulation is sequentially processed in the order of data read from or written to the memory on the designated chip-select. The ECC engine does not differentiate read accesses from write accesses and does not differentiate data from command or status information. It is the software responsibility to make sure only relevant data are passed to the NAND flash memory while the ECC computation engine is active.

The starting NAND page location must be programmed first, followed by an ECC accumulation context reset with an ECC enabling, if required. The NAND device accesses discussed in the following sections must be limited to data read or write until the specified number of ECC calculations is completed.

#### **7.1.3.3.12.3.1.1 ECC Result Register and ECC Computation Accumulation Size**

The GPMC includes up to nine ECC result registers (GPMC\_ECCj\_RESULT, j = 1 to 9) to store ECC computation results when the specified number of bytes or 16-bit words has been computed.

The ECC result registers are used sequentially; one ECC result is stored in one ECC result register on the list, the next ECC result is stored in the next ECC result register on the list, and so forth, until the last ECC computation. The value of the GPMC\_ECCj\_RESULT register value is valid only when the programmed number of bytes or 16-bit words has been accumulated, which means that the same number of bytes or 16-bit words has been read from or written to the NAND device in sequence.

The GPMC\_ECC\_CONTROL[3-0] ECCPOINTER field must be set to the correct value to select the ECC result register to be used first in the list for the incoming ECC computation process. The ECCPointer can be read to determine which ECC register is used in the next ECC result storage for the ongoing ECC computation. The value of the GPMC\_ECCj\_RESULT register (j = 1 to 9) can be considered valid when ECCPOINTER equals j + 1. When the GPMC\_ECCj\_RESULT (where j = 9) is updated, ECCPOINTER is frozen at 10, and ECC computing is stopped (ECCENABLE = 0).

The ECC accumulator must be reset before any ECC computation accumulation process. The GPMC\_ECC\_CONTROL[8] ECCCLEAR bit must be set to 1 (nonpersistent bit) to clear the accumulator and all ECC result registers.

For each ECC result (each register, j = 1 to 9), the number of bytes or 16-bit words used for ECC computing accumulation can be selected from between two programmable values.

The ECCjRESULTSIZE bits (j = 1 to 9) in the GPMC\_ECC\_SIZE\_CONFIG register select which programmable size value (ECCSIZE0 or ECCSIZE1) must be used for this ECC result (stored in GPMC\_ECCj\_RESULT register ).

The ECCSIZE0 and ECCSIZE1 fields allow selection of the number of bytes or 16-bit words used for ECC computation accumulation. Any even values from 2 to 512 are allowed.

Flexibility in the number of ECCs computed and the number of bytes or 16-bit words used in the successive ECC computations enables different NAND page error-correction strategies. Usually based on 256 or 512 bytes and on 128 or 256 16-bit word, the number of ECC results required is a function of the NAND device page size. Specific ECC accumulation size can be used when computing the ECC on the NAND spare byte.

For example, with a 2 Kbyte data page 8-bit wide NAND device, eight ECCs accumulated on 256 bytes can be computed and added to one extra ECC computed on the 24 spare bytes area where the eight ECC results used for comparison and correction with the computed data page ECC are stored. The GPMC then provides nine GPMC\_ECCj\_RESULT registers (j= 1 to 9) to store the results. In this case, ECCSIZE0 is set to 256, and ECCSIZE1 is set to 24; the ECC[1-8]RESULTSIZE bits are cleared to 0, and the ECC9RESULTSIZE bit is set to 1.

#### **7.1.3.3.12.3.1.2 ECC Enabling**

The GPMC\_ECC\_CONFIG[3-1] ECCCS field selects the allocated chip-select. The GPMC\_ECC\_CONFIG[0] ECCENABLE bit enables ECC computation on the next detected read or write access to the selected chip-select.

The ECCPOINTER, ECCCLEAR, ECCSIZE, ECCjRESULTSIZE (where j = 1 to 9), ECC16B, and ECCCS fields must not be changed or cleared while an ECC computation is in progress.

The ECC accumulator and ECC result register must not be changed or cleared while an ECC computation is in progress.

Table 7-12 describes the ECC enable settings.

Table 7-12. ECC Enable Settings

| Bit Field                      | Register             | Value | Comments  |
|--------------------------------|----------------------|-------|---|
| ECCCS                          | GPMC_ECC_CONFIG      | 0-3h  | Selects the chip-select where ECC is computed   |
| ECC16B                         | GPMC_ECC_CONFIG      | 0/1   | Selects column number for ECC calculation   |
| ECCCLEAR                       | GPMC_ECC_CONTROL     | 0-7h  | Clears all ECC result registers   |
| ECCPOINTER                     | GPMC_ECC_CONTROL     | 0-7h  | A write to this bit field selects the ECC result register where the first ECC computation is stored. Set to 1 by default. |
| ECCSIZE1                       | GPMC_ECC_SIZE_CONFIG | 0-FFh | Defines ECCSIZE1  |
| ECCSIZE0                       | GPMC_ECC_SIZE_CONFIG | 0-FFh | Defines ECCSIZE0  |
| ECCjRESULTSIZE (j from 1 to 9) | GPMC_ECC_SIZE_CONFIG | 0/1   | Selects the size of ECCn result register  |
| ECCENABLE                      | GPMC_ECC_CONFIG      | 1     | Enables the ECC computation   |

#### 7.1.3.3.12.3.1.3 ECC Computation

The ECC algorithm is a multiple parity bit accumulation computed on the odd and even bit streams extracted from the byte or Word 16 streams. The parity accumulation is split into row and column accumulations, as shown in Figure 7-31 and Figure 7-32. The intermediate row and column parities are used to compute the upper level row and column parities. Only the final computation of each parity bit is used for ECC comparison and correction.

P1o = bit7 XOR bit5 XOR bit3 XOR bit1 on each byte of the data stream

P1e = bit6 XOR bit4 XOR bit2 XOR bit0 on each byte of the data stream

P2o = bit7 XOR bit6 XOR bit5 XOR bit2 on each byte of the data stream

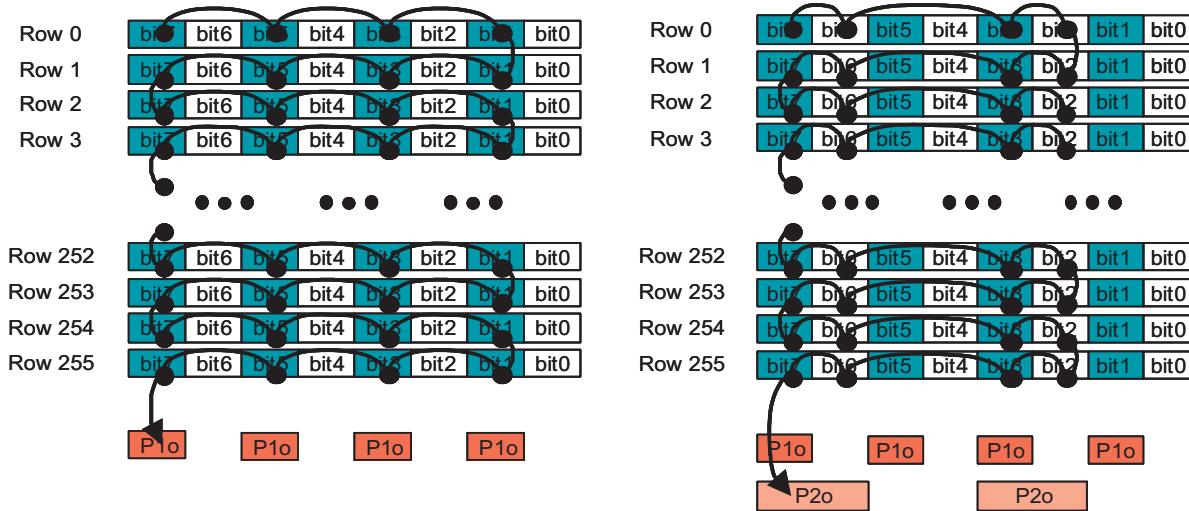

P2e = bit5 XOR bit4 XOR bit1 XOR bit0 on each byte of the data stream

P4o = bit7 XOR bit6 XOR bit5 XOR bit4 on each byte of the data stream

P4e = bit3 XOR bit2 XOR bit1 XOR bit0 on each byte of the data stream

Each column parity bit is XORed with the previous accumulated value.

Figure 7-31. Hamming Code Accumulation Algorithm (1 of 2)

For line parities, the bits of each new data are XORed together, and line parity bits are computed as:

$$P8e = \text{row0} \text{ XOR } \text{row2} \text{ XOR } \text{row4} \text{ XOR } \dots \text{ XOR } \text{row254}$$

$$P8o = \text{row1} \text{ XOR } \text{row3} \text{ XOR } \text{row5} \text{ XOR } \dots \text{ XOR } \text{row255}$$

$$P16e = \text{row0} \text{ XOR } \text{row1} \text{ XOR } \text{row4} \text{ XOR } \text{row5} \text{ XOR } \dots \text{ XOR } \text{row252} \text{ XOR } \text{row253}$$

$$P16o = \text{row2} \text{ XOR } \text{row3} \text{ XOR } \text{row6} \text{ XOR } \text{row7} \text{ XOR } \dots \text{ XOR } \text{row254} \text{ XOR } \text{row255}$$

Unused parity bits in the result registers are cleared to 0.

**Figure 7-32. Hamming Code Accumulation Algorithm (2 of 2)**

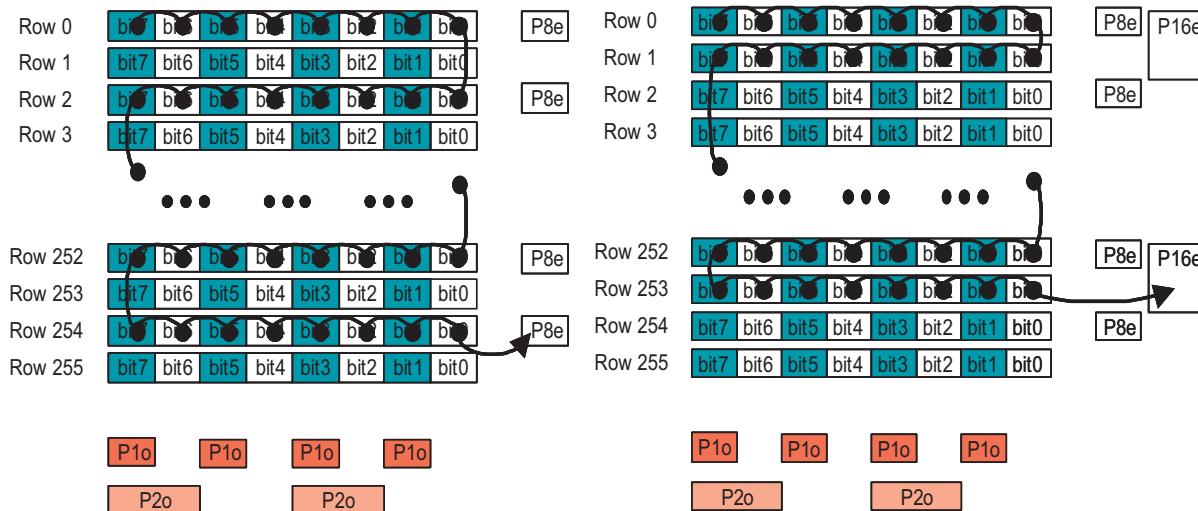

Figure 7-33 shows ECC computation for a 256-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and sixteen row parity bits (P8o-P16o-P32o--P1024o for odd parities, and P8e-P16e-P32e--P1024e for even parities).

**Figure 7-33. ECC Computation for a 256-Byte Data Stream (Read or Write)**

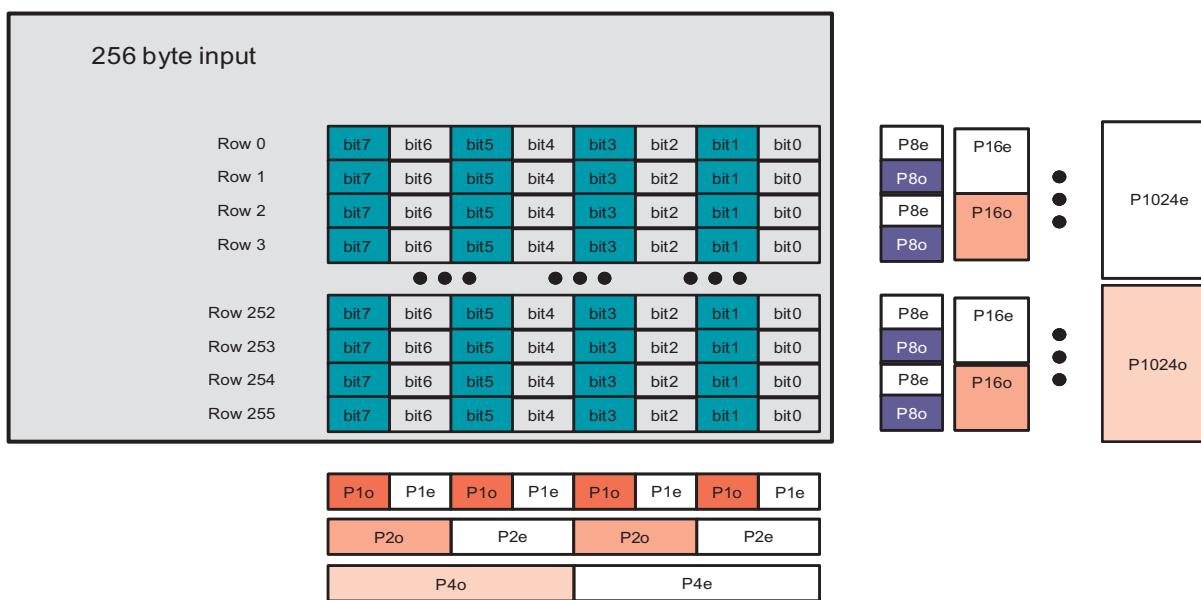

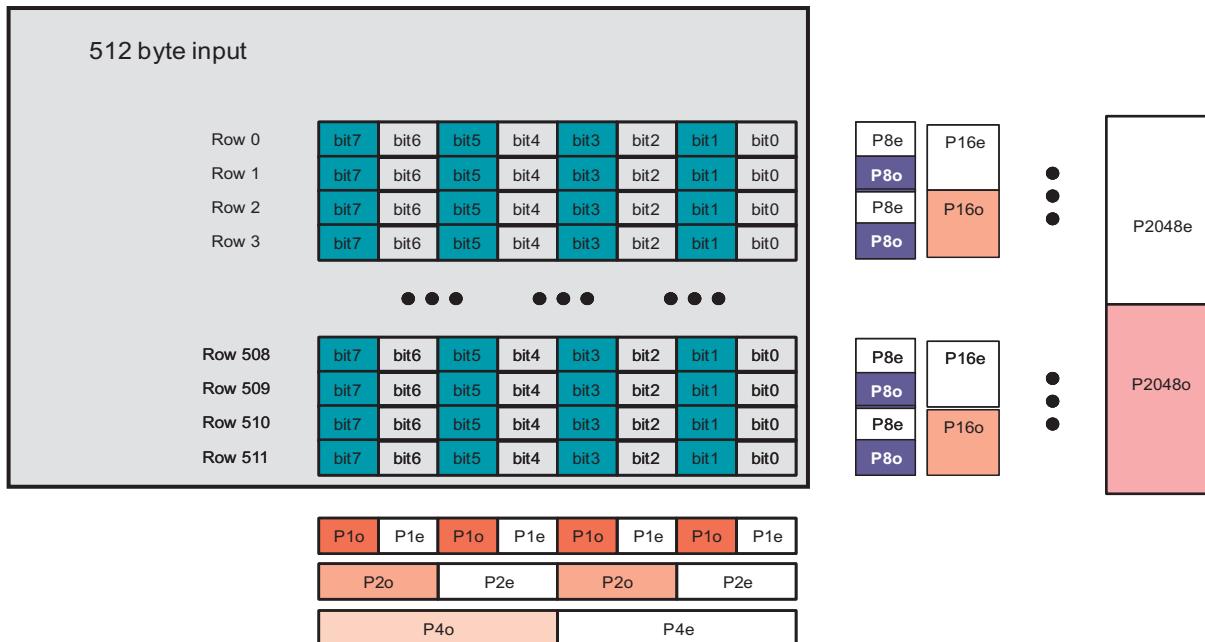

Figure 7-34 shows ECC computation for a 512-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and eighteen row parity bits (P8o-P16o-P32o--P1024o- - P2048o for odd parities, and P8e-P16e-P32e--P1024e- P2048e for even parities).

For a 2 Kbytes page, four 512 bytes ECC calculations plus one for the spare area are required. Results are stored in the GPMC\_ECCj\_RESULT registers ( $j = 1$  to 9).

**Figure 7-34. ECC Computation for a 512-Byte Data Stream (Read or Write)**

#### 7.1.3.3.12.3.1.4 ECC Comparison and Correction

To detect an error, the computed ECC result must be XORed with the parity value stored in the spare area of the accessed page.

- If the result of this logical XOR is all 0s, no error is detected and the read data is correct.
- If every second bit in the parity result is a 1, one bit is corrupted and is located at bit address (P2048o, P1024o, P512o, P256o, P128o, P64o, P32o, P16o, P8o, P4o, P2o, P1o). The software must correct the corresponding bit.
- If only one bit in the parity result is 1, it is an ECC error and the read data is correct.

#### 7.1.3.3.12.3.1.5 ECC Calculation Based on 8-Bit Word

The 8-bit based ECC computation is used for 8-bit wide NAND device interfacing.

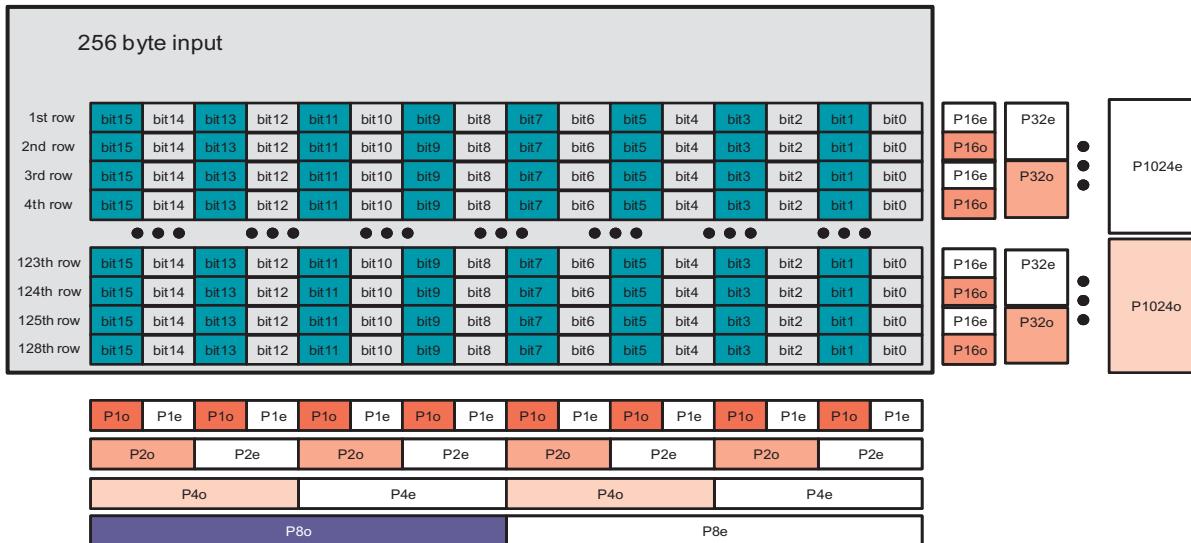

The 8-bit based ECC computation can be used for 16-bit wide NAND device interfacing to get backward compatibility on the error-handling strategy used with 8-bit wide NAND devices. In this case, the 16-bit wide data read from or written to the NAND device is fragmented into 2 bytes. According to little-endian access, the least significant bit (LSB) of the 16-bit wide data is ordered first in the byte stream used for 8-bit based ECC computation.

### 7.1.3.3.12.3.1.6 ECC Calculation Based on 16-Bit Word

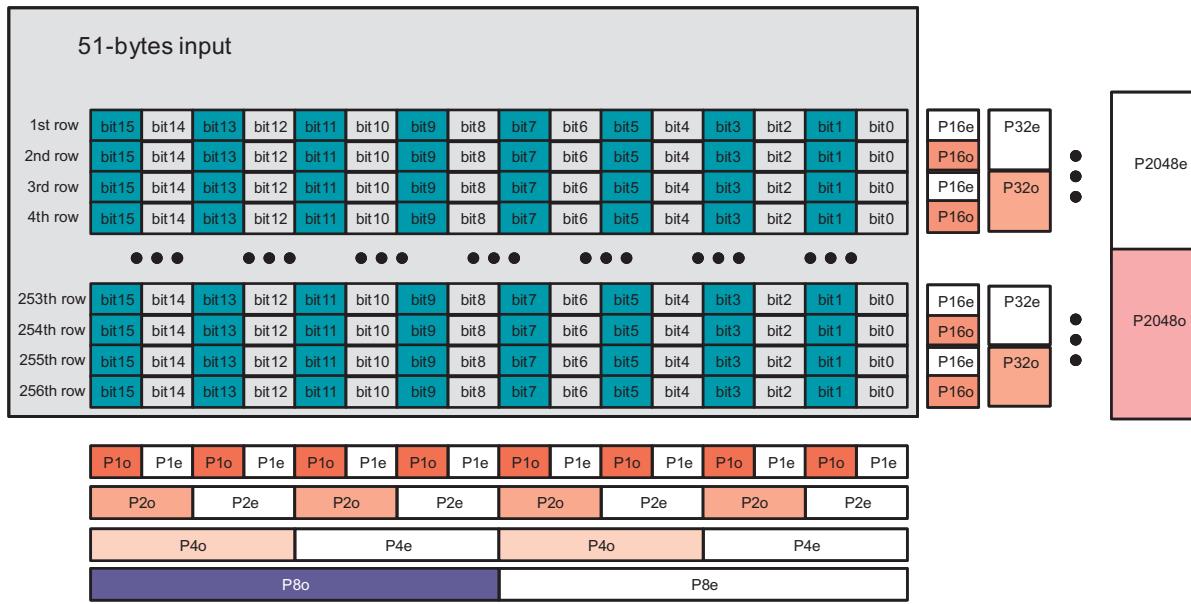

ECC computation based on a 16-bit word is used for 16-bit wide NAND device interfacing. This ECC computation is not supported when interfacing an 8-bit wide NAND device, and the GPMC\_ECC\_CONFIG[7] ECC16B bit must be cleared to 0 when interfacing an 8-bit wide NAND device.

The parity computation based on 16-bit words affects the row and column parity mapping. The main difference is that the odd and even parity bits P8o and P8e are computed on rows for an 8-bit based ECC while there are computed on columns for a 16-bit based ECC. [Figure 7-35](#) and [Figure 7-36](#).

**Figure 7-35. 128 Word16 ECC Computation**

**Figure 7-36. 256 Word16 ECC Computation**

### 7.1.3.3.12.3.2 BCH Code (Bose-Chaudhuri-Hocquenghem)

All references to Error Code Correction (ECC) in this subsection refer to the 4- to 16-bit error correction BCH code.

#### 7.1.3.3.12.3.2.1 Requirements

Read and write accesses to a NAND flash take place by whole pages, in a predetermined sequence: first the data byte page itself, then some spare bytes, including the BCH ECC (and other information). The NAND IC can cache a full page, including spares, for read and write accesses.

Typical page write sequence:

- Sequential write to NAND cache of main data + spare data, for a page. ECC is calculated on the fly. Calculated ECC may be inserted on the fly in the spares, or replaced by dummy accesses.
- When the calculated ECC is replaced by dummy accesses, it must be written to the cache in a second, separate phase. The ECC module is disabled during that time.
- NAND writes its cache line (page) to the array

Typical page read sequence:

- Sequential read of a page. ECC is calculated on the fly.
- ECC module buffers status determines the presence of errors.
- Accesses to several memories may be interleaved by the GPMC, but only one of those memories can be a NAND using the BCH engine at a time; in other words, only one BCH calculation (for example, for a single page) can be on-going at any time. Note also that the sequential nature of NAND accesses guarantees that the data is always written / read out in the same order. BCH-relevant accesses are selected by the GPMCs chip-select.
- Each page may hold up to 4 Kbytes of data, spare bytes not included. This means up to 8 x 512-byte BCH messages. Since all the data is written / read out first, followed by the BCH ECC, this means that the BCH engine must be able to hold 8 104-bit remainders or syndromes (or smaller, 52-bit ones) at the same time.

The BCH module has the capacity to store all remainders internally. After the page start, an internal counter is used to detect the 512-byte sector boundaries. On those boundaries, the current remainder is stored and the divider reset for the next calculation. At the end of the page, the BCH module contains all remainders.

- NAND access cycles hold 8 or 16 bits of data each (1 or 2 bytes); Each NAND cycle takes at least 4 cycles of the GPMCs internal clock. This means the NAND flash timing parameters must define a RDCYCLETIME and a WRCYCLETIME of at least 4 clock cycles after optimization when using the BCH calculator.
- The spare area is assumed to be large enough to hold the BCH ECC, that is, to have at least a message of 13 bytes available per 512-byte sector of data. The zone of unused spare area by the ECC may or may not be protected by the same ECC scheme, by extending the BCH message beyond 512 bytes (maximum codeword is 1023-byte long, ECC included, which leaves a lot of space to cover some spares bytes).

### 7.1.3.3.12.3.2.2 Memory-Mapping of the BCH Codeword

BCH encoding considers a block of data to protect as a polynomial message  $M(x)$ . In our standard case, 512 bytes of data (that is, 2 bits = 4096 bits) are seen as a polynomial of degree  $2 - 1 = 4095$ , with parameters ranging from  $M_0$  to  $M_{4095}$ . For 512 bytes of data, 52 bits are required for 4-bit error correction, and 104 bits are required for 8-bit error correction and 207 bits are required for 16-bit error correction. The ECC is a remainder polynomial  $R(x)$  of degree 103 (or 51, depending on the selected mode). The complete codeword  $C(x)$  is the concatenation of  $M(x)$  and  $R(x)$  as shown in [Table 7-13](#).

**Table 7-13. Flattened BCH Codeword Mapping (512 Bytes + 104 Bits)**

| Bit number | Message $M(x)$ | ECC $R(x)$ |       |      |     |       |
|------------|----------------|------------|-------|------|-----|-------|
|            | M4095          | ...        | $M_0$ | R103 | ... | $R_0$ |

If the message is extended by the addition of spare bytes to be protected by the same ECC, the principle is still valid. For example, a 3-byte extension of the message gives a polynomial message  $M(x)$  of degree  $((512 + 3) \times 8) - 1 = 4119$ , for a total of  $3 + 13 = 16$  spare bytes of spare, all protected as part of the same codeword.

The message and the ECC bits are manipulated and mapped in the GPMC byte-oriented system. The ECC bits are stored in:

- GPMC\_BCH\_RESULT0\_i
- GPMC\_BCH\_RESULT1\_i
- GPMC\_BCH\_RESULT2\_i
- GPMC\_BCH\_RESULT3\_i

### 7.1.3.3.12.3.2.3 Memory Mapping of the Data Message

The data message mapping shall follow the following rules:

- Bit endianness within a byte is little-endian, that is, the bytes LS bit is also the lowest-degree polynomial parameter: a byte b7-b0 (with b0 the LS bit) represents a segment of polynomial  $b_7 * x + b_6 * x + \dots + b_0 * x$
- The message is mapped in the NAND starting with the highest-order parameters, that is, in the lowest addresses of a NAND page.
- Byte endianness within the NANDs 16-bit words is big endian. This means that the same message mapped in 8- and 16-bit memories has the same content at the same byte address.

The BCH module has no visibility over actual addresses. The most important point is the sequence of data word the BCH sees. However, the NAND page is always scanned incrementally in read and write accesses, and this produces the mapping patterns described in the following.

[Table 7-14](#) and [Table 7-15](#) show the mapping of the same 512-byte vector (typically a BCH message) in the NAND memory space. Note that the byte 'address' is only an offset modulo 512 (200h), since the same page may contain several contiguous 512-byte sectors (BCH blocks). The LSB and MSB are respectively the bits  $M_0$  and  $M(2^{12}-1)$  of the codeword mapping given above. In both cases the data vectors are aligned, that is, their boundaries coincide with the RAMs data word boundaries.

**Table 7-14. Aligned Message Byte Mapping in 8-bit NAND**

| Byte Offset | 8-Bit Word            |
|-------------|-----------------------|
| 0           | (msb) Byte 511 (1FFh) |
| 1h          | Byte 510 (1FEh)       |
| :           | :                     |
| 1FFh        | Byte 0 (0) (LSB)      |

**Table 7-15. Aligned Message Byte Mapping in 16-bit NAND**

| Byte Offset | 16-Bit Words MSB | 16-Bit Words LSB      |
|-------------|------------------|-----------------------|
| 0           | Byte 510 (1FEh)  | (msb) Byte 511 (1FFh) |
| 2h          | Byte 508 (1FCh)  | Byte 509 (1FDh)       |
| :           | :                | :                     |
| 1FEh        | Byte 0 (0)       | (lsb) Byte 1 (1)      |

[Table 7-16](#) and [Table 7-17](#) show the mapping in memory of arbitrarily-sized messages, starting on access (byte or 16-bit word) boundaries for more clarity. Note that message may actually start and stop on arbitrary nibbles. A nibble is a 4-bit entity. The unused nibbles are not discarded, and they can still be used by the BCH module, but as part of the next message section (for example, on another sectors ECC).

**Table 7-16. Aligned Nibble Mapping of Message in 8-bit NAND**

| Byte Offset | 8-Bit Word                    |                               |
|-------------|-------------------------------|-------------------------------|
|             | 4-Bit Most Significant Nibble | 4-Bit Less Significant Nibble |
| 1           | (MSB) Nibble S-1              | Nibble S-2                    |
| 2           | Nibble S-3                    | Nibble S-4                    |
| :           | :                             | :                             |
| S/2 - 2     | Nibble 3                      | Nibble 2                      |
| S/2 - 1     | Nibble 1                      | Nibble 0 (LSB)                |

**Table 7-17. Misaligned Nibble Mapping of Message in 8-bit NAND**

| Byte Offset | 8-Bit Word                    |                               |
|-------------|-------------------------------|-------------------------------|
|             | 4-Bit Most Significant Nibble | 4-Bit Less Significant Nibble |
| 1           | (MSB) Nibble S-1              | Nibble S-2                    |
| 2           | Nibble S-3                    | Nibble S-4                    |
| :           | :                             | :                             |
| (S+1)/2 - 2 | Nibble 2                      | Nibble 1                      |
| (S+1)/2 - 1 | Nibble 0 (LSB)                |                               |

**Table 7-18. Aligned Nibble Mapping of Message in 16-bit NAND**

| Byte Offset | 16-Bit Word                   |                |                               |            |  |
|-------------|-------------------------------|----------------|-------------------------------|------------|--|
|             | 4-Bit Most Significant Nibble |                | 4-Bit Less Significant Nibble |            |  |

| (S+3)/2 - 4 | Nibble 2                      | Nibble 1   | Nibble 4                      | Nibble 3   |
| (S+3)/2 - 2 |                               |            | Nibble 0 (LSB)                |            |

Note that many other cases exist than the ones represented above, for example, where the message does not start on a word boundary.

#### 7.1.3.3.12.3.2.4 Memory Mapping of the ECC

The ECC (or remainder) is presented by the BCH module as a single 104-bit (or 52-bit), little-endian vector. It is up to the software to fetch those 13 bytes (or 6 bytes) from the modules interface, then store them to the NANDs spare area (page write) or to an intermediate buffer for comparison with the stored ECC (page read). There are no constraints on the ECC mapping inside the spare area: it is a softwarecontrolled operation.

However, it is advised to maintain a coherence in the respective formats of the message or the ECC remainder once they have been read out of the NAND. The error correction algorithm works from the complete codeword (concatenated message and remainder) once an error has been detected. The creation of this codeword should be made as straightforward as possible.

There are cases where the same NAND access contains both data and the ECC protecting that data. This is the case when the data/ECC boundary (which can be on any nibble) does not coincide with an access boundary. The ECC is calculated on-the-fly following the write. In that case, the write must also contain part of the ECC because it is impossible to insert the ECC on-the-fly. Instead:

- During the initial page write (BCH encoding), the ECC is replaced by dummy bits. The BCH encoder is by definition turned OFF during the ECC section, so the BCH result is unmodified.
  - During a second phase, the ECC is written to the correct location, next to the actual data.
  - The completed line buffer is then written to the NAND array.

### **7.1.3.3.12.3.2.5 Wrapping Modes**

For a given wrapping mode, the module automatically goes through a specific number of sections, as data is being fed into the module. For each section, the BCH core can be enabled (in which case the data is fed to the BCH divider) or not (in which case the BCH simply counts to the end of the section). When enabled, the data is added to the ongoing calculation for a given sector number (for example, number 0).

Wrapping modes are described below. To get a better understanding and see the real-life read and write sequences implemented with each mode, see [Section 7.1.3.3.12.3.3](#).

For each mode:

- A sequence describes the mode in pseudo-language, with for each section the size and the buffer used for ECC processing (if ON). The programmable lengths are size, size0 and size1.
  - A checksum condition is given. If the checksum condition is not respected for a given mode, the modules behavior is unpredictable. S is the number of sectors in the page; size0 and size1 are the section sizes programmed for the mode, in nibbles.

Note that wrapping modes 8, 9, 10, and 11 insert a 1-nibble padding where the BCH processing is OFF. This is intended for t = 4 ECC, where ECC is 6 bytes long and the ECC area is expected to include (at least) 1 unused nibble to remain byte-aligned.

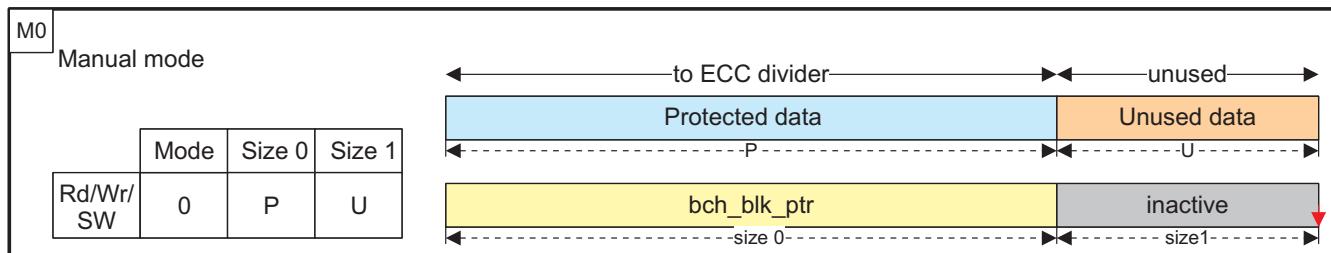

### **7.1.3.3.12.3.2.6 Manual Mode (0x0)**

This mode is intended for short sequences, added manually to a given buffer through the software data port input. A complete page may be built out of several such sequences.

To process an arbitrary sequence of 4-bit nibbles, accesses to the software data port shall be made, containing the appropriate data. If the sequence end does not coincide with an access boundary (for example, to process 5 nibbles = 20 bits in 16-bit access mode) and those nibbles need to be skipped, a number of unused nibbles shall be programmed in size1 (in the same example: 5 nibbles to process + 3 to discard = 8 nibbles = exactly  $2 \times 16$ -bit accesses: we must program size0 = 5, size1 = 3).

[Figure 7-37](#) shows the manual mode sequence and mapping. In this figure, size and size0 are the same parameter.

**Figure 7-37. Manual Mode Sequence and Mapping**

Section processing sequence:

- One time with buffer
  - size0 nibbles of data, processing ON
  - size1 nibbles of unused data, processing OFF

Checksum: size0 + size1 nibbles must fit in a whole number of accesses.

In the following sections, S is the number of sectors in the page.

#### 7.1.3.3.12.3.2.7 Mode 0x1

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S - (size0 + size1)

#### 7.1.3.3.12.3.2.8 Mode 0xA (10)

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - 1 nibble pad spare, processing OFF
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S - (size0 + 1 + size1)

#### 7.1.3.3.12.3.2.9 Mode 0x2

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S - (size0 + size1)

#### 7.1.3.3.12.3.2.10 Mode 0x3

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - size1)

#### **7.1.3.3.12.3.2.11 Mode 0x7**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = size0 + (S - size1)

#### **7.1.3.3.12.3.2.12 Mode 0x8**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - (1+size1))

#### **7.1.3.3.12.3.2.13 Mode 0x4**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)
  - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - size1)

#### **7.1.3.3.12.3.2.14 Mode 0x9**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)
  - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S - (1+size1))

**7.1.3.3.12.3.2.15 Mode 0x5**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S - (size0 + size1)

**7.1.3.3.12.3.2.16 Mode 0xB (11)**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S - (size0 + 1 + size1)

**7.1.3.3.12.3.2.17 Mode 0x6**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S - (size0 + size1)

### 7.1.3.3.12.3.3 Supported NAND Page Mappings and ECC Schemes

The following rules apply throughout the entire mapping description:

- Main data area (sectors) size is hardcoded to 512 bytes.
- Spare area size is programmable.
- All page sections (of main area data bytes, protected spare bytes, unprotected spare bytes, and ECC) are defined as explained in [Section 7.1.3.3.12.3.2.3](#).

Each one of the following sections shows a NAND page mapping example (per-sector spare mappings, pooled spare mapping, per-sector spare mapping, with ECC separated at the end of the page).

In the mapping diagrams, sections that belong to the same BCH codeword have the same color (blue or green); unprotected sections are not covered (orange) by the BCH scheme.

Below each mapping diagram, a write (encoding) and read (decoding: syndrome generation) sequence is given, with the number of the active buffers at each point in time (yellow). In the inactive zones (grey), no computing is taking place but the data counter is still active.

In [Figure 7-38](#) to [Figure 7-40](#), tables on the left summarize the mode, size0, size1 parameters to program for respectively write and read processing of a page, with the given mapping, where:

- P is the size of spare byte section Protected by the ECC (in nibbles)
- U is the size of spare byte section Unprotected by the ECC (in nibbles)
- E is the size of the ECC itself (in nibbles)
- S is the number of Sectors per page (2 in the current diagrams)

Each time the processing of a BCH block is complete (ECC calculation for write/encoding, syndrome generation for read/decoding, indicated by red arrows), the update pointer is pulsed. Note that the processing for block 0 can be the first or the last to complete, depending on the NAND page mapping and operation (read or write). All examples show a page size of 1kByte + spares, that is, S = 2 sectors of 512 bytes. The same principles can be extended to larger pages by adding more sectors.

The actual BCH codeword size is used during the error location work to restrict the search range: by definition, errors can only happen in the codeword that was actually written to the NAND, and not in the mathematical codeword of  $n = 2 - 1 = 8191$  bits. That codeword (higher-order bits) is all-zero and implicit during computations.

The actual BCH codeword size depends on the mode, on the programmed sizes and on the sector number (all sizes in nibbles):

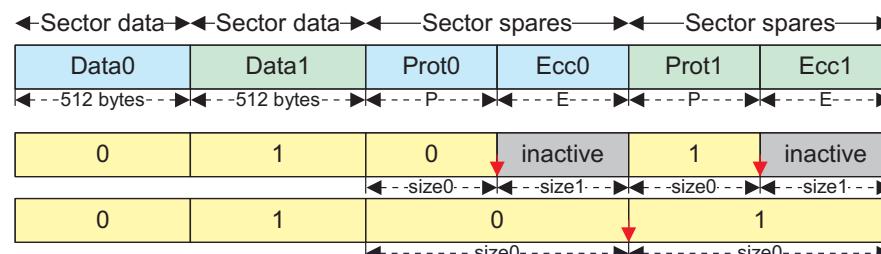

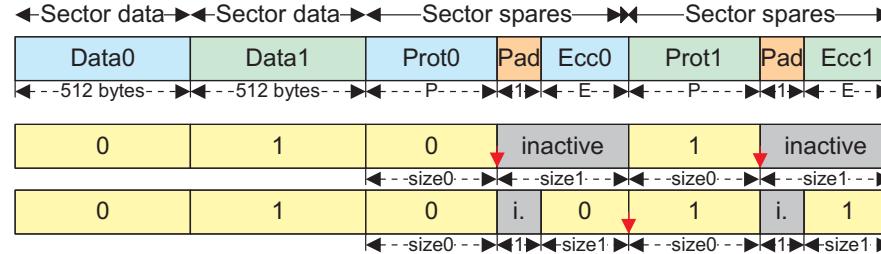

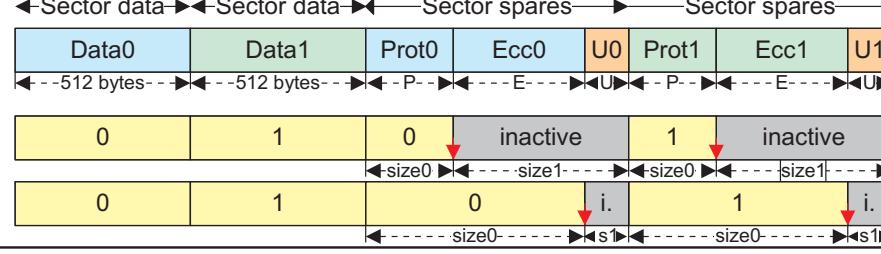

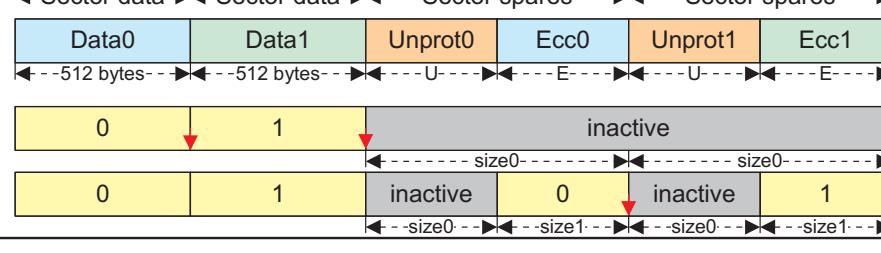

- Spares mapped and protected per sector ([Figure 7-38](#): see M1-M2-M3-M9-M10):
  - all sectors: (512) + P + E
- Spares pooled and protected by sector 0 ([Figure 7-38](#): see M5-M6):
  - sector 0 codeword: (512) + P + E
  - other sectors: (512) + E
- Unprotected spares ([Figure 7-38](#): see M4-M7-M8-M11-M12):
  - all codewords (512) + E

### 7.1.3.3.12.3.3.1 Per-Sector Spare Mappings

In these schemes (Figure 7-38), each 512-byte sector of the main area has its own dedicated section of the spare area. The spare area of each sector is composed of:

- ECC, which must be located after the data it protects
- other data, which may or may not be protected by the sectors ECC

**Figure 7-38. NAND Page Mapping and ECC: Per-Sector Schemes**

### 7.1.3.3.12.3.3.2 Pooled Spare Mapping

In these schemes (Figure 7-39), the spare area is pooled for the page.

- The ECC of each sector is aligned at the end of the spare area.
- The non-ECC spare data may or may not be covered by the ECC of sector 0

**Figure 7-39. NAND Page Mapping and ECC: Pooled Spare Schemes**

| M5    | Pooled spares<br>Spares covered by ECC0.<br>All ECC at the end (of page).       | <table border="1"> <thead> <tr> <th></th><th>Mode</th><th>Size0</th><th>Size1</th></tr> </thead> <tbody> <tr> <td>Write</td><td>7</td><td>P</td><td>E</td></tr> <tr> <td>Read</td><td>3</td><td>P</td><td>E</td></tr> </tbody> </table>           |          | Mode | Size0 | Size1 | Write | 7 | P | E        | Read | 3 | P | E |
|-------|---|---|----------|------|-------|-------|-------|---|---|----------|------|---|---|---|

### 7.1.3.3.12.3.3.3 Per-Sector Spare Mapping, With ECC Separated at the End of the Page

In these schemes (Figure 7-40), each 512-byte sector of the main area is associated with two sections of the spare area.

- ECC section, all aligned at the end of the page
- other data section, aligned before the ECCs, each of which may or may not be protected by its sectors ECC

**Figure 7-40. NAND Page Mapping and ECC: Per-Sector Schemes, with Separate ECC**

#### 7.1.3.3.12.4 Prefetch and Write-Posting Engine

NAND device data access cycles are usually much slower than the MPU system frequency; such NAND read or write accesses issued by the processor will impact the overall system performance, especially considering long read or write sequences required for NAND page loading or programming. To minimize this effect on system performance, the GPMC includes a prefetch and write-posting engine, which can be used to read from or write to any chip-select location in a buffered manner.

The prefetch and write-posting engine is a simplified embedded-access requester that presents requests to the access engine on a user-defined chip-select target. The access engine interleaves these requests with any request coming from the L3 interface; as a default the prefetch and write-posting engine has the lowest priority.

The prefetch and write-posting engine is dedicated to data-stream access (as opposed to random data access); thus, it is primarily dedicated to NAND support. The engine does not include an address generator; the request is limited to chip-select target identification. It includes a 64-byte FIFO associated with a DMA request synchronization line, for optimal DMA-based use.

The prefetch and write-posting engine uses an embedded 64 bytes (32 16-bit word) FIFO to prefetch data from the NAND device in read mode (prefetch mode) or to store host data to be programmed into the NAND device in write mode (write-posting mode). The FIFO draining and filling (read and write) can be controlled either by the MPU through interrupt synchronization (an interrupt is triggered whenever a programmable threshold is reached) or the sDMA through DMA request synchronization, with a programmable request byte size in both prefetch or posting mode.

The prefetch and write-posting engine includes a single memory pool. Therefore, only one mode, read or write, can be used at any given time. In other words, the prefetch and write-posting engine is a single-context engine that can be allocated to only one chip-select at a time for a read prefetch or a write-posting process.

The engine does not support atomic command and address phase programming and is limited to linear memory read or write access. In consequence, it is limited to NAND data-stream access. The engine relies on the MPU NAND software driver to control block and page opening with the correct data address pointer initialization, before the engine can read from or write to the NAND memory device.

Once started, the engine data reads and writes sequencing is solely based on FIFO location availability and until the total programmed number of bytes is read or written.

Any host-concurrent accesses to a different chip-select are correctly interleaved with ongoing engine accesses. The engine has the lowest priority access so that host accesses to a different chip-select do not suffer a large latency.

A round-robin arbitration scheme can be enabled to ensure minimum bandwidth to the prefetch and write-posting engine in the case of back-to-back direct memory requests to a different chip-select. If the GPMC\_PREFETCH\_CONFIG1[23] PFPWENROUNDROBIN bit is enabled, the arbitration grants the prefetch and write posting engine access to the GPMC bus for a number of requests programmed in the GPMC\_PREFETCH\_CONFIG1[19-16] PFPWWEIGHTEDPRIO field.

The prefetch/write-posting engine read or write request is routed to the access engine with the chip-select destination ID. After the required arbitration phase, the access engine processes the request as a single access with the data access size equal to the device size specified in the corresponding chip-select configuration.

The destination chip-select configuration must be set to the NAND protocol-compatible configuration for which address lines are not used (the address bus is not changed from its current value). Selecting a different chip-select configuration can produce undefined behavior.

#### 7.1.3.3.12.4.1 General Facts About the Engine Configuration

The engine can be configured only if the GPMC\_PREFETCH\_CONTROL[0] STARTENGINE bit is deasserted.

The engine must be correctly configured in prefetch or write-posting mode and must be linked to a NAND chip-select before it can be started. The chip-select is linked using the GPMC\_PREFETCH\_CONFIG1[26-24] ENGINECSSELECTOR field.

In both prefetch and write-posting modes, the engine respectively uses byte or 16-bit word access requests for an 8- or 16-bit wide NAND device attached to the linked chip-select. The FIFOThreshold and TRANSFERCOUNT fields must be programmed accordingly as a number of bytes or a number of 16-bit word.

When the GPMC\_PREFETCH\_CONFIG1[7] ENABLEENGINE bit is set, the FIFO entry on the L3 interconnect port side is accessible at any address in the associated chip-select memory region. When the ENABLEENGINE bit is set, any host access to this chip-select is rerouted to the FIFO input. Directly accessing the NAND device linked to this chip-select from the host is still possible through these registers:

- GPMC\_NAND\_COMMAND\_i
- GPMC\_NAND\_ADDRESS\_i
- GPMC\_NAND\_DATA\_i

The FIFO entry on the L3 interconnect port can be accessed with Byte, 16-bit word, or 32-bit word access size, according to little-endian format, even though the FIFO input is 32-bit wide.

The FIFO control is made easier through the use of interrupts or DMA requests associated with the FIFOThreshold bit field. The GPMC\_PREFETCH\_STATUS[30-24] FIFOPOINTER field monitors the number of available bytes to be read in prefetch mode or the number of free empty slots which can be written in write-posting mode. The GPMC\_PREFETCH\_STATUS[13-0] COUNTVALUE field monitors the number of remaining bytes to be read or written by the engine according to the TRANSFERCOUNT value. The FIFOPOINTER and COUNTVALUE bit fields are always expressed as a number of bytes even if a 16-bit wide NAND device is attached to the linked chip-select.

In prefetch mode, when the FIFOPOINTER equals 0, that is, the FIFO is empty, a host read access receives the byte last read from the FIFO as its response. In case of 32-bit word or 16-bit word read accesses, the last byte read from the FIFO is copied the required number of times to fit the requested word size. In write-posting mode, when the FIFOPOINTER equals 0, that is, the FIFO is full, a host write overwrites the last FIFO byte location. There is no underflow or overflow error reporting in the GPMC.

#### 7.1.3.3.12.4.2 Prefetch Mode

The prefetch mode is selected when the GPMC\_PREFETCH\_CONFIG1[0] ACCESSMODE bit is cleared.

The MPU NAND software driver must issue the block and page opening (READ) command with the correct data address pointer initialization before the engine can be started to read from the NAND memory device. The engine is started by asserting the GPMC\_PREFETCH\_CONTROL[0] STARTENGINE bit. The STARTENGINE bit automatically clears when the prefetch process completes.

If required, the ECC calculator engine must be initialized (i.e., reset, configured, and enabled) before the prefetch engine is started, so that the ECC is correctly computed on all data read by the prefetch engine.

When the GPMC\_PREFETCH\_CONFIG1[3] SYNCHROMODE bit is cleared, the prefetch engine starts requesting data as soon as the STARTENGINE bit is set. If using this configuration, the host must monitor the NAND device-ready pin so that it only sets the STARTENGINE bit when the NAND device is in a ready state, meaning data is valid for prefetching.

When the SYNCHROMODE bit is set, the prefetch engine starts requesting data when an active to inactive wait signal transition is detected. The transition detector must be cleared before any transition detection; see [Section 7.1.3.3.12.2.2](#). The GPMC\_PREFETCH\_CONFIG1[5-4] WAITPINSELECTOR field selects which gpmc\_wait pin edge detector triggers the prefetch engine in this synchronized mode.

If the STARTENGINE bit is set after the NAND address phase (page opening command), the engine is effectively started only after the actual NAND address phase completion. To prevent GPMC stall during this NAND address phase, set the STARTENGINE bit field before NAND address phase completion when in synchronized mode. The prefetch engine will start when an active to inactive wait signal transition is detected. The STARTENGINE bit is automatically cleared on prefetch process completion.

The prefetch engine issues a read request to fill the FIFO with the amount of data specified by GPMC\_PREFETCH\_CONFIG2[13-0] TRANSFERCOUNT field.

[Table 7-22](#) describes the prefetch mode configuration.

**Table 7-22. Prefetch Mode Configuration**

| Bit Field             | Register              | Value   | Comments  |
|-----------------------|-----------------------|---------|---|
| STARTENGINE           | GPMC_PREFETCH_CONTROL | 0       | Prefetch engine can be configured only if STARTENGINE is cleared to 0.                      |
| ENGINECSSELECTOR      | GPMC_PREFETCH_CONFIG1 | 0 to 3h | Selects the chip-select associated with a NAND device where the prefetch engine is active.  |
| ACCESSMODE            | GPMC_PREFETCH_CONFIG1 | 0       | Selects prefetch mode   |
| FIFOTHRESHOLD         | GPMC_PREFETCH_CONFIG1 |         | Selects the maximum number of bytes read or written by the host on DMA or interrupt request |
| TRANSFERCOUNT         | GPMC_PREFETCH_CONFIG1 |         | Selects the number of bytes to be read or written by the engine to the selected chip-select |
| SYNCHROMODE           | GPMC_PREFETCH_CONFIG1 | 0/1     | Selects when the engine starts the access to the chip-select                                |
| WAITPINSELECT         | GPMC_PREFETCH_CONFIG1 | 0 to 1  | Selects wait pin edge detector (if GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE = 1)                |
| ENABLEOPTIMIZEDACCESS | GPMC_PREFETCH_CONFIG1 | 0/1     | See <a href="#">Section 7.1.3.3.12.4.6</a>  |
| CYCLOOPTIMIZATION     | GPMC_PREFETCH_CONFIG1 |         | Number of clock cycle removed to timing parameters  |
| ENABLEENGINE          | GPMC_PREFETCH_CONFIG1 | 1       | Engine enabled  |
| STARTENGINE           | GPMC_PREFETCH_CONFIG1 | 1       | Starts the prefetch engine  |

#### 7.1.3.3.12.4.3 FIFO Control in Prefetch Mode

The FIFO can be drained directly by the MPU or by an eDMA channel.

In MPU draining mode, the FIFO status can be monitored through the GPMC\_PREFETCH\_STATUS[30-24] FIFOPOINTER field or through the GPMC\_PREFETCH\_STATUS[16] FIFOThresholdStatus bit. The FIFOPOINTER indicates the current number of available data to be read; FIFOThresholdStatus set to 1 indicates that at least FIFOThreshold bytes are available from the FIFO.

An interrupt can be triggered by the GPMC if the GPMC\_IRQENABLE[0] FIFOEventEnable bit is set. The FIFO interrupt event is logged, and the GPMC\_IRQSTATUS[0] FIFOEventStatus bit is set. To clear the interrupt, the MPU must read all the available bytes, or at least enough bytes to get below the programmed FIFO threshold, and the FIFOEventStatus bit must be cleared to enable further interrupt events. The FIFOEventStatus bit must always be reset prior to asserting the FIFOEventEnable bit to clear any out-of-date logged interrupt event. This interrupt generation must be enabled after enabling the STARTENGINE bit.

Prefetch completion can be monitored through the GPMC\_PREFETCH\_STATUS[13-0] COUNTVALUE field. COUNTVALUE indicates the number of currently remaining data to be requested according to the TRANSFERCOUNT value. An interrupt can be triggered by the GPMC when the prefetch process is complete (that is, COUNTVALUE equals 0) if the GPMC\_IRQENABLE[1] TERMINALCOUNTEventEnable bit is set. At prefetch completion, the TERMINALCOUNT interrupt event is also logged, and the GPMC\_IRQSTATUS[1] TERMINALCOUNTStatus bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTStatus bit. The TERMINALCOUNTStatus bit must always be cleared prior to asserting the TERMINALCOUNTEventEnable bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The COUNTVALUE value is only valid when the prefetch engine is active (started), and an interrupt is only triggered when COUNTVALUE reaches 0, that is, when the prefetch engine automatically goes from an active to an inactive state.

---

The number of bytes to be prefetched (programmed in TRANSFERCOUNT) must be a multiple of the programmed FIFOThreshold to trigger the correct number of interrupts allowing a deterministic and transparent FIFO control. If this guideline is respected, the number of ISR accesses is always required and the FIFO is always empty after the last interrupt is triggered. In other cases, the TERMINALCOUNT interrupt must be used to read the remaining bytes in the FIFO (the number of remaining bytes being lower than the FIFOThreshold value).

In DMA draining mode, the GPMC\_PREFETCH\_CONFIG1[2] DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOThreshold bytes are ready to be read from the FIFO. The DMA channel owning this DMA request must be programmed so that the number of bytes programmed in FIFOThreshold is read from the FIFO during the DMA request process. The DMA request is kept active until this number of bytes has effectively been read from the FIFO, and no other DMA request can be issued until the ongoing active request is complete.

In prefetch mode, the TERMINALCOUNT event is also a source of DMA requests if the number of bytes to be prefetched is not a multiple of FIFOThreshold, the remaining bytes in the FIFO can be read by the DMA channel using the last DMA request. This assumes that the number of remaining bytes to be read is known and controlled through the DMA channel programming model.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (the STARTENGINE bit is set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that the out-of-date active DMA request does not trigger spurious DMA transfers.

#### 7.1.3.3.12.4.4 Write-Posting Mode

The write-posting mode is selected when the GPMC\_PREFETCH\_CONFIG1[0] ACCESSMODE bit is set.

The MPU NAND software driver must issue the correct address pointer initialization command (page program) before the engine can start writing data into the NAND memory device. The engine starts when the GPMC\_PREFETCH\_CONTROL[0] STARTENGINE bit is set to 1. The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion (adding ECC handling, if required).

If used, the ECC calculator engine must be started (configured, reset, and enabled) before the posting engine is started so that the ECC parities are properly calculated on all data written by the prefetch engine to the associated chip-select.

In write-posting mode, the GPMC\_PREFETCH\_CONFIG1[3] SYNCHROMODE bit must be cleared so that posting starts as soon as the STARTENGINE bit is set and the FIFO is not empty.

If the STARTENGINE bit is set after the NAND address phase (page program command), the STARTENGINE setting is effective only after the actual NAND command completion. To prevent GPMC stall during this NAND command phase, set the STARTENGINE bit field before the NAND address completion and ensure that the associated DMA channel is enabled after the NAND address phase.

The posting engine issues a write request when valid data are available from the FIFO and until the programmed GPMC\_PREFETCH\_CONFIG2[13-0] TRANSFERCOUNT accesses have been completed.

The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion. The closing program command phase must only be issued when the full NAND page has been written into the NAND flash write buffer, including the spare area data and the ECC parities, if used.

**Table 7-23. Write-Posting Mode Configuration**

| Bit Field             | Register              | Value   | Comments   |
|-----------------------|-----------------------|---------|--|
| STARTENGINE           | GPMC_PREFETCH_CONTROL | 0       | Write-posting engine can be configured only if STARTENGINE is cleared to 0.                      |
| ENGINECSSELECTOR      | GPMC_PREFETCH_CONFIG1 | 0 to 3h | Selects the chip-select associated with a NAND device where the prefetch engine is active        |
| ACCESSMODE            | GPMC_PREFETCH_CONFIG1 | 1       | Selects write-posting mode   |
| FIFOTHRESHOLD         | GPMC_PREFETCH_CONFIG1 |         | Selects the maximum number of bytes read or written by the host on DMA or interrupt request      |
| TRANSFERCOUNT         | GPMC_PREFETCH_CONFIG2 |         | Selects the number of bytes to be read or written by the engine from/to the selected chip-select |
| SYNCHROMODE           | GPMC_PREFETCH_CONFIG1 | 0       | Engine starts the access to chip-select as soon as STARTENGINE is set.                           |
| ENABLEOPTIMIZEDACCESS | GPMC_PREFETCH_CONFIG1 | 0/1     | See <a href="#">Section 7.1.3.3.12.4.6</a>   |
| CYCLEOPTIMIZATION     | GPMC_PREFETCH_CONFIG  |         |  |
| ENABLEENGINE          | GPMC_PREFETCH_CONFIG1 | 1       | Engine enabled   |
| STARTENGINE           | GPMC_PREFETCH_CONTROL | 1       | Starts the prefetch engine   |

#### 7.1.3.3.12.4.5 FIFO Control in Write-Posting Mode

The FIFO can be filled directly by the MPU or by an sDMA channel.

In MPU filling mode, the FIFO status can be monitored through the FIFOPOINTER or through the GPMC\_PREFETCH\_STATUS[16] FIFOTHRESHOLDSTATUS bit. FIFOPOINTER indicates the current number of available free byte places in the FIFO, and the FIFOTHRESHOLDSTATUS bit, when set, indicates that at least FIFOTHRESHOLD free byte places are available in the FIFO.

An interrupt can be issued by the GPMC if the GPMC\_IRQENABLE[0] FIFOEVENTENABLE bit is set. When the interrupt is fired, the GPMC\_IRQSTATUS[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, the MPU must write enough bytes to fill the FIFO, or enough bytes to get below the programmed threshold, and the FIFOEVENTSTATUS bit must be cleared to get further interrupt events. The FIFOEVENTSTATUS bit must always be cleared prior to asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt must be enabled after enabling the STARTENGINE bit.

The posting completion can be monitored through the GPMC\_PREFETCH\_STATUS[13-0] COUNTVALUE field. COUNTVALUE indicates the current number of remaining data to be written based on the TRANSFERCOUNT value. An interrupt is issued by the GPMC when the write-posting process completes (that is, COUNTVALUE equal to 0) if the GPMC\_IRQENABLE[1] TERMINALCOUNTEVENTENABLE bit is set. When the interrupt is fired, the GPMC\_IRQSTATUS[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTSTATUS bit. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The COUNTVALUE value is only valid if the write-posting engine is active and started, and an interrupt is only issued when COUNTVALUE reaches 0, that is, when the posting engine automatically goes from active to inactive.

---

In DMA filling mode, the DMAMode bit field in the GPMC\_PREFETCH\_CONFIG1[2] DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes-free places are available in the FIFO. The DMA channel owning this DMA request must be programmed so that a number of bytes equal to the value programmed in the FIFOTHRESHOLD bit field are written into the FIFO during the DMA access. The DMA request remains active until the associated number of bytes has effectively been written into the FIFO, and no other DMA request can be issued until the ongoing active request has been completed.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (STARTENGINE set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that an out-of-date active DMA request does not trigger spurious DMA transfers.

In write-posting mode, the DMA or the MPU fill the FIFO with no consideration to the associated byte enables. Any byte stored in the FIFO is written into the memory device.

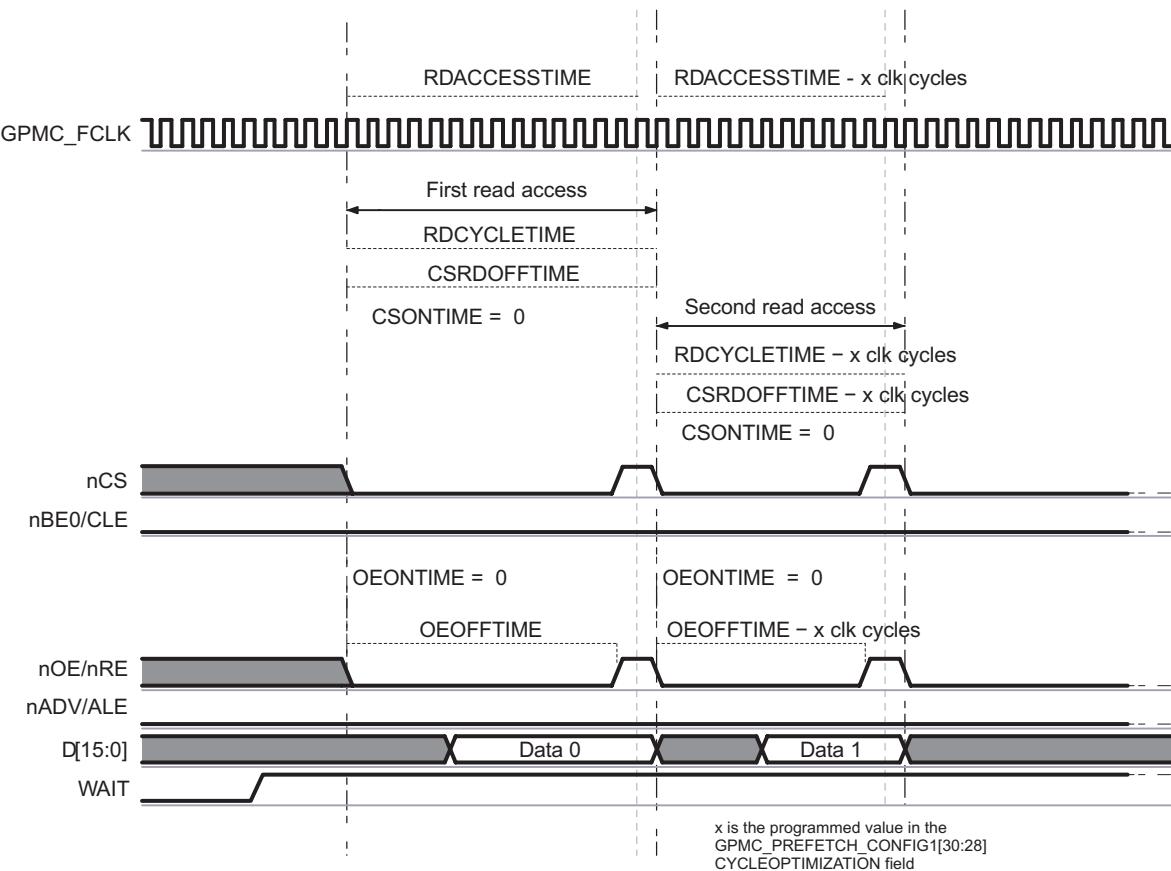

#### 7.1.3.3.12.4.6 Optimizing NAND Access Using the Prefetch and Write-Posting Engine

Access time to a NAND memory device can be optimized for back-to-back accesses if the associated CSn signal is not deasserted between accesses. The GPMC access engine can track prefetch engine accesses to optimize the access timing parameter programmed for the allocated chip-select, if no accesses to other chip-selects (that is, interleaved accesses) occur. Similarly, the access engine also eliminates the CYCLE2CYCLEDELAY even if CYCLE2CYCLESAMECSEN is set. This capability is limited to the prefetch and write-posting engine accesses, and MPU accesses to a NAND memory device (through the defined chip-select memory region or through the GPMC\_NAND\_DATA\_i) are never optimized.

The GPMC\_PREFETCH\_CONFIG1[27] ENABLEOPTIMIZEDACCESS bit must be set to enable optimized accesses. To optimize access time, the GPMC\_PREFETCH\_CONFIG1[30:28] CYCLEOPTIMIZATION field defines the number of GPMC\_FCLK cycles to be suppressed from the RDACYCLETIME, WRACYCLETIME, RDACCESSTIME, WRACCESSTIME, CSOFFTIME, ADVOFFTIME, OEOFETIME, and WEOFETIME timing parameters.

**Figure 7-41**, in the case of back-to-back accesses to the NAND flash through the prefetch engine, CYCLE2CYCLESAMECSEN is forced to 0 when using optimized accesses. The first access uses the regular timing settings for this chip-select. All accesses after this one use settings reduced by x clock cycles, x being defined by the GPMC\_PREFETCH\_CONFIG1[30:28] CYCLEOPTIMIZATION field.

**Figure 7-41. NAND Read Cycle Optimization Timing Description**

#### 7.1.3.3.12.4.7 Interleaved Accesses Between Prefetch and Write-Posting Engine and Other Chip-Selects

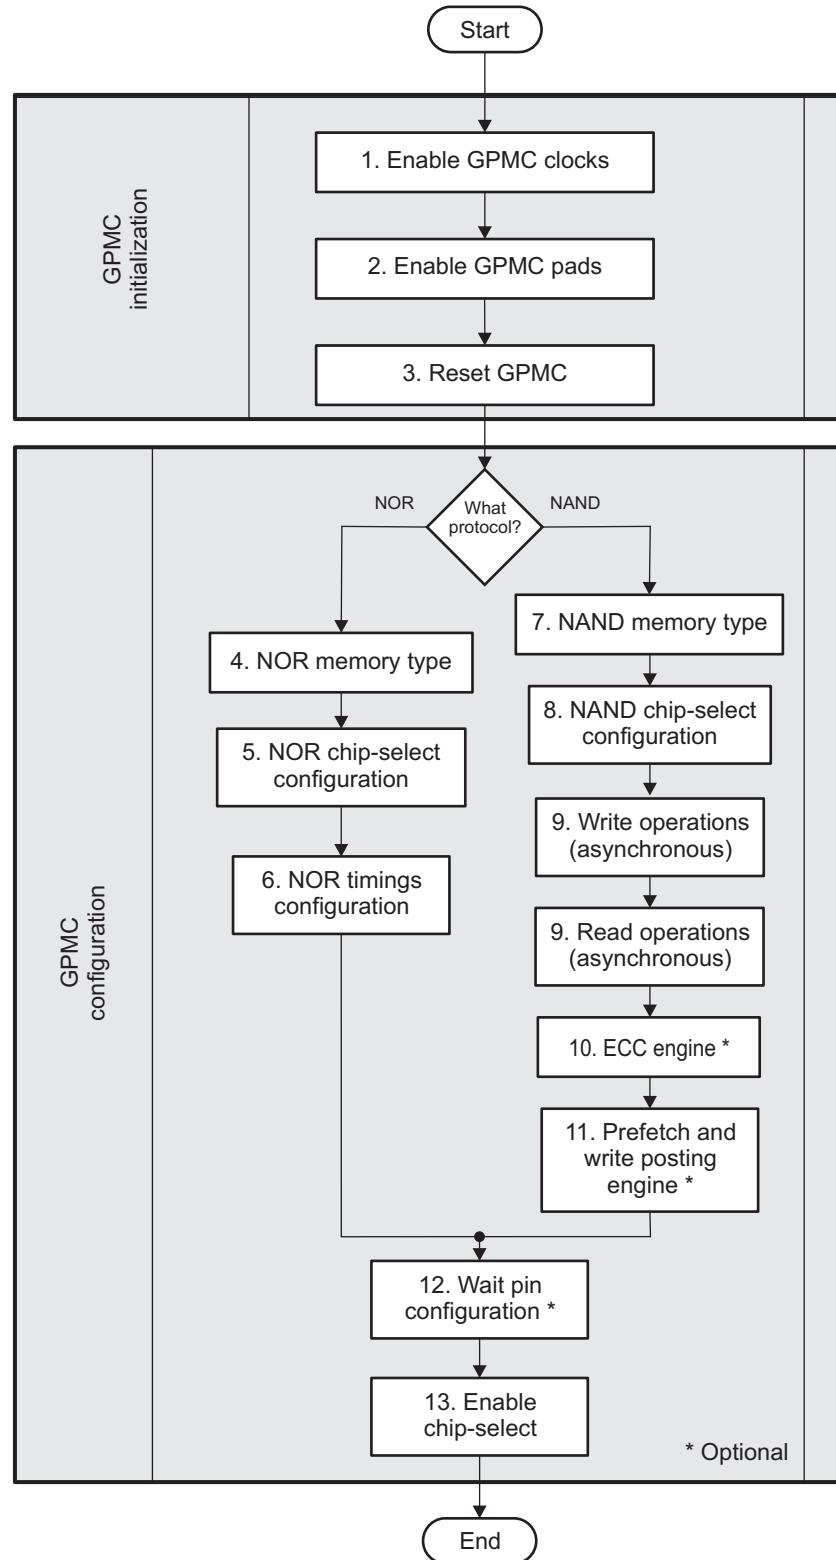

Any on-going read or write access from the prefetch and write-posting engine is completed before an access to any other chip-select can be initiated. As a default, the arbiter uses a fixed-priority algorithm, and the prefetch and write-posting engine has the lowest priority. The maximum latency added to access starting time in this case equals the RDCYCLETIME or WRCYCLETIME (optimized or not) plus the requested BUSTURNAROUND delay for bus turnaround completion programmed for the chip-select to which the NAND device is connected to.

Alternatively, a round-robin arbitration can be used to prioritize accesses to the external bus. This arbitration scheme is enabled by setting the GPMC\_PREFETCH\_CONFIG1[23] PFPWENROUNDROBIN bit. When a request to another chip-select is received while the prefetch and write-posting engine is active, priority is given to the new request. The request processed thereafter is the prefetch and write-posting engine request, even if another interconnect request is passed in the mean time. The engine keeps control of the bus for an additional number of requests programmed in the GPMC\_PREFETCH\_CONFIG1[19-16] PFPWWEIGHTEDPRIO bit field. Control is then passed to the direct interconnect request.

As an example, the round-robin arbitration scheme is selected with PFPWWEIGHTEDPRIO set to 2h. Considering the prefetch and write-posting engine and the interconnect interface are always requesting access to the external interface, the GPMC grants priority to the direct interconnect access for one request. The GPMC then grants priority to the engine for three requests, and finally back to the direct interconnect access, until the arbiter is reset when one of the two initiators stops initiating requests.

#### 7.1.3.4 GPMC High-Level Programming Model Overview

The high-level programming model introduces a top-down approach for users that need to configure the GPMC module. [Figure 7-42](#) shows a programming model top-level diagram for the GPMC. Each block of the diagram is described in one of the following subsections through a set of registers to configure. [Table 7-24](#) and [Table 7-25](#) list each step in the model.

**Figure 7-42. Programming Model Top-Level Diagram**

**Table 7-24. GPMC Configuration in NOR Mode**

| Step                          | Description                    |
|-------------------------------|--------------------------------|
| NOR Memory Type               | See <a href="#">Table 7-27</a> |
| NOR Chip-Select Configuration | See <a href="#">Table 7-28</a> |
| NOR Timings Configuration     | See <a href="#">Table 7-29</a> |
| Wait Pin Configuration        | See <a href="#">Table 7-30</a> |
| Enable Chip-Select            | See <a href="#">Table 7-31</a> |

**Table 7-25. GPMC Configuration in NAND Mode**

| Step                              | Description                    |
|-----------------------------------|--------------------------------|
| NAND Memory Type                  | See <a href="#">Table 7-32</a> |
| NAND Chip-Select Configuration    | See <a href="#">Table 7-33</a> |
| Write Operations (Asynchronous)   | See <a href="#">Table 7-34</a> |
| Read Operations (Asynchronous)    | See <a href="#">Table 7-34</a> |
| ECC Engine                        | See <a href="#">Table 7-35</a> |
| Prefetch and Write-Posting Engine | See <a href="#">Table 7-36</a> |
| Wait Pin Configuration            | See <a href="#">Table 7-37</a> |
| Enable Chip-Select                | See <a href="#">Table 7-38</a> |

### 7.1.3.5 GPMC Initialization

[Table 7-26](#) describes the settings required to reset the GPMC.

**Table 7-26. Reset GPMC**

| Sub-process Name       | Register / Bitfield         | Value |
|------------------------|-----------------------------|-------|
| Start a software reset | GPMC_SYSCONFIG[1] SOFTRESET | 1     |
| Wait until             | GPMC_SYSSTATUS[0] RESETDONE | 1     |

### 7.1.3.6 GPMC Configuration in NOR Mode

This section gives a generic configuration for parameters related to the NOR memory connected to the GPMC. [Table 7-27](#) through [Table 7-31](#) list the steps to configure the GPMC in NOR mode.

**NOTE:** In the tables of this section, 'x' in Value column stands for 'depends on configuration'.

**Table 7-27. NOR Memory Type**

| Sub-process Name  | Register / Bitfield                               | Value |
|---|---|-------|
| Set the NOR protocol  | GPMC_CONFIG1_i[11-10] DEVICETYPE                  | 0     |
| Set a device size   | GPMC_CONFIG1_i[13-12] DEVICESIZE                  | x     |
| Select an address and data multiplexing protocol            | GPMC_CONFIG1_i[9] MUXADDDATA                      | x     |
| Set the attached device page length                         | GPMC_CONFIG1_i[24-23]<br>ATTACHEDDEVICEPAGELENGTH | x     |
| Set the wrapping burst capabilities                         | GPMC_CONFIG1_i[31] WRAPBURST                      | x     |
| Select a timing signals latencies factor                    | GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY             | x     |
| Select an output clock frequency                            | GPMC_CONFIG1_i[1-0] GPMCFCLKDIVIDER               | x     |
| Choose an output clock activation time                      | GPMC_CONFIG1_i[26-25] CLKACTIVATIONTIME           | x     |
| Set a single or multiple access for read operations         | GPMC_CONFIG1_i[30] READMULTIPLE                   | x     |
| Set a synchronous or asynchronous mode for read operations  | GPMC_CONFIG1_i[29] READTYPE                       | x     |
| Set a single or multiple access for write operations        | GPMC_CONFIG1_i[28] WRITEMULTIPLE                  | x     |
| Set a synchronous or asynchronous mode for write operations | GPMC_CONFIG1_i[27] WRITETYPE                      | x     |

**Table 7-28. NOR Chip-Select Configuration**

| Sub-process Name                    | Register / Bitfield              | Value |
|-------------------------------------|----------------------------------|-------|
| Select the chip-select base address | GPMC_CONFIG7_i[5-0] BASEADDRESS  | x     |
| Select the chip-select mask address | GPMC_CONFIG7_i[11-8] MASKADDRESS | x     |

**Table 7-29. NOR Timings Configuration**

| Sub-process Name   | Register / Bitfield                 | Value |
|--|-------------------------------------|-------|
| Configure adequate timing parameters in various memory modes | See <a href="#">Section 7.1.3.9</a> |       |

**Table 7-30. WAIT Pin Configuration**

| Sub-process Name   | Register / Bitfield                         | Value |
|--|---|-------|
| Enable or disable wait pin monitoring for read operations  | GPMC_CONFIG1_i[22] WAITREADMONITORING       | x     |
| Enable or disable wait pin monitoring for write operations | GPMC_CONFIG1_i[21] WAITWRITEMONITORING      | x     |
| Select a wait pin monitoring time                          | GPMC_CONFIG1_i[19-18]<br>WAITMONITORINGTIME | x     |
| Choose the input wait pin for the chip-select              | GPMC_CONFIG1_i[17-16] WAITPINSELECT         | x     |

**Table 7-31. Enable Chip-Select**

| Sub-process Name   | Register / Bitfield       | Value |
|--|---------------------------|-------|
| When all parameters are configured, enable the chip-select | GPMC_CONFIG7_i[6] CSVALID | x     |

### 7.1.3.7 GPMC Configuration in NAND Mode

This section gives a generic configuration for parameters related to NAND memory connected to the GPMC.

**Table 7-32. NAND Memory Type**

| Sub-process Name   | Register / Bitfield                   | Value |
|--|---------------------------------------|-------|
| Set the NAND protocol  | GPMC_CONFIG1_i[11-10] DEVICETYPE      | 2h    |
| Set a device size  | GPMC_CONFIG1_i[13-12] DEVICESIZE      | x     |
| Set the address and data multiplexing protocol to non-multiplexed attached device                    | GPMC_CONFIG1_i[9] MUXADDDATA          | 0     |
| Select a timing signals latencies factor   | GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY | x     |
| Set a synchronous or asynchronous mode and a single or multiple access for read and write operations | See <a href="#">Section 7.1.3.8</a>   | x     |

**Table 7-33. NAND Chip-Select Configuration**

| Sub-process Name                                       | Register / Bitfield              | Value |
|--|----------------------------------|-------|
| Select the chip-select base address                    | GPMC_CONFIG7_i[5-0] BASEADDRESS  | x     |
| Select the chip-select minimum granularity (16M bytes) | GPMC_CONFIG7_i[11-8] MASKADDRESS | x     |

**Table 7-34. Asynchronous Read and Write Operations**

| Sub-process Name   | Register / Bitfield                 | Value |
|--|-------------------------------------|-------|
| Configure adequate timing parameters in asynchronous modes | See <a href="#">Section 7.1.3.9</a> |       |

**Table 7-35. ECC Engine**

| Sub-process Name  | Register / Bitfield   | Value            |
|---|---|------------------|
| Select the ECC result register where the first ECC computation is stored (Only applies to Hamming)    | GPMC_ECC_CONTROL[3-0] ECCPOINTER  | x                |
| Clear all ECC result registers  | GPMC_ECC_CONTROL[8] ECCCLEAR  | Write 1 to clear |
| Define ECCSIZE0 and ECCSIZE1  | GPMC_ECC_SIZE_CONFIG[19-12] ECCSIZE0 and GPMC_ECC_SIZE_CONFIG[29-22] ECCSIZE1     | x                |
| Select the size of each of the 9 result registers (size specified by ECCSIZE0 or ECCSIZE1)            | GPMC_ECC_SIZE_CONFIG[j-1] ECCjRESULTSIZE where j = 1 to 9                         | x                |
| Select the chip-select where ECC is computed  | GPMC_ECC_SIZE_CONFIG[3-1] ECCCS   | x                |
| Select the Hamming code or BCH code ECC algorithm in use  | GPMC_ECC_SIZE_CONFIG[16] ECCALGORITHM   | x                |
| Select word size for ECC calculation  | GPMC_ECC_SIZE_CONFIG[7] ECC16B  | x                |
| If the BCH code is used, Set an error correction capability and Select a number of sectors to process | GPMC_ECC_SIZE_CONFIG[13-12] ECCBCHTSEL and GPMC_ECC_SIZE_CONFIG[6-4] ECCTOPSECTOR | x                |

**Table 7-35. ECC Engine (continued)**

| Sub-process Name           | Register / Bitfield               | Value |
|----------------------------|-----------------------------------|-------|
| Enable the ECC computation | GPMC_ECC_SIZE_CONFIG[0] ECCENABLE | 1     |

**Table 7-36. Prefetch and Write-Posting Engine**

| <b>Sub-process Name</b>  | <b>Register / Bitfield</b>                        | <b>Value</b> |
|--|---|--------------|
| Disable the engine before configuration  | GPMC_PREFETCH_CONTROL[0] STARTENGINE              | 0            |
| Select the chip-select associated with a NAND device where the prefetch engine is active   | GPMC_PREFETCH_CONFIG1[26-24]<br>ENGINECSSELECTOR  | x            |
| Select access direction through prefetch engine, read or write.  | GPMC_PREFETCH_CONFIG1[0] ACCESSMODE               | x            |
| Select the threshold used to issue a DMA request   | GPMC_PREFETCH_CONFIG1[14-8]<br>FIFOThreshold      | x            |
| Select either DMA synchronized mode or SW manual mode.   | GPMC_PREFETCH_CONFIG1[2] DMAMODE                  | x            |
| Select if the engine immediately starts accessing the memory upon STARTENGINE assertion or if hardware synchronization based on a WAIT signal is used. | GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE              | x            |
| Select which wait pin edge detector should start the engine in synchronized mode   | GPMC_PREFETCH_CONFIG1[5-4]<br>WAITPINSELECTOR     | x            |
| Enter a number of clock cycles removed to timing parameters (For all back-to-back accesses to the NAND flash but not the first one)                    | GPMC_PREFETCH_CONFIG1[30-28]<br>CYCLEOPTIMIZATION | x            |
| Enable the prefetch postwrite engine   | GPMC_PREFETCH_CONFIG1[7] ENABLEENGINE             | 1            |
| Select the number of bytes to be read or written by the engine to the selected chip-select   | GPMC_PREFETCH_CONFIG2[13-0]<br>TRANSFERCOUNT      | x            |
| Start the prefetch engine  | GPMC_PREFETCH_CONTROL[0] STARTENGINE              | 1            |

**Table 7-37. WAIT Pin Configuration**

| <b>Sub-process Name</b>  | <b>Register / Bitfield</b>                    | <b>Value</b> |
|--|---|--------------|
| Selects when the engine starts the access to CS                                  | GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE          | x            |
| Select which wait pin edge detector should start the engine in synchronized mode | GPMC_PREFETCH_CONFIG1[5-4]<br>WAITPINSELECTOR | x            |

**Table 7-38. Enable Chip-Select**

| <b>Sub-process Name</b>                                    | <b>Register / Bitfield</b> | <b>Value</b> |
|--|----------------------------|--------------|
| When all parameters are configured, enable the chip-select | GPMC_CONFIG7_i[6] CSVALID  | x            |

### 7.1.3.8 Set Memory Access

This section details the bit field to configure to set the GPMC in various memory modes.

**Table 7-39. Mode Parameters Check List Table**

| Register       | Bit | Bit Field Name | Asynchronous       |                     |                             |                              | Synchronous        |                     |                              |                               |
|----------------|-----|----------------|--------------------|---------------------|-----------------------------|------------------------------|--------------------|---------------------|------------------------------|-------------------------------|
|                |     |                | Single Read Access | Single Write Access | Multiple Read (Page) Access | Multiple Write (Page) Access | Single Read Access | Single Write Access | Multiple Read (Burst) Access | Multiple Write (Burst) Access |
| GPMC_CONFIG1_i | 30  | READMULTIPLE   | 0                  | -                   | 1                           | N/S                          | 0                  | -                   | 1                            | -                             |
| GPMC_CONFIG1_i | 29  | READYTYPE      | 0                  | -                   | 0                           | N/S                          | 1                  | -                   | 1                            | -                             |
| GPMC_CONFIG1_i | 28  | WRITEMULTIPLE  | -                  | 0                   |                             | N/S                          | -                  | 0                   | -                            | 1                             |
| GPMC_CONFIG1_i | 27  | WRITETYPE      | -                  | 0                   |                             | N/S                          | -                  | 1                   | -                            | 1                             |

**Table 7-40. Access Type Parameters Check List Table**

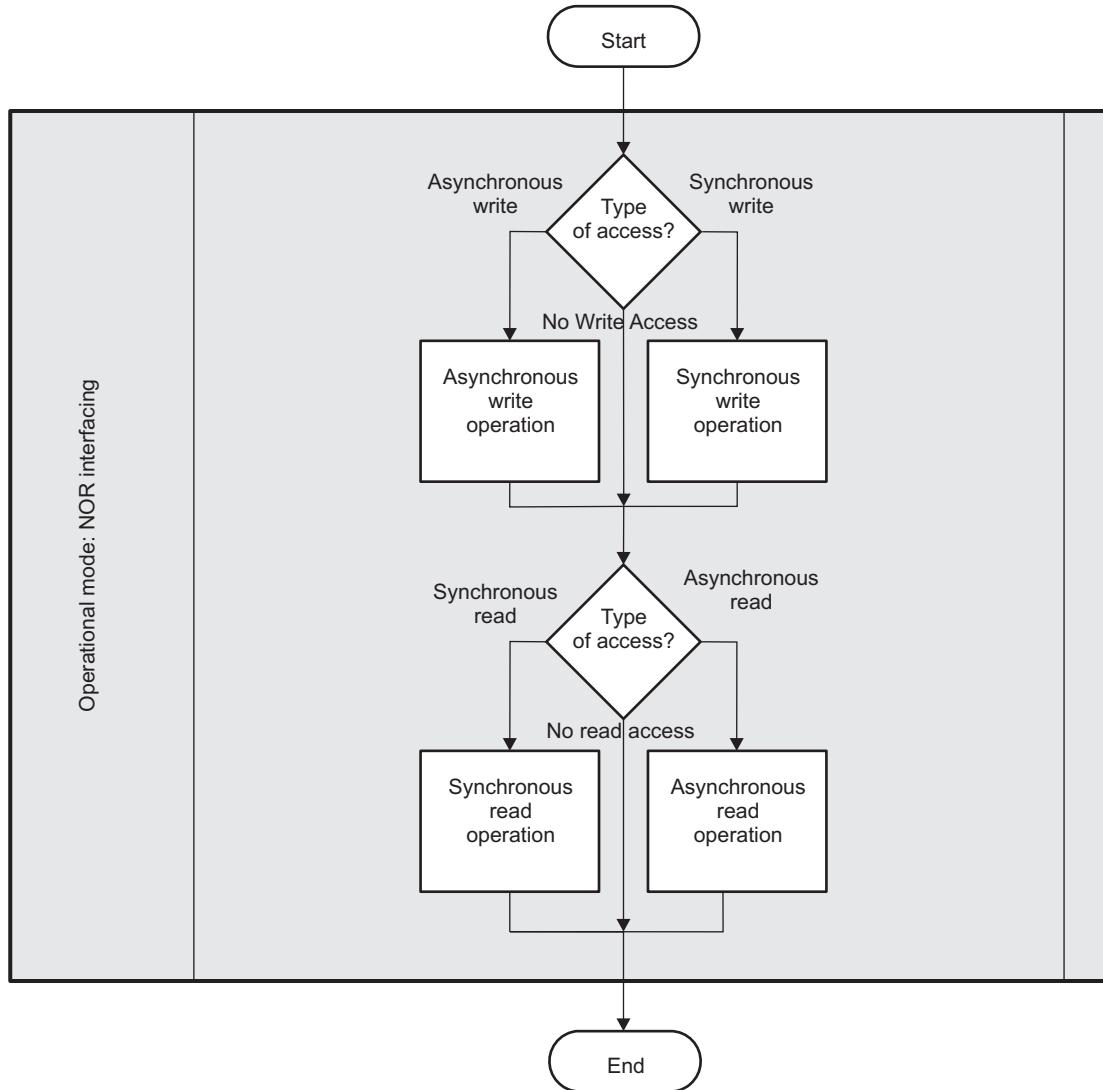

| Register       | Bit | Bit Field Name | Access Type |                  |         |
|----------------|-----|----------------|-------------|------------------|---------|
|                |     |                | Non-Mux     | Address/Data Mux | AAD Mux |
| GPMC_CONFIG1_i | 9-8 | MUXADDATA      | 0           | 2h               | 1       |

### 7.1.3.9 GPMC Timing Parameters

Figure 7-43 shows a programming model diagram for the NOR interfacing timing parameters.

Table 7-41 lists bit fields to configure adequate timing parameter in various memory modes.

**Figure 7-43. NOR Interfacing Timing Parameters Diagram**

**Table 7-41. Timing Parameters**

| Register       | Bit   | Bit Field Name      | Asynchronous       |                     |                             | Synchronous        |                     |                              |                               | Access Type     |                           |                 |
|----------------|-------|---------------------|--------------------|---------------------|-----------------------------|--------------------|---------------------|------------------------------|-------------------------------|-----------------|---------------------------|-----------------|
|                |       |                     | Single Read Access | Single Write Access | Multiple Read (Page) access | Single Read Access | Single Write Access | Multiple Read (Burst) Access | Multiple Write (Burst) Access | Non-multiplexed | Address /Data-multiplexed | AAD-multiplexed |
| GPMC_CONFIG1_i | 9-8   | MUXADDDATA          | y                  | y                   | y                           | y                  | y                   | y                            | y                             | y               | y                         | y               |

### 7.1.3.9.1 GPMC Timing Parameters Formulas

This section intends to help the user to calculate the GPMC timing bit fields values. Formulas are not listed exhaustively.

The section details:

- NAND Flash Interface Timing Parameters Formulas
- Synchronous NOR Flash Timing Parameters Formulas
- Asynchronous NOR Flash Timing Parameters Formulas

#### 7.1.3.9.1.1 NAND Flash Interface Timing Parameters Formulas

This section lists formulas to use in order to calculate NAND timing parameters. This is the case when GPMC\_CONFIG1\_i[11:10] DEVICETYPE = 2h. [Table 7-42](#) details NAND timing parameters.

**Table 7-42. NAND Formulas Description Table**

| Configuration Parameter | Unit | Description  |
|-------------------------|------|--|
| A                       | ns   | Pulse duration - GPMC_WEn valid time                                 |
| B                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_WEn valid            |
| C                       | ns   | Delay time - GPMC_BE0n_CLE/GPMC_ADVn_ALE high to GPMC_WEn valid      |
| D                       | ns   | Delay time - GPMC_AD[15:0] valid to GPMC_WEn valid                   |
| E                       | ns   | Delay time - GPMC_WEn invalid to GPMC_AD[15:0] invalid               |
| F                       | ns   | Delay time - GPMC_WEn invalid to GPMC_BE0n_CLE/GPMC_ADVn_ALE invalid |
| G                       | ns   | Delay time - GPMC_WEn invalid to GPMC_CS <sub>n</sub> invalid        |
| H                       | ns   | Cycle time - Write cycle time  |
| I                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OEn valid            |
| J                       | ns   | Setup time - GPMC_AD[15:0] valid to GPMC_OEn invalid                 |
| K                       | ns   | Pulse duration - GPMC_OEn valid time                                 |
| L                       | ns   | Cycle time - Read cycle time   |
| M                       | ns   | Delay time - GPMC_OEn invalid to GPMC_CS <sub>n</sub> invalid        |

The configuration parameters are calculated through the following formulas.

$$A = (WEOFFTime - WEONTime) * (TimeParaGranularity + 1) * GPMC_FCLK \text{ period}$$

$$B = ((WEONTime - CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEExtraDelay - CSEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$C = ((WEONTime - ADVOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEExtraDelay - ADVExtraDelay)) * GPMC_FCLK \text{ period}$$

$$D = (WEONTime * (TimeParaGranularity + 1) + 0.5 * WEExtraDelay) * GPMC_FCLK \text{ period}$$

$$E = (WrCycleTime - WEOFFTime * (TimeParaGranularity + 1) - 0.5 * WEExtraDelay) * GPMC_FCLK \text{ period}$$

$$F = (ADVWrOffTime - WEOFFTime * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay - WEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$G = (CSWrOffTime - WEOFFTime * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - WEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$H = WrCycleTime * (1 + TimeParaGranularity) * GPMC_FCLK \text{ period}$$

$$I = ((OEONTime - CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEExtraDelay - CSEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$J = ((AccessTime - OEOFFTime) * (TimeParaGranularity + 1) - 0.5 * OEExtraDelay) * GPMC_FCLK \text{ period}$$

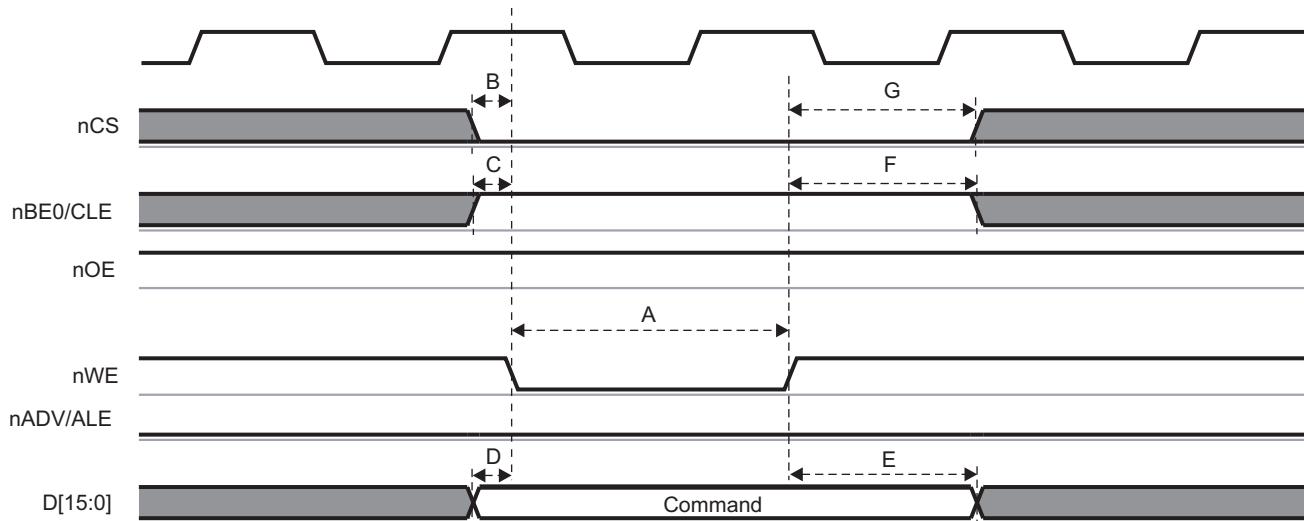

$$K = (\text{OEOffTime} - \text{OEOnTime}) * (1 + \text{TimeParaGranularity}) * \text{GPMC_FCLK period}$$

$$L = \text{RdCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC_FCLK period}$$

$$M = (\text{CSRdOffTime} - \text{OEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSEExtraDelay} - \text{OEEExtraDelay}) * \text{GPMC_FCLK period}$$

**Figure 7-44** shows a command latch cycle timing simplified example where formulas are associated with signal waves.

**Figure 7-44. NAND Command Latch Cycle Timing Simplified Example**

#### 7.1.3.9.1.2 Synchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate synchronous NOR timing parameters. This is the case when GPMC\_CONFIG1\_i[11-10] DEVICETYPE = 0 and when READTYPE or WRITETYPE are set to synchronous mode.

**Table 7-43. Synchronous NOR Formulas Description Table**

| Configuration Parameter | Unit | Description   |
|-------------------------|------|---|
| A                       | ns   | Pulse duration - GPMC_CS <sub>n</sub> low                               |
| B                       | ns   | Delay time - address bus valid to GPMC_CLK first edge                   |
|                         |      | Delay time - GPMC_BE0n_CLE/GPMC_BE1n valid to GPMC_CLK first edge       |
| C                       | ns   | Pulse duration - GPMC_BE0n_CLE/GPMC_BE1n low                            |
| D                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_BE0n_CLE/GPMC_BE1n invalid    |
|                         |      | Delay time - GPMC_CLK rising edge to GPMC_ADVn_ALE invalid              |
| E                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_CS <sub>n</sub> invalid       |
|                         |      | Delay time - GPMC_CLK rising edge to GPMC_OEn invalid                   |
| F                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_CS <sub>n</sub> transition    |
| G                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_ADVn_ALE transition           |
| H                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_OEn transition                |
| I                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_WEn transition                |
| J                       | ns   | Delay time - GPMC_CLK rising edge to GPMC_AD data bus transition        |
|                         |      | Delay time - GPMC_CLK rising edge to GPMC_BE0n_CLE/GPMC_BE1n transition |
| K                       | ns   | Pulse duration - GPMC_ADVn_ALE low                                      |
| L                       | ns   | Delay time - GPMC_WAIT invalid to first data latching GPMC_CLK edge     |

The configuration parameters are calculated through the following formulas.

For single read accesses:

$$\begin{aligned} A &= (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period} \\ C &= \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period} \\ D &= (\text{RDCYCLETIME} - \text{ACCESSTIME}) * \text{GPMC\_FCLK period} \\ E &= (\text{CSRDOFFTIME} - \text{ACCESSTIME}) * \text{GPMC\_FCLK period} \end{aligned}$$

For burst read accesses (where n is the page burst access number):

$$\begin{aligned} A &= (\text{CSRDOFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period} \\ C &= (\text{RDCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period} \\ D &= (\text{RDCYCLETIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period} \\ E &= (\text{CSRDOFFTIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period} \end{aligned}$$

For burst write accesses (where n is the page burst access number):

$$\begin{aligned} A &= (\text{CSWROFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period} \\ C &= (\text{WRCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period} \\ D &= (\text{WRCYCLETIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period} \\ E &= (\text{CSWROFFTIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period} \end{aligned}$$

For all accesses:

For CSn falling edge (CSn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CLKACTIVATIONTIME and CSONTIME are odd) or (CLKACTIVATIONTIME and CSRDOFFTIME are even)  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$  otherwise
- Case where GPMCFCLKDIVIDER = 0x2  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 3  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3  
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For CSn rising edge (CSn de-activated) in reading mode:

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CLKACTIVATIONTIME and CSRDOFFTIME are odd) or (CLKACTIVATIONTIME and CSONTIME are even)  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$  otherwise
- Case where GPMCFCLKDIVIDER = 0x2  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC\_FCLK period}$ , when (CSRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3  
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3  
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC\_FCLK period}$ , when (CSRDOFFTIME -

CLKACTIVATIONTIME - 2) is a multiple of 3

For CSn rising edge (CSn de-activated) in writing mode:

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period, when (CLKACTIVATIONTIME and CSWROFFTIME are odd) or (CLKACTIVATIONTIME and CSWROFFTIME are even)}$   
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period, when (CSWROFFTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period, when (CSWROFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period, when (CSWROFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For ADVn falling edge (ADVn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period, when (CLKACTIVATIONTIME and ADVONTIME are odd) or (CLKACTIVATIONTIME and ADVONTIME are even)}$   
 $G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period, when (ADVONTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period, when (ADVONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $G = (2 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period, when (ADVONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For ADVn rising edge (ADVn de-activated) in reading mode:

- Case where [1-0] GPMCFCLKDIVIDER = 0x0  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period, when (CLKACTIVATIONTIME and ADVRDOFFTIME are odd) or (CLKACTIVATIONTIME and ADVRDOFFTIME are even)}$   
 $G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period, when (ADVRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $G = (2 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For ADVn rising edge (ADVn de-activated) in writing mode:

- Case where [1-0] GPMCFCLKDIVIDER = 0x0  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC_FCLK period, when (CLKACTIVATIONTIME and CSWROFFTIME are odd) or (CLKACTIVATIONTIME and CSWROFFTIME are even)}$   
 $G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC_FCLK period otherwise}$

ADWROFFTIME are odd) or (CLKACTIVATIONTIME and ADWROFFTIME are even)

$G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC\_FCLK}$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$G = 0.5 * \text{ADVEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (ADWROFFTIME - CLKACTIVATIONTIME) is a multiple of 3

$G = (1 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (ADWROFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3

$G = (2 + 0.5 * \text{ADVEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (ADWROFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For OEn falling edge (OEn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0

$H = 0.5 * \text{OEEXTRADELAY} * \text{GPMC\_FCLK}$  period

- Case where GPMCFCLKDIVIDER = 0x1

$H = 0.5 * \text{OEEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (CLKACTIVATIONTIME and OEONTIME are odd) or (CLKACTIVATIONTIME and OEONTIME are even)

$H = (1 + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK}$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$H = 0.5 * \text{OEEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (OEONTIME - CLKACTIVATIONTIME) is a multiple of 3

$H = (1 + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (OEONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3

$H = (2 + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (OEONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For OEn rising edge (OEn de-activated):

- Case where [1-0] GPMCFCLKDIVIDER = 0x0

$H = 0.5 * \text{OEEXTRADELAY} * \text{GPMC\_FCLK}$  period

- Case where GPMCFCLKDIVIDER = 0x1

$H = 0.5 * \text{OEEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (CLKACTIVATIONTIME and OEOFETIME are odd) or (CLKACTIVATIONTIME and OEOFETIME are even)

$H = (1 + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK}$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$H = 0.5 * \text{OEEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (OEOFETIME - CLKACTIVATIONTIME) is a multiple of 3

$H = (1 + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (OEOFETIME - CLKACTIVATIONTIME - 1) is a multiple of 3

$H = (2 + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (OEOFETIME - CLKACTIVATIONTIME - 2) is a multiple of 3

For WEn falling edge (WEn activated):

- Case where GPMC\_CONFIG1\_i[1-0] GPMCFCLKDIVIDER = 0x0

$I = 0.5 * \text{WEEXTRADELAY} * \text{GPMC\_FCLK}$  period

- Case where GPMCFCLKDIVIDER = 0x1

$I = 0.5 * \text{WEEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (CLKACTIVATIONTIME and WEONTIME are odd) or (CLKACTIVATIONTIME and WEONTIME are even)

$I = (1 + 0.5 * \text{WEEXTRADELAY}) * \text{GPMC\_FCLK}$  period otherwise

- Case where GPMCFCLKDIVIDER = 0x2

$I = 0.5 * \text{WEEXTRADELAY} * \text{GPMC\_FCLK}$  period, when (WEONTIME - CLKACTIVATIONTIME) is a multiple of 3

$I = (1 + 0.5 * \text{WEEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when (WEONTIME - CLKACTIVATIONTIME -

1) is a multiple of 3

$I = (2 + 0.5 * \text{WEEXTRADELAY}) * \text{GPMC\_FCLK}$  period, when  $(\text{WEONTIME} - \text{CLKACTIVATIONTIME} - 2)$  is a multiple of 3

For WEn rising edge (WEn de-activated):

- Case where [1-0] GPMCFCLKDIVIDER = 0x0  
 $I = 0.5 * \text{WEEXTRADELAY} * \text{GPMC\_FCLK period}$
- Case where GPMCFCLKDIVIDER = 0x1  
 $I = 0.5 * \text{WEEXTRADELAY} * \text{GPMC\_FCLK period, when (CLKACTIVATIONTIME and WEOFFTIME are odd) or (CLKACTIVATIONTIME and WEOFFTIME are even)}$   
 $I = (1 + 0.5 * \text{WEEXTRADELAY}) * \text{GPMC\_FCLK period otherwise}$
- Case where GPMCFCLKDIVIDER = 0x2  
 $I = 0.5 * \text{WEEXTRADELAY} * \text{GPMC\_FCLK period, when (WEOFFTIME - CLKACTIVATIONTIME) is a multiple of 3}$   
 $I = (1 + 0.5 * \text{WEEXTRADELAY}) * \text{GPMC\_FCLK period, when (WEOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$   
 $I = (2 + 0.5 * \text{WEEXTRADELAY}) * \text{GPMC\_FCLK period, when (WEOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$

For GPMC\_ADVn low pulse duration:

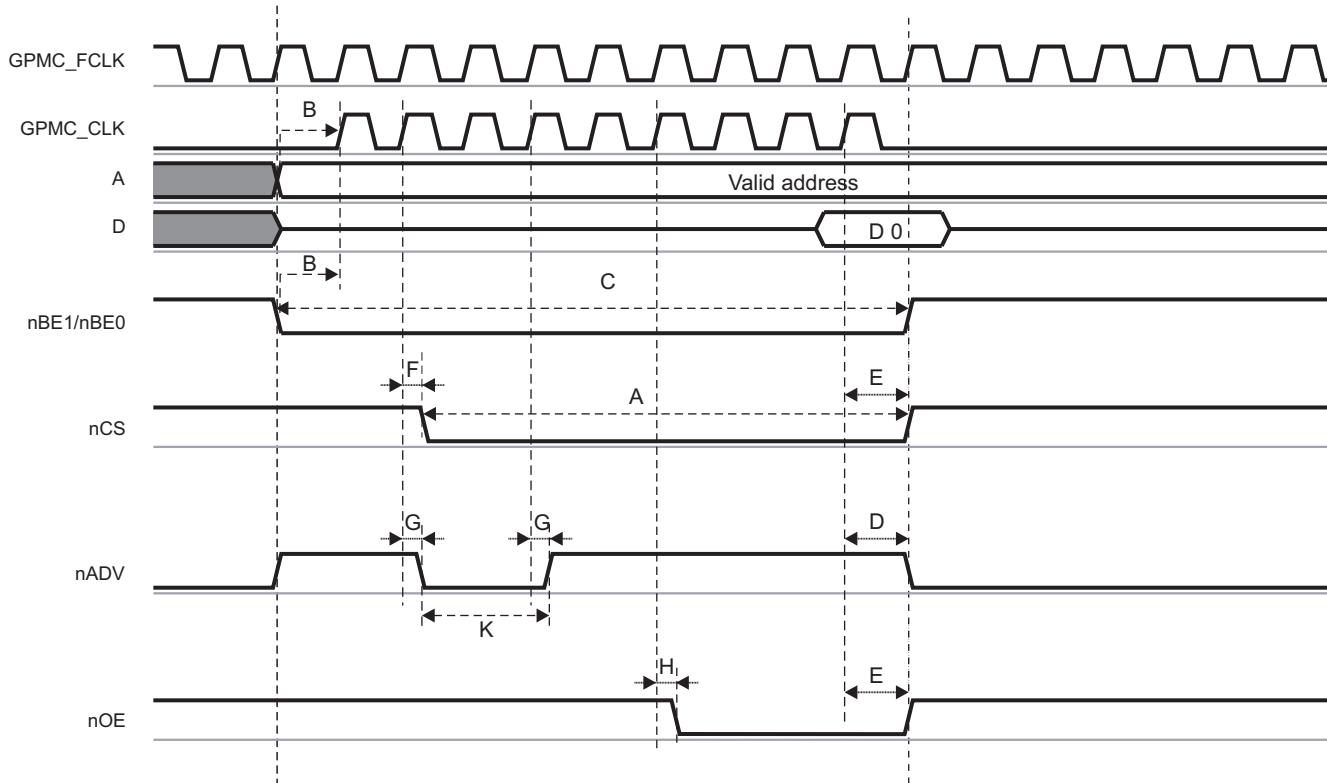

- Read operation  
 $K = (\text{ADVRDOFFTIME} - \text{ADVONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$
- Write operation  
 $K = (\text{ADVWRDOFFTIME} - \text{ADVONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$

For GPMC\_WAIT invalid to first data latching GPMC\_CLK edge:

$$L = \text{WAITMONITORINGTIME} * (\text{GPMCFCLKDIVIDER} + 1) * \text{GPMC\_FCLK period} + \text{GPMC\_CLK period}$$

[Figure 7-45](#) shows a synchronous NOR single read simplified example where formulas are associated with signal waves.

**Figure 7-45. Synchronous NOR Single Read Simplified Example**

### 7.1.3.9.1.3 Asynchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate asynchronous NOR timing parameters. This is the case when [11-10] DEVICETYPE = 0x0 and when READTYPE or WRITETYPE are set to asynchronous mode.

**Table 7-44. Asynchronous NOR Formulas Description Table**

| Configuration Parameter | Unit | Description   |
|-------------------------|------|---|
| A                       | ns   | Pulse duration - GPMC_CS <sub>n</sub> low                                     |
| B                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_ADV <sub>n</sub> _ALE invalid |
| C                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OEn invalid (single read)     |
| D                       | ns   | Pulse duration - address bus valid - 2nd, 3rd and 4th accesses                |
| E                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_WEn valid                     |
| F                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_WEn invalid                   |
| G                       | ns   | Address invalid duration between 2 successive R/W accesses                    |
| H                       | ns   | Setup time - read data valid before GPMC_OEn high                             |
| I                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OEn invalid (burst read)      |
| J                       | ns   | Delay time - address bus valid to GPMC_CS <sub>n</sub> valid                  |
|                         |      | Delay time - data bus valid to GPMC_CS <sub>n</sub> valid                     |
|                         |      | Delay time - GPMC_BE0n_CLE/GPMC_BE1n valid to GPMC_CS <sub>n</sub> valid      |
| K                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_ADV <sub>n</sub> _ALE valid   |
| L                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_OEn valid                     |
| M                       | ns   | Delay time - GPMC_CS valid to first data latching edge                        |
| N                       | ns   | Pulse duration - GPMC_BE0n_CLE/GPMC_BE1n valid time                           |
| O                       | ns   | Delay time - GPMC_CS <sub>n</sub> valid to GPMC_ADV <sub>n</sub> _ALE valid   |

The configuration parameters are calculated through the following formulas. Note that these formulas are not exhaustive.

GPMC\_CS<sub>n</sub> low pulse:

For single read:  $A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$

For burst read:  $A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$ , where N = page burst access number

For single write:  $A = (\text{CSWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$

For burst write:  $A = (\text{CSWROFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$ , where N = page burst access number

GPMC\_CS<sub>n</sub> valid to GPMC\_ADV<sub>n</sub>\_ALE invalid delay:

For reading:  $B = ((\text{ADVRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

For writing:  $B = ((\text{ADVVROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

$C = ((\text{OEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

$D = \text{PAGEBURSTACCESSTIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$

$E = ((\text{WEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

$F = ((\text{WEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

$G = \text{CYCLE2CYCLEDELAY} * \text{GPMC_FCLK period}$

$H = ((OEOFFSETIME - ACCESSTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * OEEXTRADELAY) * GPMC_FCLK$  period

$I = ((OEOFFSETIME + (N - 1) * PAGEBURSTACCESSTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (OEEXTRADELAY - CSEXTRADELAY)) * GPMC_FCLK$  period, where  $N$  = page burst access number

$J = (CSONTIME * (TIMEPARAGRANULARITY + 1) + 0.5 * CSEXTRADELAY) * GPMC_FCLK$  period

$K = ((ADVONTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (ADVEXTRADELAY - CSEXTRADELAY)) * GPMC_FCLK$  period

$L = ((OEONTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (OEEXTRADELAY - CSEXTRADELAY)) * GPMC_FCLK$  period  $M = ((ACCESSTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) - 0.5 * CSEXTRADELAY) * GPMC_FCLK$  period

GPMC\_BE0n\_CLE/GPMC\_BE1n pulse:

For single read:  $N = RDCYCLETIME * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK$  period

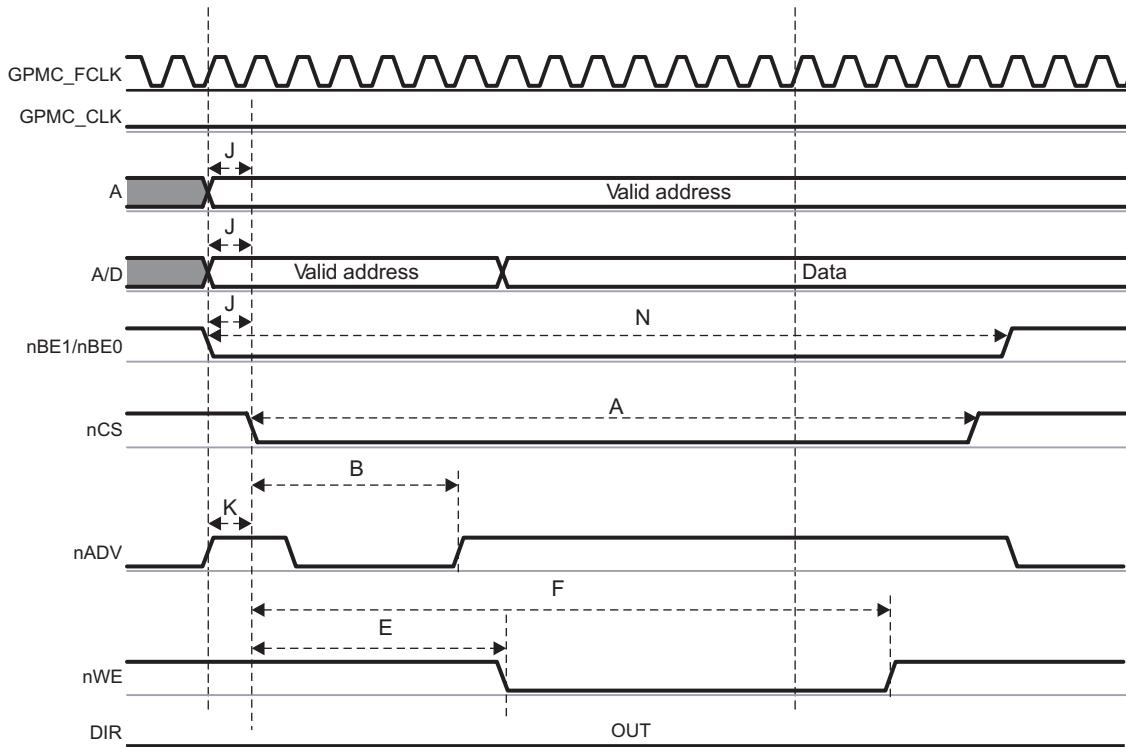

For burst read:  $N = (RDCYCLETIME + (N - 1) * PAGEBURSTACCESSTIME) * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK$  period, where  $N$  = page burst access number

For burst write:  $N = (WRCYCLETIME + (N - 1) * PAGEBURSTACCESSTIME) * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK$  period, where  $N$  = page burst access number

$O = ((WRCYCLETIME + (N - 1) * PAGEBURSTACCESSTIME - CSONTIME) * (TIMEPARAGRANULARITY + 1) + 0.5 * (ADVEXTRADELAY - CSEXTRADELAY)) * GPMC_FCLK$  period

Figure 7-46 shows an asynchronous NOR single write simplified example where formulas are associated with signal waves.

**Figure 7-46. Asynchronous NOR Single Write Simplified Example**

Write multiple access is not supported in asynchronous mode. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

## 7.1.4 Use Cases

### 7.1.4.1 How to Set GPMC Timing Parameters for Typical Accesses

#### 7.1.4.1.1 External Memory Attached to the GPMC Module

As discussed in the introduction to this chapter, the GPMC module supports the following external memory types:

- Asynchronous or synchronous, 8-bit or 16-bit-width memory or device
- 16-bit address/data-multiplexed or not multiplexed NOR flash device
- 8- or 16-bit NAND flash device

The following examples show how to calculate GPMC timing parameters by showing a typical parameter setup for the access to be performed.

The example is based on a 512-Mb multiplexed NOR flash memory with the following characteristics:

- Type: NOR flash (address/data-multiplexed mode)
- Size: 512M bits
- Data Bus: 16 bits wide
- Speed: 104 MHz clock frequency
- Read access time: 80 ns

#### 7.1.4.1.2 Typical GPMC Setup

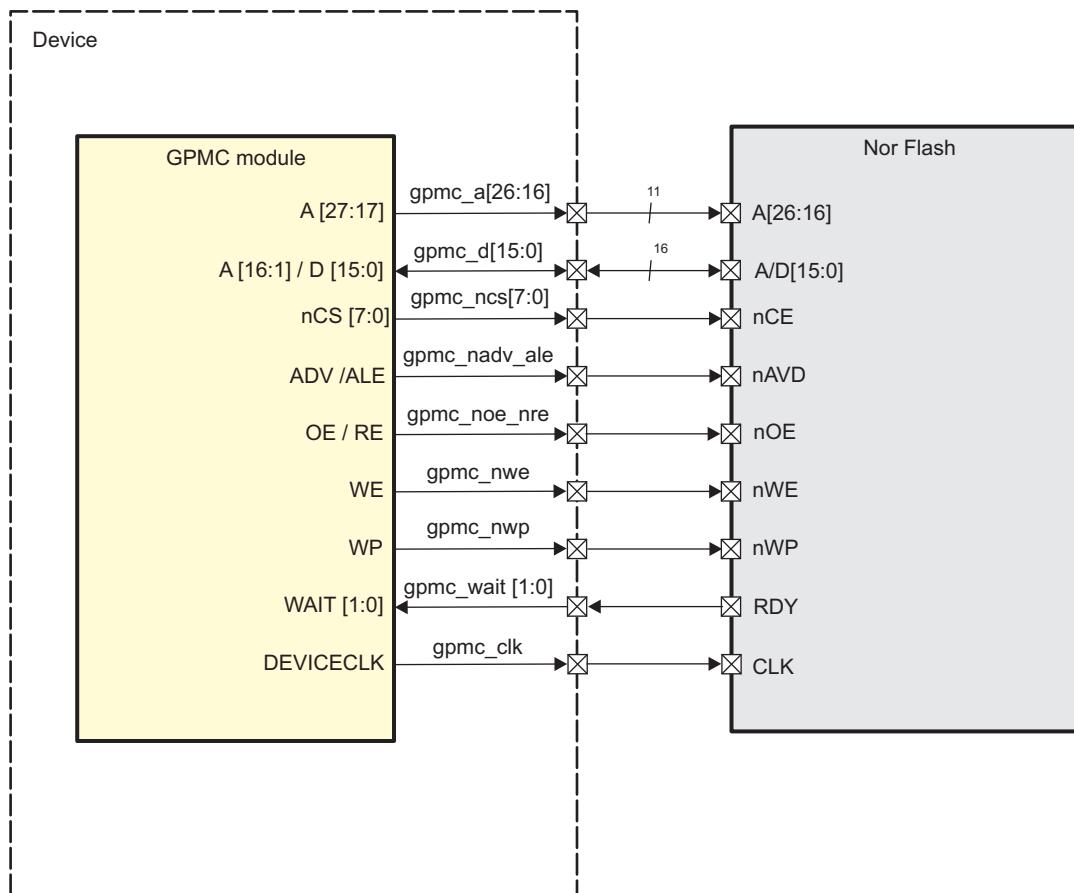

[Table 7-45](#) lists some of the I/Os of the GPMC module.

**Table 7-45. GPMC Signals**

| Signal Name    | I/O      | Description  |
|----------------|----------|--|
| GPMC_FCLK      | Internal | Functional and interface clock. Acts as the time reference.                          |
| GPMC_CLK       | O        | External clock provided to the external device for synchronous operations            |
| GPMC_A[27:17]  | O        | Address  |
| GPMC_AD[15: 0] | I/O      | Data-multiplexed with addresses A[16:1] on memory side                               |
| GPMC_CSxn      | O        | Chip-select (where x = 0, or 1)  |
| GPMC_ADVn_ALE  | O        | Address valid enable   |
| GPMC_OE_REn    | O        | Output enable (read access only)   |
| GPMC_WEn       | O        | Write enable (write access only)   |
| GPMC_WAIT[1:0] | I        | Ready signal from memory device. Indicates when valid burst data is ready to be read |

Figure 7-47 shows the typical connection between the GPMC module and an attached NOR Flash memory.

**Figure 7-47. GPMC Connection to an External NOR Flash Memory**

The following sections demonstrate how to calculate GPMC parameters for three access types:

- Synchronous burst read
- Asynchronous read
- Asynchronous single write

#### 7.1.4.1.3 GPMC Configuration for Synchronous Burst Read Access

The clock runs at 104 MHz ( $f = 104$  MHz;  $T = 9,615$  ns).

[Table 7-46](#) shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

[Table 7-47](#) shows how to calculate timings for the GPMC using the memory parameters.

[Figure 7-48](#) shows the synchronous burst read access.

**Table 7-46. Useful Timing Parameters on the Memory Side**

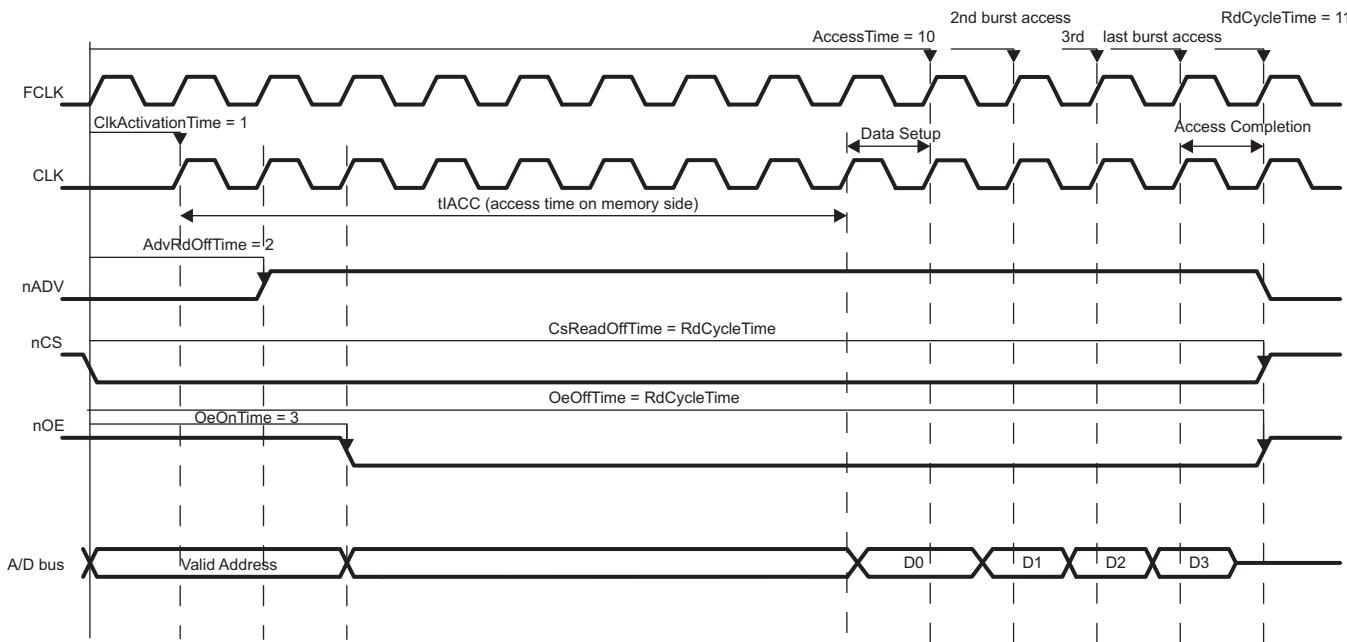

| AC Read Characteristics on the Memory Side | Description                                   | Duration (ns) |
|--|---|---------------|
| tCES                                       | CSn setup time to clock                       | 0             |
| tACS                                       | Address setup time to clock                   | 3             |
| tIACC                                      | Synchronous access time                       | 80            |
| tBACC                                      | Burst access time valid clock to output delay | 5,2           |
| tCEZ                                       | Chip-select to High-Impedance                 | 7             |
| tOEZ                                       | Output enable to High-Impedance               | 7             |
| tAVC                                       | ADVn setup time                               | 6             |
| tAVD                                       | AVDn pulse                                    | 6             |
| tACH                                       | Address hold time from clock                  | 3             |

The following terms, which describe the timing interface between the controller and its attached device, are used to calculate the timing parameters on the GPMC side:

- Read Access time (GPMC side): Time required to activate the clock + read access time requested on the memory side + data setup time required for optimal capture of a burst of data
- Data setup time (GPMC side): Ensures a good capture of a burst of data (as opposed to taking a burst of data out). One word of data is processed in one clock cycle ( $T = 9,615$  ns). The read access time between 2 bursts of data is tBACC = 5,2 ns. Therefore, data setup time is a clock period - tBACC = 4,415 ns of data setup.
- Access completion (GPMC side): (Different from page burst access time) Time required between the last burst access and access completion: CSn/OEn hold time (CSn and OEn must be released at the end of an access. These signals are held to allow the access to complete).
- Read cycle time (GPMC side): Read Access time + access completion
- Write cycle time for burst access: Not supported for NOR flash memory

**Table 7-47. Calculating GPMC Timing Parameters**

| Parameter Name on GPMC Side | Formula   | Duration (ns)               | Number of Clock Cycles (F = 104 MHz) | GPMC Register Configurations |
|-----------------------------|---|-----------------------------|--------------------------------------|------------------------------|
| GPMC FCLK Divider           | -   | -                           | -                                    | GPMCFCLKDIVIDER = 0          |
| ClkActivationTime           | min ( tCES, tACS )  | 3                           | 1                                    | CLKACTIVATIONTIME = 1        |
| RdAccessTime                | roundmax ( ClkActivationTime + tIACC + DataSetupTime )              | 94,03: (9,615 + 80 + 4,415) | 10 : roundmax (94,03 / 9,615)        | ACCESTIME = Ah               |
| PageBurstAccessTime         | roundmax (tBACC)  | roundmax (5,2)              | 1                                    | PAGEBURSTACCESTIME = 1       |
| RdCycleTime                 | AccessTime + max ( tCEZ, tOEZ )                                     | 101, 03: (94, 03 + 7)       | 11                                   | RDCYCLETIME = Bh             |
| CsOnTime                    | tCES  | 0                           | 0                                    | CSONTIME = 0                 |
| CsReadOffTime               | RdCycleTime   | -                           | 11                                   | CSRDOFFTIME = Bh             |
| AdvOnTime                   | tAVC  | 0                           | 0                                    | ADVONTIME = 0                |
| AdvRdOffTime                | tAVD + tAVC   | 12                          | 2                                    | ADVRDOFFTIME = 2h            |
| OeOnTime                    | (ClkActivationTime + tACH) < OeOnTime < (ClkActivationTime + tIACC) | -                           | 3, for instance                      | OEONTIME = 3h                |
| OeOffTime                   | RdCycleTime   | -                           | 11                                   | OEOFETIME = Bh               |

**Figure 7-48. Synchronous Burst Read Access (Timing Parameters in Clock Cycles)**

#### 7.1.4.1.4 GPMC Configuration for Asynchronous Read Access

The clock runs at 104 MHz ( $f = 104$  MHz;  $T = 9,615$  ns).

[Table 7-48](#) shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

[Table 7-49](#) shows how to calculate timings for the GPMC using the memory parameters.

[Figure 7-49](#) shows the asynchronous read access.

**Table 7-48. AC Characteristics for Asynchronous Read Access**

| AC Read Characteristics on the Memory Side | Description                               | Duration (ns) |
|--|---|---------------|
| tCE  | Read Access time from CSn low             | 80            |
| tAAVDS                                     | Address setup time to rising edge of ADVn | 3             |
| tAVDP                                      | ADVn low time                             | 6             |
| tCAS                                       | CSn setup time to ADVn                    | 0             |
| tOE  | Output enable to output valid             | 6             |
| tOEZ                                       | Output enable to High-Impedance           | 7             |

Use the following formula to calculate the RdCycleTime parameter for this typical access:

$$\text{RdCycleTime} = \text{RdAccessTime} + \text{AccessCompletion} = \text{RdAccessTime} + 1 \text{ clock cycle} + \text{tOEZ}$$

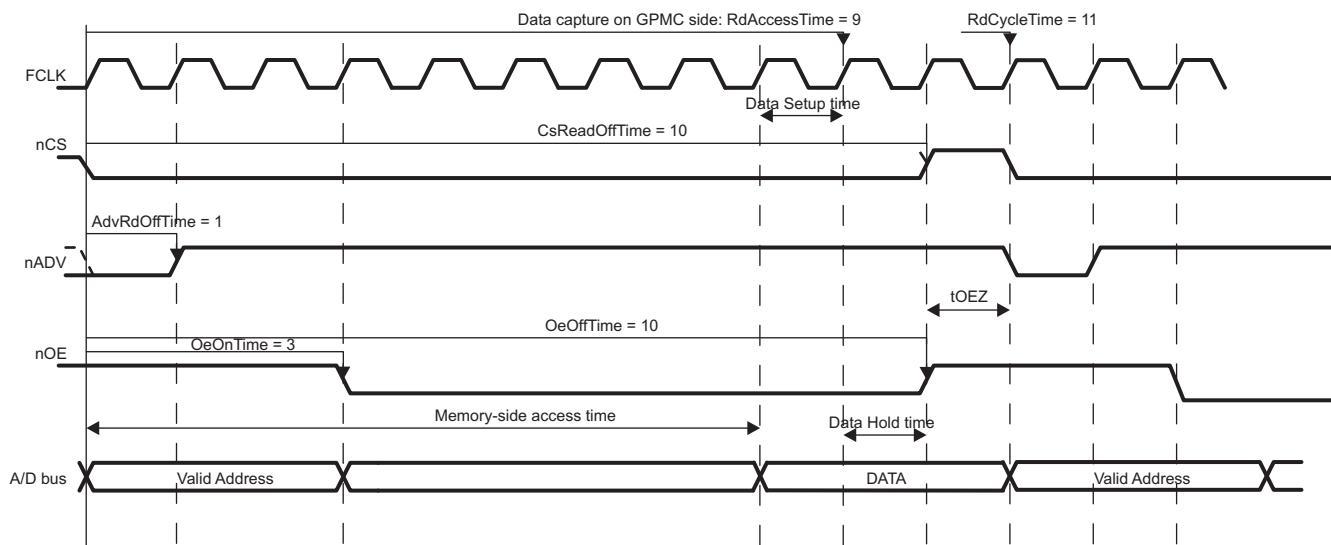

- First, on the memory side, the external memory makes the data available to the output bus. This is the memory-side read access time defined in [Table 7-49](#): the number of clock cycles between the address capture (ADVn rising edge) and the data valid on the output bus.

The GPMC requires some hold time to allow the data to be captured correctly and the access to be finished.

- To read the data correctly, the GPMC must be configured to meet the data setup time requirement of the memory; the GPMC module captures the data on the next rising edge. This is access time on the GPMC side.
- There must also be a data hold time for correctly reading the data (checking that there is no OEn/CSn deassertion while reading the data). This data hold time is 1 clock cycle (that is, AccessTime + 1).
- To complete the access, OEn/CSn signals are driven to high-impedance. AccessTime + 1 + tOEZ is the read cycle time.
- Addresses can now be relatched and a new read cycle begun.

**Table 7-49. GPMC Timing Parameters for Asynchronous Read Access**

| Parameter Name on GPMC side | Formula   | Duration (ns) | Number of Clock Cycles ( $F = 104$ MHz) | GPMC Register Configurations |
|-----------------------------|---|---------------|---|------------------------------|
| ClkActivationTime           | n/a (asynchronous mode)                         |               |   |                              |
| AccessTime                  | round max (tCE)                                 | 80            | 9                                       | ACCESSTIME = 9h              |
| PageBurstAccessTime         | n/a (single access)                             |               |   |                              |
| RdCycleTime                 | AccessTime + 1cycle + tOEZ                      | 96, 615       | 11                                      | RDCYCLETIME = Bh             |
| CsOnTime                    | tCAS  | 0             | 0                                       | CSONTIME = 0                 |
| CsReadOffTime               | AccessTime + 1 cycle                            | 89, 615       | 10                                      | CSRDOFFTIME = Ah             |
| AdvOnTime                   | tAAVDS  | 3             | 1                                       | ADVONTIME = 1                |
| AdvRdOffTime                | tAAVDS + tAVDP                                  | 9             | 1                                       | ADVRDOFFTIME = 1             |
| OeOnTime                    | OeOnTime $\geq$ AdvRdOffTime (multiplexed mode) | -             | 3, for instance                         | OEONTIME = 3h                |
| OeOffTime                   | AccessTime + 1cycle                             | 89, 615       | 10                                      | OEOFETIME = Ah               |

**Figure 7-49. Asynchronous Single Read Access (Timing Parameters in Clock Cycles)**

#### 7.1.4.1.5 GPMC Configuration for Asynchronous Single Write Access

The clock runs at 104 MHz: ( $f = 104$  MHz;  $T = 9,615$  ns).

[Table 7-50](#) shows how to calculate timings for the GPMC using the memory parameters.

[Table 7-51](#) shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

[Figure 7-50](#) shows the synchronous burst write access.

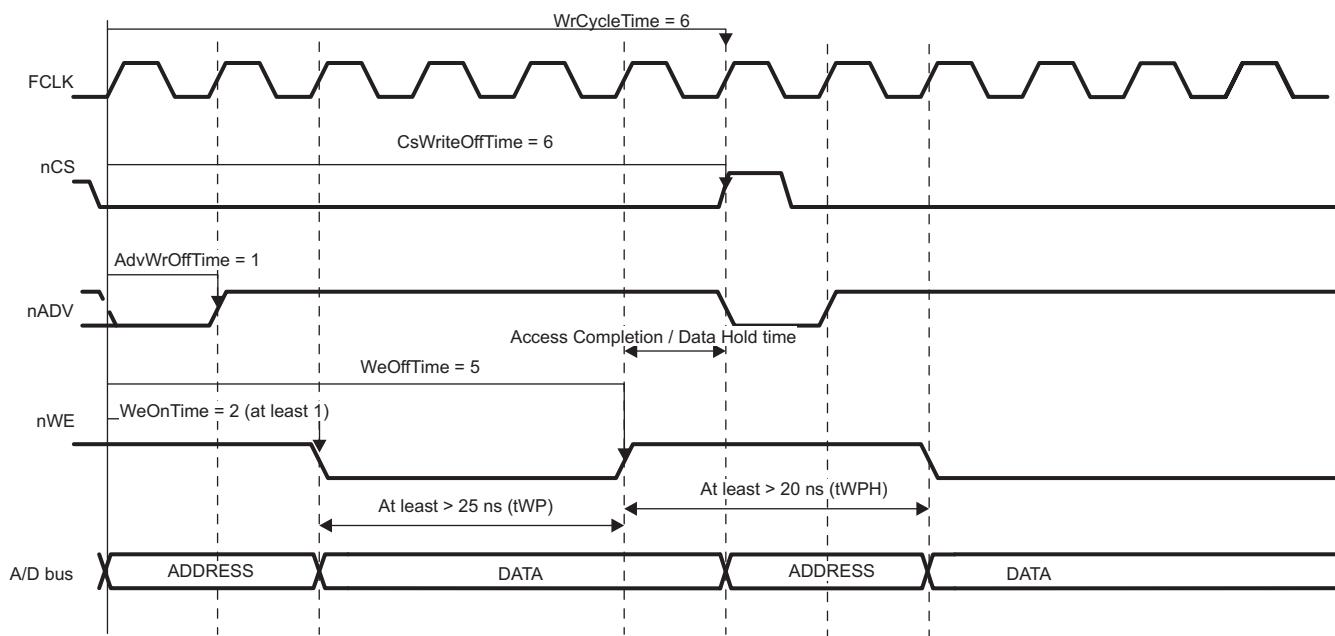

**Table 7-50. AC Characteristics for Asynchronous Single Write (Memory Side)**

| AC Characteristics on the Memory Side | Description            | Duration (ns) |
|---------------------------------------|------------------------|---------------|
| tWC                                   | Write cycle time       | 60            |
| tAVDP                                 | ADVn low time          | 6             |
| tWP                                   | Write pulse width      | 25            |
| tWPH                                  | Write pulse width high | 20            |
| tCS                                   | CSn setup time to WEn  | 3             |
| tCAS                                  | CSn setup time to ADVn | 0             |
| tAVSC                                 | ADVn setup time        | 3             |

For asynchronous single write access, write cycle time is WrCycleTime = WeOffTime + AccessCompletion = WeOffTime + 1. For the AccessCompletion, the GPMC requires 1 cycle of data hold time (CSn de-assertion).

**Table 7-51. GPMC Timing Parameters for Asynchronous Single Write**

| Parameter Name on GPMC side | Formula  | Duration (ns) | Number of Clock Cycles (F = 104 MHz) | GPMC Register Configurations |
|-----------------------------|--|---------------|--------------------------------------|------------------------------|
| ClkActivationTime           | n/a (asynchronous mode)  |               |                                      |                              |
| AccessTime                  | Applicable only to WAITMONITORING (the value is the same as for read access) |               |                                      |                              |
| PageBurstAccessTime         | n/a (single access)  |               |                                      |                              |
| WrCycleTime                 | WeOffTime + AccessCompletion   | 57, 615       | 6                                    | WRCYCLETIME = 6h             |
| CsOnTime                    | tCAS   | 0             | 0                                    | CSONTIME = 0                 |
| CsWrOffTime                 | WeOffTime + 1  | 57, 615       | 6                                    | CSWROFFTIME = 6h             |
| AdvOnTime                   | tAVSC  | 3             | 1                                    | ADVONTIME = 1                |
| AdvWrOffTime                | tAVSC + tAVDP  | 9             | 1                                    | ADVWRFFTIME = 1              |
| WeOnTime                    | tCS  | 3             | 1                                    | WEONTIME = 1                 |
| WeOffTime                   | tCS + tWP + tWPH   | 48            | 5                                    | WEOFFTIME = 5h               |

**Figure 7-50. Asynchronous Single Write Access (Timing Parameters in Clock Cycles)**

### 7.1.4.2 How to Choose a Suitable Memory to Use With the GPMC

This section is intended to help the user select a suitable memory device to interface with the GPMC controller.

#### 7.1.4.2.1 Supported Memories or Devices

NAND flash and NOR flash architectures are the two flash technologies. The GPMC supports various types of external memory or device, basically any one that supports NAND or NOR protocols:

- 8- and 16-bit width asynchronous or synchronous memory or device (8-bit: non burst device only)
- 16-bit address and data multiplexed NOR flash devices (pSRAM)
- 8- and 16-bit NAND flash device

#### 7.1.4.2.2 NAND Interface Protocol

NAND flash architecture, introduced in 1989, is a flash technology. NAND is a page-oriented memory device, that is, read and write accesses are done by pages. NAND achieves great density by sharing common areas of the storage transistor, which creates strings of serially connected transistors (in NOR devices, each transistor stands alone). Thanks to its high density NAND is best suited to devices requiring high capacity data storage, such as pictures, music, or data files. NAND non-volatility, makes of it a good storage solution for many applications where mobility, low power, and speed are key factors. Low pin count and simple interface are other advantages of NAND.

Table 7-52 summarizes the NAND interface signals level applied to external device or memories.

**Table 7-52. NAND Interface Bus Operations Summary**

| Bus Operation         | CLE | ALE | CEn | WE <sub>n</sub> | RE <sub>n</sub> | WP <sub>n</sub> |
|-----------------------|-----|-----|-----|-----------------|-----------------|-----------------|
| Read (cmd input)      | H   | L   | L   | RE              | H               | x               |
| Read (add input)      | L   | H   | L   | RE              | H               | x               |
| Write (cmd input)     | H   | L   | L   | RE              | H               | H               |
| Write (add input)     | L   | H   | L   | RE              | H               | H               |
| Data input            | L   | L   | L   | RE              | H               | H               |
| Data output           | L   | L   | L   | H               | FE              | x               |
| Busy (during read)    | x   | x   | H   | H               | H               | x               |
| Busy (during program) | x   | x   | x   | x               | x               | H               |
| Busy (during erase)   | x   | x   | x   | x               | x               | H               |
| Write protect         | x   | x   | x   | x               | x               | L               |
| Stand-by              | x   | x   | H   | x               | x               | H/L             |

#### 7.1.4.2.3 NOR Interface Protocol

NOR flash architecture, introduced in 1988, is a flash technology. Unlike NAND, which is a sequential access device, NOR is directly addressable; i.e., it is designed to be a random access device. NOR is best suited to devices used to store and run code or firmware, usually in small capacities. While NOR has fast read capabilities it has slow write and erase functions compared to NAND architecture.

Table 7-53 summarizes the NOR interface signals level applied to external device or memories.

**Table 7-53. NOR Interface Bus Operations Summary**

| Bus Operation        | CLK     | ADV <sub>n</sub> | CS <sub>n</sub> | OEn | WE <sub>n</sub> | WAIT     | DQ[15:0] |
|----------------------|---------|------------------|-----------------|-----|-----------------|----------|----------|
| Read (asynchronous)  | x       | L                | L               | L   | H               | Asserted | Output   |
| Read (synchronous)   | Running | L                | L               | L   | H               | Driven   | Output   |
| Read (burst suspend) | Halted  | x                | L               | H   | H               | Active   | Output   |
| Write                | x       | L                | L               | H   | L               | Asserted | Input    |

**Table 7-53. NOR Interface Bus Operations Summary (continued)**

| Bus Operation  | CLK | ADVn | CSn | OEn | WEn | WAIT     | DQ[15:0] |
|----------------|-----|------|-----|-----|-----|----------|----------|
| Output disable | x   | x    | L   | H   | H   | Asserted | High-Z   |
| Standby        | x   | x    | H   | x   | x   | High-Z   | High-Z   |

#### 7.1.4.2.4 Other Technologies

Other supported device type interact with the GPMC through the NOR interface protocol.

OneNAND Flash is a high-density and low-power memory device. It is based on single- or multi-level-cell NAND core with SRAM and logic, and interfaces as a synchronous NOR Flash, plus has synchronous write capability. It reads faster than conventional NAND and writes faster than conventional NOR flash. Hence, it is appropriate for both mass storage and code storage.

pSRAM stands for pseudo-static random access memory. pSRAM is a low-power memory device for mobile applications. pSRAM is based on the DRAM cell with internal refresh and address control features, and interfaces as a synchronous NOR Flash, plus has synchronous write capability.

#### 7.1.4.2.5 Supported Protocols

The GPMC supports the following interface protocols when communicating with external memory or external devices:

- Asynchronous read/write access
- Asynchronous read page access (4-8-16 Word16)
- Synchronous read/write access
- Synchronous read burst access without wrap capability (4-8-16 Word16)
- Synchronous read burst access with wrap capability (4-8-16 Word16)

#### 7.1.4.2.6 GPMC Features and Settings

This section lists GPMC features and settings:

- Supported device type: up to four NAND or NOR protocol external memories or devices
- Operating Voltage: 3.3V
- Maximum GPMC addressing capability: 512 MBytes divided into eight chip-selects
- Maximum supported memory size: 256 MBytes (must be a power-of-2)
- Minimum supported memory size: 16 MBytes (must be a power-of-2). Aliasing occurs when addressing smaller memories.
- Data path to external memory or device: 8- and 16-bit wide
- Burst and page access: burst of 4-8-16 Word16
- Supports bus keeping
- Supports bus turn around

## 7.1.5 Registers

**Table 7-54** provides a summary of the GPMC registers. All GPMC registers are aligned to 32-bit address boundaries. All register file accesses, except the GPMC\_NAND\_DATA\_i register, are little-endian. If the GPMC\_NAND\_DATA\_i register is accessed, the endianness is access-dependent.

In this section, i corresponds to the chip-select number, i = 0 to 6.

**Table 7-54. GPMC Registers**

| Address Offset   | Register Name                      | Section                          |

### 7.1.5.1 GPMC\_REVISION

This register contains the IP revision code.

**Figure 7-51. GPMC\_REVISION**

|    |          |   |     |
|----|----------|---|-----|
| 31 | Reserved |   | 16  |
|    | R-0      |   |     |
| 15 | 8        | 7 | 0   |
|    | Reserved |   | REV |
|    | R-0      |   | R-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-55. GPMC\_REVISION Field Descriptions**

| Bit  | Field    | Value | Description  |
|------|----------|-------|--|
| 31-8 | Reserved | 0     | Reserved   |
| 7-0  | REV      | 0-FFh | IP revision. Major revision is [7-4]. Minor revision is [3-0]. Examples: 10h for revision 1.0, 21h for revision 2.1. |

### 7.1.5.2 GPMC\_SYSCONFIG

This register controls the various parameters of the OCP interface.

**Figure 7-52. GPMC\_SYSCONFIG**

|    |          |           |                         |
|----|----------|-----------|-------------------------|

| 2    | Reserved  | 0                   | Reserved   |
| 1    | SOFTRESET | 0<br>1              | Software reset (Set 1 to this bit triggers a module reset. This bit is automatically reset by hardware. During reads, it always returns 0)<br>Normal mode<br>The module is reset   |
| 0    | AUTOIDLE  | 0<br>1              | Internal OCP clock gating strategy<br>Interface clock is free-running<br>Reserved  |

### **7.1.5.3 GPMC\_SYSSTATUS**

This register provides status information about the module, excluding the interrupt status information.

**Figure 7-53. GPMC\_SYSSTATUS**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-57. GPMC\_SYSSTATUS Field Descriptions**

| <b>Bit</b> | <b>Field</b> | <b>Value</b> | <b>Description</b>  |
|------------|--------------|--------------|---|
| 31-1       | Reserved     | 0            | Reserved  |
| 0          | RESETDONE    | R0<br>R1     | Internal reset monitoring<br>Internal module reset in on-going<br>Reset completed |

### 7.1.5.4 GPMC\_IRQSTATUS

This interrupt status register regroups all the status of the module internal events that can generate an interrupt.

**Figure 7-54. GPMC\_IRQSTATUS**

|          |          |                              |                              |
|----------|----------|------------------------------|------------------------------|
|          |          |                              |                              |
| Reserved |          |                              |                              |

| 0     | FIFOEVENTSTATUS          | R0<br>W0<br>R1<br>W1 | Status of the FIFOEvent interrupt<br>Indicates than less than GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and less than FIFOTHRESHOLD bytes free places are available in write-posting mode.<br>FIFOEVENTSTATUS bit unchanged<br>Indicates than at least GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and at least FIFOTHRESHOLD bytes free places are available in write-posting mode.<br>FIFOEVENTSTATUS bit is reset |

### 7.1.5.5 GPMC\_IRQENABLE

The interrupt enable register allows to mask/unmask the module internal sources of interrupt, on a event-by-event basis.

**Figure 7-55. GPMC\_IRQENABLE**

|          |    |                              |                              |    |
|----------|----|------------------------------|------------------------------|----|
| 31       |    |                              |                              | 16 |
| Reserved |    |                              |                              |    |
|          |    |                              | R-0                          |    |
| 15       | 10 | 9                            | 8                            |    |
| Reserved |    | WAIT1EDGE<br>DETECTIONENABLE | WAIT0EDGE<br>DETECTIONENABLE |    |
| R-0      |    | R/W-0                        | R/W-0                        |    |
| 7        | 2  | 1                            | 0                            |    |
| Reserved |    | TERMINAL<br>COUNTENABLE      | FIFOEVENT<br>ENABLE          |    |
| R-0      |    | R/W-0                        | R/W-0                        |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-59. GPMC\_IRQENABLE Field Descriptions**

| Bit   | Field                    | Value | Description   |
|-------|--------------------------|-------|---|
| 31-10 | Reserved                 | 0     | Reserved  |
| 9     | WAIT1EDGEDETECTIONENABLE | 0     | Enables the Wait1 Edge Detection interrupt                                      |
|       |                          | 1     | Wait1EdgeDetection interrupt is masked  |
|       |                          | 1     | Wait1EdgeDetection event generates an interrupt if occurs                       |
| 8     | WAIT0EDGEDETECTIONENABLE | 0     | Enables the Wait0 Edge Detection interrupt                                      |
|       |                          | 1     | Wait0EdgeDetection interrupt is masked  |
|       |                          | 1     | Wait0EdgeDetection event generates an interrupt if occurs                       |
| 7-2   | Reserved                 | 0     | Reserved  |
| 1     | TERMINALCOUNTEVENTENABLE | 0     | Enables TerminalCountEvent interrupt issuing in pre-fetch or write posting mode |
|       |                          | 1     | TerminalCountEvent interrupt is masked  |
|       |                          | 1     | TerminalCountEvent interrupt is not masked                                      |
| 0     | FIFOEVENTENABLE          | 0     | Enables the FIFOEvent interrupt   |
|       |                          | 1     | FIFOEvent interrupt is masked   |
|       |                          | 1     | FIFOEvent interrupt is not masked   |

### 7.1.5.6 GPMC\_TIMEOUT\_CONTROL

The GPMC\_TIMEOUT\_CONTROL register allows the user to set the start value of the timeout counter

**Figure 7-56. GPMC\_TIMEOUT\_CONTROL**

|          |          |    |                   |  |   |          |   |               |  |   |    |
|----------|----------|----|-------------------|--|---|----------|---|---------------|--|---|----|
| 31       | Reserved |    |                   |  |   |          |   |               |  |   | 16 |
|          | R-0      |    |                   |  |   |          |   |               |  |   |    |
| 15       | 13       | 12 |                   |  | 4 | 3        | 1 |               |  | 0 |    |
| Reserved |          |    | TIMEOUTSTARTVALUE |  |   | Reserved |   | TIMEOUTENABLE |  |   |    |
| R-0      |          |    | R/W-0             |  |   | R-0      |   | R/W-0         |  |   |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-60. GPMC\_TIMEOUT\_CONTROL Field Descriptions**

| Bit   | Field             | Value  | Description   |
|-------|-------------------|--------|---|
| 31-13 | Reserved          | 0      | Reserved  |
| 12-4  | TIMEOUTSTARTVALUE | 0-1FFh | Start value of the time-out counter (000 corresponds to 0 GPMC.FCLK cycle, 1h corresponds to 1 GPMC.FCLK cycle, and 1FFh corresponds to 511 GPMC.FCLK cycles) |
| 3-1   | Reserved          | 0      | Reserved  |
| 0     | TIMEOUTENABLE     | 0<br>1 | Enable bit of the TimeOut feature<br>TimeOut feature is disabled<br>TimeOut feature is enabled  |

### 7.1.5.7 GPMC\_ERR\_ADDRESS

The GPMC\_ERR\_ADDRESS register stores the address of the illegal access when an error occurs.

**Figure 7-57. GPMC\_ERR\_ADDRESS**

|      |       |            |   |
|------|-------|------------|---|
| 31   | 30    |            | 0 |
| Rsvd |       | ILLEGALADD |   |
| R-0  | R/W-0 |            |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-61. GPMC\_ERR\_ADDRESS Field Descriptions**

| Bit  | Field      | Value        | Description  |
|------|------------|--------------|--|
| 31   | Reserved   | 0            | Reserved   |
| 30-0 | ILLEGALADD | 0-7FFF FFFFh | Address of illegal access: A30 (0 for memory region, 1 for GPMC register region) and A29-A0 (1GByte maximum) |

### 7.1.5.8 GPMC\_ERR\_TYPE

The GPMC\_ERR\_TYPE register stores the type of error when an error occurs.

**Figure 7-58. GPMC\_ERR\_TYPE**

|    |          |                  |                   |               |          |            |  |       |
|----|----------|------------------|-------------------|---------------|----------|------------|--|-------|
| 31 | Reserved |                  |                   |               |          |            |  | 16    |
|    | R-0      |                  |                   |               |          |            |  |       |

| 6     | CSVALID     | 0<br>1                    | Chip-select enable (reset value is 1 for CS[0] and 0 for CS[1-5]).<br>0 CS disabled<br>1 CS enabled   |
| 5-0   | BASEADDRESS | 0-3Fh                     | Chip-select base address.<br>CSi base address where i = 0 to 3 (16 Mbytes minimum granularity). Bits [5-0] corresponds to A29, A28, A27, A26, A25, and A24.   |

### 7.1.5.18 GPMC\_NAND\_COMMAND\_i

This register is not a true register, just an address location.

**Figure 7-68. GPMC\_NAND\_COMMAND\_i**

|                     |   |
|---------------------|---|
| 31                  | 0 |
| GPMC_NAND_COMMAND_i |   |
| W-0                 |   |

LEGEND: W = Write only; -n = value after reset

**Table 7-72. GPMC\_NAND\_COMMAND\_i Field Descriptions**

| Bit  | Field               | Value        | Description   |
|------|---------------------|--------------|---|
| 31-0 | GPMC_NAND_COMMAND_i | 0xFFFF FFFFh | Writing data at the GPMC_NAND_COMMAND_i location places the data as the NAND command value on the bus, using a regular asynchronous write access. |

### 7.1.5.19 GPMC\_NAND\_ADDRESS\_i

This register is not a true register, just an address location.

**Figure 7-69. GPMC\_NAND\_ADDRESS\_i**

|                     |   |
|---------------------|---|
| 31                  | 0 |
| GPMC_NAND_ADDRESS_i |   |
| W-0                 |   |

LEGEND: W = Write only; -n = value after reset

**Table 7-73. GPMC\_NAND\_ADDRESS\_i Field Descriptions**

| Bit  | Field               | Value        | Description   |
|------|---------------------|--------------|---|
| 31-0 | GPMC_NAND_ADDRESS_i | 0xFFFF FFFFh | Writing data at the GPMC_NAND_ADDRESS_i location places the data as the NAND partial address value on the bus, using a regular asynchronous write access. |

### 7.1.5.20 GPMC\_NAND\_DATA\_i

This register is not a true register, just an address location.

**Figure 7-70. GPMC\_NAND\_DATA\_i**

|                  |   |
|------------------|---|
| 31               | 0 |
| GPMC_NAND_DATA_i |   |
| R/W              |   |

LEGEND: R/W = Read/Write; R = Read only; W = Write only; -n = value after reset

**Table 7-74. GPMC\_NAND\_DATA\_i Field Descriptions**

| Bit  | Field            | Value        | Description   |
|------|------------------|--------------|---|
| 31-0 | GPMC_NAND_DATA_i | 0xFFFF FFFFh | Reading data from the GPMC_NAND_DATA_i location or from any location in the associated chip-select memory region activates an asynchronous read access. |

### 7.1.5.21 GPMC\_PREFETCH\_CONFIG1

**Figure 7-71. GPMC\_PREFETCH\_CONFIG1**

## 7.2 OCMC-RAM

### 7.2.1 *Introduction*

#### 7.2.1.1 OCMC-RAM Features

The on-chip memory controller consists of two separate modules that are OCP to memory wrappers. The first wrapper is for a ROM; the second is for a RAM. Each wrapper has its own dedicated interface to the L3 interconnect.

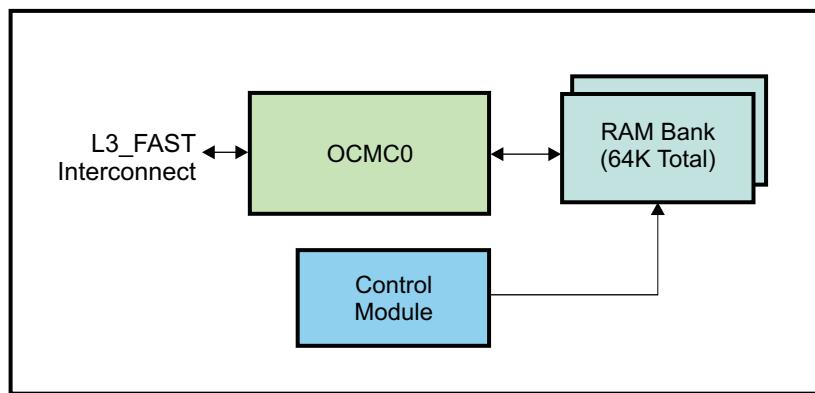

- 32- or 64-bit width
- Initial latency max 2 cycles (due to OCP to memory core wrapper).
- Multiple memory bank control based on address MSBs
- Full OCP IP 2.0 Burst support. No wait state.

#### 7.2.1.2 Unsupported OCMC-RAM Features

For this device, the OCMC-RAM implementation does not support parity.

### 7.2.2 Integration

This device includes a single instantiation of the on-chip memory controller interfacing to a single 64-K bank of RAM.

**Figure 7-87. OCMC RAM Integration**

#### 7.2.2.1 OCMC RAM Connectivity Attributes

The general connectivity attributes for the OCMC RAM modules are summarized in [Table 7-91](#).

**Table 7-91. OCMC RAM Connectivity Attributes**

| Attributes          | Type               |
|---------------------|--------------------|
| Power Domain        | Peripheral Domain  |
| Clock Domain        | PD_PER_L3_GCLK     |
| Reset Signals       | PER_DOM_RST_N      |
| Idle/Wakeup Signals | Smart Idle         |
| Interrupt Requests  | None               |
| DMA Requests        | None               |
| Physical Address    | L3 Fast slave port |

#### 7.2.2.2 OCMC RAM Clock and Reset Management

The OCMC module uses a single clock for the module and its OCP interface.

**Table 7-92. OCMC RAM Clock Signals**

| Clock Signal                                    | Max Freq | Reference / Source | Comments                    |
|---|----------|--------------------|-----------------------------|
| prcm_ocmc_clock<br>Interface / Functional clock | 200 MHz  | CORE_CLKOUTM4      | pd_per_l3_gclk<br>From PRCM |

#### 7.2.2.3 OCMC RAM Pin List

The OCMC RAM module does not include any external interface pins.

## 7.3 EMIF

### 7.3.1 *Introduction*

#### 7.3.1.1 Features

The general features of the EMIF module are as follows:

- 16-bit data path to external SDRAM memory
- One 128-bit OCPIP 2.2 interface
- Support for the following memory types:
  - mDDR (LPDDR1)
  - DDR2
  - DDR3

#### **External memory configurations supported:**

- Memory device capacity
  - Up to 1G Byte addressability
- Flexible bank/row/column/chip-select address multiplexing schemes
- Device driver strength feature for mobile DDR supported
- Supports following CAS latencies:
  - DDR2 => 2, 3, 4, 5, 6, and 7
  - DDR3 => 5, 6, 7, 8, 9, 10, and 11
  - mDDR => 2, 3, and 4
- Supports following number of internal banks:
  - DDR2 => 1, 2, 4, and 8
  - DDR3 => 1, 2, 4, and 8
  - mDDR => 1, 2, and 4
- Supports 256, 512, 1024, and 2048-word page sizes
- Supports burst length of 8 (sequential burst)
- Write/read leveling/calibration and data eye training in conjunction with DID
- Self Refresh and Power-Down modes for low power:
  - Flexible OCP to DDR address mapping to support Partial Array Self Refresh in LPDDR1, DDR2 and DDR3.
  - Temperature Controlled Self Refresh for LPDDR1 and DDR3 having on-chip temperature sensor.
- Periodic ZQ calibration for DDR3
- ODT on DDR2 and DDR3
- Prioritized refresh scheduling
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Big and little endian modes

### 7.3.1.2 Unsupported EMIF Features

The following EMIF4DC module features are not supported in this device.

**Table 7-93. Unsupported EMIF Features**

| Feature            | Reason                   |
|--------------------|--------------------------|
| 32-bit data        | Only 16 bits pinned out  |
| Multiple DDR banks | Only 1 CS/ODT pinned out |
| DDR2 CAS Latency 2 | Not supported by DID     |

## 7.3.2 Integration

### 7.3.2.1 EMIF Connectivity Attributes

The general connectivity attributes for the EMIF are shown in [Table 7-94](#).

**Table 7-94. EMIF Connectivity Attributes**

| Attributes          | Type  |
|---------------------|---|
| Power Domain        | Peripheral Domain                               |
| Clock Domain        | PD_PER_L3_GCLK (OCP)<br>PD_PER_EMIF_GCLK (Func) |
| Reset Signals       | POR_N   |
| Idle/Wakeup Signals | Smart Idle                                      |
| Interrupt Requests  | 1 interrupt to MPU Subsystem (DDRERR0)          |
| DMA Requests        | None  |
| Physical Address    | L3 Fast Slave Port                              |

### 7.3.2.2 EMIF Clock Management

The EMIF4 OCP interface (ocp\_clk) is clocked by the L3 Fast clock sourced from the Core PLL. The DDR Command and Data macros are clocked by the DDR PLL. The PRCM divides this clock by two to create the EMIF functional clock (m\_clk).

The OCP and functional clocks may be asynchronous because synchronization is managed in the EMIF internal FIFO (EMIF4 is set in asynchronous mode).

**Table 7-95. EMIF Clock Signals**

| Clock Signal   | Maximum Frequency | Reference Source   | Comments                      |
|--|-------------------|--------------------|-------------------------------|
| ocp_clk<br>(Interface clock)   | 200 MHz           | CORE_CLKOUTM4      | pd_per_l3_gclk<br>From PRCM   |
| m_clk<br>(EMIF functional clock)   | 152 MHz           | DDR PLL CLKOUT / 2 | pd_per_emif_gclk<br>From PRCM |
| cmd0_dfi_clk<br>cmd1_dfi_clk<br>cmd2_dfi_clk<br>data0_dfi_clk<br>data1_dfi_clk<br>(Macro clocks) | 303 MHz           | DDR PLL CLKOUT     | clkout_po<br>From DDR PLL     |

### 7.3.2.3 EMIF Pin List

The EMIF/DDR external interface signals are shown in [Table 7-96](#).

**Table 7-96. EMIF Pin List**

| Pin               | Type | Description             |
|-------------------|------|-------------------------|
| DDR_CK<br>DDR_NCK | O    | Differential clock pair |
| DDR_CKE           | O    | Clock enable            |
| DDR_CS0           | O    | Chip select             |
| DDR_RASn          | O    | Row address strobe      |
| DDR_CASn          | O    | Column address strobe   |
| DDR_WEn           | O    | Write enable            |
| DDR_BA[2:0]       | O    | Bank address            |

**Table 7-96. EMIF Pin List (continued)**

| <b>Pin</b>    | <b>Type</b> | <b>Description</b>         |
|---------------|-------------|----------------------------|
| DDR_A[15:0]   | O           | Row/column address         |
| DDR_DQS[1:0]  | I/O         | Data strobes               |
| DDR_DQSn[1:0] | I/O         | Complimentary data strobes |
| DDR_DQM[1:0]  | O           | Data masks                 |
| DDR_D[15:0]   | I/O         | Data                       |
| DDR_ODT       | O           | On-die termination         |
| DDR_RESETn    | O           | DDR device reset           |
| DDR_VREF      | I           | I/O Voltage reference      |
| DDR_VTP       | I           | VTP compensation pin       |

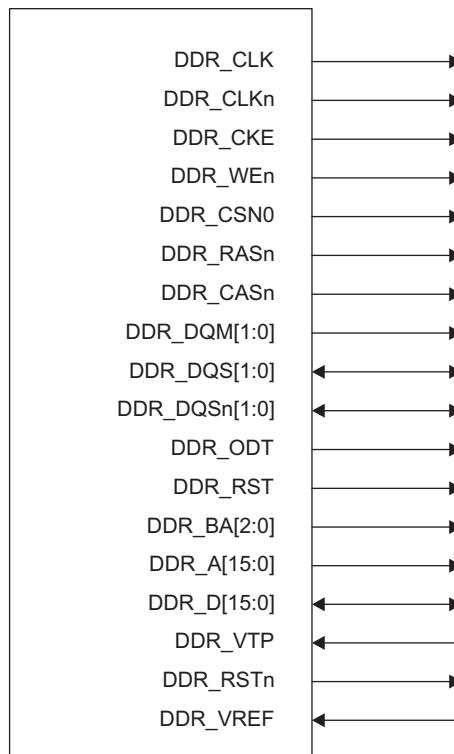

### 7.3.3 Functional Description

#### 7.3.3.1 Signal Descriptions

The DDR2/3/mDDR memory controller signals are shown in [Figure 7-88](#) and described in [Table 7-97](#). The following features are included:

- The maximum width for the data bus (DDR\_D[15:0]) is 16-bits
- The address bus (DDR\_A[15:0]) is 16-bits wide with an additional 3 bank address pins (DDR\_BA[2:0])
- Two differential output clocks (DDR\_CK and DDR\_nCK) driven by internal clock sources
- Command signals: Row and column address strobe (DDR\_RASn and DDR\_CASn), write enable strobe (DDR\_WEn), data strobe (DDR\_DQS[1:0] and DDR\_DQSn[1:0]), and data mask (DDR\_DQM[1:0]).
- One chip select signal (DDR\_CSN0) and one clock enable signal (DDR\_CKE)
- One on-die termination output signals (DDR\_ODT).

**Figure 7-88. DDR2/3/mDDR Memory Controller Signals**

**Table 7-97. DDR2/3/mDDR Memory Controller Signal Descriptions**

| Pin              | Description  |
|------------------|--|
| DDR_D[15:0]      | Bidirectional data bus. Input for data reads and output for data writes.                       |
| DDR_A[15:0]      | External address output.   |
| DDR_CSN0         | Chip select output.  |
| DDR_DQM[1:0]     | Active-low output data mask.   |
| DDR_CLK/DDR_CLKn | Differential clock outputs. All DDR2/3/mDDR interface signals are synchronous to these clocks. |
| DDR_CKE          | Clock enable. Used to select Power-Down and Self-Refresh operations.                           |
| DDR_CASn         | Active-low column address strobe.  |
| DDR_RASn         | Active-low row address strobe.   |
| DDR_WEn          | Active-low write enable.   |

**Table 7-97. DDR2/3/mDDR Memory Controller Signal Descriptions (continued)**

| Pin                        | Description  |
|----------------------------|--|
| DDR_DQS[1:0]/DDR_DQSn[1:0] | Differential data strobe bidirectional signals. Edge-aligned inputs on reads and center-aligned outputs on writes.                   |
| DDR_ODT                    | On-die termination signal to external DDR2/3 SDRAM. ODT is not supported for mDDR.   |
| DDR_BA[2:0]                | Bank-address control outputs.  |
| DDR_VREF                   | Memory Controller reference voltage. This voltage must be supplied externally. See the device-specific data manual for more details. |
| DDR_VTP                    | DDR2/3/mDDR VTP Compensation Resistor Connection.  |
| DDR_RESETn                 | Reset output. Asynchronous reset for DDR3 devices.   |

### 7.3.3.2 Clock Control

DDR2/3/mDDR clock is derived directly from the DDR PLL's VCO output. The frequency of DDR\_CLK can be determined by using the following formula:

$$\text{DDR\_CLK frequency} = (\text{DDRPLL input clock frequency} \times \text{multiplier}) / ((\text{pre-divider}+1) * \text{post-divider})$$

The second output clock of the DDR2/3/mDDR memory controller DDR\_CLKn, is the inverse of DDR\_CLK. You can change the multiplier, pre-divider and post-divider to get the desired DDR\_CLK frequency.

For detailed information on DDR PLL, see [Section 8.1, Power Management and Clock Module \(PRCM\)](#).

### 7.3.3.3 DDR2/3/mDDR Memory Controller Subsystem Overview

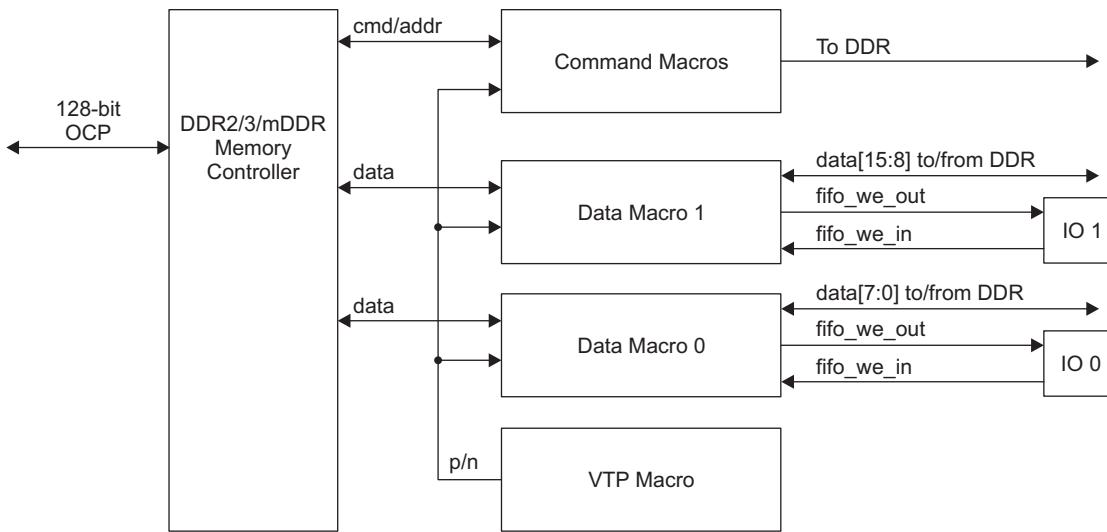

The DDR2/3/mDDR memory controller can gluelessly interface to most standard DDR2/3/mDDR SDRAM devices and supports such features as self-refresh mode and prioritized refresh. In addition, it provides flexibility through programmable parameters such as the refresh rate, CAS latency, and many SDRAM timing parameters. The DDR2/3/mDDR subsystem consists of the following:

- DDR2/3/mDDR memory controller
- Command macro
- Data macro
- VTP controller macro
- IOs for DQS gate

The subsystem supports JEDEC standard compliant DDR2/DDR3 and mDDR(LPDRR1) devices. It does not support CAS latency of 2 for DDR2 due to data and command macro limitations. It supports a 128-bit wide OCP interface on the core side for programmability. The subsystem can be used to connect to 16-bit memory devices.

[Figure 7-89](#) shows the DDR2/3/mDDR subsystem block diagram.

**Figure 7-89. DDR2/3/mDDR Subsystem Block Diagram**

Where

**fifo\_we\_out** = DQS enable output for timing match between DQS and system (Memory) clock.

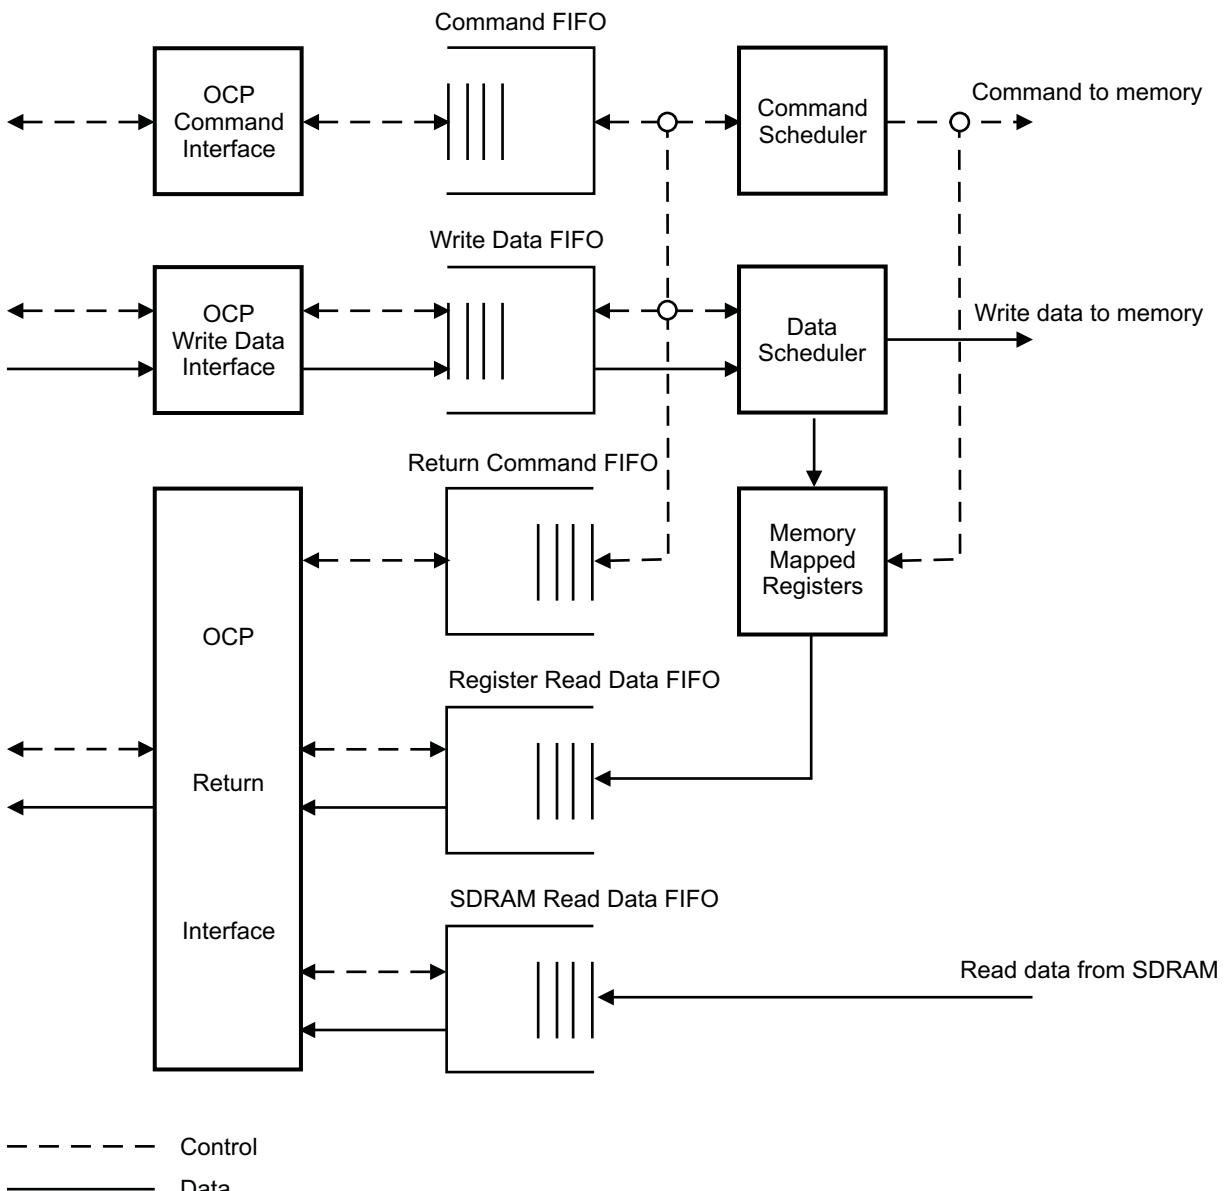

**fifo\_we\_in** = DQS enable input for timing match between DQS and system (Memory) clock.

#### 7.3.3.3.1 DDR2/3/mDDR Memory Controller Interface

To move data efficiently from on-chip resources to external DDR2/3/mDDR SDRAM device, the DDR2/3/mDDR memory controller makes use of a command FIFO, a write data FIFO, a return command FIFO, and two Read Data FIFOs. Purpose of each FIFO is described below.

Figure 7-90 shows the block diagram of the DDR2/3/mDDR memory controller FIFOs. Commands, write data, and read data arrive at the DDR2 memory controller parallel to each other. The same peripheral bus is used to write and read data from external memory as well as internal memory-mapped registers.

**Figure 7-90. DDR2/3/mDDR Memory Controller FIFO Block Diagram**

The command FIFO stores all the commands coming in on the OCP command interface.

The Write Data FIFO stores the write data for all the write transactions coming in on the OCP write data interface.

The Return Command FIFO stores all the return transactions that are to be issued to the OCP return interface. These include the write status return and the read data return commands.

There are two Read Data FIFOs that store the read data to be sent to the OCP return interface. One Read Data FIFO stores read data from the memory mapped registers and other Read Data FIFO stores read data from external memory.

### 7.3.3.3.2 Data Macro

The data macro consists of 8 data channels, one pair of complementary strobes (one pair for 8 bits of data), and one data mask channel (one for 8 bits of data).

The data macros consists of PHY Data Macro, DLLs and IOs integrated into a macro.

The data macro is a bidirectional interface. It is used to transmit data from the memory controller to the external memory chip during a write operation and receive data from memory and transmit it to the memory controller during a read operation.

During a write operation, the data macro translates 32/16-bit words from memory controller to 8-bit words and transmits them at double the bit rate to the memory along with the strobe. The strobe is center-aligned to the data. Data can be prevented from writing to the memory using data mask signal.

During a read operation, the data macro receives 8-bit DDR data along with the strobe and converts it to 32/16-bit words and transmits them to the memory controller along with the read-valid signals.

#### **7.3.3.3.3 Command Macro**

It consists of PHY Command Macro, DLLs and the IOs integrated together. The command macro acts as a unidirectional macro that transmits address and control bits from memory controller to the memory chip. The clocks DDR\_CLK and DDR\_CLKn are used by the memory to register the command and address transmitted on the transmit channels. All address and control signals are transmitted clock-centered with respect to DDR\_CLK and DDR\_CLKn. The memory, on the positive edge of DDR\_CLK and the negative edge of DDR\_CLKn, samples all address and control signals.

#### **7.3.3.3.4 VTP Controller Macro**

The VTP controller macro evaluates silicon performance at current voltage, temperature, and process (VTP) to enable IO drivers to set constant predetermined output driver impedance. The controller operates by comparing driver impedances to the external reference resistor and adjusting driver impedance to obtain an impedance match. VTP Controller supports the following features:

- The VTP controller generates information regarding the Voltage, temperature, and process(VTP) on a chip to be shared with the device's IO drivers
- Requires a Clock input from the core running at 20MHz or less
- 56 Clock cycles are needed to guarantee the VTP outputs are initially set after reset is removed
- Can be used in static or dynamic update mode of operation
- The VTP controller has internal noise filtering which allows it to control spurious update requests due to noise

Impedance of the drivers and terminations must be updated often even while in operation. In such scenarios where Voltage and Temperature are variables VTP macro can be configured in dynamic update mode. In contrast, static mode of operation does not allow dynamic calibration of IO impedance, and hence consumes lesser power compared to dynamic update mode.

It is possible that under noisy conditions, dynamic update controller can generate too frequent update requests. Noise can cause the controller to request a change in the impedance that can again be quickly reversed on subsequent clock cycles. To prevent the controller from making excessive numbers of impedance changes, a digital filter is included which can be configured to regulate the update rate. For example if the user configures the filter value as F2=0,F1=1 and F0=1, then an impedance update will be performed only if four successive update requests are generated from the VTP controller. It is recommended to use a filter value of 011'b.

Table 7-98 shows the configuration details of the digital filter.

**Table 7-98. Digital Filter Configuration**

| F2 | F1 | F0 | Description                             |
|----|----|----|---|
| 0  | 0  | 0  | Off                                     |
| 0  | 0  | 1  | Update on 2 consecutive update requests |
| 0  | 1  | 0  | Update on 3 consecutive update requests |
| 0  | 1  | 1  | Update on 4 consecutive update requests |
| 1  | 0  | 0  | Update on 5 consecutive update requests |
| 1  | 0  | 1  | Update on 6 consecutive update requests |
| 1  | 1  | 0  | Update on 7 consecutive update requests |

**Table 7-98. Digital Filter Configuration (continued)**

| F2 | F1 | F0 | Description                             |
|----|----|----|---|
| 1  | 1  | 1  | Update on 8 consecutive update requests |

### 7.3.3.3.5 DQS-Gate IOs

To effectively model the I/O delay on the DQS gating signal during a read request (the DQS receiver and the CLK driver I/Os), the signal is expected to be looped on a single I/O connecting fifo\_we\_in to fifo\_we\_out. The board and memory delay, being fairly constant across PTV variations, are calibrated within the IDID using a compensated delay line. The loop-back is done at the die level without bringing the signals out to the package level. Each Data Macro supports delay compensation independent of each other.

The data and command macros are responsible for System level flight time compensation. The following controls are supported by the DDR2/3/mDDR controller Sub System.

- Aligning DDR\_DQS w.r.t DDR\_CLK during Write Cycle: For DDR3 operation, initiate the write leveling state machine on each rank in turn to capture the proper delay settings to align DDR\_DQS with DDR\_CLK clock for each memory chip. If one wants to do this in a manual way one can write to the control register that controls the delay of DDR\_DQS vs DDR\_CLK Clock position. To produce a given amount of skew to center the DDR\_DQS vs. Clock at the SDRAM the following register can be programmed.

Data Macro 0/1 Write DQS Slave Ratio Register=256 x ([command delay] – [DDR\_DQS delay]) / DDR\_CLK Clock period.

- Aligning ADDR/CMD w.r.t DDR\_CLK
- Aligning DDR\_DQ[15:0] w.r.t DDR\_DQS during Write Operation
- Offset DDR\_D[15:0] w.r.t DDR\_DQS during Read Operation
- Align FIFO WE Window

### 7.3.3.4 Address Mapping

The DDR2/3/mDDR memory controller views external DDR2/3/mDDR SDRAM as one continuous block of memory. This statement is true regardless of the number of memory devices located on the chip select space. The DDR2/3/mDDR memory controller receives DDR2/3/mDDR memory access requests along with a 32-bit logical address from the rest of the system. In turn, DDR2/3/mDDR memory controller uses the logical address to generate a row/page, column, and bank address for the DDR2/3/mDDR SDRAM. The number of column, row and bank address bits used is determined by the IBANK, RSIZE and PAGESIZE fields (see [Table 7-99](#)). The DDR2/3/mDDR memory controller uses up to 16 bits for the row/page address.

**Table 7-99. IBANK, RSIZE and PAGESIZE Fields Information**

| Bit Field | Bit Value | Bit Description  |
|-----------|-----------|--|
| RSIZE     |           | Defines the number of address lines to be connected to DDR2/3/mDDR memory device |
|           | 0         | 9 row bits   |
|           | 1h        | 10 row bits  |
|           | 2h        | 11 row bits  |
|           | 3h        | 12 row bits  |
|           | 4h        | 13 row bits  |
|           | 5h        | 14 row bits  |
|           | 6h        | 15 row bits  |
|           | 7h        | 16 row bits  |

**Table 7-99. IBANK, RSIZE and PAGESIZE Fields Information (continued)**

| Bit Field | Bit Value | Bit Description  |
|-----------|-----------|--|
| PAGESIZE  |           | Defines the page size of each page of the external DDR2/3/mDDR memory device   |
|           | 0         | 256 words (requires 8 column address bits)                                     |
|           | 1h        | 512 words (requires 9 column address bits)                                     |
|           | 2h        | 1024 words (requires 10 column address bits)                                   |
|           | 3h        | 2048 words (requires 11 column address bits)                                   |
| IBANK     |           | Defines the number of internal banks on the external DDR2/3/mDDR memory device |
|           | 0         | 1 bank   |
|           | 1h        | 2 banks  |
|           | 2h        | 4 banks  |
|           | 3h        | 8 banks  |
| EBANK     |           | Defines the number of DDR2/3/mDDR memory controller chip selects               |
|           | 0         | CS0 only   |
|           | 1h        | Reserved   |

When addressing SDRAM, if the REG\_IBANK\_POS field in the SDRAM Config register is set to 0, and the REG\_EBANK\_POS field in the SDRAM Config 2 register is also set to 0, the DDR2/3/mDDR memory controller uses the three fields, IBANK, EBANK and PAGESIZE in the SDRAM Config register to determine the mapping from source address to SDRAM row, column, bank, and chip select. If the REG\_IBANK\_POS field in the SDRAM Config register is set to 1, 2, or 3, or the REG\_EBANK\_POS field in the SDRAM Config 2 register is set to 1, the DDR2/3/mDDR memory controller uses the 4 fields - IBANK, EBANK, PAGESIZE, and ROWSIZE in the SDRAM Config register to determine the mapping from source address to SDRAM row, column, bank, and chip select. In all cases the DDR2/3/mDDR memory controller considers its SDRAM address space to be a single logical block regardless of the number of physical devices or whether the devices are mapped across 1 or 2 DDR2/3/mDDR memory controller chip selects.

#### 7.3.3.4.1 Address Mapping when REG\_IBANK\_POS=0 and REG\_EBANK\_POS=0

For REG\_IBANK\_POS=0 and REG\_EBANK\_POS=0, the effect of address mapping scheme is that as the source address increments across DDR2/3/mDDR memory device page boundaries, the DDR2/3/mDDR controller moves onto the same page in the next bank in the current device DDR\_CS<sub>n</sub>[0]. This movement along the banks of the current proceeds to the same page in the next device(if EBANK=1, DDR\_CS<sub>n</sub>[1]) and proceeds through the same page in all its banks before moving over to the next page in the first device(DDR\_CS<sub>n</sub>[0]). The DDR2/3/mDDR controller exploits this traversal across internal banks and chip selects while remaining on the same page to maximize the number of open DDR2/3/mDDR memory device banks within the overall DDR2/3/mDDR memory device space.

Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, and can interleave among all of them.

**Table 7-100. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=0 and REG\_EBANK\_POS=0**

| Logical Address |                                     |                                     |  |
|-----------------|-------------------------------------|-------------------------------------|--|
| Row Address     | Chip Select                         | Bank Address                        | Column Address                         |
|                 | # of bits defined by EBANK of SDRCR | # of bits defined by IBANK of SDRCR | # of bits defined by PAGESIZE of SDRCR |
| 15 bits         | EBANK=0 => 0 bits                   | IBANK=0 => 0 bits                   | PAGESIZE=0 => 8 bits                   |
|                 | EBANK=1 => 1 bit                    | IBANK=1 => 1 bit                    | PAGESIZE=1 => 9 bits                   |
|                 |                                     | IBANK=2 => 2 bits                   | PAGESIZE=2 => 10 bits                  |
|                 |                                     | IBANK=3 => 3 bits                   | PAGESIZE=3 => 11 bits                  |

#### 7.3.3.4.2 Address Mapping when REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 0

For REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 0, the interleaving of banks within a device (per chip select) is limited to 4 banks. However, it can still interleave banks between the two chip selects. Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among eight of them.

**Table 7-101. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=1 and REG\_EBANK\_POS=0**

| Logical Address                     |                                     |                                     |                                     |  |
|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|--|
| Bank Address[2]                     | Row Address                         | Chip Select                         | Bank Address[1:0]                   | Column Address                         |
| # of bits defined by IBANK of SDRCR | # of bits defined by RSIZE of SDRCR | # of bits defined by EBANK of SDRCR | # of bits defined by IBANK of SDRCR | # of bits defined by PAGESIZE of SDRCR |
| IBANK=0 => 0 bits                   | RSIZE=0 => 9 bits                   | EBANK=0 => 0 bits                   | IBANK=0 => 0 bits                   | PAGESIZE=0 => 8 bits                   |
| IBANK=1 => 0 bits                   | RSIZE=1 => 10 bits                  | EBANK=1 => 1 bit                    | IBANK=1 => 1 bit                    | PAGESIZE=1 => 9 bits                   |
| IBANK=2 => 0 bits                   | RSIZE=2 => 11 bits                  |                                     | IBANK=2 => 2 bits                   | PAGESIZE=2 => 10 bits                  |
| IBANK=3 => 1 bit                    | RSIZE=3 => 12 bits                  |                                     | IBANK=3 => 3 bits                   | PAGESIZE=3 => 11 bits                  |
|                                     | RSIZE=4 => 13 bits                  |                                     |                                     |  |
|                                     | RSIZE=5 => 14 bits                  |                                     |                                     |  |
|                                     | RSIZE=6 => 15 bits                  |                                     |                                     |  |
|                                     | RSIZE=7 => 16 bits                  |                                     |                                     |  |

#### 7.3.3.4.3 Address Mapping when REG\_IBANK\_POS=2 and REG\_EBANK\_POS = 0

For REG\_IBANK\_POS=2 and REG\_EBANK\_POS = 0, the interleaving of banks within a device (per chip select) is limited to 2 banks. However, it can still interleave banks between the two chip selects. Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (eight internal banks across 2 chip selects) open at a time, but can only interleave among four of them.

**Table 7-102. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=2 and REG\_EBANK\_POS=0**

| Logical Address                     |                                     |                                     |                                     |  |
|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|--|
| Bank Address[2:1]                   | Row Address                         | Chip Select                         | Bank Address[0]                     | Column Address                         |
| # of bits defined by IBANK of SDRCR | # of bits defined by RSIZE of SDRCR | # of bits defined by EBANK of SDRCR | # of bits defined by IBANK of SDRCR | # of bits defined by PAGESIZE of SDRCR |
| IBANK=0 => 0 bits                   | RSIZE=0 => 9 bits                   | EBANK=0 => 0 bits                   | IBANK=0 => 0 bits                   | PAGESIZE=0 => 8 bits                   |
| IBANK=1 => 0 bits                   | RSIZE=1 => 10 bits                  | EBANK=1 => 1 bit                    | IBANK=1 => 1 bit                    | PAGESIZE=1 => 9 bits                   |
| IBANK=2 => 1 bit                    | RSIZE=2 => 11 bits                  |                                     | IBANK=2 => 1 bit                    | PAGESIZE=2 => 10 bits                  |
| IBANK=3 => 2 bits                   | RSIZE=3 => 12 bits                  |                                     | IBANK=3 => 1 bit                    | PAGESIZE=3 => 11 bits                  |

|                                     | RSIZE=5 => 14 bits                  |                                     |                                     |  |
|                                     | RSIZE=6 => 15 bits                  |                                     |                                     |  |
|                                     | RSIZE=7 => 16 bits                  |                                     |                                     |  |

#### 7.3.3.4.4 Address Mapping when REG\_IBANK\_POS= 3 and REG\_EBANK\_POS = 0

For REG\_IBANK\_POS= 3 and REG\_EBANK\_POS = 0, the DDR2/3/mDDR controller cannot interleave banks within a device (per chip select). However, it can still interleave banks between the two chip selects. Thus, the DDR2/3/mDDR controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among two of them.

**Table 7-103. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=3 and REG\_EBANK\_POS=0**

| Logical Address                     |                                     |                                     |  |
|-------------------------------------|-------------------------------------|-------------------------------------|--|
| Bank Address                        | Row Address                         | Chip Select                         | Column Address                         |
| # of bits defined by IBANK of SDRCR | # of bits defined by RSIZE of SDRCR | # of bits defined by EBANK of SDRCR | # of bits defined by PAGESIZE of SDRCR |
| IBANK=0 => 0 bits                   | RSIZE=0 => 9 bits                   | EBANK=0 => 0 bits                   | PAGESIZE=0 => 8 bits                   |
| IBANK=1 => 1 bit                    | RSIZE=1 => 10 bits                  | EBANK=1 => 1 bit                    | PAGESIZE=1 => 9 bits                   |
| IBANK=2 => 2 bits                   | RSIZE=2 => 11 bits                  |                                     | PAGESIZE=2 => 10 bits                  |
| IBANK=3 => 3 bits                   | RSIZE=3 => 12 bits                  |                                     | PAGESIZE=3 => 11 bits                  |
|                                     | RSIZE=4 => 13 bits                  |                                     |  |
|                                     | RSIZE=5 => 14 bits                  |                                     |  |
|                                     | RSIZE=6 => 15 bits                  |                                     |  |
|                                     | RSIZE=7 => 16 bits                  |                                     |  |

#### 7.3.3.4.5 Address Mapping when REG\_IBANK\_POS = 0 and REG\_EBANK\_POS = 1

For REG\_IBANK\_POS = 0 and REG\_EBANK\_POS = 1, the DDR2/3/mDDR memory controller interleaves among all the banks within a device (per chip select). However, the DDR2/3/mDDR memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/3/mDDR memory controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among 8 of them.

**Table 7-104. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=0 and REG\_EBANK\_POS=1**

| Logical Address                     |                                     |                                     |  |
|-------------------------------------|-------------------------------------|-------------------------------------|--|

| # of bits defined by EBANK of SDRCR | # of bits defined by RSIZE of SDRCR | # of bits defined by IBANK of SDRCR | # of bits defined by PAGESIZE of SDRCR |
| EBANK=0 => 0 bits                   | RSIZE=0 => 9 bits                   | IBANK=0 => 0 bits                   | PAGESIZE=0 => 8 bits                   |
| EBANK=1 => 1 bit                    | RSIZE=1 => 10 bits                  | IBANK=1 => 1 bit                    | PAGESIZE=1 => 9 bits                   |
|                                     | RSIZE=2 => 11 bits                  | IBANK=2 => 2 bits                   | PAGESIZE=2 => 10 bits                  |
|                                     | RSIZE=3 => 12 bits                  | IBANK=3 => 3 bits                   | PAGESIZE=3 => 11 bits                  |
|                                     | RSIZE=4 => 13 bits                  |                                     |  |
|                                     | RSIZE=5 => 14 bits                  |                                     |  |
|                                     | RSIZE=6 => 15 bits                  |                                     |  |
|                                     | RSIZE=7 => 16 bits                  |                                     |  |

#### 7.3.3.4.6 Address Mapping when REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 1

For REG\_IBANK\_POS = 1 and REG\_EBANK\_POS = 1, the interleaving of banks within a device (per chip select) is limited to 4 banks. Also, the DDR2/3/mDDR memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/3/mDDR memory controller can keep a maximum of 16 banks (8 internal banks across 2 chip selects) open at a time, but can only interleave among four of them.

**Table 7-105. OCP Address to DDR2/3/mDDR Address Mapping for REG\_IBANK\_POS=1 and REG\_EBANK\_POS = 1**

| Logical Address                     |                                     |                                     |                                     |  |

|                 |              | RSIZE=6 => 15 bits |                |
|                 |              | RSIZE=7 => 16 bits |                |

Since the DDR2/3/mDDR memory controller interleaves among less number of banks when IBANK\_POS!=0 or EBANK\_POS=1, these cases are lower in performance than the IBANK\_POS=0 case. Thus these cases are only recommended to be used along with partial array self-refresh where performance can be traded off for power savings.

### 7.3.3.5 Performance Management

#### 7.3.3.5.1 Command Ordering and Scheduling

The DDR2/3/mDDR memory controller performs command re-ordering and scheduling in an attempt to achieve efficient transfers with maximum throughput. The goal is to maximize the utilization of the data, address, and command buses while hiding the overhead of opening and closing DDR2/3/mDDR SDRAM rows. Command re-ordering takes place within the command FIFO.

The DDR2/3/mDDR memory controller examines all the commands stored in the command FIFO to schedule commands to the external memory. All commands from same master will complete in order, regardless of the master priority. The memory controller does not guarantee ordering between commands from different masters. However, the memory controller will maintain data coherency. Therefore, the memory controller will block a command, regardless of master priority, if that command is to the same block address (2048 bytes) as an older command. Thus, the memory controller might have one or more pending read or write for each master. Among all pending reads, the memory controller selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the memory controller selects all writes that have their corresponding SDRAM banks already open.

As a result of the above reordering, at any point of time the memory controller might have several pending reads and writes that have their corresponding banks open. The memory controller then selects the highest priority read from pending reads, and the highest priority write from pending writes. If two or more commands have the highest priority, the memory controller selects the oldest command. As a result, the memory controller might now have a final read and a final write command. The memory controller will pick either the read or the write command depending on the value programmed in the Read Write Execution Threshold register. The memory controller will keep executing reads until the read threshold is met and then switch to executing writes. The memory controller will then keep executing writes until the write threshold is met and then switch back to executing reads. The memory controller will satisfy meeting the threshold values only if that type of command is available for execution, otherwise it will switch to the other type. Similarly, the memory controller will satisfy meeting the threshold value only if the FIFOs for that type have space (Read Data FIFO for reads and Write Status FIFO for writes), otherwise it will switch to the other type.

The memory controller completes executing an OCP command before it switches to another command.

All the accesses to an SDRAM are pipe-lined to maximize the external bus utilization. In other words accesses to an SDRAM are issued back to back such that there are minimum idle cycles between any two accesses. This includes the scheduling listed above to minimize the overhead of opening and closing of SDRAM banks. All of these is done while fulfilling the access timing requirements of an SDRAM.

Besides commands received from on-chip resources, the DDR2/3/mDDR memory controller also issues refresh commands. The DDR2/3/mDDR memory controller attempts to delay refresh commands as long as possible to maximize performance while meeting the SDRAM refresh requirements. As the DDR2/3/mDDR memory controller issues read, write, and refresh commands to DDR2/3/mDDR SDRAM device, it follows the following priority scheme:

1. (Highest priority) SDRAM refresh request due to Refresh Must level of refresh urgency reached (Refer Section Refresh Scheduling)

2. Request for a read or a write.
3. SDRAM Activate commands.
4. SDRAM Deactivate commands.
5. SDRAM Deep Power-Down request.
6. SDRAM clock stop or Power-Down request.
7. SDRAM refresh request due to Refresh May or Release level of refresh urgency reached (Refer Section Refresh Scheduling)
8. (Lowest priority) SDRAM self-refresh request.

#### **7.3.3.5.2 Command Starvation**

The reordering and scheduling rules listed above may lead to command starvation, which is the prevention of certain commands from being processed by the DDR2/3/mDDR memory controller. Command starvation results from the following conditions:

- A continuous stream of high-priority read commands can block a low-priority write command
- A continuous stream of DDR2/3/mDDR SDRAM commands to a row in an open bank can block commands to the closed row in the same bank.

To avoid these conditions, the DDR2/3/mDDR memory controller can momentarily raise the priority of the oldest command in the command FIFO after a set number of transfers have been made. The REG\_COS\_COUNT\_1,REG\_COS\_COUNT\_2 field in the Interface Configuration Register (INT\_CONFIG) sets the number of the transfers that must be made before the DDR2/3/mDDR memory controller will raise the priority of the oldest command. See Class of Service (COS) section for more details.

---

**NOTE:** Leaving the REG\_COS bits at their default value (FFh) in the Interface Configuration register (INT\_CONFIG) disables this feature of the DDR2/3/mDDR memory controller. This means commands can stay in the command FIFO indefinitely. Therefore, these bits should be set to FEh immediately following reset to enable this feature with the highest level of allowable memory transfers. It is suggested that system-level prioritization be set to avoid placing high-bandwidth masters on the highest priority levels. These bits can be left as FEh unless advanced bandwidth/prioritization control is required.

---

#### **7.3.3.5.3 Possible Race Condition**

A race condition may exist when certain masters write data to the DDR2/3/mDDR memory controller. For example, if master A passes a software message via a buffer in DDR2/3/mDDR memory and does not wait for indication that the write completes, when master B attempts to read the software message it may read stale data and therefore receive an incorrect message. In order to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write completion status from the DDR2/3/mDDR memory controller before indicating to master B that the data is ready to be read. If master A does not wait for indication that a write is complete, it must perform the following workaround:

1. Perform the required write.
2. Perform a dummy write to the DDR2 memory controller module ID and revision register.
3. Perform a dummy read to the DDR2 memory controller module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3.

The completion of the read in step 3 ensures that the previous write was done.

For a list of the master peripherals that need this workaround, see the device-specific data sheet.

#### **7.3.3.5.4 Class of Service (COS)**

The commands in the Command FIFO can be mapped to 2 classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the connection ID.

The mapping based on priority can be done by setting the appropriate values in the Priority to Class of Service Mapping register (PRI\_COS\_MAP).

The mapping based on connection ID can be done by setting the appropriate values of connection ID and the masks in the Connection ID to Class of Service Mapping registers(CONNID\_COS\_1\_MAP and CONNID\_COS\_2\_MAP).

There are 3 connection ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 connection IDs mapped to it. For example, a connection ID value of 0xFF along with a mask value of 0x3 will map all connection IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter (REG\_COS\_COUNT). The value of this counter can be set in the Interface Configuration Register. When the latency counter for a command expires, i.e., reaches the value programmed for the class of service that the command belongs to, that command will be the one that is executed next. If there are more than one commands that have expired latency counters, the command with the highest priority will be executed first. One exception to this rule is, if the oldest command in the queue has an expired reg\_pr\_old\_count, that command will be executed first irrespective of priority or class of service. This is done to prevent a continuous block effect.

The connection ID mapping allows the same connection ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by connection ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The DDR2/3/mDDR memory controller will try executing the command as soon as possible, when the smaller of the two counters ( REG\_COS\_COUNT\_1 OR REG\_COS\_COUNT\_2) expire.

#### **7.3.3.5.5 Refresh Scheduling**

The DDR2/3/mDDR memory controller issues autorefresh (REFR) commands to DDR2/3/mDDR SDRAM devices at a rate defined in the refresh rate (REFRESH\_RATE) bit field in the SDRAM refresh control register (SDRFC). A refresh interval counter is loaded with the value of the REFRESH\_RATE bit field and decrements by 1 each cycle until it reaches zero. Once the interval counter reaches zero, it reloads with the value of the REFRESH\_RATE bit. Each time the interval counter expires, a refresh backlog counter increments by 1. Conversely, each time the DDR2/3/mDDR memory controller performs a REFR command, the backlog counter decrements by 1. This means the refresh backlog counter records the number of REFR commands the DDR2/3/mDDR memory controller currently has outstanding.

The DDR2/3/mDDR memory controller issues REFR commands based on the level of urgency. The level of urgency is defined below. Whenever the refresh level of urgency is reached, the DDR2/3/mDDR memory controller issues a REFR command before servicing any new memory access requests. Following a REFR command, the DDR2/3/mDDR memory controller waits T\_RFC cycles, defined in the SDRAM timing 1 register (SDRTIM1), before rechecking the refresh urgency level.

The refresh counters do not operate when the SDRAM memory is in self-refresh mode.

**Table 7-108. Refresh Modes**

| Urgency Level   | Description   |
|-----------------|---|
| Refresh May     | Backlog count is greater than 0. Indicates there is a backlog of REFR commands, when the DDR2/3/mDDR memory controller is not busy it will issue the REFR command.  |
| Refresh Release | Backlog count is greater than 4. Indicates that the refresh backlog of REFR commands is getting high and when DDR2/3/mDDR memory controller is not busy it should issue the REFR command.   |
| Refresh Must    | Backlog count is greater than 7. Indicates that the refresh backlog of REFR commands is getting excessive and DDR2/3/mDDR memory controller should perform an auto refresh cycle before servicing any new memory access requests. |

The DDR2/3/mDDR memory controller starts servicing new memory accesses after Refresh Release level is cleared. If any of the commands in the Command FIFO have class of service latency counters that are expired, the DDR2/3/mDDR memory controller will not wait for Refresh Release level to be cleared but will only perform one refresh command and exit the refresh state.

### 7.3.3.6 DDR3 Read-Write Leveling

The DDR2/3/mDDR memory controller supports read-write leveling in conjunction with the DDR PHY. The DDR2/3/mDDR memory controller supports two types of write/read leveling:

1. Full leveling
2. Incremental leveling

---

**NOTE:** Please refer the device specific data sheet to know the type of leveling supported.

---

Each leveling type has three parts:

1. Write leveling
2. Read DQS gate training
3. Read data eye training

Read and write leveling is only supported to DDR3 memory.

The DDR2/3/mDDR memory controller does not perform full leveling after initialization upon reset deassertion. Full leveling must be triggered by software after the DDR2/3/mDDR memory controller registers are properly configured. The DDR2/3/mDDR memory controller supports triggering of full leveling through software through the use of the REG\_RDWRLVLFULL\_START field in the Read-Write Leveling Control register(RWLCR). Since full leveling takes considerable amount of time and refreshes cannot be issued to DDR3 when DDR3 is put in leveling mode, refresh interval will be violated and data inside DDR3 can be lost. Although, this is not an issue at power-up, this might be an issue if full leveling is triggered when DDR3 is functional.

The memory controller supports incremental leveling to better track voltage and temperature changes during normal operation. The incremental leveling can be enabled by writing a non-zero value to the REG\_WRLVLINC\_INT, REG\_RDLVLGATEINC\_INT, and REG\_RDLVLINC\_INT fields in the Read-Write Leveling Control register(RWLCR). The memory controller periodically triggers incremental write leveling every time REG\_WRLVLINC\_INT expires. In other words, the REG\_WRLVLINC\_INT defines the interval between successive incremental write leveling.

Similarly, the memory controller periodically triggers incremental read DQS gate training every time REG\_RDLVLGATEINC\_INT expires, and triggers incremental read data eye training every time REG\_RDLVLINC\_INT expires.

To minimize impact on bandwidth, the software can program these intervals such that these three intervals do not expire at same time. The value of interval programmed is dependent on the slope of voltage and temperature changes.

The memory controller supports increasing the rate of incremental leveling automatically for a defined period of time. This can be achieved by programming the Read-Write Leveling Ramp Window register(RDWR\_LVL\_RMP\_WIN) and the Read-Write Leveling Ramp Control register(RDWR\_LVL\_RMP\_CTRL). Whenever a pulse is received, the memory controller would use the intervals programmed in the Read-Write Leveling Ramp Control register until the REG\_RDWRLVLINC\_RMP\_WIN in the Read-Write Leveling Ramp Window register expires. After the expiration of REG\_RDWRLVLINC\_RMP\_WIN the memory controller switches back to use the intervals programmed in the Read-Write Leveling Control register.

To guarantee none of the incremental leveling events are missed, the REG\_RDWRLVLINC\_RMP\_WIN must be programmed greater than the intervals in the Read-Write Leveling Ramp Control register.

If the memory controller is in Self-Refresh or Power-Down modes when any of the incremental leveling intervals expire, the memory controller will exit Self-Refresh or Power-Down mode, perform the required leveling, and then re-enter the Self-Refresh or Power-Down mode. The memory controller also triggers incremental leveling on Self-Refresh exit.

### 7.3.3.7 PRCM Sequence for DDR2/3/mDDR Memory controller

The memory controller clock, reset and power are handled by the device PRCM module. Refer to the Power Reset Clock Management (PRCM) chapter for the PRCM register details.

### 7.3.3.8 Interrupt Support

The DDR2/3/mDDR controller is compliant with Open Core Protocol Specification (OCP-IP 2.2). The controller supports only Idle, Write, Read, and WriteNonPost command types. Also, the controller supports only incrementing, wrapping, and 2-dimensional block addressing modes. The controller supports generation of an error interrupt if an unsupported command or a command with unsupported addressing mode is received.

### 7.3.3.9 EDMA Event Support

The DDR2/3/mDDR memory controller is a DMA slave peripheral and therefore does not generate EDMA events. Data read and write requests may be made directly by masters including the EDMA controller.

### 7.3.3.10 Emulation Considerations

The DDR2/3/mDDR memory controller will remain fully functional during emulation halts to allow emulation access to external memory.

### 7.3.3.11 Power Management

This section defines the power management capabilities and requirements.

#### 7.3.3.11.1 Clock Stop Mode

The memory controller supports Clock Stop mode for LPDDR1/mDDR. The memory controller automatically stops the clocks to the memory, after the memory controller is idle for REG\_CS\_TIM number of DDR clock cycles and the REG\_LP\_MODE field is set to 1. The REG\_LP\_MODE and REG\_CS\_TIM fields can be programmed in the power management control register (PMCR).

When the clock to the memory is stopped, the memory controller services register accesses as normal. If an SDRAM access is requested, or the Refresh Must level is reached while in the Clock Stop mode, the memory controller will start the clocks. The memory controller now can issue any commands. If the power saving mode is changed by changing REG\_LP\_MODE from 1 to some other value, the memory controller will exit Clock Stop mode and enter the new power saving mode.

#### 7.3.3.11.2 Self-Refresh Mode

The DDR2/3/mDDR memory controller supports self-refresh mode for low power. The memory controller automatically puts the SDRAM into self-refresh after the memory controller is idle for REG\_SR\_TIM number of DDR clock cycles and the REG\_LP\_MODE field is set to 2. The REG\_LP\_MODE and REG\_SR\_TIM fields can be programmed in the Power Management Control register(PMCR). The memory controller will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of REG\_SR\_TIM, the memory controller will start issuing refreshes to complete the refresh backlog, and then issue a SELF-REFRESH command to the SDRAM.

In self-refresh mode, the memory controller automatically stops the clocks DDR\_CLK to the SDRAM. The memory controller maintains DDR\_CKE low to maintain the self-refresh state. When the SDRAM is in self-refresh, the memory controller services register accesses as normal. If the REG\_LP\_MODE field is set not equal to 2, or an SDRAM access is requested while it is in self-refresh, and T\_CKE + 1 cycles have elapsed since the SELF-REFRESH command was issued, the memory controller will bring the SDRAM out of self-refresh. The value of T\_CKE is taken from SDRAM Timing 2 register. For DDR3, memory controller will also exit self-refresh to perform incremental leveling.

**Exit sequence of self-refresh mode for LPDDR1 device:** The memory controller:

- Enables clocks.
- Drives DDR\_CKE high.

- Waits for T\_XSNR + 1 cycles. The value of T\_XSNR is taken from SDRAM Timing 2 register.
- Starts an auto-refresh cycle in the next cycle.
- Enters its idle state and can issue any commands.

**Exit sequence of self-refresh mode for DDR2 device:** The memory controller:

- Enables clocks.
- Drives DDR\_CKE high.
- Waits for T\_XSNR + 1 cycles. The value of T\_XSNR is taken from SDRAM Timing 2 register.
- If the REG\_DDR\_DISABLE\_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to the extended mode register 1 with the pad\_a\_o bits set as follows:

| Bits         | Value           | Description  |
|--------------|-----------------|--|
| DDR_A[15:13] | 0x0             | !reg_ddr2_ddqs   |
| DDR_A[12]    | 0x0             | Output buffer enabled                                      |
| DDR_A[11]    | 0x0             | RDQS disable   |
| DDR_A[10]    | !reg_ddr2_ddqs  | Differential DQS enable value from SDRAM Config register   |
| DDR_A[9:7]   | 0x0             | Exit OCD calibration mode                                  |
| DDR_A[6]     | reg_ddr_term[1] | DDR2 termination resistor value from SDRAM Config register |
| DDR_A[5:3]   | 0x0             | Additive latency = 0                                       |
| DDR_A[2]     | reg_ddr_term[0] | DDR2 termination resistor value from SDRAM Config register |
| DDR_A[1]     | reg_sdram_drive | SDRAM drive strength from SDRAM Config register            |
| DDR_A[0]     | 0x1             | Disable DLL  |

- Starts an auto-refresh cycle in the next cycle.
- Enters its idle state and can issue any other commands except a write or a read. A write or a read will only be issued after T\_XSRD + 1 clock cycles have elapsed since DDR\_CKE is driven high. The value of T\_XSRD is taken from SDRAM Timing 2 register.

**Exit sequence of self-refresh mode for DDR3 device:** The memory controller:

- Enables clocks.
- Drives DDR\_CKE high.
- Waits for T\_XSNR + 1 cycles. The value of T\_XSNR is taken from SDRAM Timing 2 register.
- If the REG\_DDR\_DISABLE\_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to the extended mode register 1 with the pad\_a\_o bits set as follows:

| Bits         | Value              | Description  |
|--------------|--------------------|--|
| DDR_A[15:13] | 0x0                | Reserved   |
| DDR_A[12]    | 0x0                | Output buffer enabled                                      |
| DDR_A[11]    | 0x0                | TDQS disable   |
| DDR_A[10]    | 0x0                | Reserved   |
| DDR_A[9]     | reg_ddr_term[2]    | DDR3 termination resistor value from SDRAM Config register |
| DDR_A[8]     | 0x0                | Reserved   |
| DDR_A[7]     | 0x0                | Write leveling disabled                                    |
| DDR_A[6]     | reg_ddr_term[1]    | DDR3 termination resistor value from SDRAM Config register |
| DDR_A[5]     | reg_sdram_drive[1] | SDRAM drive strength from SDRAM Config register            |
| DDR_A[4:3]   | 0x0                | Additive latency = 0                                       |
| DDR_A[2]     | reg_ddr_term[0]    | DDR3 termination resistor value from SDRAM Config register |
| DDR_A[1]     | reg_sdram_drive[0] | SDRAM drive strength from SDRAM Config register            |
| DDR_A[0]     | 0x1                | Disable DLL  |

- Starts an auto-refresh cycle in the next cycle.
- Performs one write incremental leveling.
- Performs read DQS incremental training.
- Performs read data-eye incremental training.
- Enters its idle state and can issue any other commands except a write or a read. A write or a read will only be issued after  $T_{XSRD} + 1$  clock cycles have elapsed since DDR\_CKE is driven high. The value of  $T_{XSRD}$  is taken from SDRAM Timing 2 register.

#### **7.3.3.11.3 Power Down Mode**

The memory controller also supports power-down mode for low power. The memory controller automatically puts the SDRAM into power-down after the memory controller is idle for REG\_PD\_TIM number of DDR clock cycles and the REG\_LP\_MODE field is set to 4. The REG\_LP\_MODE and REG\_PD\_TIM fields can be programmed in the Power Management Control register (PMCR). If the Refresh Must level is not reached before the entry into power-down, the memory controller will not precharge all banks before issuing the POWER-DOWN command. This will result in SDRAM entering active power-down mode.

If the Refresh Must level is reached before the entry into power-down, the memory controller will precharge all banks and issue refreshes until the Refresh Release Level is reached before issuing the POWER-DOWN command. This will result in SDRAM entering precharge power-down mode.

In power-down mode, the memory controller does not stop the clocks DDR\_CLK to the SDRAM. The memory controller maintains DDR\_CKE low to maintain the power-down state.

When the SDRAM is in power-down, the memory controller services register accesses as normal. If the REG\_LP\_MODE field is set not equal to 4, or an SDRAM access is requested, or the Refresh Must level is reached while the SDRAM is in power-down, the memory controller will bring the SDRAM out of power-down. For DDR3, memory controller will also exit power-down to perform incremental leveling.

Exit sequence of power-down mode for DDR2, DDR3 and LPDDR1: The memory controller

- Drives DDR\_CKE high after  $T_{CKE} + 1$  cycles have elapsed since the POWER-DOWN command was issued. The value of  $T_{CKE}$  is taken from SDRAM Timing 2 register.
- Waits for  $T_{XP} + 1$  cycles. The value of  $T_{XP}$  is taken from SDRAM Timing 2 register.
- Enters its idle state and can issue any commands.

#### **7.3.3.11.4 Deep Power-Down Mode**

For ultimate power savings, the memory controller supports deep power-down mode for LPDDR1.

The SDRAM can be forced into deep power-down through software by setting the reg\_dpd\_en field in the Power Management Control register to 1. In this case, the memory controller will continue normal operation until all SDRAM memory access requests have been serviced. At this point the memory controller will issue a DEEP POWER-DOWN command. The memory controller then maintains pad\_cke\_o low to maintain the Deep Power-Down state. In deep power-down mode, the memory controller automatically stops the clocks to the SDRAM.

Setting the REG\_DPD\_EN field to 1 overrides the setting of REG\_LP\_MODE field. Therefore, if the SDRAM is in Clock Stop, Self Refresh, or Power-Down mode, and REG\_DPD\_EN field is set to 1, the memory controller will exit those modes and go into deep power-down mode.

When the SDRAM is in deep power-down, the memory controller services register accesses as normal.

If the REG\_DPD\_EN field is set to 0, or an SDRAM access is requested, the memory controller will bring the SDRAM out of deep power-down.

Exit sequence for LPDDR1: The memory controller:

- Performs SDRAM initialization as specified in the LPDDR1(mDDR) SDRAM Memory Initialization section.
- Enters its idle state and can issue any commands.

Since the memory controller performs initialization upon deep power-down exit, the REG\_REFRESH\_RATE field in the SDRAM Refresh Control register must be set appropriately to meet the 200 $\mu$ s wait requirement for LPDDR1.

#### 7.3.3.11.5 Save and Restore Mode

The DDR2/3/mDDR memory controller supports save and restore mechanism to completely switch off power to the DDR2/3/mDDR memory controller. The following sequence of operations is followed to put DDR2/3/mDDR memory controller in off mode:

An external master reads the following memory mapped registers and saves their value external to the DDR2/3/mDDR memory controller.

1. SDRAM Config register (SDRCR)
  2. SDRAM Config 2 register
  3. SDRAM Refresh Control register (SDRRCR)
  4. SDRAM Refresh Control Shadow register (SDRRCR)
  5. SDRAM Timing 1 register (SDRTIM1)
  6. SDRAM Timing 1 Shadow register (SDRTIM1SR)
  7. SDRAM Timing 2 register (SDRTIM2)
  8. SDRAM Timing 2 Shadow register (SDRTIM2SR)
  9. SDRAM Timing 3 register (SDRTIM3)
  10. SDRAM Timing 3 Shadow register (SDRTIM3SR)
  11. Power Management Control register (PMCR)
  12. Power Management Control Shadow register (PMCSR)
  13. Interface Configuration register (INT\_CONFIG)
  14. System OCP Interrupt Enable Set Register (SOIESR)
  15. DDR PHY Control 1 register (DDRPHYCR)
  16. DDR PHY Control 1 Shadow register (DDRPHYCSR)
- Memory controller completes all pending transactions and drains all its FIFOs.
  - Memory controller puts the SDRAM in Self Refresh.
  - Memory controller copies all shadow memory mapped registers to its main registers. It is assumed that the shadow register always has the same value as its corresponding main register.
  - Memory controller waits for all interrupts to be serviced.
  - Memory controller acknowledges assertion of internal power down request.
  - The internal module reset signal is asserted.
  - The clocks and power to the memory controller can now be switched off.

To restore power to the memory controller, the following sequence of operations is followed:

- The power and clocks to the Memory controller are switched on.
- The internal module reset signal is deasserted, indicating to the Memory controller that it is waking up from off mode.
- The memory controller does not perform SDRAM initialization and forces its state machine to be in self-refresh.
- The external master restores all of the above memory mapped registers.
- The external master restores all of the above memory mapped registers.
- The system can now perform access to the external memory.

#### 7.3.3.11.6 EMIF PHY Clock Gating

The clock to the DDR2/3/mDDR PHY can be gated off to achieve power saving. For more information, see the EMIF0/1 Clock Gate Control register (EMIF\_CLK\_GATE).

### 7.3.4 Use Cases

For details on connecting this device to mDDR/DDR2/DDR3 devices, see the device-specific data sheet, which will include specific instructions and routing guidelines for interfacing to mDDR (LPDDR), DDR2, and DDR3 devices.

### 7.3.5 EMIF4D Registers

[Table 7-109](#) lists the memory-mapped registers for the EMIF4D. All register offset addresses not listed in [Table 7-109](#) should be considered as reserved locations and the register contents should not be modified.

**Table 7-109. EMIF4D REGISTERS**

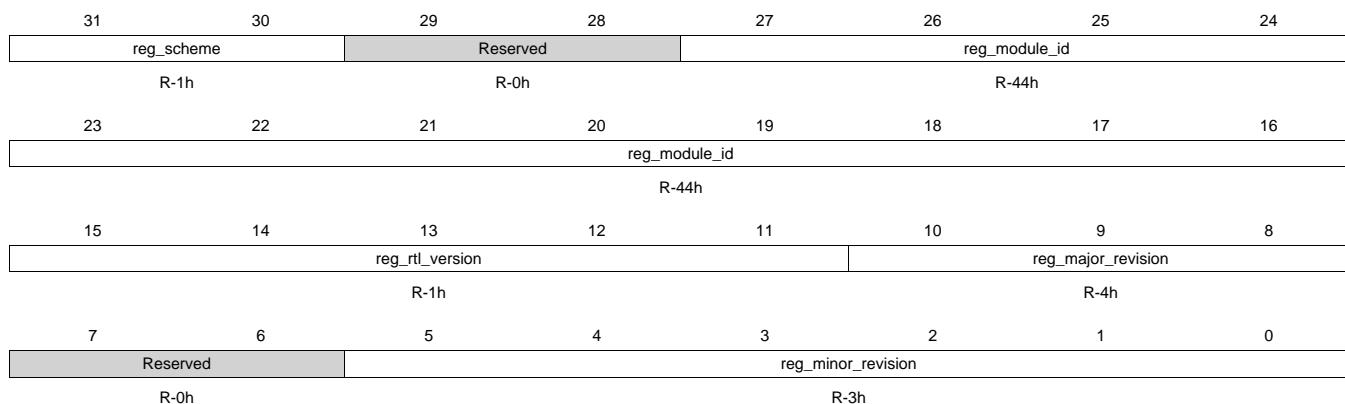

| Offset | Acronym             | Register Name  | Section                          |
|--------|---------------------|--|----------------------------------|
| 0h     | EMIF_MOD_ID_REV     |  | <a href="#">Section 7.3.5.1</a>  |
| 4h     | STATUS              |  | <a href="#">Section 7.3.5.2</a>  |

| R/W-0h        |          |    |             |               |    | R/W-0h |    |  |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

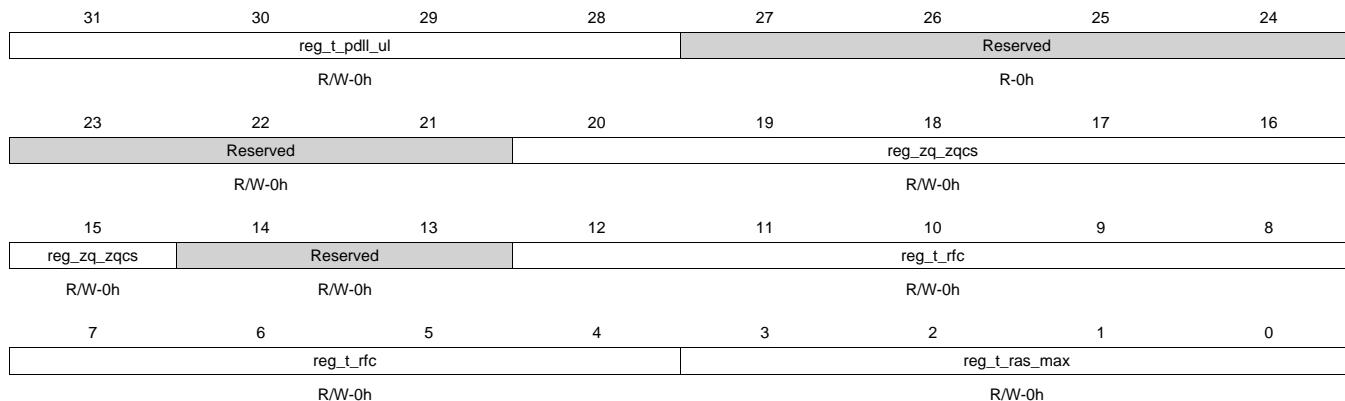

**Table 7-120. SDRAM\_TIM\_3 Register Field Descriptions**

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-28 | reg_t_pdll_ul | R/W  | 0h    | Minimum number of DDR clock cycles for PHY DLL to unlock. A value of N will be equal to N x 128 clocks.   |
| 27-24 | Reserved      | R    | 0h    |   |
| 23-21 | Reserved      | R/W  | 0h    | Reserved.   |
| 20-15 | reg_zq_zqcs   | R/W  | 0h    | Number of DDR clock clock cycles for a ZQCS command, minus one.   |
| 14-13 | Reserved      | R/W  | 0h    | Reserved.   |
| 12-4  | reg_t_rfc     | R/W  | 0h    | Minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.   |
| 3-0   | reg_t_ras_max | R/W  | 0h    | Maximum number of reg_refresh_rate intervals from Activate to Precharge command.<br>This field must be equal to ((tRASmax / tREFI)-1) rounded down to the next lower integer.<br>This field is only applicable for mDDR.<br>This field must be programmed to 0xF for other SDRAM types. |

### 7.3.5.12 SDRAM\_TIM\_3\_SHDW Register (offset = 2Ch) [reset = 0h]

SDRAM\_TIM\_3\_SHDW is shown in [Figure 7-102](#) and described in [Table 7-121](#).

**Figure 7-102. SDRAM\_TIM\_3\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

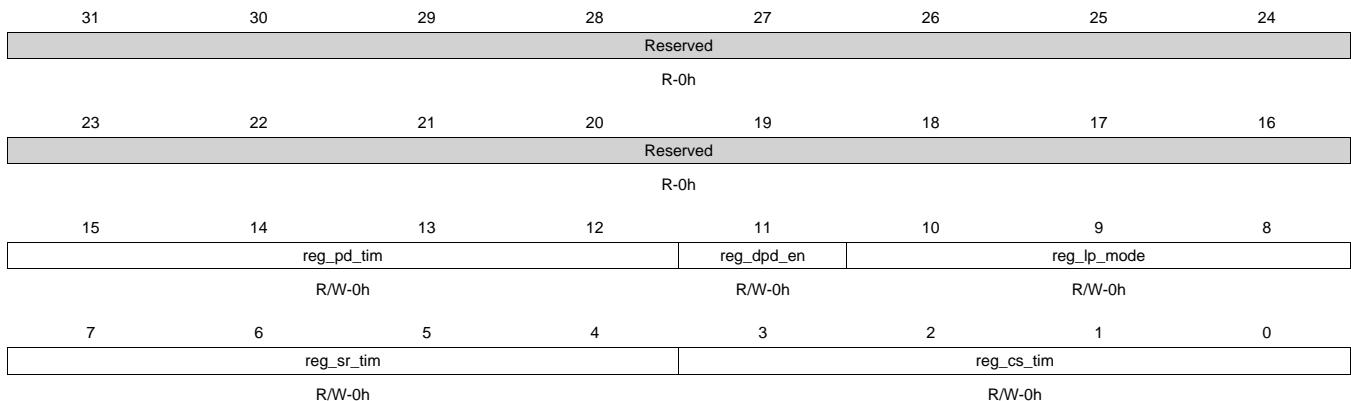

**Table 7-121. SDRAM\_TIM\_3\_SHDW Register Field Descriptions**

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-28 | reg_t_pdll_ul | R/W  | 0h    | Minimum number of DDR clock cycles for PHY DLL to unlock. A value of N will be equal to N x 128 clocks.   |
| 27-24 | Reserved      | R    | 0h    |   |
| 23-21 | Reserved      | R/W  | 0h    | Reserved.   |
| 20-15 | reg_zq_zqcs   | R/W  | 0h    | Number of DDR clock clock cycles for a ZQCS command, minus one.   |
| 14-13 | Reserved      | R/W  | 0h    | Reserved.   |
| 12-4  | reg_t_rfc     | R/W  | 0h    | Minimum number of DDR clock cycles from Refresh or Load Mode to Refresh or Activate, minus one.   |
| 3-0   | reg_t_ras_max | R/W  | 0h    | Maximum number of reg_refresh_rate intervals from Activate to Precharge command.<br>This field must be equal to ((tRASmax / tREFI)-1) rounded down to the next lower integer.<br>This field is only applicable for mDDR.<br>This field must be programmed to 0xF for other SDRAM types. |

### 7.3.5.13 PWR\_MGMT\_CTRL Register (offset = 38h) [reset = 0h]

PWR\_MGMT\_CTRL is shown in [Figure 7-103](#) and described in [Table 7-122](#).

**Figure 7-103. PWR\_MGMT\_CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-122. PWR\_MGMT\_CTRL Register Field Descriptions**

| Bit   | Field       | Type | Reset | Description  |
|-------|-------------|------|-------|--|
| 31-16 | Reserved    | R    | 0h    |  |
| 15-12 | reg_pd_tim  | R/W  | 0h    | Power Management timer for Power-Down.<br>The EMIF will put the external SDRAM in Power-Down mode after the EMIF is idle for these number of m_clk cycles and if reg_lp_mode field is set to 4.<br>Set to 0 to immediately enter Power-Down mode.<br>Set to 1 for 16 clocks.<br>Set to 2 for 32 clocks.<br>Set to 3 for 64 clocks.<br>Set to 4 for 128 clocks.<br>Set to 5 for 256 clocks.<br>Set to 6 for 512 clocks.<br>Set to 7 for 1024 clocks.<br>Set to 8 for 2048 clocks.<br>Set to 9 for 4096 clocks.<br>Set to 10 for 8192 clocks.<br>Set to 11 for 16384 clocks.<br>Set to 12 for 32768 clocks.<br>Set to 13 for 65536 clocks.<br>Set to 14 for 131072 clocks.<br>Set to 15 for 262144 clocks.<br>Note: After updating this field, at least one dummy read access to SDRAM is required for the new value to take affect. |
| 11    | reg_dpd_en  | R/W  | 0h    | Deep Power Down enable.<br>Set to 0 for normal operation.<br>Set to 1 to enter deep power down mode.<br>This mode will override the reg_lp_mode field setting.   |
| 10-8  | reg_lp_mode | R/W  | 0h    | Automatic Power Management enable.<br>Set to 1 for Clock Stop, set to 2 for Self Refresh, and set to 4 for Power-Down.<br>All other values will disable automatic power management.  |

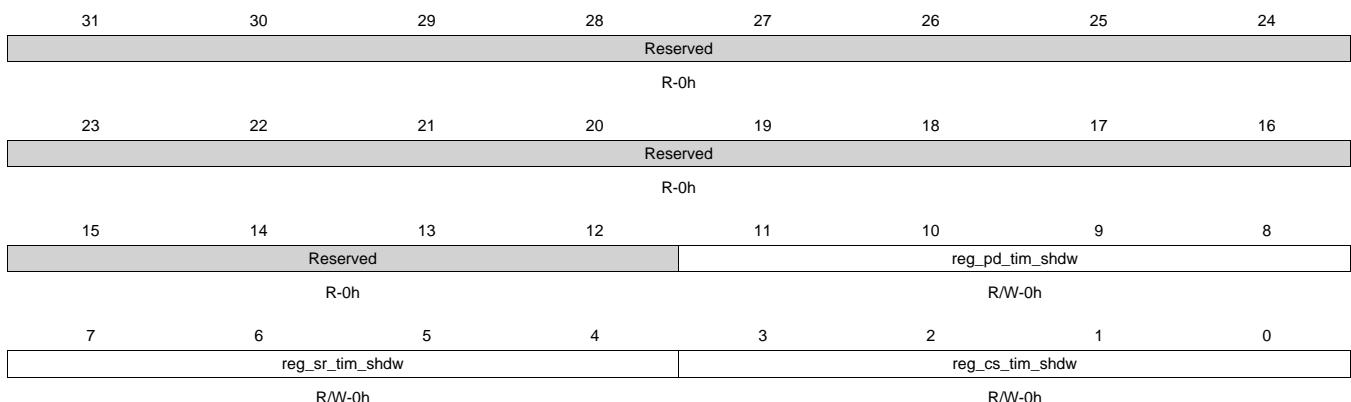

**Table 7-122. PWR\_MGMT\_CTRL Register Field Descriptions (continued)**

| Bit | Field      | Type | Reset | Description   |
|-----|------------|------|-------|---|
| 7-4 | reg_sr_tim | R/W  | 0h    | <p>Power Management timer for Self Refresh.</p> <p>The EMIF will put the external SDRAM in Self Refresh mode after the EMIF is idle for these number of m_clk cycles and if reg_lp_mode field is set to 2.</p> <p>Set to 0 to immediately enter Self Refresh mode.</p> <p>Set to 1 for 16 clocks.</p> <p>Set to 2 for 32 clocks.</p> <p>Set to 3 for 64 clocks.</p> <p>Set to 4 for 128 clocks.</p> <p>Set to 5 for 256 clocks.</p> <p>Set to 6 for 512 clocks.</p> <p>Set to 7 for 1024 clocks.</p> <p>Set to 8 for 2048 clocks.</p> <p>Set to 9 for 4096 clocks.</p> <p>Set to 10 for 8192 clocks.</p> <p>Set to 11 for 16384 clocks.</p> <p>Set to 12 for 32768 clocks.</p> <p>Set to 13 for 65536 clocks.</p> <p>Set to 14 for 131072 clocks.</p> <p>Set to 15 for 262144 clocks.</p> <p>Note: After updating this field, at least one dummy read access to SDRAM is required for the new value to take affect.</p> |
| 3-0 | reg_cs_tim | R/W  | 0h    | <p>Power Management timer for Clock Stop.</p> <p>The EMIF will put the external SDRAM in Clock Stop mode after the EMIF is idle for these number of m_clk cycles and if reg_lp_mode field is set to 1.</p> <p>Set to 0 to immediately enter Clock Stop mode.</p> <p>Set to 1 for 16 clocks.</p> <p>Set to 2 for 32 clocks.</p> <p>Set to 3 for 64 clocks.</p> <p>Set to 4 for 128 clocks.</p> <p>Set to 5 for 256 clocks.</p> <p>Set to 6 for 512 clocks.</p> <p>Set to 7 for 1024 clocks.</p> <p>Set to 8 for 2048 clocks.</p> <p>Set to 9 for 4096 clocks.</p> <p>Set to 10 for 8192 clocks.</p> <p>Set to 11 for 16384 clocks.</p> <p>Set to 12 for 32768 clocks.</p> <p>Set to 13 for 65536 clocks.</p> <p>Set to 14 for 131072 clocks.</p> <p>Set to 15 for 262144 clocks.</p> <p>Note: After updating this field, at least one dummy read access to SDRAM is required for the new value to take affect.</p>       |

### 7.3.5.14 PWR\_MGMT\_CTRL\_SHDW Register (offset = 3Ch) [reset = 0h]

PWR\_MGMT\_CTRL\_SHDW is shown in [Figure 7-104](#) and described in [Table 7-123](#).

**Figure 7-104. PWR\_MGMT\_CTRL\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-123. PWR\_MGMT\_CTRL\_SHDW Register Field Descriptions**

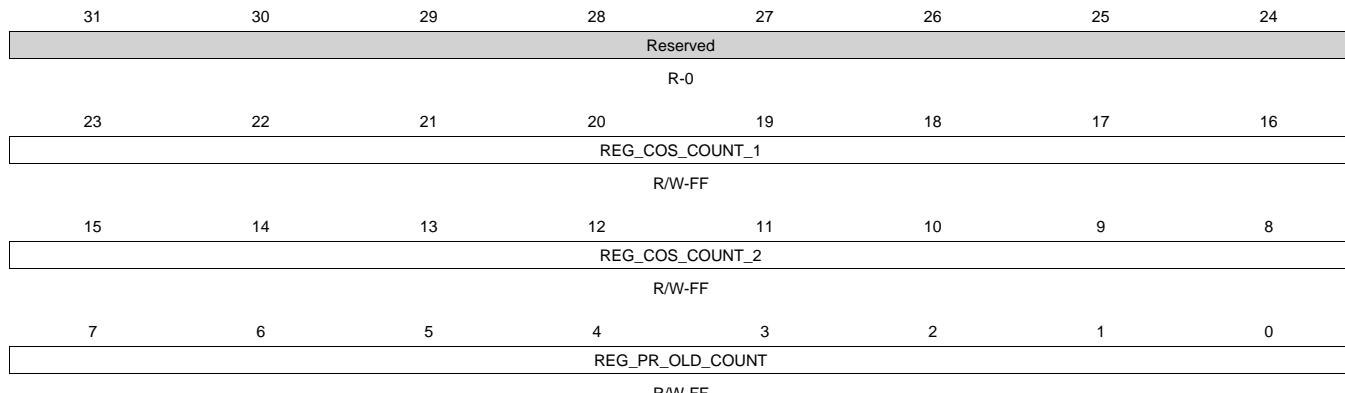

| Bit   | Field           | Type | Reset | Description  |
|-------|-----------------|------|-------|--|
| 31-12 | Reserved        | R    | 0h    |  |
| 11-8  | reg_pd_tim_shdw | R/W  | 0h    | Shadow field for reg_pd_tim.<br>This field is loaded into reg_pd_tim field in Power Management Control register when SldleAck is asserted. |
| 7-4   | reg_sr_tim_shdw | R/W  | 0h    | Shadow field for reg_sr_tim.<br>This field is loaded into reg_sr_tim field in Power Management Control register when SldleAck is asserted. |
| 3-0   | reg_cs_tim_shdw | R/W  | 0h    | Shadow field for reg_cs_tim.<br>This field is loaded into reg_cs_tim field in Power Management Control register when SldleAck is asserted. |

### 7.3.5.15 INT\_CONFIG Register (offset = 54h) [reset = 0h]

Interface Configuration Register

Interface Configuration Register is shown in [Figure 7-105](#) and described in [Table 7-124](#).

**Figure 7-105. Interface Configuration Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-124. Interface Configuration Register Field Descriptions**

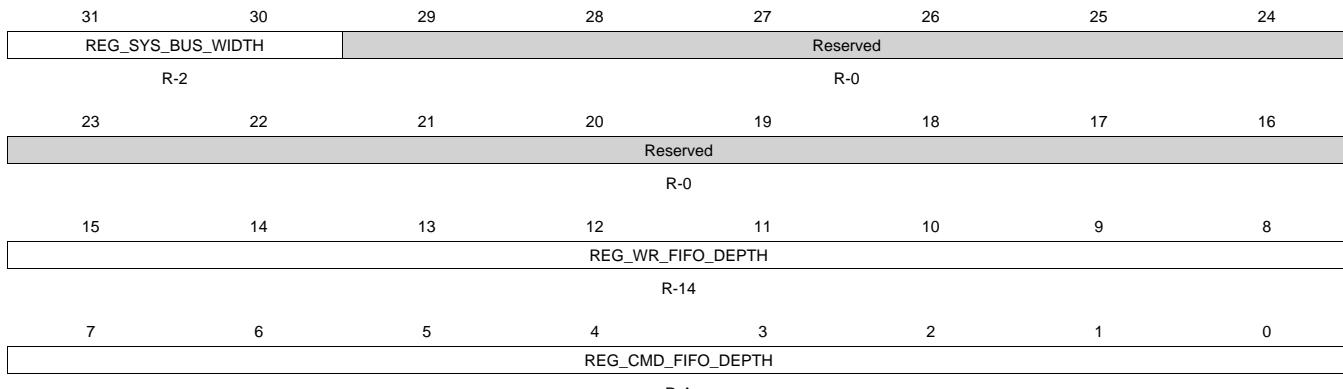

| Bit   | Field            | Type | Reset | Description   |
|-------|------------------|------|-------|---|
| 31-24 | Reserved         | R    | R     | Reserved for future use.  |
| 23-16 | REG_COS_COUNT_1  | R/W  | 0xFF  | Priority Raise Counter for class of service 1.<br>Number of m_clk cycles after which the EMIF momentarily raises the priority of the class of service 1 commands in the Command FIFO.<br>A value of N will be equal to N x 16 clocks. |
| 15-8  | REG_COS_COUNT_2  | R/W  | 0xFF  | Priority Raise Counter for class of service 2.<br>Number of m_clk cycles after which the EMIF momentarily raises the priority of the class of service 2 commands in the Command FIFO.<br>A value of N will be equal to N x 16 clocks. |
| 7-0   | REG_PR_OLD_COUNT | R/W  | 0xFF  | Priority Raise Old Counter.<br>Number of m_clk cycles after which the EMIF momentarily raises the priority of the oldest command in the OCP Command FIFO.<br>A value of N will be equal to N x 16 clocks.                             |

### 7.3.5.16 INT\_CFG\_VAL\_1 Register (offset = 58h) [reset = 0h]

Interface Configuration Value 1 Register

Interface Configuration Value 1 Register is shown in [Figure 7-106](#) and described in [Table 7-125](#).

**Figure 7-106. Interface Configuration Value 1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-125. Interface Configuration Value 1 Register Field Descriptions**

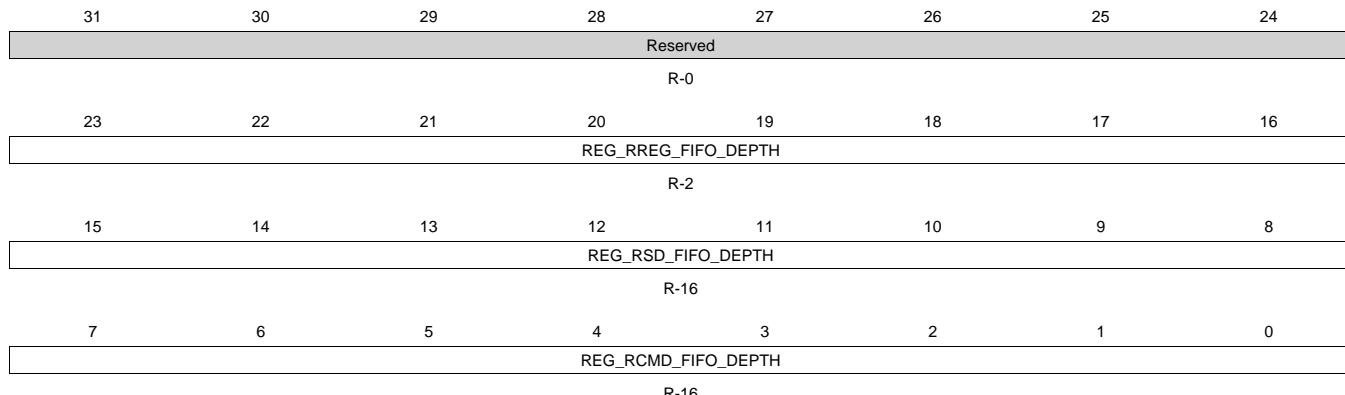

| Bit   | Field              | Type | Reset | Description   |
|-------|--------------------|------|-------|---|
| 31-30 | REG_SYS_BUS_WIDTH  | R    | 2     | L3 OCP data bus width for a particular configuration.<br>0 = 32 bit wide.<br>1 = 64 bit wide.<br>2 = 128 bit wide.<br>3 = 256 bit wide. |
| 29-16 | Reserved           | R    | 0     | Reserved for future use.  |
| 15-8  | REG_WR_FIFO_DEPTH  | R    | 0x14  | Write Data FIFO depth for a particular configuration.   |
| 7-0   | REG_CMD_FIFO_DEPTH | R    | 0xA   | Command FIFO depth for a particular configuration.  |

### 7.3.5.17 INT\_CFG\_VAL\_2 Register (offset = 5Ch) [reset = 0h]

Interface Configuration Value 2 Register

Interface Configuration Value 2 Register is shown in [Figure 7-107](#) and described in [Table 7-126](#).

**Figure 7-107. Interface Configuration Value 2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

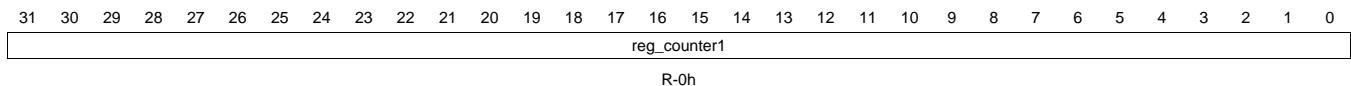

**Table 7-126. Interface Configuration Value 2 Register Field Descriptions**

| Bit   | Field               | Type | Reset | Description   |
|-------|---------------------|------|-------|---|
| 31-24 | Reserved            | R    | 0     | Reserved for future use.                                      |
| 23-16 | REG_RREG_FIFO_DEPTH | R    | 0x2   | Register Read Data FIFO depth for a particular configuration. |
| 15-8  | REG_RSD_FIFO_DEPTH  | R    | 0x16  | SDRAM Read Data FIFO depth for a particular configuration.    |
| 7-0   | REG_RCMD_FIFO_DEPTH | R    | 0x16  | Read Command FIFO depth for a particular configuration.       |

### 7.3.5.18 PERF\_CNT\_1 Register (offset = 80h) [reset = 0h]

PERF\_CNT\_1 is shown in [Figure 7-108](#) and described in [Table 7-127](#).

**Figure 7-108. PERF\_CNT\_1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

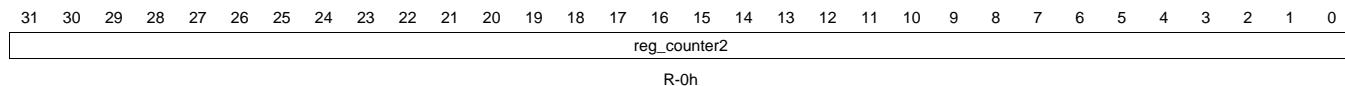

**Table 7-127. PERF\_CNT\_1 Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description  |
|------|--------------|------|-------|--|
| 31-0 | reg_counter1 | R    | 0h    | 32-bit counter that can be configured as specified in the Performance Counter Config Register and Performance Counter Master Region Select Register. |

### 7.3.5.19 PERF\_CNT\_2 Register (offset = 84h) [reset = 0h]

PERF\_CNT\_2 is shown in [Figure 7-109](#) and described in [Table 7-128](#).

**Figure 7-109. PERF\_CNT\_2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

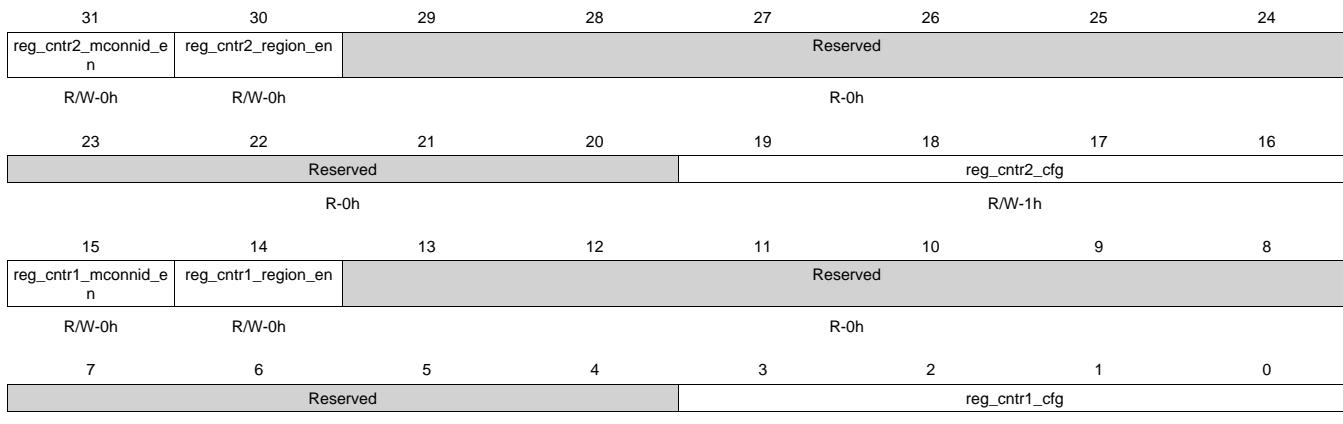

**Table 7-128. PERF\_CNT\_2 Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description  |
|------|--------------|------|-------|--|
| 31-0 | reg_counter2 | R    | 0h    | 32-bit counter that can be configured as specified in the Performance Counter Config Register and Performance Counter Master Region Select Register. |

### 7.3.5.20 PERF\_CNT\_CFG Register (offset = 88h) [reset = 10000h]

PERF\_CNT\_CFG is shown in [Figure 7-110](#) and described in [Table 7-129](#).

**Figure 7-110. PERF\_CNT\_CFG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

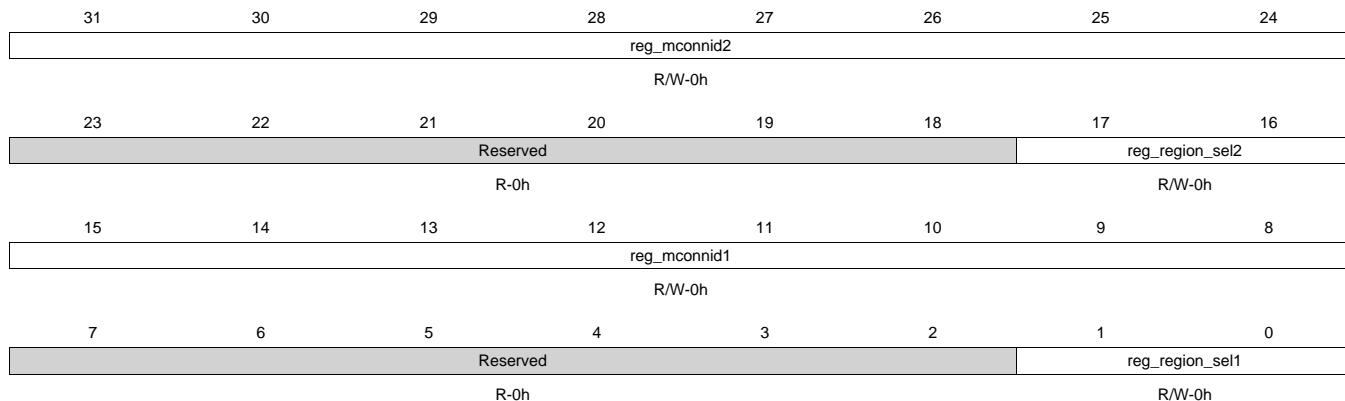

**Table 7-129. PERF\_CNT\_CFG Register Field Descriptions**

| Bit   | Field                | Type | Reset | Description  |
|-------|----------------------|------|-------|--|
| 31    | reg_cntr2_mconnid_en | R/W  | 0h    | MConnID filter enable for Performance Counter 2 register.                      |
| 30    | reg_cntr2_region_en  | R/W  | 0h    | Chip Select filter enable for Performance Counter 2 register.                  |
| 29-20 | Reserved             | R    | 0h    |  |
| 19-16 | reg_cntr2_cfg        | R/W  | 1h    | Filter configuration for Performance Counter 2.<br>Refer to table for details. |
| 15    | reg_cntr1_mconnid_en | R/W  | 0h    | MConnID filter enable for Performance Counter 1 register.                      |
| 14    | reg_cntr1_region_en  | R/W  | 0h    | Chip Select filter enable for Performance Counter 1 register.                  |
| 13-4  | Reserved             | R    | 0h    |  |
| 3-0   | reg_cntr1_cfg        | R/W  | 0h    | Filter configuration for Performance Counter 1.<br>Refer to table for details. |

### 7.3.5.21 PERF\_CNT\_SEL Register (offset = 8Ch) [reset = 0h]

PERF\_CNT\_SEL is shown in [Figure 7-111](#) and described in [Table 7-130](#).

**Figure 7-111. PERF\_CNT\_SEL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

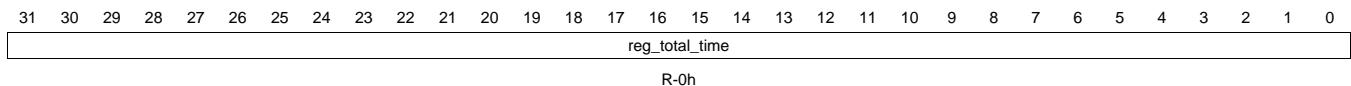

**Table 7-130. PERF\_CNT\_SEL Register Field Descriptions**

| Bit   | Field           | Type | Reset | Description                                    |
|-------|-----------------|------|-------|--|
| 31-24 | reg_mconnid2    | R/W  | 0h    | MConnID for Performance Counter 2 register.    |
| 23-18 | Reserved        | R    | 0h    |  |
| 17-16 | reg_region_sel2 | R/W  | 0h    | MAddrSpace for Performance Counter 2 register. |
| 15-8  | reg_mconnid1    | R/W  | 0h    | MConnID for Performance Counter 1 register.    |
| 7-2   | Reserved        | R    | 0h    |  |
| 1-0   | reg_region_sel1 | R/W  | 0h    | MAddrSpace for Performance Counter 1 register. |

### 7.3.5.22 PERF\_CNT\_TIM Register (offset = 90h) [reset = 0h]

PERF\_CNT\_TIM is shown in [Figure 7-112](#) and described in [Table 7-131](#).

**Figure 7-112. PERF\_CNT\_TIM Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

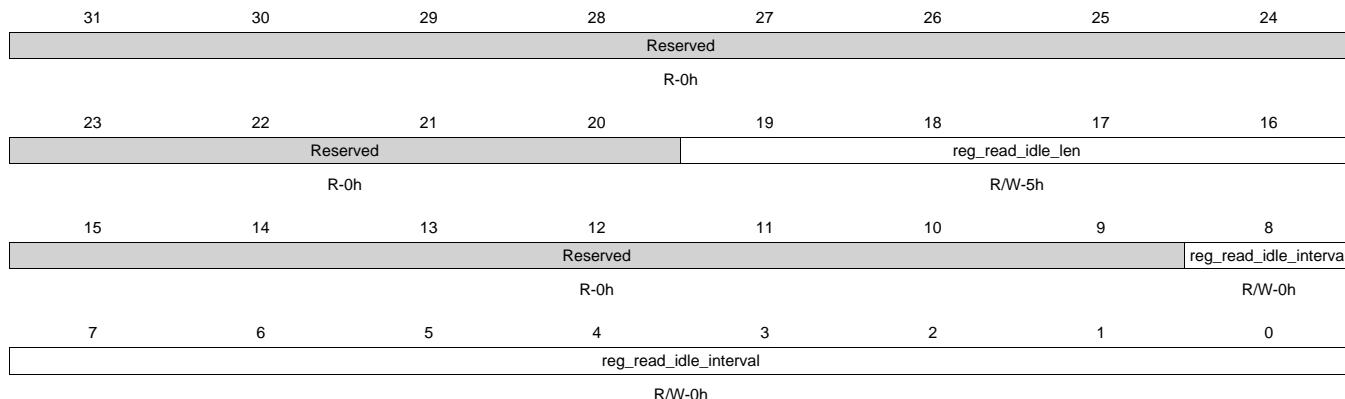

**Table 7-131. PERF\_CNT\_TIM Register Field Descriptions**

| Bit  | Field          | Type | Reset | Description   |
|------|----------------|------|-------|---|
| 31-0 | reg_total_time | R    | 0h    | 32-bit counter that continuously counts number for m_clk cycles elapsed after EMIF is brought out of reset. |

### 7.3.5.23 READ\_IDLE\_CTRL Register (offset = 98h) [reset = 50000h]

READ\_IDLE\_CTRL is shown in [Figure 7-113](#) and described in [Table 7-132](#).

**Figure 7-113. READ\_IDLE\_CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

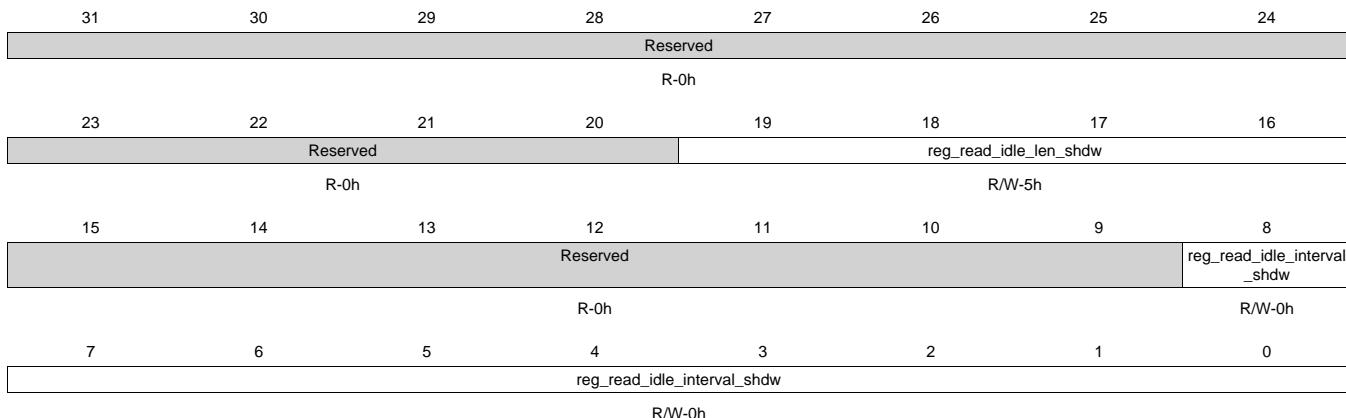

**Table 7-132. READ\_IDLE\_CTRL Register Field Descriptions**

| Bit   | Field                  | Type | Reset | Description   |
|-------|------------------------|------|-------|---|
| 31-20 | Reserved               | R    | 0h    |   |
| 19-16 | reg_read_idle_len      | R/W  | 5h    | The Read Idle Length field determines the minimum size (reg_read_idle_len-1 clock cycles) of Read Idle window for the read idle detection as well as the force read idle time.                    |
| 15-9  | Reserved               | R    | 0h    |   |
| 8-0   | reg_read_idle_interval | R/W  | 0h    | The Read Idle Interval field determines the maximum interval ((reg_read_idle_interval-1)*64 clock cycles) between read idle detections or force. A value of zero disables the read idle function. |

### 7.3.5.24 READ\_IDLE\_CTRL\_SHDW Register (offset = 9Ch) [reset = 50000h]

READ\_IDLE\_CTRL\_SHDW is shown in [Figure 7-114](#) and described in [Table 7-133](#).

**Figure 7-114. READ\_IDLE\_CTRL\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

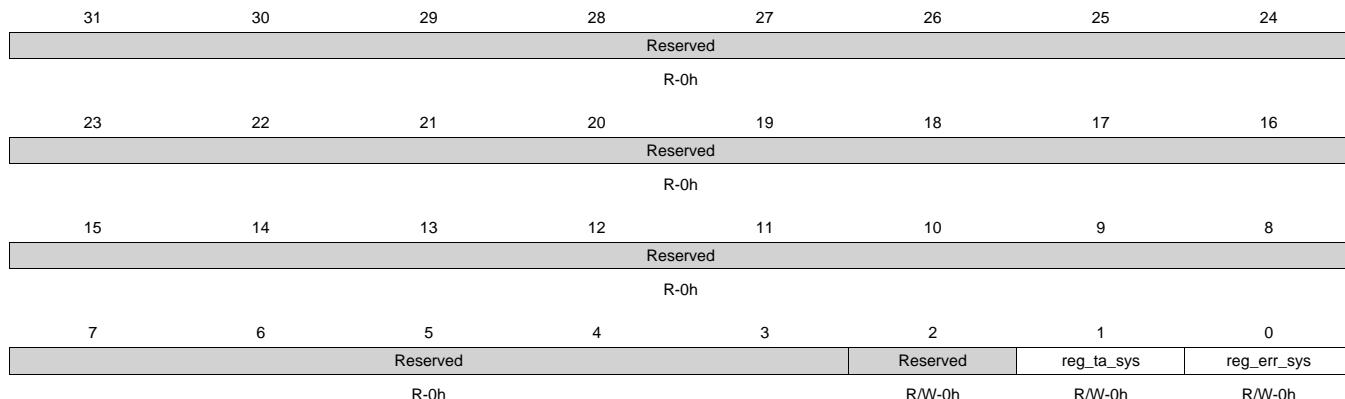

**Table 7-133. READ\_IDLE\_CTRL\_SHDW Register Field Descriptions**

| Bit   | Field                       | Type | Reset | Description   |
|-------|-----------------------------|------|-------|---|
| 31-20 | Reserved                    | R    | 0h    |   |
| 19-16 | reg_read_idle_len_shdw      | R/W  | 5h    | Shadow field for reg_read_idle_len.<br>This field is loaded into reg_read_idle_len field in Read Idle Control register when SIdleAck is asserted            |
| 15-9  | Reserved                    | R    | 0h    |   |
| 8-0   | reg_read_idle_interval_shdw | R/W  | 0h    | Shadow field for reg_read_idle_interval.<br>This field is loaded into reg_read_idle_interval field in Read Idle Control register when SIdleAck is asserted. |

### 7.3.5.25 IRQSTATUS\_RAW\_SYS Register (offset = A4h) [reset = 0h]

IRQSTATUS\_RAW\_SYS is shown in [Figure 7-115](#) and described in [Table 7-134](#).

**Figure 7-115. IRQSTATUS\_RAW\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

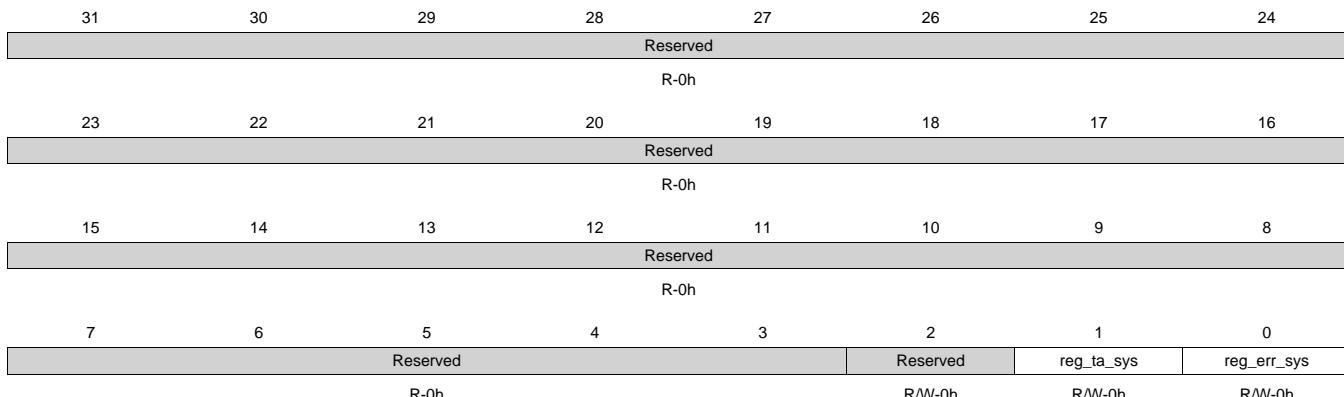

**Table 7-134. IRQSTATUS\_RAW\_SYS Register Field Descriptions**

| Bit  | Field       | Type | Reset | Description   |
|------|-------------|------|-------|---|
| 31-3 | Reserved    | R    | 0h    |   |
| 2    | Reserved    | R/W  | 0h    | Reserved.   |
| 1    | reg_ta_sys  | R/W  | 0h    | Raw status of system OCP interrupt.<br>Write 1 to set the (raw) status, mostly for debug.<br>Writing a 0 has no effect. |
| 0    | reg_err_sys | R/W  | 0h    | Raw status of system OCP interrupt.<br>Write 1 to set the (raw) status, mostly for debug.<br>Writing a 0 has no effect. |

### 7.3.5.26 IRQSTATUS\_SYS Register (offset = ACh) [reset = 0h]

IRQSTATUS\_SYS is shown in [Figure 7-116](#) and described in [Table 7-135](#).

**Figure 7-116. IRQSTATUS\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

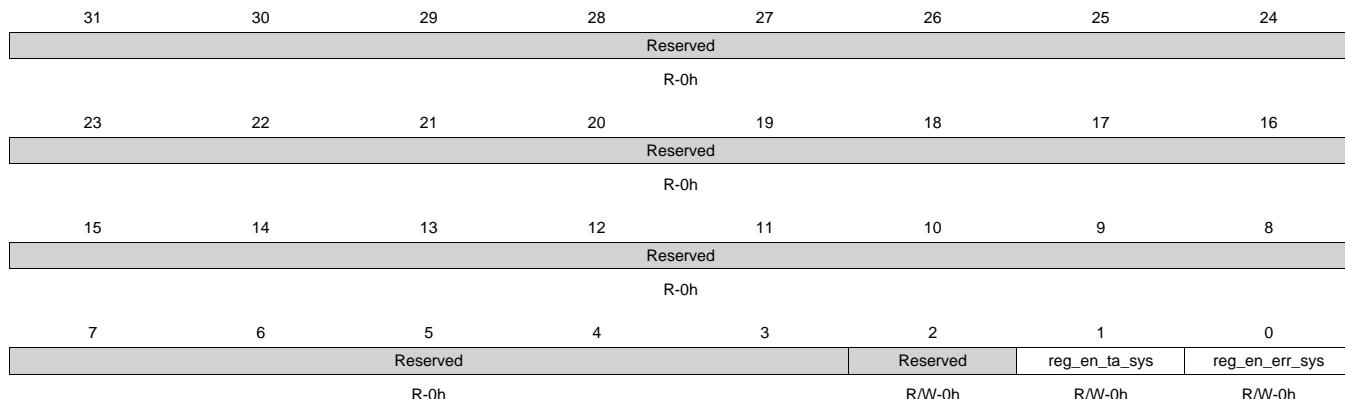

**Table 7-135. IRQSTATUS\_SYS Register Field Descriptions**

| Bit  | Field       | Type | Reset | Description   |
|------|-------------|------|-------|---|
| 31-3 | Reserved    | R    | 0h    |   |
| 2    | Reserved    | R/W  | 0h    | Reserved.   |
| 1    | reg_ta_sys  | R/W  | 0h    | Enabled status of system OCP interrupt.<br>Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled).<br>Writing a 0 has no effect. |
| 0    | reg_err_sys | R/W  | 0h    | Enabled status of system OCP interrupt.<br>Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled).<br>Writing a 0 has no effect. |

### 7.3.5.27 IRQENABLE\_SET\_SYS Register (offset = B4h) [reset = 0h]

IRQENABLE\_SET\_SYS is shown in [Figure 7-117](#) and described in [Table 7-136](#).

**Figure 7-117. IRQENABLE\_SET\_SYS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

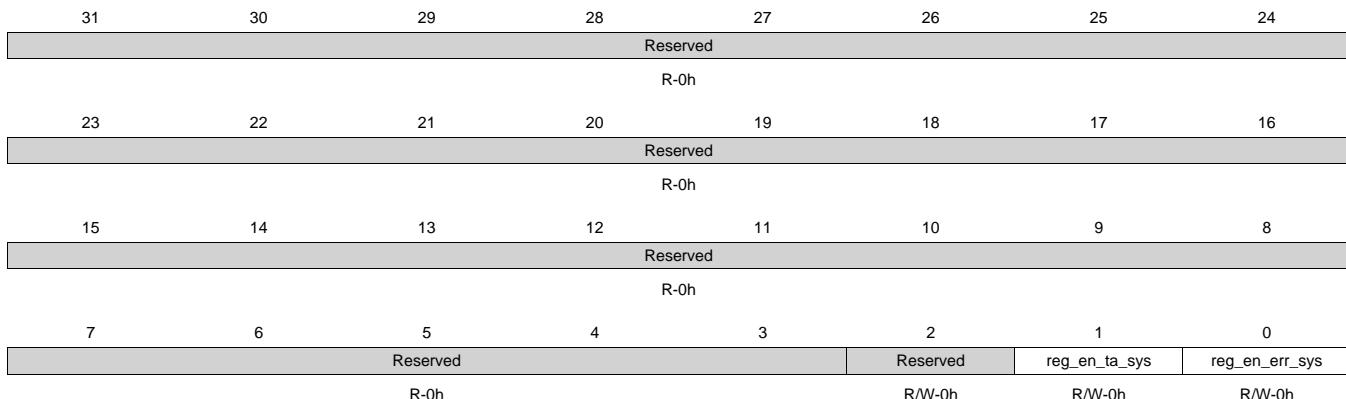

**Table 7-136. IRQENABLE\_SET\_SYS Register Field Descriptions**

| Bit  | Field                       | Type | Reset | Description   |

### 7.3.5.33 DDR\_PHY\_CTRL\_1 Register (offset = E4h) [reset = 0h]

DDR\_PHY\_CTRL\_1 is shown in [Figure 7-123](#) and described in [Table 7-142](#).

A write to the DDR PHY Control 1 register must be followed by a write to the SDRAM\_CONFIG register to ensure that the control update/acknowledge protocol is performed on the DID. If CAS latency = 5, the minimum read latency =  $5 + 2 = 7$  and reg\_read\_latency must be programmed as  $7 - 1 = 6$ . The maximum read latency =  $5 + 7 = 12$  and reg\_read\_latency must be programmed as  $12 - 1 = 11$ .

**Figure 7-123. DDR\_PHY\_CTRL\_1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-142. DDR\_PHY\_CTRL\_1 Register Field Descriptions**

| Bit   | Field                       | Type | Reset | Description  |
|-------|-----------------------------|------|-------|--|
| 31-21 | Reserved                    | R/W  | 0h    | Reserved.  |
| 20    | reg_phy_enable_dynamic_pwrn | R/W  | 1h    | Dynamically enables powering down the IO receiver when not performing a read.<br>0 = IO receivers always powered up.<br>1 = IO receivers only powered up during a read.  |
| 19-16 | Reserved                    | R/W  | 0h    | Reserved.  |
| 15    | reg_phy_rst_n               | R/W  | 0h    | Writing a 1 to this bit will hold the PHY macros in reset.<br>Writing a 0 will bring PHY macros out of reset.  |
| 14    | Reserved                    | R/W  | 0h    | Reserved.  |
| 13-12 | reg_phy_idle_local_odt      | R/W  | 0h    | Value to drive on the 2-bit local_odt PHY outputs when reg_phy_dynamic_pwrn_enable is asserted and a read is not in progress and reg_phy_dynamic_pwrn_enable. Typically this is the value required to disable termination (00) to save power when idle.  |
| 11-10 | reg_phy_wr_local_odt        | R/W  | 0h    | This bit controls the value assigned to the reg_phy_wr_local_odt input on the data macros.<br>Always set to 00.  |
| 9-8   | reg_phy_rd_local_odt        | R/W  | 0h    | Value to drive on the 2-bit local_odt PHY outputs when output enable is not asserted and a read is in progress (where in progress is defined as after a read command is issued and until all read data has been returned all the way to the controller.) Typically this is set to the value required to enable termination at the desired strength for read usage.<br>00 = ODT off.<br>01 = ODT off.<br>10 = Full thevenin load.<br>11 = Half thevenin load. |
| 7-5   | Reserved                    | R/W  | 0h    | Reserved.  |

**Table 7-142. DDR\_PHY\_CTRL\_1 Register Field Descriptions (continued)**

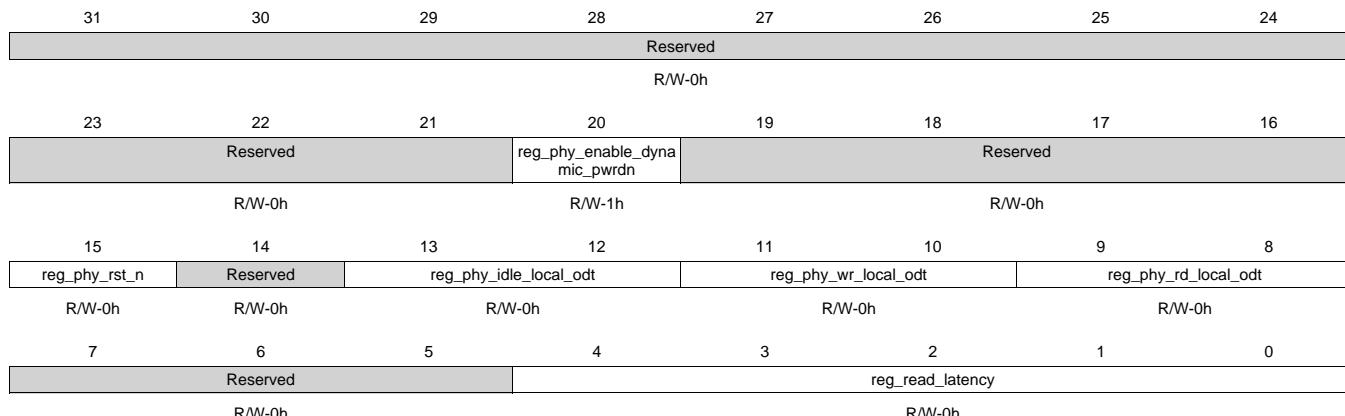

| Bit | Field            | Type | Reset | Description   |
|-----|------------------|------|-------|---|
| 4-0 | reg_read_latency | R/W  | 0h    | This field defines the latency for read data from DDR SDRAM in number of DDR clock cycles.<br>The value applied should be equal to the required value minus one.<br>The maximum read latency supported by the DDR PHY is equal to CAS latency plus 7 clock cycles.<br>The minimum read latency must be equal to CAS latency plus 2 clock cycle. |

### 7.3.5.34 DDR\_PHY\_CTRL\_1\_SHDW Register (offset = E8h) [reset = 0h]

DDR\_PHY\_CTRL\_1\_SHDW is shown in [Figure 7-124](#) and described in [Table 7-143](#).

A write to the DDR PHY Control 1 register must be followed by a write to the SDRAM\_CONFIG register to ensure that the control update/acknowledge protocol is performed on the DID. If CAS latency = 5, the minimum read latency =  $5 + 2 = 7$  and reg\_read\_latency must be programmed as  $7 - 1 = 6$ . The maximum read latency =  $5 + 7 = 12$  and reg\_read\_latency must be programmed as  $12 - 1 = 11$ .

**Figure 7-124. DDR\_PHY\_CTRL\_1\_SHDW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 7-143. DDR\_PHY\_CTRL\_1\_SHDW Register Field Descriptions**

| Bit   | Field                        | Type | Reset | Description  |
|-------|------------------------------|------|-------|--|
| 31-21 | Reserved                     | R/W  | 0h    | Reserved.  |
| 20    | reg_phy_enable_dynamic_pwrnd | R/W  | 1h    | Dynamically enables powering down the IO receiver when not performing a read.<br>0 = IO receivers always powered up.<br>1 = IO receivers only powered up during a read.  |
| 19-16 | Reserved                     | R/W  | 0h    | Reserved.  |
| 15    | reg_phy_rst_n                | R/W  | 0h    | Writing a 1 to this bit will hold the PHY macros in reset.<br>Writing a 0 will bring PHY macros out of reset.  |
| 14    | Reserved                     | R/W  | 0h    | Reserved.  |
| 13-12 | reg_phy_idle_local_odt       | R/W  | 0h    | Value to drive on the 2-bit local_odt PHY outputs when reg_phy_dynamic_pwrnd_enable is asserted and a read is not in progress and reg_phy_dynamic_pwrnd_enable. Typically this is the value required to disable termination (00) to save power when idle.  |
| 11-10 | reg_phy_wr_local_odt         | R/W  | 0h    | This bit controls the value assigned to the reg_phy_wr_local_odt input on the data macros.<br>Always set to 00.  |
| 9-8   | reg_phy_rd_local_odt         | R/W  | 0h    | Value to drive on the 2-bit local_odt PHY outputs when output enable is not asserted and a read is in progress (where in progress is defined as after a read command is issued and until all read data has been returned all the way to the controller.) Typically this is set to the value required to enable termination at the desired strength for read usage.<br>00 = ODT off.<br>01 = ODT off.<br>10 = Full thevenin load.<br>11 = Half thevenin load. |
| 7-5   | Reserved                     | R/W  | 0h    | Reserved.  |

**Table 7-143. DDR\_PHY\_CTRL\_1\_SHDW Register Field Descriptions (continued)**

| Bit | Field            | Type | Reset | Description   |
|-----|------------------|------|-------|---|
| 4-0 | reg_read_latency | R/W  | 0h    | This field defines the latency for read data from DDR SDRAM in number of DDR clock cycles.<br>The value applied should be equal to the required value minus one.<br>The maximum read latency supported by the DDR PHY is equal to CAS latency plus 7 clock cycles.<br>The minimum read latency must be equal to CAS latency plus 2 clock cycle. |

### 7.3.5.35 PRI\_COS\_MAP Register (offset = 100h) [reset = 0h]

Priority to Class of Service Mapping Register

Priority to Class of Service Mapping Register is shown in [Figure 7-125](#) and described in [Table 7-144](#).

### 7.3.6 DDR2/3/mDDR PHY Registers

**Table 7-148** lists the memory-mapped registers for the DDR2/3 mDDR PHY. Configure the DDR PHY Control Register for calibration of board delay and other parameters to get the SDRAM device working at a different speed. See the device-specific data manual for the base memory address of these registers.

**Table 7-148. Memory-Mapped Registers for DDR2/3/mDDR PHY**

| Register Name                        | Type | Register  | Register   | Address |
|--------------------------------------|------|---|------------|---------|
|                                      |      | Description   | Reset      | Offset  |

### 7.3.6.1 DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0)

The DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0) is shown in the figure and table below.

**Figure 7-129. DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0)**

|    |          |   |                 |    |
|----|----------|---|-----------------|----|
| 31 | Reserved |   |                 | 16 |
|    | R-0      |   |                 |    |
| 15 | 10       | 9 | CMD_SLAVE_RATIO | 0  |
|    | Reserved |   | R/W-80h         |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-149. DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2\_REG\_PHY\_CTRL\_SLAVE\_RATIO\_0) Field Descriptions**

| Bit   | Field           | Value | Description   |
|-------|-----------------|-------|---|
| 31-10 | Reserved        |       | Reserved  |
| 9-0   | CMD_SLAVE_RATIO | 0-80h | Ratio value for address/command launch timing in DDR PHY macro. This is the fraction of a clock cycle represented by the shift to be applied to the read DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line. |

### 7.3.6.2 DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0)

The DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0) is shown in the figure and table below.

**Figure 7-130. DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2\_REG\_PHY\_DLL\_LOCK\_DIFF\_0)**

|    |          |   |               |    |
|----|----------|---|---------------|----|
| 31 | Reserved |   |               | 16 |
|    | R-0      |   |               |    |
| 15 | 4        | 3 | DLL_LOCK_DIFF | 0  |

## 7.4 ELM

### 7.4.1 Introduction

Non-managed NAND flash memories can be dense and nonvolatile in their own nature, but error-prone. When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as bare NANDs, the correction process is delegated to the memory controller.

The general-purpose memory controller (GPMC) probes data read from an external NAND flash and uses this to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare-area data field, with a maximum block size of 1023 bytes. Computation is based on a Bose-Chaudhuri-Hocquenghem (BCH) algorithm. The error-location module (ELM) extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error-correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a programmable configuration parameter. 4-, 8-, and 16-bit error-correction levels are supported. The ELM relies on a static and fixed definition of the generator polynomial for each error-correction level that corresponds to the generator polynomials defined in the GPMC (there are three fixed polynomial for the three correction error levels). A larger number of errors than the programmed error-correction level may be detected, but the ELM cannot correct them all. The offending block is then tagged as uncorrectable in the associated computation exit status register. If the computation is successful, that is, if the number of errors detected does not exceed the maximum value authorized for the chosen correction capability, the exit status register contains the information on the number of detected errors.

When the error-location process completes, an interrupt is triggered to inform the central processing unit (CPU) that its status can be checked. The number of detected errors and their locations in the NAND block can be retrieved from the module through register accesses.

#### 7.4.1.1 ELM Features

The ELM has the following features:

- 4, 8, and 16 bits per 512-byte block error-location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error-location process completion:
  - When the full page has been processed in page mode
  - For each syndrome polynomial in continuous mode

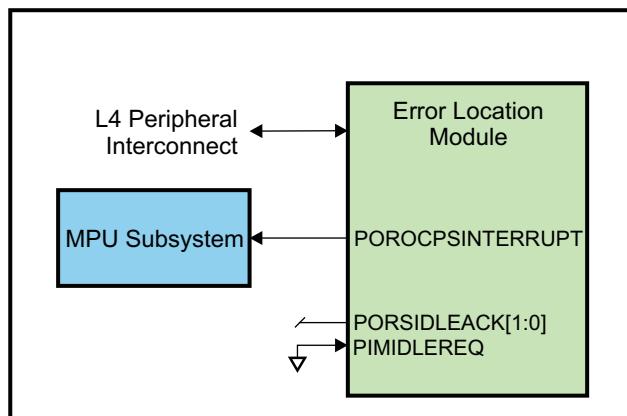

#### 7.4.1.2 Unsupported ELM Features

There are no unsupported ELM features in this device.

## 7.4.2 Integration

The error location module (ELM) is used to extract error addresses from syndrome polynomials generated using a BCH algorithm. Each of these polynomials gives a status of the read operations for a 512 bytes block from a NAND flash and its associated BCH parity bits, plus optionally some spare area information.

The ELM is intended to be used in conjunction with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND Flash page and stored in GPMC registers are passed to the ELM module. The MPU can then easily correct the data block by flipping the bits pointed to by the ELM error locations outputs.

**Figure 7-140. ELM Integration**

### 7.4.2.1 ELM Connectivity Attributes

The general connectivity for the ELM module in this device is summarized in [Table 7-162](#).

**Table 7-162. ELM Connectivity Attributes**

| Attributes          | Type                         |
|---------------------|------------------------------|
| Power Domain        | Peripheral Domain            |
| Clock Domain        | L4PER_L4LS_GCLK              |
| Reset Signals       | PER_DOM_RST_N                |
| Idle/Wakeup Signals | Smart Idle                   |
| Interrupt Requests  | 1 interrupt to MPU Subsystem |
| DMA Requests        | None                         |
| Physical Address    | L4 Peripheral slave port     |

### 7.4.2.2 ELM Clock and Reset Management

The ELM operates from a single OCP interface clock.

**Table 7-163. ELM Clock Signals**

| Clock Signal               | Max Freq | Reference / Source | Comments                      |
|----------------------------|----------|--------------------|-------------------------------|
| Functional/interface clock | 100 MHz  | CORE_CLKOUTM4 / 2  | pd_per_l4ls_gclk<br>From PRCM |

### 7.4.2.3 ELM Pin List

The ELM module does not include any external interface pins.

### 7.4.3 Functional Description

The ELM is designed around the error-location engine, which handles the computation based on the input syndrome polynomials.

The ELM maps the error-location engine to a standard interconnect interface by using a set of registers to control inputs and outputs.

#### 7.4.3.1 ELM Software Reset

To perform a software reset, write a 1 to the ELM\_SYSCONFIG[1] SOFTRESET bit. The ELM\_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the ELM\_SYSCONFIG[1] SOFTRESET bit is automatically reset.

#### 7.4.3.2 ELM Power Management

[Table 7-164](#) describes the power-management features available to the ELM module.

**Table 7-164. Local Power Management Features**

| Feature                | Registers                                 | Description  |
|------------------------|---|--|
| Clock autogating       | ELM_SYSCONFIG[0]<br>AUTOGATING bit        | This bit allows a local power optimization inside the module by gating the ELM_FCLK clock upon the interface activity. |
| Slave idle modes       | ELM_SYSCONFIG[4:3]<br>SIDLEMODE bit field | Force-idle, No-idle, and Smart-idle modes are available.   |
| Clock activity         | ELM_SYSCONFIG[8]<br>CLOCKACTIVITY bit     | The clock can be switched-off or maintained during the wake-up period.   |
| Master Standby modes   | N/A                                       |  |
| Global Wake-up Enable  | N/A                                       |  |
| Wake-up Sources Enable | N/A                                       |  |

**CAUTION**

The PRCM module has no hardware means of reading CLOCKACTIVITY settings. Thus, software must ensure consistent programming between the ELM CLOCKACTIVITY and ELM clock PRCM control bits.

#### 7.4.3.3 ELM Interrupt Requests

[Table 7-165](#) lists the event flags, and their masks, that can cause module interrupts.

**Table 7-165. Events**

| Event Flag                      | Event Mask                          | Map to  | Description  |
|---------------------------------|-------------------------------------|---------|--|
| ELM_IRQSTATUS[8]<br>PAGE_VALID  | ELM_IRQENABLE[8]<br>PAGE_MASK       | ELM_IRQ | Page interrupt                                     |
| ELM_IRQSTATUS[7]<br>LOC_VALID_7 | ELM_IRQENABLE[7]<br>LOCATION_MASK_7 | ELM_IRQ | Error-location interrupt for syndrome polynomial 7 |
| ELM_IRQSTATUS[6]<br>LOC_VALID_6 | ELM_IRQENABLE[6]<br>LOCATION_MASK_6 | ELM_IRQ | Error-location interrupt for syndrome polynomial 6 |
| ELM_IRQSTATUS[5]<br>LOC_VALID_5 | ELM_IRQENABLE[5]<br>LOCATION_MASK_5 | ELM_IRQ | Error-location interrupt for syndrome polynomial 5 |
| ELM_IRQSTATUS[4]<br>LOC_VALID_4 | ELM_IRQENABLE[4]<br>LOCATION_MASK_4 | ELM_IRQ | Error-location interrupt for syndrome polynomial 4 |
| ELM_IRQSTATUS[3]<br>LOC_VALID_3 | ELM_IRQENABLE[3]<br>LOCATION_MASK_3 | ELM_IRQ | Error-location interrupt for syndrome polynomial 3 |
| ELM_IRQSTATUS[2]<br>LOC_VALID_2 | ELM_IRQENABLE[2]<br>LOCATION_MASK_2 | ELM_IRQ | Error-location interrupt for syndrome polynomial 2 |

**Table 7-165. Events (continued)**

| Event Flag                      | Event Mask                          | Map to  | Description  |
|---------------------------------|-------------------------------------|---------|--|
| ELM_IRQSTATUS[1]<br>LOC_VALID_1 | ELM_IRQENABLE[1]<br>LOCATION_MASK_1 | ELM_IRQ | Error-location interrupt for syndrome polynomial 1 |
| ELM_IRQSTATUS[0]<br>LOC_VALID_0 | ELM_IRQENABLE[0]<br>LOCATION_MASK_0 | ELM_IRQ | Error-location interrupt for syndrome polynomial 0 |

#### 7.4.3.4 Processing Initialization

ELM\_LOCATION\_CONFIG global setting parameters must be set before using the error-location engine. The ELM\_LOCATION\_CONFIG[1:0] ECC\_BCH\_LEVEL bit defines the error-correction level used (4-, 8-, or 16-bit error-correction). The ELM\_LOCATION\_CONFIG[26:16] ECC\_SIZE bit field defines the maximum buffer length beyond which the engine processing no longer looks for errors.

The CPU can choose to use the ELM in continuous mode or page mode. If all ELM\_PAGE\_CTRL[i] SECTOR\_i bits are reset (i is the syndrome polynomial number, i = 0 to 7), continuous mode is used. In any other case, page mode is implicitly selected.

- Continuous mode: Each syndrome polynomial is processed independently – results for a syndrome can be retrieved and acknowledged at any time, whatever the status of the other seven processing contexts.
- Page mode: Syndrome polynomials are grouped into atomic entities – only one page can be processed at any given time, even if all eight contexts are not used for this page. Unused contexts are lost and cannot be affected to any other processing. The full page must be acknowledged and cleared before moving to the next page.

For completion interrupts to be generated correctly, all ELM\_IRQENABLE[i] LOCATION\_MASK\_i bits (i = 0 to 7) must be forced to 0 when in page mode, and set to 1 in continuous mode. Additionally, the ELM\_IRQENABLE[8] PAGE\_MASK bit must be set to 1 when in page mode.

The CPU initiates error-location processing by writing a syndrome polynomial into one of the eight possible register sets. Each of these register sets includes seven registers:

ELM\_SYNDROME\_FRAGMENT\_0\_i to ELM\_SYNDROME\_FRAGMENT\_6\_i. The first six registers can be written in any order, but ELM\_SYNDROME\_FRAGMENT\_6\_i must be written last because it includes the validity bit, which instructs the ELM that this syndrome polynomial must be processed (the ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID bit).

As soon as one validity bit is asserted (ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID = 0x1, with i = 0 to 7), error-location processing can start for the corresponding syndrome polynomial. The associated ELM\_LOCATION\_STATUS\_i and ELM\_ERROR\_LOCATION\_0\_i to ELM\_ERROR\_LOCATION\_15\_i registers are not reset (i = 0 to 7). The software must not consider them until the corresponding ELM\_IRQSTATUS[i] LOC\_VALID\_i bit is set.

#### 7.4.3.5 Processing Sequence

While the error-location engine is busy processing one syndrome polynomial, further syndrome polynomials can be written. They are processed when the current processing completes.

The engine completes early when:

- No error is detected; that is, when the ELM\_LOCATION\_STATUS\_i[8] ECC\_CORRECTABLE bit is set to 1 and the ELM\_LOCATION\_STATUS\_i[4:0] ECC\_NB\_ERRORS bit field is set to 0x0.
- Too many errors are detected; that is, when the ELM\_LOCATION\_STATUS\_i[8] ECC\_CORRECTABLE bit is set to 0 while the ELM\_LOCATION\_STATUS\_i[4:0] ECC\_NB\_ERRORS bit field is set with the value output by the error-location engine. The reported number of errors is not ensured if ECC\_CORRECTABLE is 0.

If the engine completes early, the associated error-location registers ELM\_ERROR\_LOCATION\_0\_i to ELM\_ERROR\_LOCATION\_15\_i are not updated (i = 0 to 7).

In all other cases, the engine goes through the entire error-location process. Each time an error-location is found, it is logged in the associated ECC\_ERROR\_LOCATION bit field. The first error detected is logged in the ELM\_ERROR\_LOCATION\_0\_i[12:0] ECC\_ERROR\_LOCATION bit field; the second in the ELM\_ERROR\_LOCATION\_1\_i[12:0] ECC\_ERROR\_LOCATION bit field, and so on.

**Table 7-166. ELM\_LOCATION\_STATUS\_i Value Decoding Table**

| ECC_CORRECTABLE Value | ECC_NB_ERRORS Value | Status | Number of Errors Detected | Action Required  |
|-----------------------|---------------------|--------|---------------------------|--|
| 1                     | 0                   | OK     | 0                         | None   |
| 1                     | $\neq 0$            | OK     | ECC_NB_ERRORS             | Correct the data buffer read based on the ELM_ERROR_LOCATION_0_i to ELM_ERROR_LOCATION_15_i results. |
| 0                     | Any                 | Failed | Unknown                   | Software-dependant   |

#### 7.4.3.6 Processing Completion

When the processing for a given syndrome polynomial completes, its ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID bit is reset. It must not be set again until the exit status registers, ELM\_LOCATION\_STATUS\_i ( $i = 0$  to 7), for this processing are checked. Failure to comply with this rule leads to potential loss of the first polynomial process data output.

The error-location engine signals the process completion to the ELM. When this event is detected, the corresponding ELM\_IRQSTATUS[i] LOC\_VALID\_i bit is set ( $i = 0$  to 7). The processing-exit status is available from the associated ELM\_LOCATION\_STATUS\_i register, and error locations are stored in order in the ECC\_ERROR\_LOCATION fields. The software must only read valid error-location registers based on the number of errors detected and located.

Immediately after the error-location engine completes, a new syndrome polynomial can be processed, if any is available, as reported by the ELM\_SYNDROME\_FRAGMENT\_6\_i[16] SYNDROME\_VALID validity bit, depending on the configured error-correction level. If several syndrome polynomials are available, a round-robin arbitration is used to select one for processing.

In continuous mode (that is, all bits in ELM\_PAGE\_CTRL are reset), an interrupt is triggered whenever a ELM\_IRQSTATUS[i] LOC\_VALID\_i bit is asserted. The CPU must read the ELM\_IRQSTATUS register to determine which polynomial is processed and retrieve the exit status and error locations (ELM\_LOCATION\_STATUS\_i and ELM\_ERROR\_LOCATION\_0\_i to ELM\_ERROR\_LOCATION\_15\_i). When done, the CPU must clear the corresponding ELM\_IRQSTATUS[i] LOC\_VALID\_i bit by writing it to 1. Other status bits must be written to 0 so that other interrupts are not unintentionally cleared. When using this mode, the ELM\_IRQSTATUS[8] PAGE\_VALID interrupt is never triggered.

In page mode, the module does not trigger interrupts for the processing completion of each polynomial because the ELM\_IRQENABLE[i] LOCATION\_MASK\_i bits are cleared. A page is defined using the ELM\_PAGE\_CTRL register. Each SECTOR\_i bit set means the corresponding polynomial i is part of the page processing. A page is fully processed when all tagged polynomials have been processed, as logged in the ELM\_IRQSTATUS[i] LOC\_VALID\_i bit fields. The module triggers an ELM\_IRQSTATUS[8] PAGE\_VALID interrupt whenever it detects that the full page has been processed. To make sure the next page can be correctly processed, all status bits in the ELM\_IRQSTATUS register must be cleared by using a single atomic-write access.

---

**NOTE:** Do not modify page setting parameters in the ELM\_PAGE\_CTRL register unless the engine is idle, no polynomial input is valid, and all interrupts have been cleared.

---

Because no polynomial-level interrupt is triggered in page mode, polynomials cleared in the ELM\_PAGE\_CTRL[i] SECTOR\_i bit fields ( $i = 0$  to 7) are processed as usual, but are essentially ignored. The CPU must manually poll the ELM\_IRQSTATUS bits to check for their status.

## 7.4.4 Basic Programming Model

### 7.4.4.1 ELM Low Level Programming Model

#### 7.4.4.1.1 Processing Initialization

**Table 7-167. ELM Processing Initialization**

| Step   | Register/ Bit Field / Programming Model  | Value  |
|--|--|--|
| Resets the module  | ELM_SYSCONFIG[1] SOFTRESET   | 0x1  |
| Wait until reset is done.  | ELM_SYSSTATUS[0] RESETDONE   | 0x1  |
| Configure the slave interface power management.                                | ELM_SYSCONFIG[4:3] SIDLEMODE   | Set value  |
| Defines the error-correction level used  | ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL   | Set value  |
| Defines the maximum buffer length  | ELM_LOCATION_CONFIG[26:16] ECC_SIZE  | Set value  |
| Sets the ELM in continuous mode or page mode                                   | ELM_PAGE_CTRL  | Set value  |
| <b>If</b> continuous mode is used  | All ELM_PAGE_CTRL[i] SECTOR_i (i = 0 to 7)   | 0x0  |
| Enables interrupt for syndrome polynomial i                                    | ELM_IRQENABLE[i] LOCATION_MASK_i   | 0x1  |
| <b>else</b> (page mode is used)  | One syndrome polynomial i is set ELM_PAGE_CTRL[i] SECTOR_i (i = 0 to 7)  | 0x1  |
| Disable all interrupts for syndrome polynomial and enable PAGE_MASK interrupt. | All ELM_IRQENABLE[i] LOCATION_MASK_i = 0x0 and ELM_IRQENABLE[8] PAGE_MASK = 0x1                                  | Set value  |
| <b>endif</b>   |  | Set value  |
| Set the input syndrome polynomial i.   | ELM_SYNDROME_FRAGMENT_0_i<br>ELM_SYNDROME_FRAGMENT_1_i<br>ELM_SYNDROME_FRAGMENT_5_i<br>ELM_SYNDROME_FRAGMENT_6_i | Set value<br>Set value<br>Set value<br>Set value |
| Initiates the computation process  | ELM_SYNDROME_FRAGMENT_6_i[16]<br>SYNDROME_VALID  | 0x1  |

#### 7.4.4.1.2 Read Results

The engine goes through the entire error-location process and results can be read. [Table 7-168](#) and [Table 7-169](#) describe the processing completion for continuous and page modes, respectively.

**Table 7-168. ELM Processing Completion for Continuous Mode**

| Step   | Register/ Bit Field / Programming Model  | Value |
|--|--|-------|
| Wait until process is complete for syndrome polynomial i:<br>Wait until the ELM_IRQ interrupt is generated, or poll the status register.   |  |       |
| Read for which i the error-location process is complete.   | ELM_IRQSTATUS[i] LOC_VALID_i   | 0x1   |
| <b>if</b> the process fails (too many errors)  | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE   | 0x0   |
| It is software dependant.  |  |       |
| <b>else</b> (process successful, the engine completes)   | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE   | 0x1   |
| Read the number of errors.   | ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS   |       |
| Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers.<br>It is the software responsibility to correct errors in the data buffer. | ELM_ERROR_LOCATION_0_i[12:0]<br>ECC_ERROR_LOCATION<br>ELM_ERROR_LOCATION_1_i[12:0]<br>ECC_ERROR_LOCATION<br>...<br>ELM_ERROR_LOCATION_15_i[12:0]<br>ECC_ERROR_LOCATION |       |

**Table 7-168. ELM Processing Completion for Continuous Mode (continued)**

| Step                                 | Register/ Bit Field / Programming Model | Value |
|--------------------------------------|---|-------|
| <b>endif</b>                         |   |       |
| Clear the corresponding i interrupt. | ELM_IRQSTATUS[i] LOC_VALID_i            | 0x1   |

A new syndrome polynomial can be processed after the end of processing (ELM\_SYNDRome\_FRAGMENT\_6\_i[16] SYNDROME\_VALID = 0x0) and after the exit status register check (ELM\_LOCATION\_STATUS\_i).

**Table 7-169. ELM Processing Completion for Page Mode**

| Step   | Register/ Bit Field / Programming Model             | Value |
|--|---|-------|
| Wait until process is complete for syndrome polynomial i:  |   |       |
| Wait until the ELM_IRQ interrupt is generated, or poll the status register.  |   |       |
| Wait for page completed interrupt:<br>All error locations are valid.   | ELM_IRQSTATUS[8] PAGE_VALID                         | 0x1   |
| <b>Repeat</b> the following actions the necessary number of times. That is, once for each valid defined block in the page. |   |       |
| Read the process exit status.  | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE            |       |
| <b>if</b> the process fails (too many errors)  | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE            | 0x0   |
| It is software dependant.  |   |       |
| <b>else</b> (process successful, the engine completes)   | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE            | 0x1   |
| Read the number of errors.   | ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS            |       |
| Read the error-location bit addresses for syndrome polynomial i of the ECC_NB_ERRORS first registers.                      | ELM_ERROR_LOCATION_0_i[12:0]<br>ECC_ERROR_LOCATION  |       |
|  | ELM_ERROR_LOCATION_1_i[12:0]<br>ECC_ERROR_LOCATION  |       |
|  | ...   |       |
|  | ELM_ERROR_LOCATION_15_i[12:0]<br>ECC_ERROR_LOCATION |       |
| <b>endif</b>   |   |       |
| <b>End Repeat</b>  |   |       |
| Clear the ELM_IRQSTATUS register.  | ELM_IRQSTATUS                                       | 0x1FF |

Next page can be correctly processed after a page is fully processed, when all tagged polynomials have been processed (ELM\_IRQSTATUS[i] LOC\_VALID\_i = 0x1 for all syndrome polynomials i used in the page).

#### 7.4.4.2 Use Case: ELM Used in Continuous Mode

In this example, the ELM module is programmed for an 8-bit error-correction capability in continuous mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, a non-zero polynomial syndrome is reported from the GPMC (Polynomial syndrome 0 is used in the ELM):

- P = 0xA16ABE115E44F767BFB0D0980

**Table 7-170. Use Case: Continuous Mode**

| Step   | Register/ Bit Field / Programming Model | Value |
|--|---|-------|
| Resets the module  | ELM_SYSConfig[1] SOFTRESET              | 0x1   |
| Wait until reset is done.  | ELM_SYSSTATUS[0] RESETDONE              | 0x1   |
| Configure the slave interface power management:<br>Smart idle is used. | ELM_SYSConfig[4:3] SIDLEMODE            | 0x2   |

**Table 7-170. Use Case: Continuous Mode (continued)**

| Step   | Register/ Bit Field / Programming Model  | Value  |
|--|--|--|
| Defines the error-correction level used: 8 bits  | ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL   | 0x1  |
| Defines the maximum buffer length: 528 bytes (2x528 = 1056)  | ELM_LOCATION_CONFIG[26:16] ECC_SIZE  | 0x420  |

| Clear the corresponding interrupt for polynomial 0.  | ELM_IRQSTATUS[0] LOC_VALID_0   | 0x1  |

The NAND flash data in the sector are seen as a polynomial of degree 4223 (number of bits in a 528 byte buffer minus 1), with each data bit being a coefficient in the polynomial. When reading from a NAND flash using the GPMC module, computation of the polynomial syndrome assumes that the first NAND word read at address 0x0 contains the highest-order coefficient in the message. Furthermore, in the 16-bit NAND word, bits are ordered from bit 7 to bit 0, then from bit 15 to bit 8. Based on this convention, an address table of the data buffer can be built. NAND memory addresses in [Table 7-171](#) are given in decimal format.

**Table 7-171. 16-bit NAND Sector Buffer Address Map**

| NAND<br>Memory<br>Address | Message bit addresses in the memory word |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|---------------------------|--|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| 260                       | 55                                       | 54   | 53   | 52   | 51   | 50   | 49   | 48   | 63   | 62   | 61   | 60   | 59   | 58   | 57   | 56   |
| 261                       | 39                                       | 38   | 37   | 36   | 35   | 34   | 33   | 32   | 47   | 46   | 45   | 44   | 43   | 42   | 41   | 40   |
| 262                       | 23                                       | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   |
| 263                       | 7  | 6    | 5    | 4    | 3    | 2    | 1    | 0    | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    |

The table can now be used to determine which bits in the buffer were incorrect and must be flipped. In this example, the first bit to be flipped is bit 4 from the 49th byte read from memory. It is up to the processor to correctly map this word to the copied buffer and to flip this bit. The same process must be repeated for all detected errors.

#### 7.4.4.3 Use Case: ELM Used in Page Mode

In this example, the ELM module is programmed for an 16-bit error-correction capability in page mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, four non-zero polynomial syndromes are reported from the GPMC (Polynomial syndrome 0, 1, 2, and 3 are used in the ELM):

- P0 = 0xE8B0 12ADD5A318E05BE B0693DB28330B5CC A329AA05E0B718EF
- P1 = 0xBAD0 49A0D932C22E6669 0948DF08BE093336 79C6BA10E5F935EB
- P2 = 0x69D9 B86ABCD5EC3697FA A6498FEE54556EA0 1579EF7D60BA3189
- P3 = 0x0

**Table 7-172. Use Case: Page Mode**

| Step   | Register/ Bit Field / Programming Model | Value |
|--|---|-------|
| Resets the module  | ELM_SYSCONFIG[1] SOFTRESET              | 0x1   |
| Wait until reset is done.  | ELM_SYSSTATUS[0] RESETDONE              | 0x1   |

<sup>(1)</sup> i = 0 to 8

#### 7.4.5.1 ELM Revision Register (ELM\_REVISION)

This register contains the IP revision code. The ELM Revision Register (ELM\_REVISION) is shown in [Figure 7-141](#) and described in [Table 7-174](#).

**Figure 7-141. ELM Revision Register (ELM\_REVISION)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

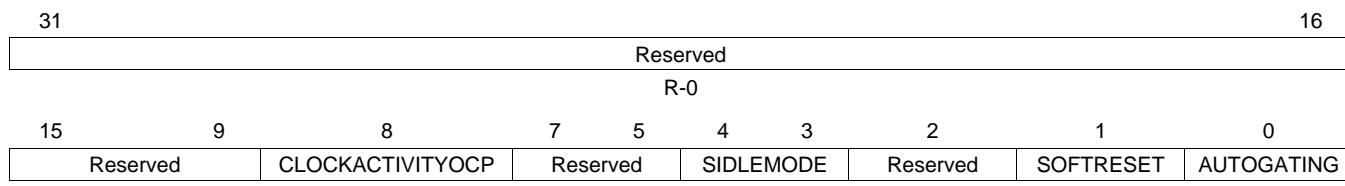

**Table 7-174. ELM Revision Register (ELM\_REVISION) Field Descriptions**

| Bit  | Field    | Value        | Description |
|------|----------|--------------|-------------|
| 31-0 | REVISION | 0xFFFF FFFFh | IP Revision |

#### 7.4.5.2 ELM System Configuration Register (ELM\_SYSCONFIG)

This register allows controlling various parameters of the OCP interface. The ELM System Configuration Register (ELM\_SYSCONFIG) is shown in [Figure 7-142](#) and described in [Table 7-175](#).

**Figure 7-142. ELM System Configuration Register (ELM\_SYSCONFIG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-175. ELM System Configuration Register (ELM\_SYSCONFIG) Field Descriptions**

| Bit  | Field            | Value               | Description  |
|------|------------------|---------------------|--|
| 31-9 | Reserved         | 0                   | Reserved   |
| 8    | CLOCKACTIVITYOCP | 0<br>1              | OCP Clock activity when module is in IDLE mode (during wake up mode period).<br>OCP Clock can be switch-off<br>OCP Clock is maintained during wake up period   |
| 7-5  | Reserved         | 0                   | Reserved   |
| 4-3  | SIDLEMODE        | 0<br>1h<br>2h<br>3h | Slave interface power management (IDLE req/ack control).<br>FORCE Idle. IDLE request is acknowledged unconditionally and immediately. (Default <i>Dumb</i> mode for safety)<br>NO idle. IDLE request is never acknowledged.<br>SMART Idle. The acknowledgment to an IDLE request is given based on the internal activity.<br>Reserved - do not use |
| 2    | Reserved         | 0                   | Reserved   |
| 1    | SOFTRESET        | 0<br>1              | Module software reset. This bit is automatically reset by hardware (During reads, it always returns 0.). It has same effect as the OCP hardware reset.<br>Normal mode.<br>Start soft reset sequence.   |
| 0    | AUTOGATING       | 0<br>1              | Internal OCP clock gating strategy. (No module visible impact other than saving power.)<br>OCP clock is free-running.<br>Automatic internal OCP clock gating strategy is applied based on the OCP interface activity.  |

#### 7.4.5.3 ELM System Status Register (ELM\_SYSSTATUS)

The ELM System Status Register (ELM\_SYSSTATUS) is shown in Figure 7-143 and described in Table 7-176.

**Figure 7-143. ELM System Status Register (ELM\_SYSSTATUS)**

|    |          |          |
|----|----------|----------|
| 31 | Reserved | 1      0 |
|    | R-0      | R-0      |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-176. ELM System Status Register (ELM\_SYSSTATUS) Field Descriptions**

| Bit  | Field     | Value  | Description  |
|------|-----------|--------|--|
| 31-1 | Reserved  | 0      | Reserved   |
| 0    | RESETDONE | 0<br>1 | Internal reset monitoring (OCP domain). Undefined since:<br>From hardware perspective, the reset state is 0.<br>From software user perspective, when the accessible module is 1.<br><br>Reset is on-going<br>Reset is done (completed) |

#### 7.4.5.4 ELM Interrupt Status Register (ELM\_IRQSTATUS)

This register doubles as a status register for the error-location processes. The ELM Interrupt Status Register (ELM\_IRQSTATUS) is shown in [Figure 7-144](#) and described in [Table 7-177](#).

**Figure 7-144. ELM Interrupt Status Register (ELM\_IRQSTATUS)**

|             |             |             |             |             |             |             |             |  |    |
|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|--|----|
| 31          | Reserved    |             |             |             |             |             |             |  | 16 |
| R-0         |             |             |             |             |             |             |             |  |    |
| 15          | Reserved    |             |             |             |             |             |             |  | 8  |
| R-0         |             |             |             |             |             |             |             |  |    |
| 7           | 6           | 5           | 4           | 3           | 2           | 1           | 0           |  |    |
| LOC_VALID_7 | LOC_VALID_6 | LOC_VALID_5 | LOC_VALID_4 | LOC_VALID_3 | LOC_VALID_2 | LOC_VALID_1 | LOC_VALID_0 |  |    |
| R/W-0       |  |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-177. ELM Interrupt Status Register (ELM\_IRQSTATUS) Field Descriptions**

| Bit  | Field       | Value | Description   |
|------|-------------|-------|---|
| 31-9 | Reserved    | 0     | Reserved  |
| 8    | PAGE_VALID  | 0     | Error-location status for a full page, based on the mask definition.                          |
|      |             | 0     | Read: Error locations invalid for all polynomials enabled in the ECC_INTERRUPT_MASK register. |
|      |             | 1     | Read: All error locations valid.  |
|      |             | 0     | Write: No effect.   |
|      |             | 1     | Write: Clear interrupt.   |
| 7    | LOC_VALID_7 | 0     | Error-location status for syndrome polynomial 7.  |
|      |             | 0     | Read: No syndrome processed or process in progress.   |
|      |             | 1     | Read: Error-location process completed.   |
|      |             | 0     | Write: No effect.   |
|      |             | 1     | Write: Clear interrupt.   |
| 6    | LOC_VALID_6 | 0     | Error-location status for syndrome polynomial 6.  |
|      |             | 0     | Read: No syndrome processed or process in progress.   |
|      |             | 1     | Read: Error-location process completed.   |
|      |             | 0     | Write: No effect.   |
|      |             | 1     | Write: Clear interrupt.   |
| 5    | LOC_VALID_5 | 0     | Error-location status for syndrome polynomial 5.  |
|      |             | 0     | Read: No syndrome processed or process in progress.   |
|      |             | 1     | Read: Error-location process completed.   |
|      |             | 0     | Write: No effect.   |
|      |             | 1     | Write: Clear interrupt.   |
| 4    | LOC_VALID_4 | 0     | Error-location status for syndrome polynomial 4.  |
|      |             | 0     | Read: No syndrome processed or process in progress.   |
|      |             | 1     | Read: Error-location process completed.   |
|      |             | 0     | Write: No effect.   |
|      |             | 1     | Write: Clear interrupt.   |
| 3    | LOC_VALID_3 | 0     | Error-location status for syndrome polynomial 3.  |
|      |             | 0     | Read: No syndrome processed or process in progress.   |
|      |             | 1     | Read: Error-location process completed.   |
|      |             | 0     | Write: No effect.   |
|      |             | 1     | Write: Clear interrupt.   |

**Table 7-177. ELM Interrupt Status Register (ELM\_IRQSTATUS) Field Descriptions (continued)**

| Bit | Field       | Value | Description   |
|-----|-------------|-------|---|
| 2   | LOC_VALID_2 | 0     | Error-location status for syndrome polynomial 2.<br>Read: No syndrome processed or process in progress. |
|     |             | 1     | Read: Error-location process completed.   |
| 1   | LOC_VALID_1 | 0     | Write: No effect.   |
|     |             | 1     | Write: Clear interrupt.   |
| 0   | LOC_VALID_0 | 0     | Error-location status for syndrome polynomial 0.<br>Read: No syndrome processed or process in progress. |
|     |             | 1     | Read: Error-location process completed.   |
|     |             | 0     | Write: No effect.   |
|     |             | 1     | Write: Clear interrupt.   |

#### 7.4.5.5 ELM Interrupt Enable Register (ELM\_IRQENABLE)

The ELM Interrupt Enable Register (ELM\_IRQENABLE) is shown in [Figure 7-145](#) and described in [Table 7-178](#).

**Figure 7-145. ELM Interrupt Enable Register (ELM\_IRQENABLE)**

|    |                 |                 |                 |                 |                 |                 |                 |                 |    |
|----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|----|
| 31 | Reserved        |                 |                 |                 |                 |                 |                 |                 | 16 |
|    | R-0             |                 |                 |                 |                 |                 |                 |                 |    |
| 15 | Reserved        |                 |                 |                 |                 |                 |                 |                 |    |
|    | PAGE_MASK       |                 |                 |                 |                 |                 |                 |                 |    |
|    | R/W-0           |                 |                 |                 |                 |                 |                 |                 |    |
| 7  | LOCATION_MASK_7 | LOCATION_MASK_6 | LOCATION_MASK_5 | LOCATION_MASK_4 | LOCATION_MASK_3 | LOCATION_MASK_2 | LOCATION_MASK_1 | LOCATION_MASK_0 | 0  |
|    | R/W-0           |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-178. ELM Interrupt Enable Register (ELM\_IRQENABLE) Field Descriptions**

| Bit  | Field           | Value | Description  |
|------|-----------------|-------|--|
| 31-9 | Reserved        | 0     | Reserved   |
| 8    | PAGE_MASK       | 0     | Page interrupt mask bit                                      |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 7    | LOCATION_MASK_7 | 0     | Error-location interrupt mask bit for syndrome polynomial 7. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 6    | LOCATION_MASK_6 | 0     | Error-location interrupt mask bit for syndrome polynomial 6. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 5    | LOCATION_MASK_5 | 0     | Error-location interrupt mask bit for syndrome polynomial 5. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 4    | LOCATION_MASK_4 | 0     | Error-location interrupt mask bit for syndrome polynomial 4. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 3    | LOCATION_MASK_3 | 0     | Error-location interrupt mask bit for syndrome polynomial 3. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 2    | LOCATION_MASK_2 | 0     | Error-location interrupt mask bit for syndrome polynomial 2. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 1    | LOCATION_MASK_1 | 0     | Error-location interrupt mask bit for syndrome polynomial 1. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |
| 0    | LOCATION_MASK_0 | 0     | Error-location interrupt mask bit for syndrome polynomial 0. |
|      |                 | 1     | Disable interrupt.   |
|      |                 | 1     | Enable interrupt.  |

#### 7.4.5.6 ELM Location Configuration Register (ELM\_LOCATION\_CONFIG)

The ELM Location Configuration Register (ELM\_LOCATION\_CONFIG) is shown in [Figure 7-146](#) and described in [Table 7-179](#).

**Figure 7-146. ELM Location Configuration Register (ELM\_LOCATION\_CONFIG)**

| 31       | 27 | 16       | 16 | 15       | 2 | 1             | 0 |

#### 7.4.5.7 ELM Page Definition Register (ELM\_PAGE\_CTRL)

The ELM Page Definition Register (ELM\_PAGE\_CTRL) is shown in [Figure 7-147](#) and described in [Table 7-180](#).

**Figure 7-147. ELM Page Definition Register (ELM\_PAGE\_CTRL)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-180. ELM Page Definition Register (ELM\_PAGE\_CTRL) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved.   |
| 7    | SECTOR_7 | 0-1   | Set to 1 if syndrome polynomial 7 is part of the page in page mode. Must be 0 in continuous mode. |
| 6    | SECTOR_6 | 0-1   | Set to 1 if syndrome polynomial 6 is part of the page in page mode. Must be 0 in continuous mode. |
| 5    | SECTOR_5 | 0-1   | Set to 1 if syndrome polynomial 5 is part of the page in page mode. Must be 0 in continuous mode. |
| 4    | SECTOR_4 | 0-1   | Set to 1 if syndrome polynomial 4 is part of the page in page mode. Must be 0 in continuous mode. |
| 3    | SECTOR_3 | 0-1   | Set to 1 if syndrome polynomial 3 is part of the page in page mode. Must be 0 in continuous mode. |
| 2    | SECTOR_2 | 0-1   | Set to 1 if syndrome polynomial 2 is part of the page in page mode. Must be 0 in continuous mode. |
| 1    | SECTOR_1 | 0-1   | Set to 1 if syndrome polynomial 1 is part of the page in page mode. Must be 0 in continuous mode. |
| 0    | SECTOR_0 | 0-1   | Set to 1 if syndrome polynomial 0 is part of the page in page mode. Must be 0 in continuous mode. |

#### 7.4.5.8 ELM\_SYNDROME\_FRAGMENT\_0\_i Register

The ELM\_SYNDROME\_FRAGMENT\_0\_i Register is shown in [Figure 7-148](#) and described in [Table 7-181](#).

**Figure 7-148. ELM\_SYNDROME\_FRAGMENT\_0\_i Register**

|       |            |   |
|-------|------------|---|
| 31    | SYNDROME_0 | 0 |
| R/W-0 |            |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

|-------|--------------------|---------|-----------------------------|
| 31-13 | Reserved           | 0       | Reserved                    |
| 12-0  | ECC_ERROR_LOCATION | 0-1FFFh | Error-location bit address. |

## **Power, Reset, and Clock Management (PRCM)**

This chapter describes the PRCM of the device.

| Topic   | Page       |
|---|------------|
| <b>8.1 Power, Reset, and Clock Management .....</b> | <b>499</b> |

## 8.1 Power, Reset, and Clock Management

### 8.1.1 Introduction

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements. This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

### 8.1.2 Device Power-Management Architecture Building Blocks

To provide a versatile architecture supporting multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage management.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains. A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

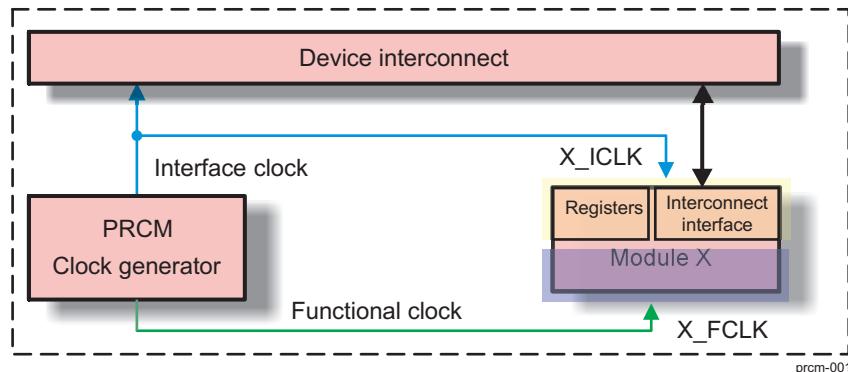

### 8.1.3 Clock Management

The PRCM module along with the control module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

#### 8.1.3.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks.

**Figure 8-1. Functional and Interface Clocks**

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).

- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified by an \_ICLK suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an \_FCLK suffix

### 8.1.3.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or may be gated otherwise. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks. The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module or initiators) or cannot initiate transactions and only responds to the transactions initiated by the master (called slave module or targets). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules.
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules.

#### 8.1.3.2.1 Master Standby Protocol

Master standby protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for the purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes. Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode. Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the module register bit field <Module>\_SYSCONFIG.MIDLEMODE or <Module>\_SYSCONFIG.STANDBYMODE. The behavior, identified by standby mode values, must be configured.

**Table 8-1. Master Module Standby-Mode Settings**

| Standby Mode Value | Selected Mode | Description   |
|--------------------|---------------|---|
| 0x0                | Force-standby | The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent the loss of data at the time the clocks are gated. |
| 0x1                | No-standby    | The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient from a power-saving perspective because it never allows the output clocks of the PRCM module to be gated        |

**Table 8-1. Master Module Standby-Mode Settings (continued)**

| Standby Mode Value | Selected Mode                    | Description  |
|--------------------|----------------------------------|--|
| 0x2                | Smart-standby                    | The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.  |
| 0x3                | Smart-standbywakeup-capable mode | The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in STANDBY state. The mode is relevant only if the appropriate module mwakeup output is implemented. |

The standby status of a master module is indicated by the CM\_<Power\_domain>\_<Module>\_CLKCTRL[x]. STBYST bit in the PRCM module.

**Table 8-2. Master Module Standby Status**

| STBYST Bit Value | Description                   |
|------------------|-------------------------------|
| 0x0              | The module is functional.     |
| 0x1              | The module is in standby mode |

#### 8.1.3.2.2 Slave Idle Protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an idle request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module. Similarly, an idled slave module may need to be wakened because of a service request from a master module or as a result of an event (called a wake-up event; for example, interrupt or DMA request) received by the slave module. In this situation the PRCM module enables the clocks to the module and then deasserts the idle request to signal the module to wake up. Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the module register bit field <Module>\_SYSCONFIG. SIDLEMODE or <Module>\_SYSCONFIG. IDLEMODE. The behavior, listed in the Idle Mode Value column, must be configured by software.

**Table 8-3. Module Idle Mode Settings**

| Idle Mode Value | Selected Mode | Description  |
|-----------------|---------------|--|
| 0x0             | Force-idle    | The module unconditionally acknowledges the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent the loss of data at the time the clock is switched off.   |
| 0x1             | No-idle       | The module never acknowledges any idle request from the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state. |

**Table 8-3. Module Idle Mode Settings (continued)**

| Idle Mode Value | Selected Mode                  | Description  |
|-----------------|--------------------------------|--|
| 0x2             | Smart-idle                     | The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or direct memory access (DMA) requests are processed. This is the best approach to efficient system power management.  |
| 0x3             | Smart-idle wakeup-capable mode | The module acknowledges the idle request basing its decision on its internal wakeup-capable mode activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module wakeup output(s) is implemented. |

The idle status of a slave module is indicated by the CM\_<Powerdomain>\_<Module>\_CLKCTRL[x] IDLEST bit field in the PRCM module.

**Table 8-4. Idle States for a Slave Module**

| IDLEST Bit VALUE | Idle Status    | Description   |
|------------------|----------------|---|
| 0x0              | Functional     | The module is fully functional. The interface and functional clocks are active.                             |
| 0x1              | In transition  | The module is performing a wake-up or a sleep transition.   |
| 0x2              | Interface idle | The module interface clock is idled. The module may remain functional if using a separate functional clock. |
| 0x3              | Full idle      | The module is fully idle. The interface and functional clocks are gated in the module.                      |

For the idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM\_<Power domain>\_<module>\_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the idle request to the module unconditionally (that is, immediately when the software requests).

**Table 8-5. Slave Module Mode Settings in PRCM**

| MODULEMODE Bit VALUE | Selected Mode | Description   |
|----------------------|---------------|---|
| 0x0                  | Disabled      | The PRCM module unconditionally asserts the module idle request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled).. |
| 0x1                  | Reserved      | NA  |

**Table 8-5. Slave Module Mode Settings in PRCM (continued)**

| MODULEMODE Bit VALUE | Selected Mode | Description   |
|----------------------|---------------|---|
| 0x2                  | Enabled       | This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module. |
| 0x3                  | Reserved      | NA  |

In addition to the IDLE and STANDBY protocol, PRCM offers also the possibility to manage optional clocks, through a direct SW control: "OptFclken" bit from programming register.

**Table 8-6. Module Clock Enabling Condition**

| Clock Enabling   |     |                       |                         |
|--|-----|-----------------------|-------------------------|
| Clock associated with STANDBY protocol                   | AND | Clock Domain is ready |                         |
|  |     | OR                    | MStandby is de-asserted |
|  |     |                       | Mwakeup is asserted     |
| Clock associated with IDLE protocol, as interface clock  | AND | Clock Domain is ready |                         |
|  |     | OR                    | Idle status = FUNCT     |
|  |     |                       | Idle status = TRANS     |
| Clock associated with IDLE protocol, as functional clock | AND | Clock Domain is ready |                         |
|  |     | OR                    | Idle status = FUNCT     |
|  |     |                       | Idle status = IDLE      |
| Optional clock   | AND | Clock domain is ready |                         |
|  |     |                       | OptFclken=Enabled ('1') |

### 8.1.3.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module. By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE (GATED) states). Thus, a clock domain allows control of the dynamic power consumption of the device. The device is partitioned into multiple clock domains, and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to individually activate and gate each clock domain of the device.

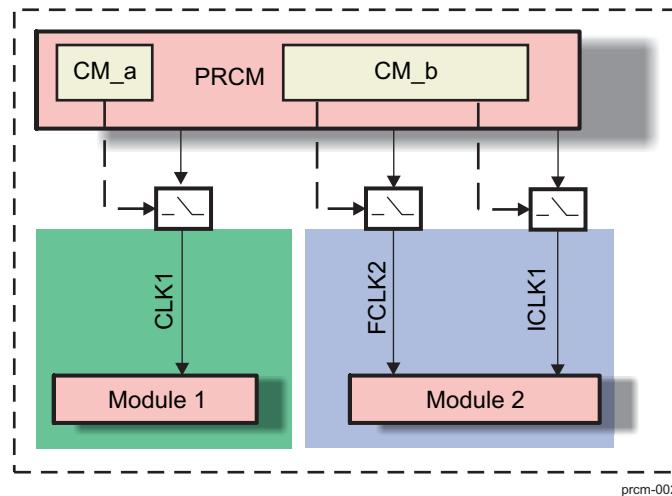

**Figure 8-2. Generic Clock Domain**

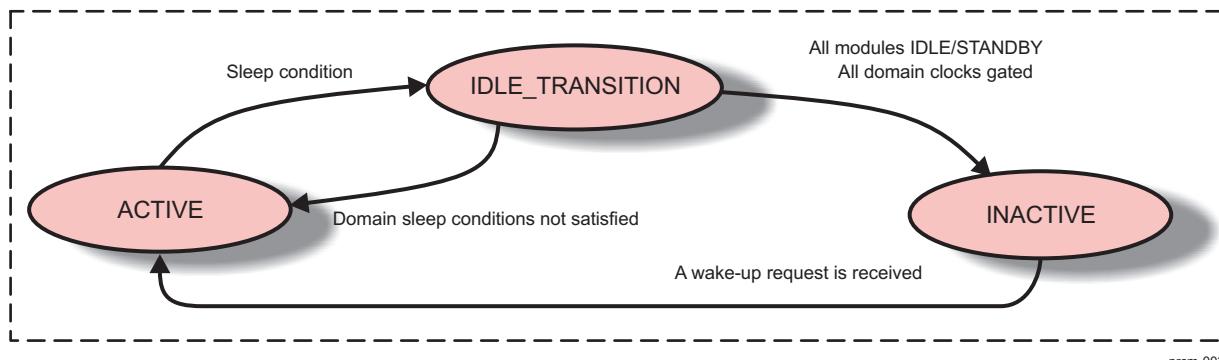

Figure above is an example of two clock managers: CM\_a and CM\_b. Each clock manager manages a clock domain. The clock domain of CM\_b is composed of two clocks: a functional clock (FCLK2) and an interface clock (ICLK1), while the clock domain of CM\_a consists of a clock (CLK1) that is used by the module as a functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use. The PRCM module lets software check the status of the clock domain functional clocks. The CM\_<Clock domain>\_CLKSTCTRL[x] CLKACTIVITY\_<FCLK/Clock name\_FCLK> bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table shows the possible states of the functional clock.

**Table 8-7. Clock Domain Functional Clock States**

| CLKACTIVITY BIT Value | Status | Description  |
|-----------------------|--------|--|
| 0x0                   | Gated  | The functional clock of the clock domain is inactive |
| 0x1                   | Active | The functional clock of the clock domain is running  |

#### 8.1.3.3.1 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings. A clock domain can switch between three possible states: ACTIVE, IDLE\_TRANSITION, and INACTIVE. Figure 8-3 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

**Figure 8-3. Clock Domain State Transitions**

**Table 8-8. Clock Domain States**

| State           | Description   |
|-----------------|---|
| ACTIVE          | <p>Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state.</p> <p>All interface clocks to the nondisabled slave modules in the clock domain are provided. All functional and interface clocks to the active master modules (that is, not in STANDBY) in the clock domain are provided. All enabled optional clocks to the modules in the clock domain are provided.</p> |
| IDLE_TRANSITION | <p>This is a transitory state.</p> <p>Every master module in the clock domain is in STANDBY state.</p> <p>Every idle request to all the slave modules in the clock domain is asserted. The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active.</p> <p>All enabled optional clocks to the modules in the clock domain are provided.</p>                    |
| INACTIVE        | <p>All clocks within the clock domain are gated.</p> <p>Every slave module in the clock is in IDLE state and set to disabled.</p> <p>Every slave module in the clock domain (that is, those whose MODULEMODE is set to disabled) is in IDLE state and set to disabled.</p> <p>Every optional functional clock in the clock domain is gated</p>  |

Each clock domain transition behavior is managed by an associated register bit field in the CM\_<Clock domain>\_CLKSTCTRL[x] CLKTRCTRL PRCM module

**Table 8-9. Clock Transition Mode Settings**

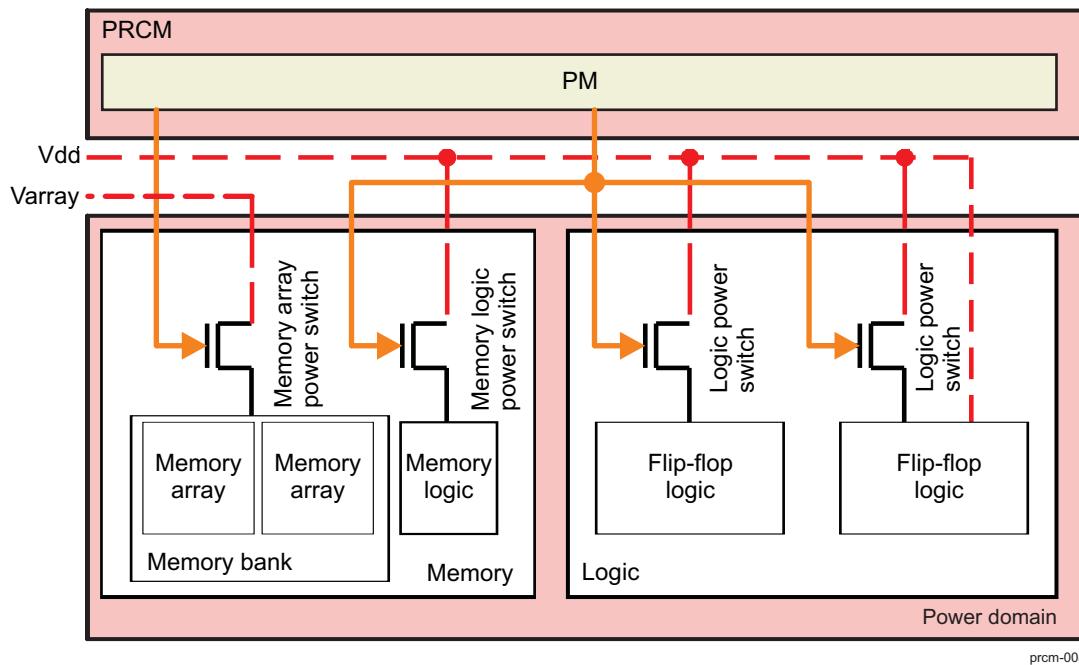

| CLKTRCTRL Bit Value | Selected Mode | Description   |
|---------------------|---------------|---|
| 0x0                 | NO_SLEEP      | Sleep transition cannot be initiated. Wakeup transition may however occur.  |
| 0x1                 | SW_SLEEP      | A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied |
| 0x2                 | SW_WKUP       | A software-forced clock domain wake-up transition is initiated  |
| 0x3                 | Reserved      | NA  |

### 8.1.4 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device allows the PRCM module to turn on and off specific sections of the device without affecting the others.

#### 8.1.4.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see Figure). A power domain can be turned on and off without affecting the other parts of the device.

**Figure 8-4. Generic Power Domain Architecture**

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into a logic area and a memory area.

**Table 8-10. States of a Memory Area in a Power Domain**

| State | Description                                      |
|-------|--|
| ON    | The memory array is powered and fully functional |
| OFF   | The memory array is powered down                 |

**Table 8-11. States of a Logic Area in a Power Domain**

| State | Description   |
|-------|---|
| ON    | Logic is fully powered                                    |
| OFF   | Logic power switches are off. All the logic (DFF) is lost |

#### 8.1.4.2 Power Domain Management

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state.

**Table 8-12. Power Domain Control and Status Registers**

| Register/Bit Field                             | Type    | Description  |
|--|---------|--|
| PM_<Power domain>_PWRSTCTRL[1:0]<br>POWERSTATE | Control | Selects the target power state of the power domain among OFF, ON, or RETENTION.          |
| PM_<Power domain>_PWRSTST[1:0]<br>POWERSTATEST | Status  | Identifies the current state of the power domain. It can be OFF, ON, or RETENTION.       |
| PM_<Power domain>_PWRSTST[2]<br>LOGICSTATEST   | Status  | Identifies the current state of the logic area in the power domain. It can be OFF or ON. |

**Table 8-12. Power Domain Control and Status Registers (continued)**

| Register/Bit Field                           | Type   | Description  |
|--|--------|--|
| PM_<Power domain>_PWRSTST[5:4]<br>MEMSTATEST | Status | Identifies the current state of the memory area in the power domain. It can be OFF, ON, or RETENTION |

#### 8.1.4.2.1 Power-Management Techniques

The following section describes the state-of-the-art power-management techniques supported by the device.

##### 8.1.4.2.1.1 Adaptive Voltage Scaling

AVS is a power-management technique based in Smart Reflex that is used for automatic control of the operating voltages of the device to reduce active power consumption. With Smart Reflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power-supply voltage. AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device

#### 8.1.4.3 Power Modes

The following power modes are for easy reference applicable for typical use cases. The design does not restrict these to be the only modes. In order of the lowest power to the highest power, these modes are named RTC-Only, DeepSleep0, DeepSleep1, DeepSleep2, Standby and Active. All voltage supplies must be maintained for the each of the Deep Sleep, Standby and Active modes. In Active mode, all power domains are ON. In RTC mode, only the supplies to the RTC subsystem are supplied.

The contents of SDRAM are preserved in any of the Deep Sleep/Standby modes. This is done by placing SDRAM in self-refresh prior to entering Deep Sleep.

**Table 8-13. Typical Power Modes**

| Use Case   | Power Mode | Application state   | Power Domain States& Supply Voltages  |
|------------|------------|---|---|
| RTC-Only   |            | Only RTC voltage domain is alive.<br>Optionally, SDRAM can be kept in self-refresh which will reduce the boot time.   | VDD_MPU = 0v<br>VDD_CORE = 0v<br>VDDS_RTC supply is active.<br>Optionally, IO supplies can be left ON   |
| DeepSleep0 |            | PD_PER peripheral & CortexA8 / MPU register information will be lost.<br>On-chip peripheral register (context) information of PD_PER domain needs to be saved by application to SDRAM before entering this mode.<br>SDRAM is in self-refresh. For wakeup, boot ROM executes and branches to peripheral context restore followed by system resume. | Master Oscillator = OFF<br>VDD_MPU = 0.95v<br>VDD_CORE = 0.95v<br>PD_WKUP = ON<br>PD_MPU = OFF<br>PD_PER = OFF<br>PD_GFX = OFF<br>All IO supplies & RTC supplies are ON |
| DeepSleep1 |            | On-chip peripheral registers are preserved.<br>CortexA8 context/registers are lost and hence application needs to save them to MPU Subsystem or L3 OCMC RAM or SDRAM before entering DeepSleep.<br>SDRAM is in self-refresh.<br>For wakeup, boot ROM executes and branch to system resume.  | Master Oscillator = OFF<br>VDD_MPU = 0.95v<br>VDD_CORE = 0.95v<br>PD_WKUP = ON<br>PD_MPU = OFF<br>PD_PER = ON<br>PD_GFX = OFF<br>All IO supplies & RTC supplies are ON  |

**Table 8-13. Typical Power Modes (continued)**

| Use Case   | Power Mode | Application state  | Power Domain States & Supply Voltages   |
|------------|------------|--|---|
| DeepSleep2 |            | Everything is preserved including SDRAM.   | Master Oscillator = OFF<br>VDD_MPU = 0.95v<br>VDD_CORE = 0.95v<br>PD_WKUP = ON<br>PD_MPU = ON<br>PD_PER = ON<br>PD_GFX = OFF<br>All IO supplies & RTC supplies are ON   |
| Standby    |            | Everything is preserved including SDRAM.<br>Only required module clocks are enabled, rest are clock gated. | Master Oscillator = ON<br>One PLL is ON.<br>VDD_MPU = 0.95v<br>VDD_CORE = OPP50<br>PD_WKUP = ON<br>PD_MPU = ON<br>PD_PER = ON<br>PD_GFX = OFF<br>All IO supplies & RTC supplies are ON<br>If more PLLs /power domains/ modules are required, the power will increase accordingly. |
| Active     |            | All Features   | Master Oscillator = ON<br>One or more PLLs are ON<br>VDD_MPU = ON<br>VDD_CORE = ON<br>PD_WKUP = ON<br>PD_MPU = ON<br>PD_PER = ON<br>PD_GFX = ON   |

#### 8.1.4.3.1 Active

In Active mode, the supply to all voltage rails must be maintained. All power domains come up in ON state and the device is fully functional.

#### 8.1.4.3.2 Standby

In Standby mode, the supply to all voltage rails must be maintained. The power consumption can be minimized if the supply voltage placed at its minimum operating voltage. Using Software the required PLL's are made active depending upon wakeup or use case requirements and the rest are placed in low power bypass modes. All non-essential IP blocks are powered down. A peripheral interrupt to CortexM3, will cause it to un-clock gate the A8 after which A8 services the pending interrupt. SDRAM contents are preserved. This is useful for quick standby/resume kind of application.

#### 8.1.4.3.3 DeepSleep0

In DeepSleep0 mode, the supply to all voltage rails are maintained, only the PD\_RTC and PD\_WKUP power domains are ON. The master crystal oscillator is disabled. PD\_MPU is OFF. The contents of OCMC RAM are preserved. Additionally the contents of the SDRAM are preserved by placing the SDRAM in self-refresh. Activity on wake up peripherals via wake up events enables the master crystal oscillator using the oscillator control circuit. Also, the wake up events interrupt CortexM3.

#### 8.1.4.3.4 Deepsleep1

In DeepSleep1 mode, the supply to all voltage rails are maintained, the PD\_RTC, PD\_WKUP & PD\_PER power domains are ON. The PD\_GFX power domain is OFF (but could be optionally ON at the cost of more power). The master crystal oscillator is disabled. The contents of internal SRAM are preserved. Additionally the contents of the SDRAM are preserved by placing the SDRAM in self-refresh. Activity on wake up peripherals via wake up events enables the master crystal oscillator using the oscillator control circuit. Also, the wake up events interrupt CortexM3.

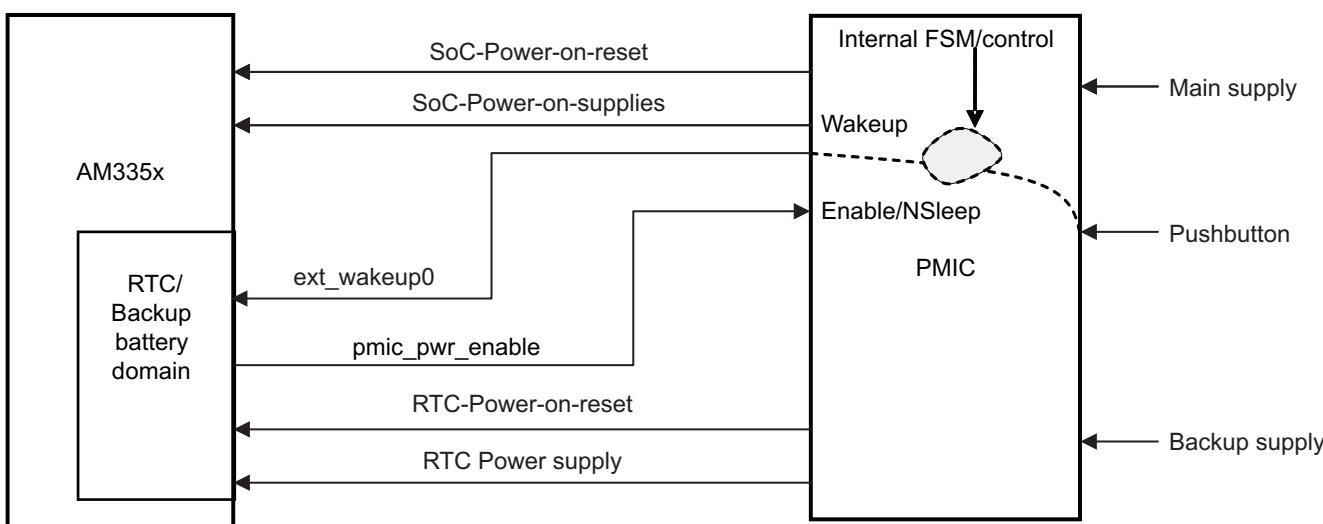

#### 8.1.4.3.5 Deepsleep2

In DeepSleep2 mode, the supply to all voltage rails are maintained, all power domains are ON. The PD\_GFX power domain is OFF (but could be optionally ON at the cost of more power). The master crystal oscillator is disabled. The contents of internal SRAM are preserved. Additionally the contents of the SDRAM are preserved by placing the SDRAM in self-refresh. Activity on wake up peripherals via wake events enables the master crystal oscillator using the oscillator control circuit. Also, the wake events interrupt CortexM3.

#### 8.1.4.3.6 RTC-Only

The following diagram gives a high level view of system which implements the RTC-only mode.

**Figure 8-5. High Level System View for RTC-only Mode**

If RTC-only mode is not required or implemented by the end application, RTC power supply (CAP\_VDD\_RTC) may be connected to VDD\_CORE or a separate 1.1-V power source. In addition, the RTC power-on reset (RTC\_PWRONRSTn) can be connected to the SoC power-on reset (PWRONRSTn) if their power domains are at the same voltage level (i.e., VDDSHV6 is the same voltage as VDDS\_RTC).

The RTC battery backup domain consists of RTCSS (subsystem), a dedicated on-chip 32.768 Hz crystal oscillator and I/Os associated with RTCSS — pmic\_power\_en and ext\_wakeup.

In RTC-only mode, only the RTC power supply is expected to be ON. All the remaining supplies are expected to be OFF. For SDRAM to be in self-refresh during this mode, the CKE pin of the DDR interface needs to have a pulldown on the board.

#### 8.1.4.4 Main Oscillator Control During Deep Sleep

The Deepsleep oscillator circuit is used to control the main oscillator by disabling it during deep sleep and enabling during active/wakeup. By default during reset, the oscillator is enabled and the oscillator control circuit comes up disabled (in-active). In order to activate the oscillator control circuit for deepsleep, DSENABLE bit of DEEPSLEEP\_CTRL register must set. Once this is set and whenever wake M3 enters standby, the oscillator control will disable the oscillator causing the clock to be shut OFF. Any async event from the wakeup sources will cause the oscillator control to re-enable the oscillator after a period of DSCOUNT configured in DEEPSLEEP\_CTRL register.

#### 8.1.4.5 Wakeup Sources/Events

Following events will wake up the device from Deep sleep(low power) modes. These are part of the Wakeup Power domain and remain always ON.

- GPIO0 bank
- dmtimer1\_1ms (timer based wakeup)
- USB2PHY (USB resume signaling from suspend) – Both USB ports supported.
- TSC (touch screen controller, ADC monitor functions )
- UART0 (Infra-red support)
- I2C0

These wake events apply on any of the deep sleep modes and standby mode.

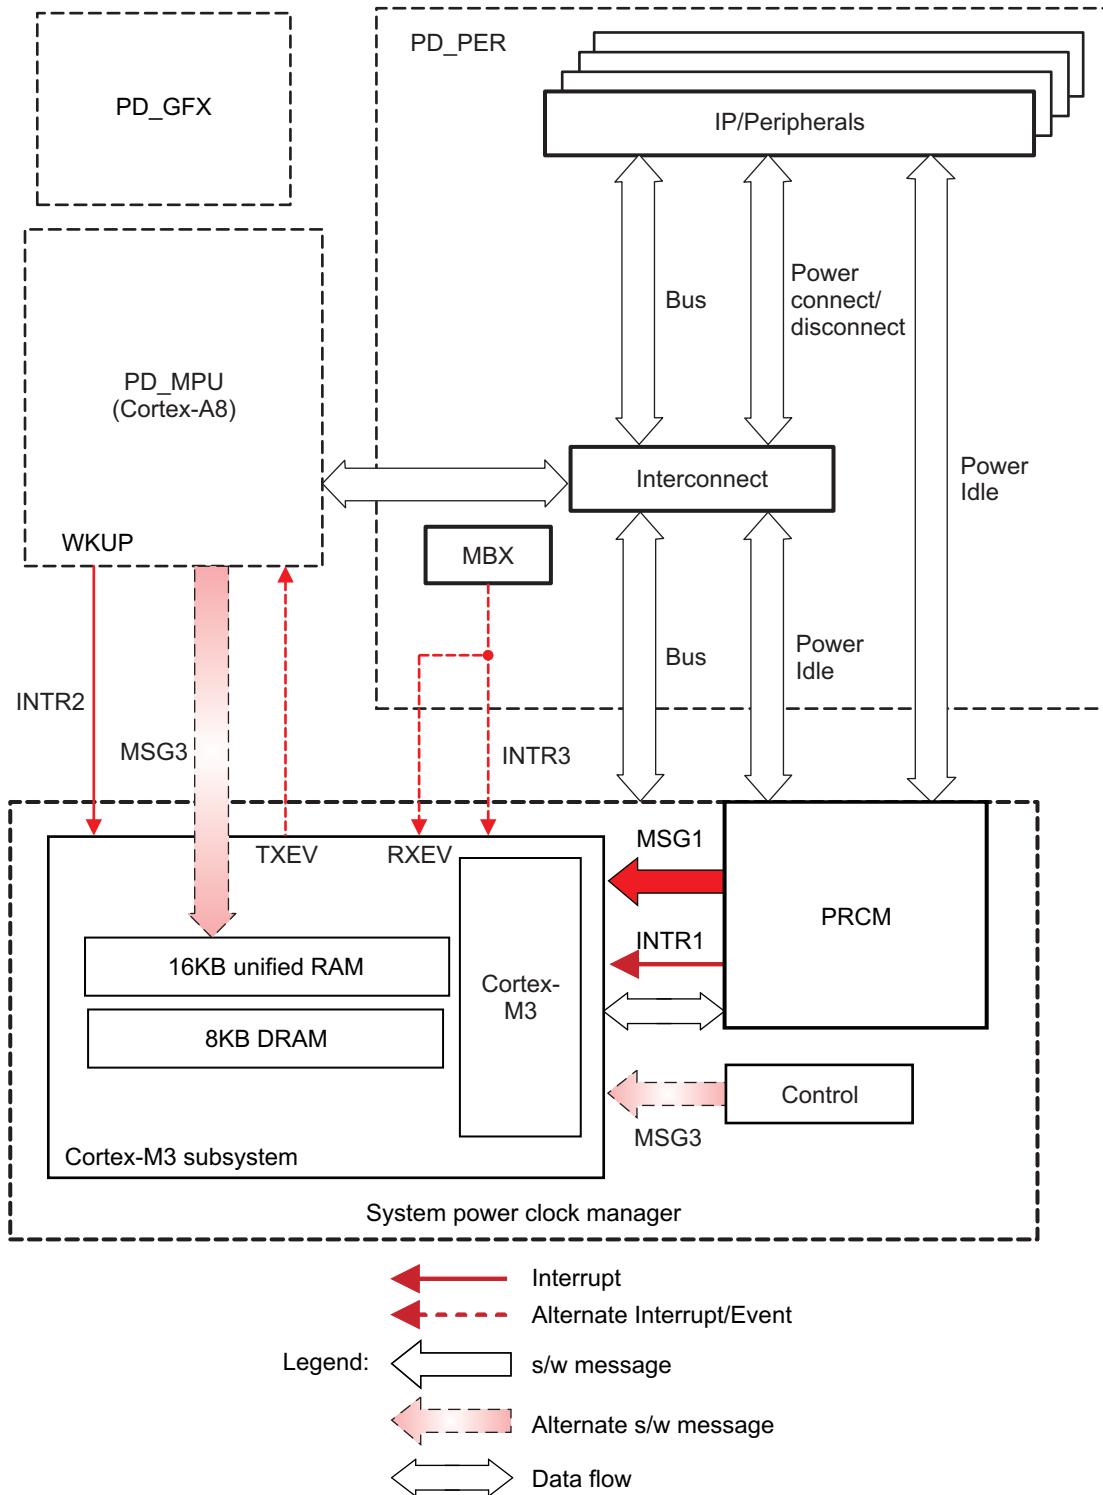

#### 8.1.4.6 Functional Sequencing for Power Management with Cortex M3

The AM335x device contains a dedicated Cortex M3 processor to handle the power management transitions. It is part of the Wake up Power domain (PD\_WKUP). Implementing the Power modes are part of the MPU and Cortex A8 processors.

The power management sequence kicks off with Cortex A8 MPU executing a WFI instruction with the following steps:

1. During Active power mode, the Cortex A8 MPU executes a WFI instruction to enter IDLE mode.
2. Cortex M3 gets an interrupt and gets active, It powers down the MPU power domain( if required).
3. Registers interrupt for the Wake up peripheral(which is listed in Wake up sources in previous section).
4. Executes WFI and goes into idle state.
5. The wake up event triggers an interrupt to Cortex M3 system and it wakes up the Cortex A8 MPU.

Generally, A8 and CortexM3 are not expected to be active at the same time CortexM3 along with PRCM is the power manager primarily for PD\_MPU and PD\_PER. Other power domains (e.g., PD\_GFX) may be handled directly using Cortex A8 MPU software. [Figure 8-6](#) gives a system level view of the Power management system between Cortex A8 MPU and Cortex M3.

**Figure 8-6. System Level View of Power Management of Cortex A8 MPU and Cortex M3**

**Table 8-14. M3 Interrupts 1–3**

| Interrupt Name       | Interrupt Number in M3 | Explanation   |
|----------------------|------------------------|---|
| INTR1 (PRCM_M3_IRQ1) | 16                     | Generated by PRCM when MPU power domain is clock gated. |
| INTR2 (PRCM_M3_IRQ2) | 34                     | Generated by wakeup events                              |

**Table 8-14. M3 Interrupts 1–3 (continued)**

| Interrupt Name | Interrupt Number in M3 | Explanation             |
|----------------|------------------------|-------------------------|
| INTR3 (MBINTO) | 31                     | Mailbox interrupt to M3 |

#### 8.1.4.6.1 Periodic Idling of Cortex A8 MPU

To implement Cortex A8 MPU periodic ON/OFF in the use case, the control flow could be implemented according to the following steps:

1. Cortex A8 MPU executes WFI instruction
2. Any peripheral interrupt in any of the next steps will trigger a wake interrupt to CortexM3 via MPU Subsystem's WKUP signal (INTR2 shown on the diagram). Cortex M3 powers down the MPU(PD\_MPUMPU)
3. On receiving an interrupt Cortex M3 switches ON the MPU power domain by turning on PD\_MPUMPU
4. Cortex M3 goes into idle mode using WFI instruction

#### 8.1.4.6.2 Sleep Sequencing

This section gives the system level guidelines for sleep sequencing. The guidelines can serve as an example for implementing the sleep mode sequencing. The user can opt to implement a sequence with certain steps interchanged between the MPU and Cortex M3 processor.

1. Application saves context of peripherals to memories supporting retention and DDR – this step is only required for DeepSleep0.
2. MPU OCMC\_RAM remains in retention
3. Unused power domains are turned OFF - program clock/power domains PWRSTCTRL, save contexts etc
4. Software populates L3\_OCMC\_RAM for wakeup restoration viz Save EMIF settings, public restoration pointers, etc.
5. Execute WFI from SRAM
6. Any peripheral interrupt will trigger a wake interrupt to CortexM3 via Cortex A8 MPU's WKUP signal (INTR2 shown on the diagram).
7. After MPU power domain is clock gated PRCM will provide an interrupt to CortexM3 (using INTR1 shown in the block diagram)
8. CortexM3 starts execution as follows:
  - CortexM3 configures PLL / HSDIVIDER power down States (bypass modes). During Idle bypass mode (low power mode) the PLL / HSDIVIDER goes into bypass and provides the clock outputs directly from the oscillator clock.
  - CortexM3 disables IP/Peripheral/Interconnects based on MSG1/MSG2/MSG3 sconnect/disconnect/Idle protocol kicks off and completes
  - PRCM turns OFF power domains based on MSG1/MSG2/MSG3 Only applicable for DeepSleep0 & DeepSleep1.
  - CortexM3 lowers the PMIC voltage to OPP50 voltage
  - CortexM3 configures I/O PADs for lowest power as dictated by CortexA8 using MSG2/MSG3
  - CortexM3 goes into WFI
9. Hardware oscillator control circuit disables the oscillator once CortexM3 goes into WFI

#### 8.1.4.6.3 Wakeup Sequencing

This section gives the guidelines for Wakeup sequencing.

1. One of the wakeup event triggers (which was configured during the sleep sequencing) will initiate a wakeup sequence
2. The wake up event will switch on the oscillator (if it was configured to go OFF during sleep)

3. The wake up event will also trigger interrupt to Cortex M3
4. On the wakeup event due to interrupt Cortex M3 execute the following
  - Restore the voltages to normal Operating voltage
  - Enable PLL locking
  - Cortex M3 will switch ON the power domains and/or enable clocks for PD\_PER
  - Cortex M3 will switch ON the power domains and/or enable clocks for PD\_MPU
  - Executes WFI
5. Cortex A8 MPU starts executing from ROM reset vector
6. Restore the application context(only for Deep sleep 0)

### **8.1.5 PRCM Module Overview**

The PRCM is structured using the architectural concepts presented in the 5000x Power Management Framework. This framework provides:

A set of modular, re-usable FSM blocks to be assembled into the full clock and power management mechanism. A register set and associated programming model. Functional sub-block definitions for clock management, power management, system clock source generation, and master clock generation.

The device supports an enhanced power management scheme based on four functional power domains:

#### **Generic Domains**

- WAKEUP
- MPU
- PER
- RTC

The PRCM provides the following functional features:

- Software configurable for direct, automatic, or a combination thereof, functional power domain state transition control
- Device power-up sequence control
- Device sleep / wake-up sequence control
- Centralized reset generation and management
- Centralized clock generation and management

The PRCM modules implement these general functional interfaces:

- OCP configuration ports
- Direct interface to device boundary
- Power switch control signals
- Device control signals
- Clocks control signals
- Resets signals
- A set of power management protocol signals for each module to control and monitor standby, idle and wake-up modes (CM and PRM)
- Emulation signals

#### **8.1.5.1 Interface Descriptions**

This section lists and shortly describes the different interfaces that allow PRCM to communicate with other modules or external devices.

### 8.1.5.1.1 OCP Interfaces

The PRCM has 1 target OCP interfaces, compliant with respect to the OCP/IP2 standard. The OCP port, for the PRCM module is used to control power, reset and wake-up Management.

### 8.1.5.1.2 OCP Slave Interfaces

PRCM implements a 32-bit OCP target interface compliant to the OCP/IP2.0 standard.

### 8.1.5.1.3 Power Control Interface

The Device does has power domain switches over the device, this interface provides PRCM control over power domain switches and receives responses from the power domains which indicate the switch status. It also controls the isolation signals. The control for power domain switches will be latched in PRCM Status Registers

### 8.1.5.1.4 Device Control Interface

This interface provides PRM management of several device-level features which are not specific to any single power domain. This PRM interface controls signals to/from the device for global control:

- Device Type coding
- IOs isolation control

### 8.1.5.1.5 Clocks Interface

This interface gathers all clock inputs and outputs managed by PRCM modules.

### 8.1.5.1.6 Resets Interface

This interface gathers all resets inputs and outputs managed by PRCM module.

### 8.1.5.1.7 Modules Power Management Control Interface

Modules or subsystems in the device are split over 2 categories:

- Initiator: an initiator is a module able to generate traffic on the device interconnects (typically: processors, MMU, EDMA).
- Target: a target is a module that cannot generate traffic on the device interconnects, but that can generate interrupts or DMA request to the system (typically: peripherals). PRCM handles a power management handshake protocol with each module or sub-system. This protocol allows performing proper clock and power transition taking into account each module activity or state.

### 8.1.5.1.8 Initiator Modules Interface

PRCM module handle all initiator modules power management interfaces: MStandby signal MWait signal

### 8.1.5.1.9 Targets Modules Interface

PRCM module handle all target modules power management interfaces: SIdleReq signal SIdleAck signal FCLKEN signal

**Note:** USB Support for SWakeUp

## 8.1.6 Clock Generation and Management

PRCM provides a centralized control for the generation, distribution and gating of most clocks in the device. PRCM gathers external clocks and internally generated clocks for distribution to the other modules in the device. PRCM manages the system clock generation

### 8.1.6.1 Terminology

The PRCM produces 2 types of clock:

**Interface clocks:** these clocks primarily provide clocking for the system interconnect modules and the portions of device's functional modules which interface to the system interconnect modules. In most cases, the interface clock supplies the functional module's system interconnect interface and registers. For some modules, interface clock is also used as functional clock. In this document, interface clocks are represented by blue lines.

**Functional clock:** this clock supplies the functional part of a module or a sub-system. In some cases, a module or a subsystem may require several functional clocks: 1 or several main functional clock(s), 1 or several optional clock(s). A module needs its main clock(s) to be operational. Optional clocks are used for specific features and can be shutdown without stopping the module

#### 8.1.6.2 Clock Structure

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types of PLLs, referred to ADPLLs and ADPLLJ throughout this document.

The ADPLLs module is used for the Core, Display, ARM Subsystem and DDR PLLs

The ADPLLJ module is used for the peripheral functional clocks

The device has two reference clocks which are generated by on-chip oscillators or externally. These are for the main clock tree and RTC block, respectively.

In the case of an external oscillator, a clock can directly be connected to XTALIN pin and the oscillator will be put in bypass mode. The 32-Khz crystal oscillator is controlled and configurable by RTC IP. This device also contains an on-chip RC oscillator. This oscillator is not configurable but may be enabled or disabled through the Control Module *RCOSC\_CTRL* register.

The main oscillator on the device (see [Chapter 26, Initialization](#), for possible frequencies) produces the master high frequency clock CLK\_M\_OSC.

#### 8.1.6.3 ADPLLs

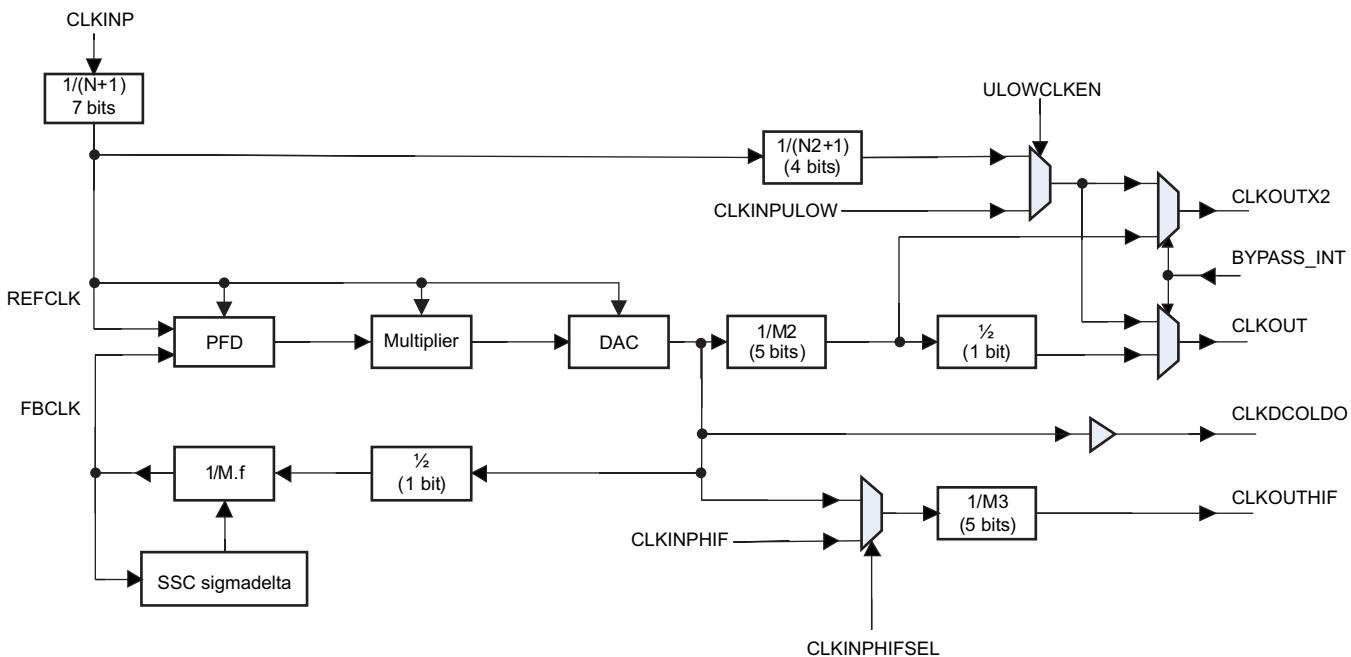

The ADPLLs is a high resolution frequency synthesizer PLL with built in level shifters which allows the generation of PLL locked frequencies up to 2 GHz. ADPLLs has a predivide feature which allows user to divide, for instance, a 24- or 26-MHz reference clock to 1-MHz and then multiply up to 2-GHz maximum.

All PLLs will come-up in bypass mode at reset. SW needs to program all the pll settings appropriately and then wait for PLL to be locked. For more details, see the configuration procedure for each PLL.

The following PLLs are:

- MPU PLL
- Core PLL
- Display PLL
- DDR PLL

Figure 8-7. ADPLLS

The ADPLLS has three input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Low frequency input clock for bypass mode only.
- CLKINPHIF: High Frequency Input Clock for post-divider M3

The ADPLLS has four output clocks:

- CLKOUTHIF: High Frequency Output Clock from Post divider M3
- CLKOUTX2: Secondary 2x Output
- CLKOUT: Primary output clock
- CLKDCOLDO: Oscillator (DCO) output clock with no bypass

The DPLL has two internal clocks:

- REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK.  
Here,  $\text{REFCLK} = \text{CLKINP}/(\text{N}+1)$ .
- BCLK: Bus clock which is used for programming the various settings using registers

The ADPLLS lock frequency is defined as follows:  $f_{\text{DPLL}} = (\text{M} * \text{CLKINP})/(\text{N}+1)$

### 8.1.6.3.1 Clock Functions

Table 8-15. Output Clocks in Locked Condition

| Pin Name            | Frequency  | Comments                  |
|---------------------|--|---------------------------|
| <b>REGM4XEN='0'</b> |  |                           |

**Table 8-15. Output Clocks in Locked Condition (continued)**

| Pin Name  | Frequency                          | Comments         |
|-----------|------------------------------------|------------------|
| CLKOUT    | [4M / (N+1)] * CLKINP * [1/M2]     |                  |
| CLKOUTX2  | 2 * [4M / (N+1)] * CLKINP * [1/M2] |                  |
| CLKDCOLDO | 2 * [4M / (N+1)] * CLKINP          |                  |
| CLKOUTHIF | CLKINPHIF / M3                     | CLKINPHIFSEL='1' |
|           | 2 * [4M / (N+1)] * CLKINP * [1/M3] | CLKINPHIFSEL='0' |

**Table 8-16. Output Clocks Before Lock and During Relock Modes**

| Pin Name  | Frequency       | Comments      |
|-----------|-----------------|---------------|
| CLKOUT    | CLKINP / (N2+1) | ULOWCLKEN='0' |
|           | CLKINPULOW      | ULOWCLKEN='1' |
| CLKOUTX2  | CLKINP / (N2+1) | ULOWCLKEN='0' |
|           | CLKINPULOW      | ULOWCLKEN='1' |
| CLKDCOLDO | Low             |               |
| CLKOUTHIF | CLKINPHIF/M3    | ULOWCLKEN='1' |
|           | Low             | ULOWCLKEN='0' |

**Note:** Since M3 divider is running on the internal LDO domain, in the case when CLKINPHIFSEL='1', CLKOUTHIF could be active only when internal LDO is ON. Hence, whenever LDOPWDN goes low to high to powerdown LDO (happens when TINITZ activated / when entering slow relock bypass mode), output CLKOUTHIF will glitch and stop. To avoid this glitch, it is recommended to gate CLKOUTHIF using control CLKOUTHIFEN before asserting TINITZ / entering any slow relock bypass mode Frequency Range (MHz)

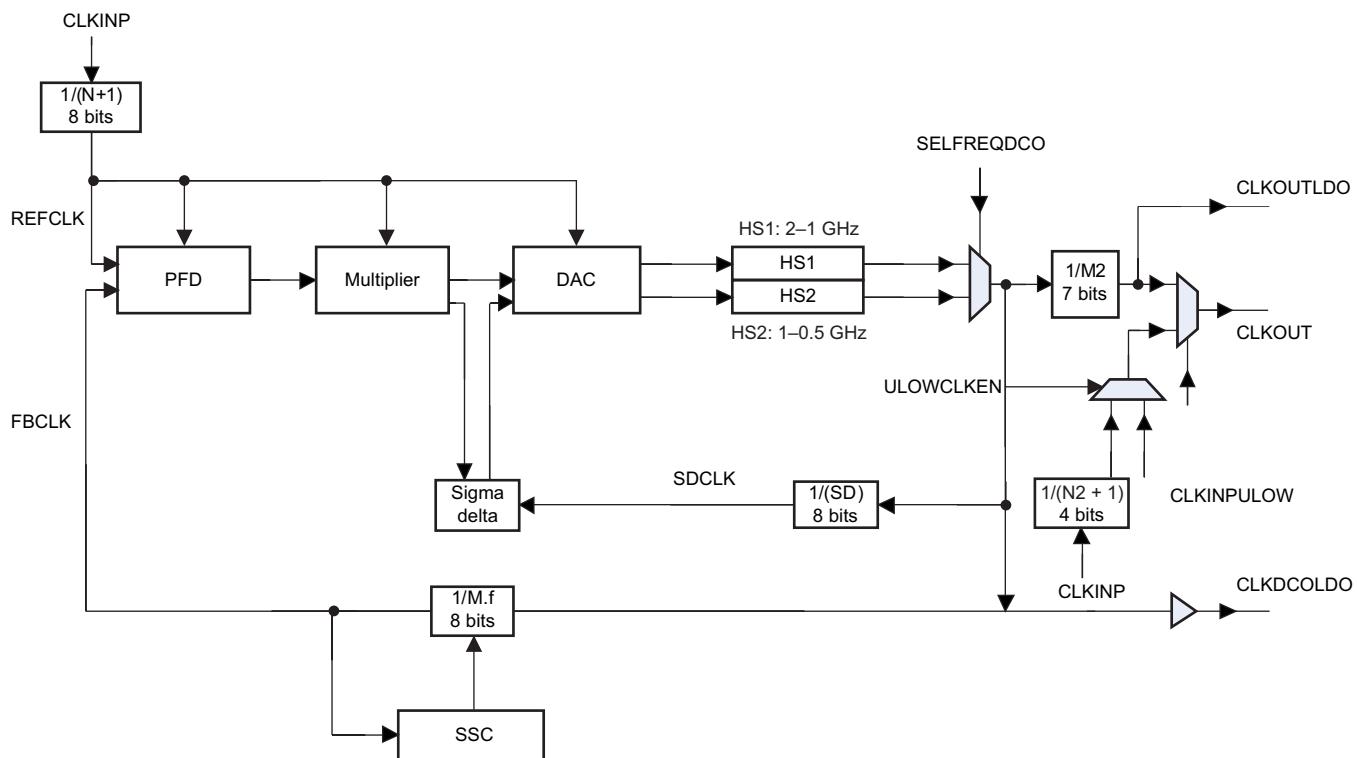

See the device-specific data manual for details on operating performance points (OPPs) supported by your device.

#### 8.1.6.4 ADPLLJ (Low Jitter PLL)

The ADPLLJ is a low jitter PLL with a 2-GHz maximum output. ADPLLJ has a predivide feature which allows user to divide, for instance, a 24-MHz or 26-MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum.

All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked. For more details, see the configuration procedure for each PLL.

Figure 8-8. Basic Structure of the ADPLLJ

The Peripheral PLL belongs to type ADPLLJ:

The DPLL has two input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Bypass input clock.

The DPLL has two internal clocks:

- REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK.  
Here,  $\text{REFCLK} = \text{CLKINP}/(\text{N}+1)$ .
- CLKDCO (Internal Oscillator clock.): This is the raw clock directly out of the digitally controlled oscillator (DCO) before the post-divider. The PLL output clock is synthesized by an internal oscillator which is phase locked to the refclk. There are two oscillators built within ADPLLJ. The oscillators are user selectable based on the synthesized output clock frequency requirement. In locked condition,  $\text{CLKDCO} = \text{CLKINP} * [\text{M}/(\text{N}+1)]$ .

The ADPLLJ lock frequency is defined as follows:  $f_{\text{DPLL}} = (\text{M} * \text{CLKINP})/(\text{N}+1)$

The DPLL has three external output clocks:

- CLKOUTLDO: Primary output clock in VDDLDOOUT domain. Bypass option not available on this output.

$$\text{CLKOUTLDO} = (\text{M} / (\text{N}+1)) * \text{CLKINP} * (1/\text{M}2)$$

- CLKOUT:

Primary output clock on digital core domain

$$\text{CLKOUT} = (\text{M} / (\text{N}+1)) * \text{CLKINP} * (1/\text{M}2)$$

- CLKDCOLDO:

Oscillator (DCO) output clock before post-division in VDDLDOOUT domain. Bypass option is not available on this output.

$$\text{CLKDCOLDO} = (\text{M} / (\text{N}+1)) * \text{CLKINP}.$$

All clock outputs of the DPLL can be gated. The Control module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. Output clock gating control for various clockouts:  
**CLKOUTEN/CLKOUTLDOEN/CLKDCOLDOEN.**

#### 8.1.6.4.1 Clock Functions

**Table 8-17. Output Clocks in Locked Condition**

| Pin Name  | Frequency                    |
|-----------|------------------------------|
| CLKOUT    | [M /(N+1)] * CLKINP * [1/M2] |
| CLKOUTLDO | [M /(N+1)] * CLKINP * [1/M2] |
| CLKDCOOUT | [M /(N+1)] * CLKINP          |

**Table 8-18. Output Clocks Before Lock and During Relock Modes**

| Pin Name  | Frequency     | Comments      |
|-----------|---------------|---------------|
| CLKOUT    | CLKINP/(N2+1) | ULOWCLKEN='0' |
|           | CLKINPLOW     | ULOWCLKEN='1' |
| CLKDCOLDO | LOW           |               |
| CLKOUTLDO | LOW           |               |

#### 8.1.6.5 M2 and N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly and provide a glitch-free frequency switch from the old to new frequencies. In other words, they can be changed while the PLL is in a locked condition, without having to switch to bypass mode. A status toggle bit will give an indication if the new divisor was accepted. These dividers can also be changed in bypass mode, and the new divisor value will be reflected on output after the PLL relocks. For more details, see the PLL configuration procedures for each PLL.

#### 8.1.6.6 Spread Spectrum Clocking (SSC)

The module supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce any electromagnetic interference (EMI) that may be caused due to the clock's fundamental or any of its harmonics. When SSC is enabled the clock's spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread ( $\Delta f$ ) and the modulation frequency ( $f_m$ ), i.e.,  $\{[10^{\log_{10}(Df/f_m)}] - 10\}$  dB.

SSC is performed by changing the feedback divider (M) in a triangular pattern. Implying, the frequency of the output clock would vary in a triangular pattern. The frequency of this pattern would be modulation frequency ( $f_m$ ). The peak ( $\Delta M$ ) or the amplitude of the triangular pattern as a percent of M would be equal to the percent of the output frequency spread ( $\Delta f$ ); that is,  $\Delta M/M = \Delta f / f_c$ . Next mark with  $F_{in}$  the frequency of the clock signal at the input of the DPLL. Because it is divided to N+1 before entering the phase detector, so the internal reference frequency is  $F_{ref} = F_{in} / (N + 1)$ .

Assume the central frequency  $f_c$  to be equal to the DPLL output frequency  $F_{out}$ , or  $f_c = F_{out} = (F_{in} / (N + 1)) * (M / M2)$ . Since this is in band modulation for the DPLL, the modulation frequency is required to be within the DPLL's loop bandwidth (lowest BW of  $F_{ref} / 70$ ). A higher modulation frequency would result in lesser spreading in the output clock.

SSC can be enabled/disabled using bit CM\_CLKMODE\_DPLL\_xxx.DPLL\_SSC\_EN (where xxx can be any one of the following DPLLS: MPU, DDR, DISP, CORE, PER). An acknowledge signal CM\_CLKMODE\_DPLL\_xxx.DPLL\_SSC\_ACK notifies the exact start and end of SSC. When SSC\_EN is de-asserted, SSC is disabled only after completion of one full cycle of the triangular pattern given by the modulation frequency. This is done in order to maintain the average frequency.

Modulation frequency ( $f_m$ ) can be programmed as a ratio of  $Fref / 4$ ; that is, the value that needs to be programmed  $ModFreqDivider = Fref / (4*f_m)$ . The ModFreqDivider is split into Mantissa and 2^Exponent ( $ModFreqDivider = ModFreqDividerMantissa * 2^{ModFreqDividerExponent}$ ). The mantissa is controlled by 7-bit signal `ModFreqDividerMantissa` through `CM_SSC_MODFREQDIV_DPLL_xxx.MODFREQDEV_MANTISSA` bit field. The exponent is controlled by 3bit signal `ModFreqDividerExponent` through the `CM_SSC_MODFREQDIV_DPLL_xxx.MODFREQDEV_EXPONENT` bit field.

**Note:** Although the same value of `ModFreqDivider` can be obtained by different combinations of mantissa and exponent values, it is recommended to get the target `ModFreqDivider` by programming maximum mantissa and a minimum exponent. To define the Frequency spread ( $\Delta f$ ),  $\Delta M$  must be controlled as explained previously. To define  $\Delta M$ , the step size of  $M$  for each  $Fref$  during the triangular pattern must be programmed; that is,

$$\begin{aligned} \Delta M &= (2^{ModFreqDividerExponent}) * ModFreqDividerMantissa * DeltaMStep \text{ IF} \\ ModFreqDividerExponent \leq 3 &\Delta M = 8 * ModFreqDividerMantissa * DeltaMStep \text{ IF} \\ ModFreqDividerExponent > 3 & \end{aligned}$$

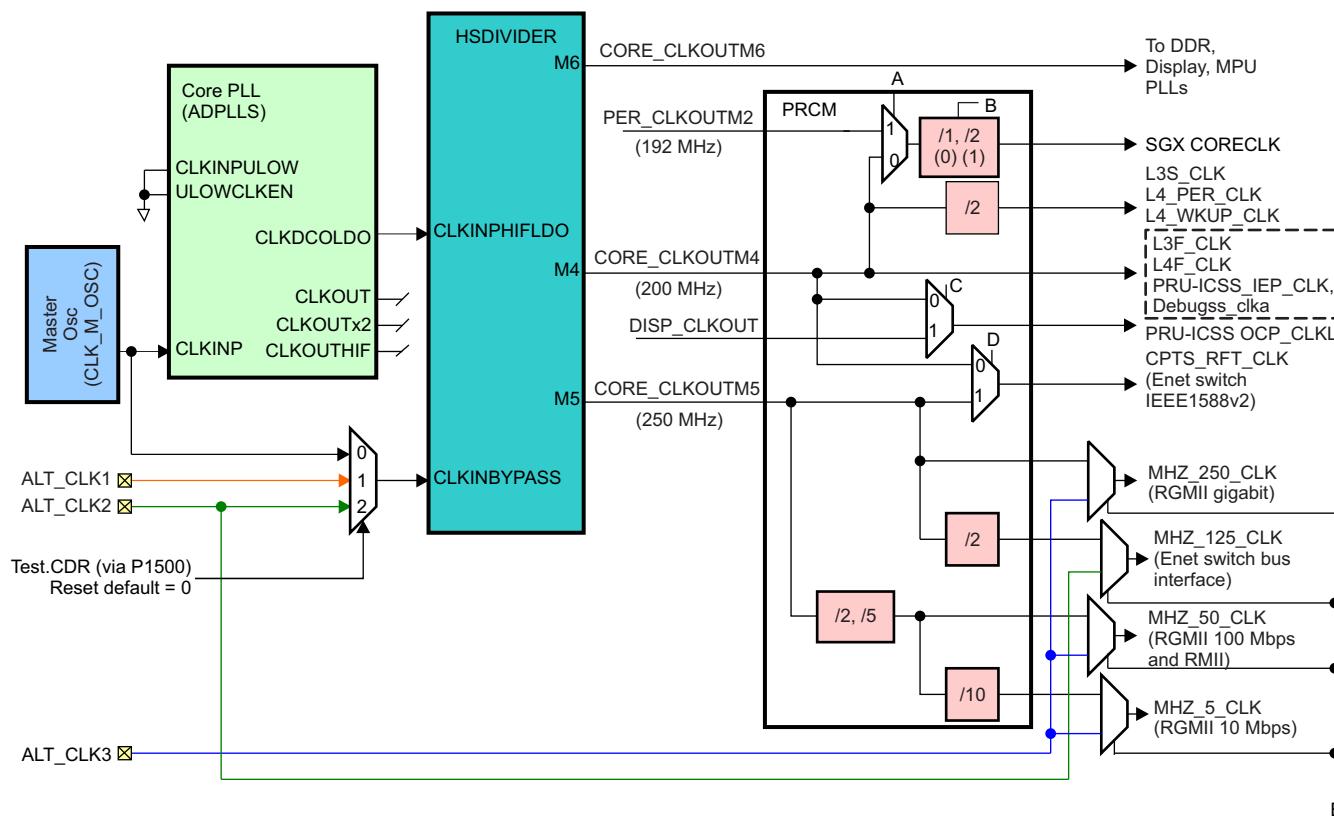

`DeltaMStep` is split into integer part and fractional part. Integer part is controlled by 2-bit signal `DeltaMStepInteger` through the `CM_SSC_DELTAMSTEP_DPLL_xxx.DELTAMSTEP_INTEGER` bit field. Fractional part is controlled by 18-bit signal `DeltaMStepFraction` through the `CM_SSC_DELTAMSTEP_DPLL_xxx.DELTAMSTEP_FRACTION` bit field.

The frequency spread achieved has an overshoot of 20 percent or an inaccuracy of +20 percent. If the `CM_CLKMODE_DPLL.DPLL_SSC_DOWNSPREAD` is set to 1, the frequency spread on lower side is twice the programmed value. The frequency spread on higher side is 0 (except for the overshoot as described previously).

There is restriction of range of  $M$  values. The restriction is  $M - \Delta M \geq 20$ . Also,  $M + \Delta M \leq 2045$ . In case the downspread feature is enabled,  $M - 2 * \Delta M \geq 20$  and  $M \leq 2045$ .

### 8.1.6.7 Core PLL Description

The Core PLL provides the source for a majority of the device infrastructure and peripheral clocks. The Core PLL comprises an ADPLLs with HSDIVIDER and additional dividers and muxes located in the PRCM as shown in [Figure 8-9](#).

**Figure 8-9. Core PLL**

ALT\_CLKs are to be used for internal test purpose and should not be used in functional mode.

**Table 8-19. PLL and Clock Frequencies**

| Mux Select | Register Bit Section 9.2.4.4    |
|------------|---------------------------------|
| A          | PRCM.CLKSEL_GFX_FCLK[1]         |
| B          | PRCM.CLKSEL_GFX_FCLK[0]         |
| C          | PRCM.CLKSEL_PRU-ICSS_OCP_CLK[0] |
| D          | PRCM.CM_CPTS_RFT_CLKSEL[0]      |
| E          | TEST.CDR (via P1500)            |

**Table 8-20** gives the typical PLL and clock frequencies. The HSDIVIDER is used to generate three divided clocks M4, M5 & M6. M4 & M5 are nominally 200 & 250 MHz, respectively.

**Table 8-20. Core PLL Typical Frequencies (MHz)**

| CLOCK  | Source         | Power-On-Reset / HSDIVIDER Bypass |                | OPP100    |            | OPP50 <sup>(1)</sup> |            |

<sup>(1)</sup> Not all interfaces and peripheral modules are available in OPP50. For more information, see the device specific datasheet.

The ADPLLS module supports two different bypass modes via their internal MNBypass mode and their external Low Power Idle bypass mode. The PLLs are in the MNBypass mode after power-on reset and can be configured by software to enter Low Power Idle bypass mode for power-down.

When the Core PLL is configured in bypass mode, the HSDIVIDER enters bypass mode and the CLKINBYPASS input is driven on the M4, M5, and M6 outputs. CLKINBYPASS defaults to the master oscillator input (typically 24 MHz).

#### 8.1.6.7.1 Core PLL Configuration

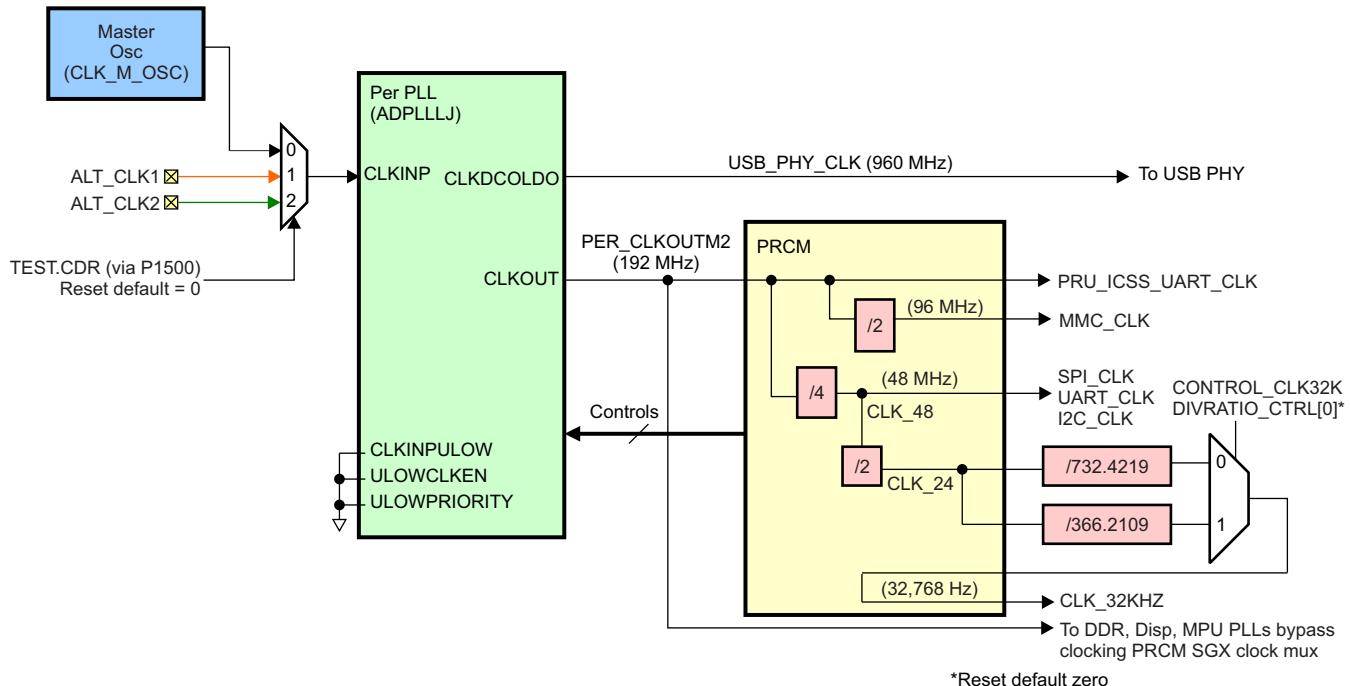

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_CORE.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_CORE.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_CORE.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_CORE.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M4, M5 and M6 dividers by setting HSDIVIDER\_CLKOUT1\_DIV bits in CM\_DIV\_M4\_DPLL\_CORE, CM\_DIV\_M5\_DPLL\_CORE, and CM\_DIV\_M6\_DPLL\_CORE to the desired values.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_CORE.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_CORE.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_CORE.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M4, M5, and M6 dividers can also be changed on-the-fly so that there is no need to put the PLL in bypass and back to lock mode. After changing CM\_DIV\_Mx\_DPLL\_CORE.DPLL\_CLKOUT1\_DIV, check CM\_DIV\_Mx\_DPLL\_CORE.DPLL\_HSDIVIDER\_CLKOUT1\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

#### 8.1.6.8 Peripheral PLL Description

The Per PLL provides the source for peripheral functional clocks. The Per PLL comprises an ADPLLJ and additional dividers and muxes located in the PRCM as shown

Figure 8-10. Peripheral PLL Structure

ALT\_CLKs are to be used for internal test purpose and should not be used in functional mode.

The PLL is locked at 960 MHz. The PLL output is divided by the M2 divider to generate a 192-MHz CLKOUT. This clock is gated in the PRCM to form the PRU-ICSS UART clock. There is a /2 divider to create 96 MHz for MMC\_CLK. The clock is also divided within the PRCM by a fixed /4 divider to create a 48-MHz clock for the SPI, UART and I2C modules. The 48-MHz clock is further divided by a fixed /2 divider and a fixed /732.4219 divider to create an accurate 32.768-KHz clock for Timer and debounce use.

Table 8-22. Per PLL Typical Frequencies (MHz)

| Clock                      | Source   | Power-On-Reset / PLL Bypass |                       | OPP100    |            | OPP50     |            |

| CLK_24                     | CLK_48   | 2                           | CLK_48 /2             | 2         | 24         | 2         | 12         |
| CLK_32KHz                  | CLK_24 (output of CLK_48/2)  | 732.4219                    | CLK_24 / <CLK32_DIV>  | 732.4219  | 0.032768   | 366.2109  | 0.032768   |

The ADPLLJ module supports two different bypass modes via their internal MNBypass mode and their external Low Power Idle bypass mode. The PLLs are in the MNBypass mode after power-on reset and can be configured by software to enter Low Power Idle bypass mode for power-down.

The PER PLL can use the Low Power Idle bypass mode. When the internal bypass mode is selected, the CLKOUT output is driven by CLKINP/(N2+1) where N2 is driven by the PRCM. CLKINP defaults to the master oscillator input (typically 24 MHz)

#### 8.1.6.8.1 Configuring the Peripheral PLL

The following steps detail how to configure the peripheral PLL.

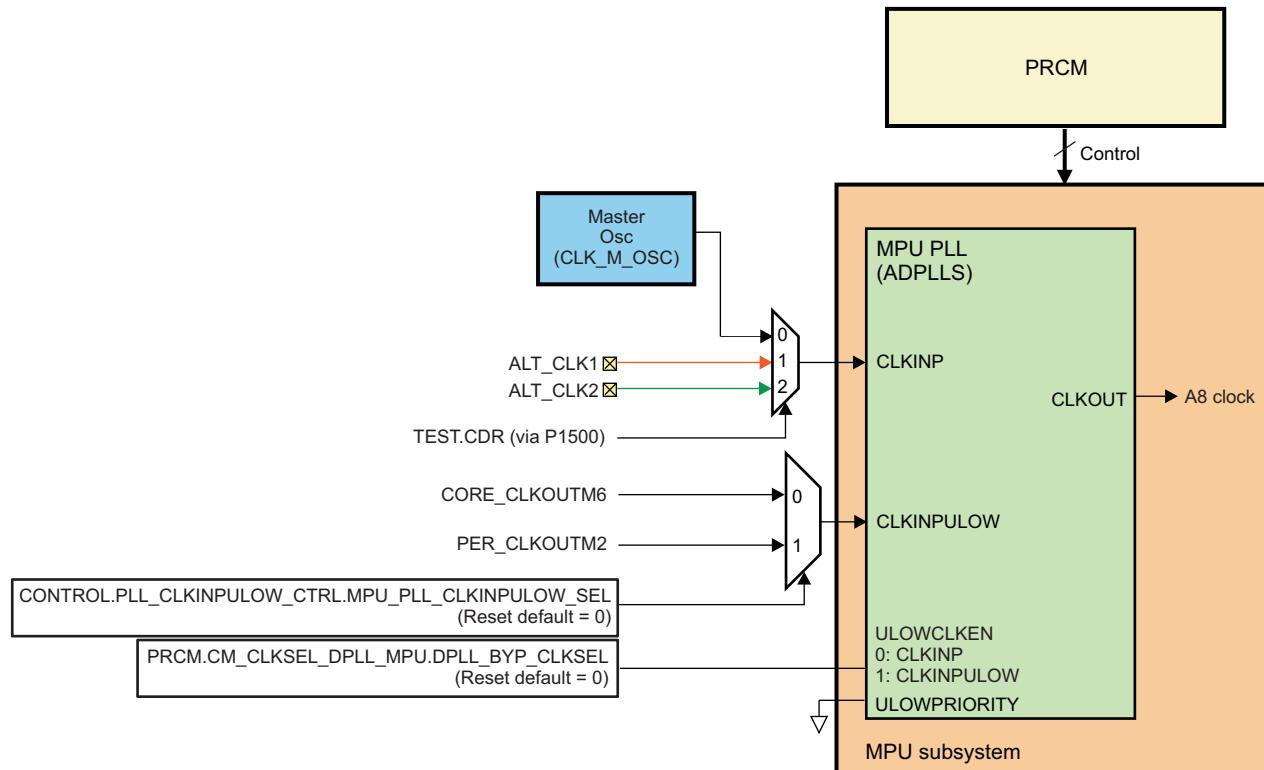

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_PER.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_PER.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_PER.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_PER.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_PER.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_PER.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_PER.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_PER.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (ie., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_PER.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_PER.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

#### 8.1.6.9 MPU PLL Description

The Cortex A8 MPU subsystem includes an internal ADPLLS for generating the required Cortex A8 MPU clocks. This PLL is driven by the master oscillator output with control provided by PRCM registers.

Figure 8-11. MPU Subsystem PLL Structure

For example:

For a frequency for MPU, say 600 MHz, the ADPLLs is configured (PLL locked at 1200 MHz and M2 Divider =1) so as to expect CLKOUT = 600 MHz .

The ULOWCLKEN input from a programmable PRCM register selects whether CLKINP or CLKINPULOW is the bypass clock source. This is a glitch free switch. When CLKINP is selected it is sourced through the ADPLLs 1/(N2+1) divider. The PRCM register defaults to 0 on power-up to select the CLKINP source.

The CLKINPULOW input may be sourced from the CORE\_CLKOUTM6 from the Core PLL, or PER\_CLKOUTM2 from the Per PLL. These PLL output clocks can be used as alternate clock sources in low power active use cases for the MPU Subsystem clock when the PLL is in bypass mode.

#### 8.1.6.9.1 Configuring the MPU PLL

The following steps detail how to configure the MPU PLL.

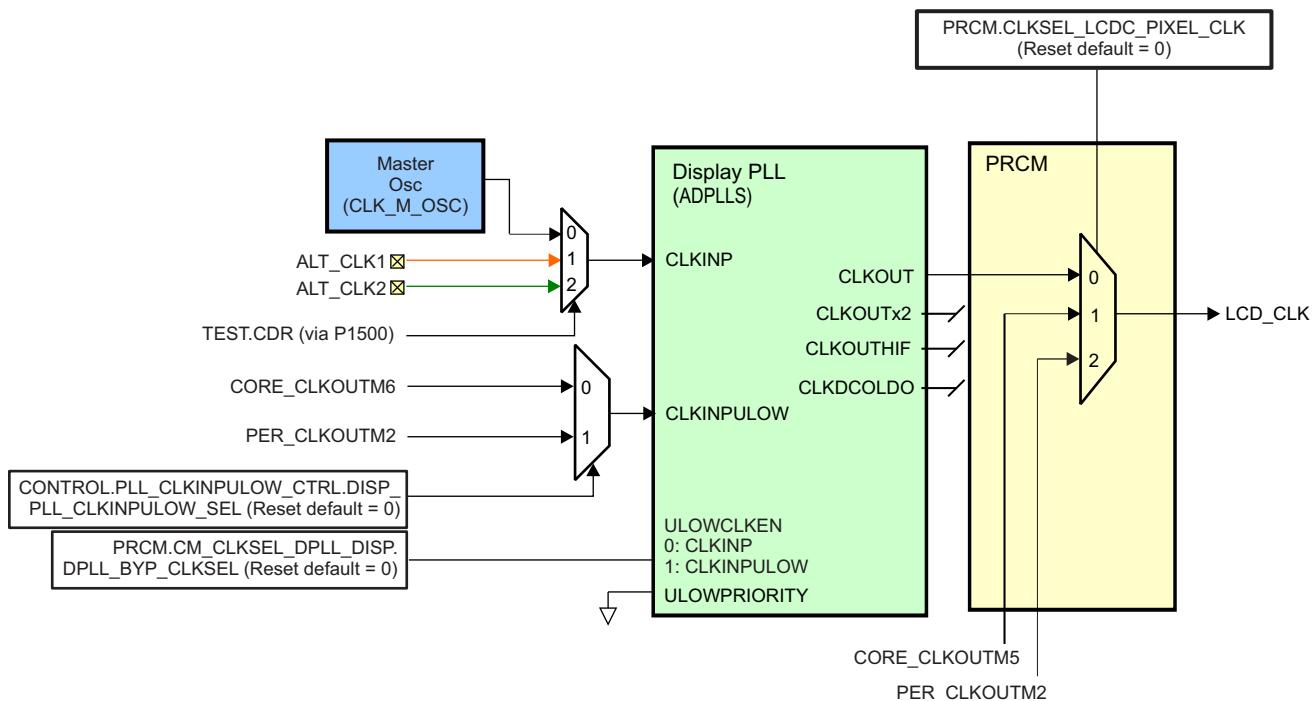

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_MPU.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_MPU.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_MPU.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_MPU.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_MPU.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_MPU.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_MPU.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_MPU.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (ie., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_MPU.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_MPU.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

### 8.1.6.10 Display PLL Description

The Display PLL provides the pixel clock required for the LCD display and is independent from the other peripheral and infrastructure clocks. The PLL is clocked from the Master Oscillator. The ADPLLS M2 divider determines the output clock frequency which is clock gated by the PRCM as shown in [Figure 8-12](#).

**Figure 8-12. Display PLL Structure**

For example: say frequency for pixel clock 100 MHz, the ADPLLS is configured (PLL locked at 200 MHz and M2 Divider =1) so as to expect CLKOUT = 100 MHz.

The ULOWCLKEN input from a programmable PRCM register selects whether CLKINP or CLKINPULOW is the bypass clock source. This is a glitch free switch. When CLKINP is selected it is sourced through the ADPLLS 1/(N2+1) divider. The PRCM register defaults to 0 on power-up to select the CLKINP source.

The CLKINPULOW input is sourced from the CORE\_CLKOUTM6 from the Core PLL or PER\_CLKOUTM2 from the Per PLL. This PLL output clock can be used as an alternate clock source in low power active use cases for the pixel clock when the Display PLL is in bypass mode.

#### 8.1.6.10.1 Configuring the Display PLL

The following steps detail how to configure the display PLL.

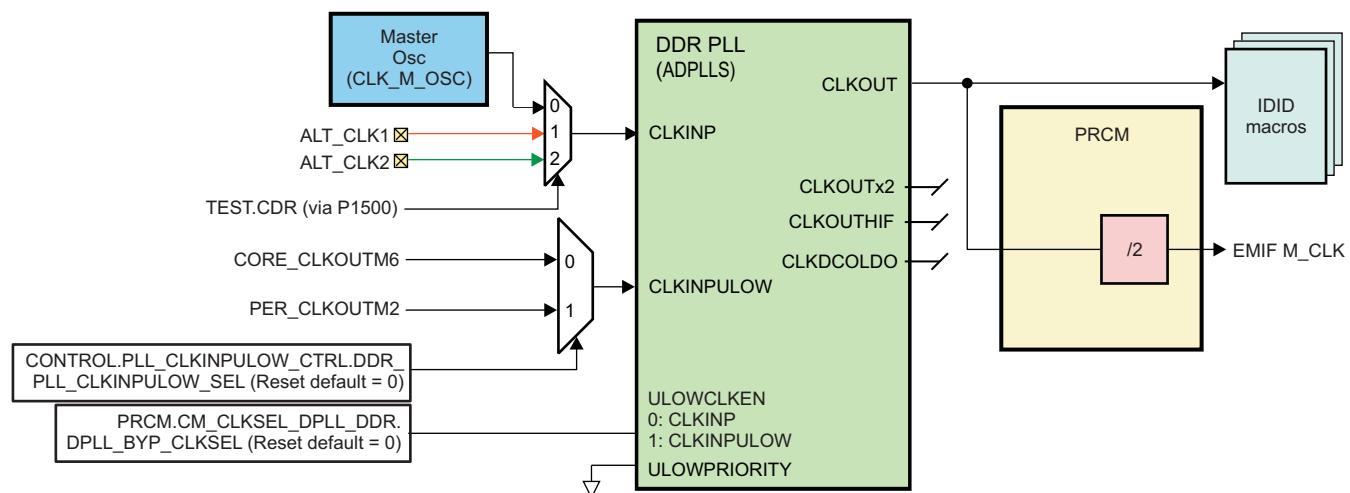

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_DISP.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_DISP.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_DISP.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_DISP.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_DISP.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_DISP.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_DISP.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_DISP.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (ie., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_DISP.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_DISP.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

### 8.1.6.11 DDR PLL Description

The DDR PLL provides the clocks required by the DDR macros and the EMIF and is independent from the other peripheral and infrastructure clocks. The PLL is clocked from the Master Oscillator. The ADPLLS M2 divider determines the output clock frequency which is connected directly to the DDR Macros. The clock is also routed through the PRCM where a fixed /2 divider is used to create the M\_CLK used by the EMIF as shown in Figure 8-13.

Figure 8-13. DDR PLL Structure

For OPP information, see the device-specific data manual.

Example frequency for DDR clock, say 266 MHz, the ADPLLS is configured (PLL locked at 532 MHz and M2 Divider =1) so as to expect CLKOUT = 266 MHz.

The ULOWCLKEN input from a programmable PRCM register selects whether CLKINP or CLKINPULOW is the bypass clock source. This is a glitch free switch. When CLKINP is selected it is sourced through the ADPLLS 1/(N2+1) divider. The PRCM register defaults to 0 on power-up to select the CLKINP source.

The CLKINPULOW input may be sourced from the CORE\_CLKOUTM6 from the Core PLL, or PER\_CLKOUTM2 from the Per PLL. These PLL output clocks can be used as alternate clock sources in low power active use cases for the DDR clocks when PLL is in bypass mode

#### 8.1.6.11.1 Configuring the DDR PLL

The following steps detail how to configure the DDR PLL.

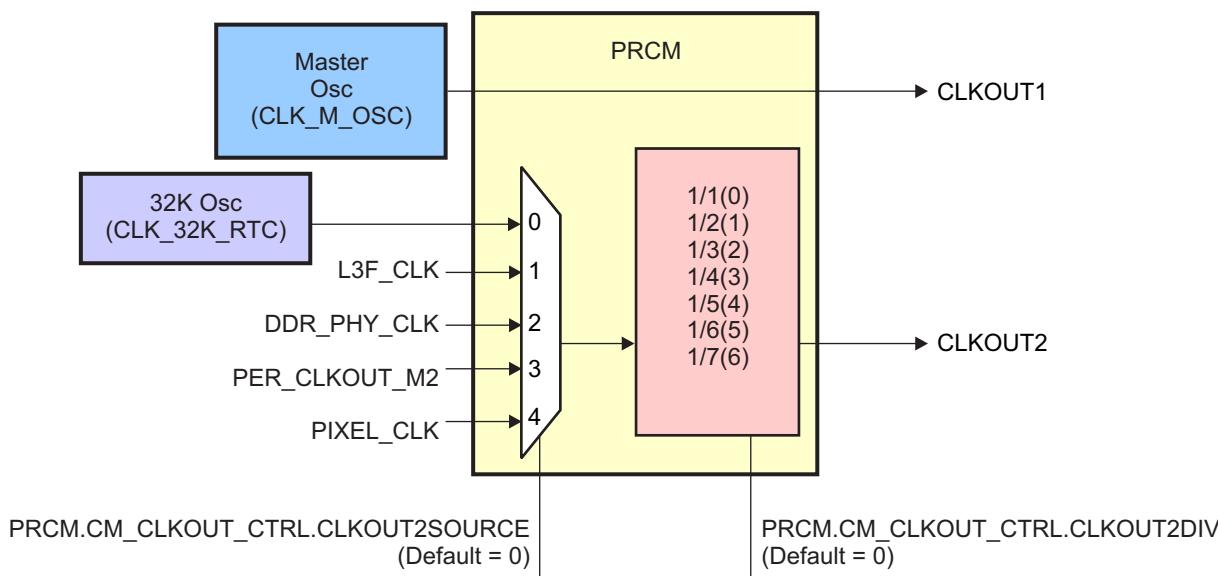

1. Switch PLL to bypass mode by setting CM\_CLKMODE\_DPLL\_DDR.DPLL\_EN to 0x4.
2. Wait for CM\_IDLEST\_DPLL\_DDR.ST\_MN\_BYPASS = 1 to ensure PLL is in bypass (CM\_IDLEST\_DPLL\_DDR.ST\_DPLL\_CLK should also change to 0 to denote the PLL is unlocked).
3. Configure Multiply and Divide values by setting CM\_CLKSEL\_DPLL\_DDR.DPLL\_MULT and DPLL\_DIV to the desired values.
4. Configure M2 divider by setting CM\_DIV\_M2\_DPLL\_DDR.DPLL\_CLKOUT\_DIV to the desired value.
5. Switch over to lock mode by setting CM\_CLKMODE\_DPLL\_DDR.DPLL\_EN to 0x7.
6. Wait for CM\_IDLEST\_DPLL\_DDR.ST\_DPLL\_CLK = 1 to ensure PLL is locked (CM\_IDLEST\_DPLL\_DDR.ST\_MN\_BYPASS should also change to 0 to denote the PLL is out of bypass mode).

**Note:** M2 divider can also be changed on-the-fly (i.e., there is no need to put the PLL in bypass and back to lock mode). After changing CM\_DIV\_M2\_DPLL\_DDR.DPLL\_CLKOUT\_DIV, check CM\_DIV\_M2\_DPLL\_DDR.DPLL\_CLKOUT\_DIVCHACK for a toggle (a change from 0 to 1 or 1 to 0) to see if the change was acknowledged by the PLL.

#### 8.1.6.12 CLKOUT Signals

The CLKOUT1 and CLKOUT2 signals go device pads and can be used as source clocks for FPGAs or other system devices. CLKOUT1 created from the master oscillator. CLKOUT2 can be sourced from the 32-KHz crystal oscillator or any of the PLL (except MPU PLL) outputs. The selected output can be further modified by a programmable divider to create the desired output frequency.

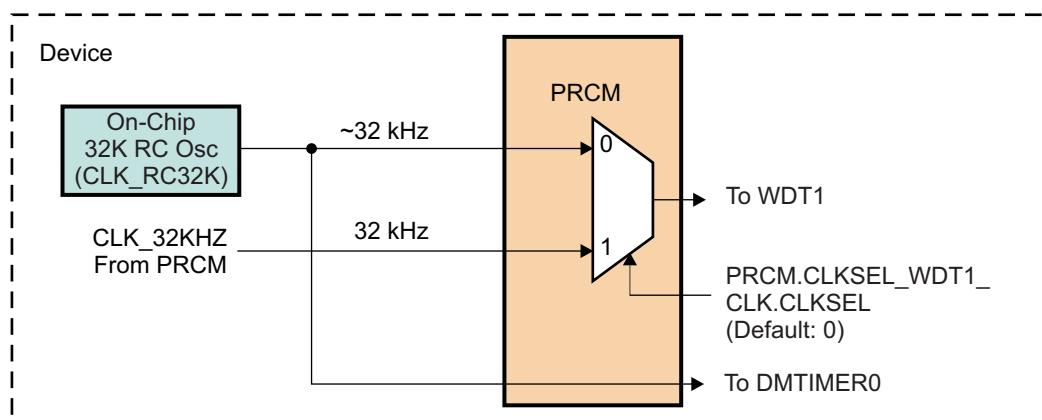

**Figure 8-14. CLKOUT Signals**

#### 8.1.6.13 Timer Clock Structure

The CLK\_32KHZ clock is an accurate 32.768-MHz clock derived from the PER PLL and can also be selected for the WDT1. The DMTIMER0 can only be clocked from the internal RC oscillator (CLK\_RC32K). The clock options are shown in Figure 8-15.

**Figure 8-15. Watchdog Timer Clock Selection**

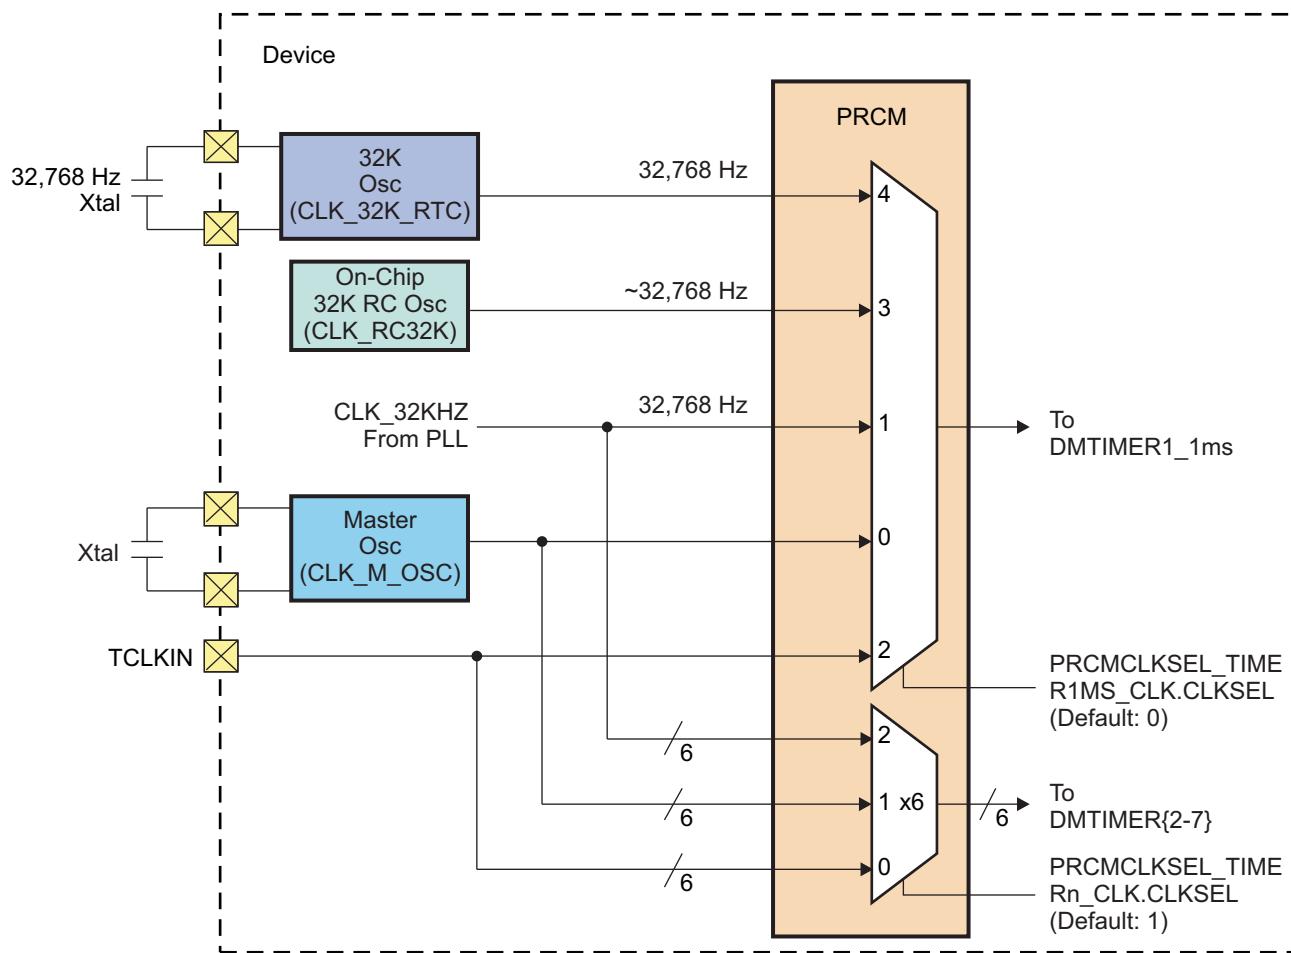

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

The clock selections for the other device Timer modules are shown in [Figure 8-16](#). CLK\_32KHZ, the master oscillator, and the external pin (TCLKIN) are optional clocks available for timers which may be selected based on end use application.

DMTIMER1 is implemented using the DMTimer\_1ms module which is capable of generating an accurate 1ms tick using a 32.768 KHz clock. During low power modes, the Master Oscillator is disabled. CLK\_32KHZ also would not be available in this scenario since it is sourced from the Master Osc based PER PLL. Hence, in low power modes DMTIMER1 in the WKUP domain can use the 32K RC oscillator for generating the OS (operating system) 1ms tick generation and timer based wakeup. Since most applications expect an accurate 1ms OS tick which the inaccurate 32K RC (16-60 KHz) oscillator cannot provide, a separate 32768 Hz oscillator (32K Osc) is provided as another option.

**Figure 8-16. Timer Clock Selection**

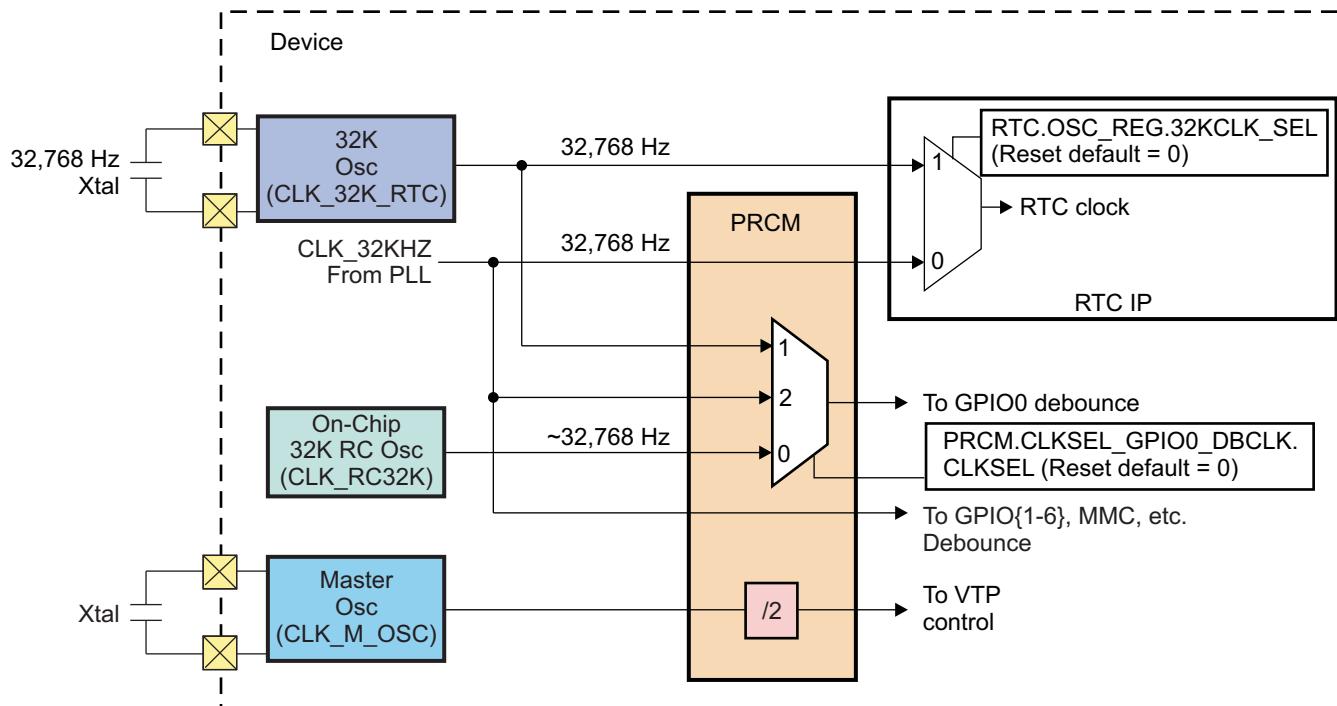

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

The RTC, Debounce and VTP clock options are shown in [Figure 8-17](#). In low power modes, the debounce for GPIO0 in WKUP domain can use the accurate 32768 Hz crystal oscillator or the inaccurate (16 KHz to 60 KHz) 32K RC oscillator when the Master Osc is powered down.

The 32K Osc requires an external 32768-Hz crystal.

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

**Figure 8-17. RTC, VTP, and Debounce Clock Selection**

All mux selections are in PRCM unless explicitly shown otherwise in the diagrams.

### 8.1.7 Reset Management

#### 8.1.7.1 Overview

The PRCM manages the resets to all power domains inside device and generation of a single reset output signal through device pin, PWRONRSTn, for external use. The PRCM has no knowledge of or control over resets generated locally within a module, e.g., via the OCP configuration register bit IPName\_SYSConfig.SoftReset.

All PRCM reset outputs are asynchronously asserted. These outputs are active-low except for the PLL resets. Deassertion is synchronous to the clock which runs a counter used to stall, or delay, reset de-assertion upon source deactivation. This clock will be CLK\_M\_OSC used by all the reset managers. All modules receiving a PRCM generated reset are expected to treat the reset as asynchronous and implement local re-synchronization upon de-activation as needed.

One or more Reset Managers are required per power domain. Independent management of multiple reset domains is required to meet the reset sequencing requirements of all modules in the power domain.

#### 8.1.7.2 Reset Concepts and Definitions

The PRCM collects many sources of reset. Here below is a list of qualifiers of the source of reset:

- Cold reset: it affects all the logic in a given entity
- Warm reset: it is a partial reset which doesn't affect all the logic in a given entity
- Global reset: it affects the entire device
- Local reset: it affects part of the device (1 power domain for example)
- S/W reset: it is initiated by software
- H/W reset: it is hardware driven

Each reset source is specified as being a cold or warm type. Cold types are synonymous with power-on-reset (POR) types. Such sources are applied globally within each receiving entity (i.e., sub-system, module, macro-cell) upon assertion. Cold reset events include: device power-up, power-domain power-up, and eFuse programming failures.

Warm reset types are not necessarily applied globally within each receiving entity. A module may use a warm reset to reset a subset of its logic. This is often done to speed-up reset recovery time, i.e., the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include: software initiated per power-domain, watch-dog time-out, externally triggered, and emulation initiated.

Reset sources, warm or cold types, intended for device-wide effect are classified as global sources. Reset sources intended for regional effect are classified as local sources.

Each Reset Manager provides two reset outputs. One is a cold reset generated from the group of global and local cold reset sources it receives. The other is a warm+cold reset generated from the combined groups of, global and local, cold and warm reset sources it receives.

The Reset Manager asserts one, or both, of its reset outputs asynchronously upon reset source assertion. Reset deassertion is extended beyond the time the source gets de-asserted. The reset manager will then extend the active period of the reset outputs beyond the release of the reset source, according to the PRCM's internal constraints and device's constraints. Some reset durations can be software-configured. Most (but not all) reset sources are logged by PRCM's reset status registers. The same reset output can generally be activated by several reset sources and the same reset source can generally activate several reset outputs. All the reset signals output of the PRCM are active low. Several conventions are used in this document for signal and port names. They include:

- "\_RST" in a signal or port name is used to denote reset signal.
- "\_PWRON\_RST" in a signal or port name is used to denote a cold reset source

### 8.1.7.3 Global Power On Reset (Cold Reset)

There are several cold reset sources. See [Table 8-23](#) for a summary of the different reset sources.

#### 8.1.7.3.1 Power On Reset (PORz)

The source of power on reset is PORz signal on the device. Everything on device is reset with assertion of power on reset. This reset is non-blockable. PORz can be driven by external power management devices or power supervisor circuitry. During power-up, when power supplies to the device are ramping up, PORz needs to be driven Low. When the ramp-up is complete and supplies reach their steady-state values, PORz need to be driven High. During normal operation when any of the device power supplies are turned OFF, PORz must be driven Low.

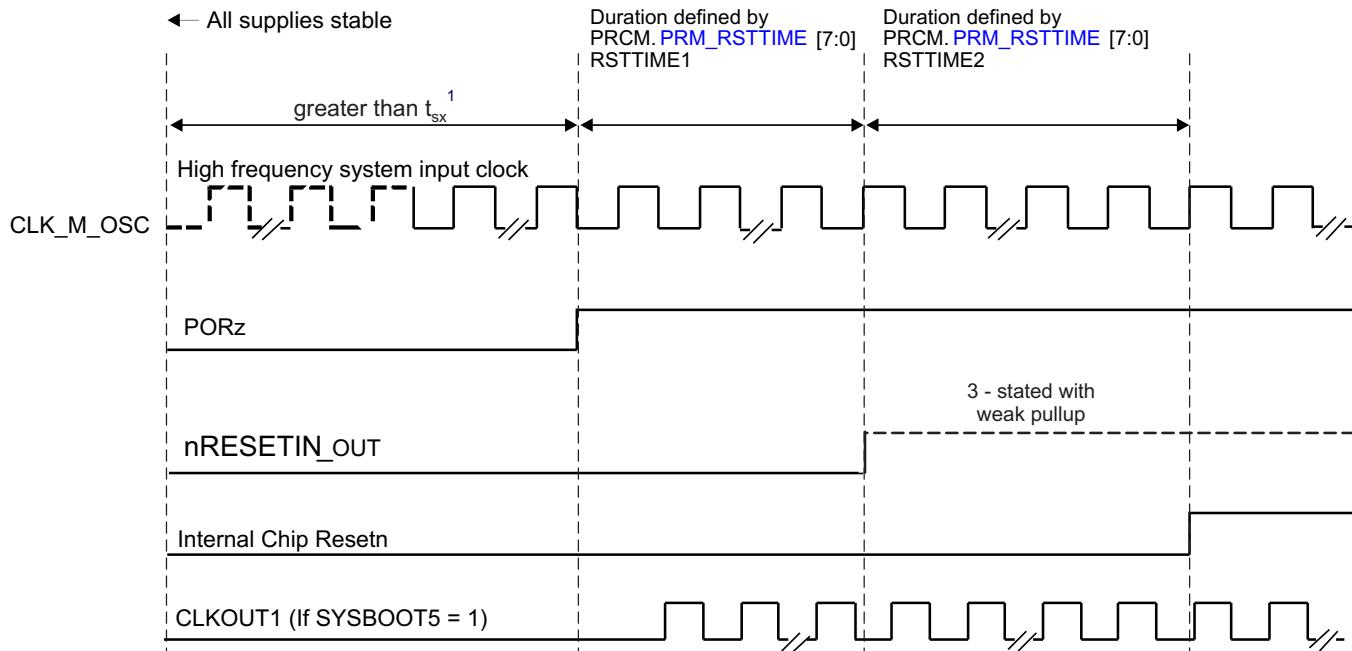

#### 8.1.7.3.2 PORz Sequence

- PORz pin at chip boundary gets asserted (goes low). **Note:** The state of nRESETIN\_OUT during PORz assertion should be a don't care, it should not affect PORz (only implication is if they are both asserted and nRESETIN\_OUT is deasserted after PORz you will get re-latching of boot config pins and may see warm nRESETIN\_OUT flag set in PRCM versus POR).
- All IOs will go to tri-state immediately.
- When power comes-up, PORz value will propagate to the PRCM.
- PRCM will fan out reset to the complete chip and all logic which uses async reset will get reset. nRESETIN\_OUT will go low to indicate reset-in-progress.
- External clocks will start toggling and PRCM will propagate these clocks to the chip keeping PLLs in bypass mode.
- All logic using sync reset will get reset.
- When power and clocks to the chip are stable, PORz must be de-asserted.
- Boot configuration pins are latched upon de-assertion of PORz pin
- IO cell controls from IPs for all the IOs with a few exceptions (see datasheet for details) are driven by GPIO module. GPIO puts all IOs in input mode.

- FuseFarm reset will be de-asserted to start eFuse scanning.
- Once eFuse scanning is complete, reset to the host processor and to all other peripherals (peripherals without local processor) will be de-asserted.
- nRESETIN\_OUT will be de-asserted after time defined by PRM\_RSTTIME.RSTTIME1.
- Once host processors finish booting then all remaining peripherals will see reset de-assertion.

Note that all modules with local CPUs will have local reset asserted by default at PORz and reset de-assertion would require host processor to write to respective registers in PRCM.

**Figure 8-18. PORz**

(1) For information on  $t_{sx}$ , see *AM335x ARM Cortex-A8 Microprocessors (MPUs)* (literature number [SPRS717](#)).

#### 8.1.7.3.3 Bad Device Reset

This reset is asserted whenever the DEVICE\_TYPE encodes an unsupported device type, such as the code for a "bad" device.

#### 8.1.7.3.4 Global Cold Software Reset (GLOBAL\_COLD\_SW\_RST)

The source for GLOBAL\_COLD\_SW\_RST is generated internally by the PRM. It is activated upon setting the PRM\_RSTCTRL.RST\_GLOBAL\_COLD\_SW bit in the PRM memory map. This bit is self-clearing, i.e., it is automatically cleared by the hardware.

#### 8.1.7.4 Global Warm Reset

##### 8.1.7.4.1 External Warm Reset

nRESETIN\_OUT is a bidirectional warm reset signal. As an input, it is typically used by an external source as a device reset. Refer to Table 8-24 for a summary of the differences between a warm reset and cold reset. Some of these differences are:

- The warm reset can be blocked to the EMAC switch and its reference clock source PLL using the RESET\_ISO register in the Control Module.
- The warm reset assumes that clocks and power to the chip are stable from assertion through deassertion, whereas during the cold reset, the power supplies can become stable during assertion
- Some PRCM and Control module registers are warm reset insensitive and maintain their value

throughout a warm reset

- SYSBOOT pins are not latched with a warm reset. The device will boot with the SYSBOOT values from the previous cold reset.
- Most debug subsystem logic is not affected by warm reset. This allows you to maintain any debug sessions throughout a warm reset event.
- PLLs are not affected by warm reset

As an output, nRESETIN\_OUT can be used to reset external devices. nRESET\_OUT will drive low during a cold reset or an internally generated warm reset. After completion of a cold or warm reset, nRESETIN\_OUT will continue to drive low for a period defined by PRM\_RSTTIME.RSTTIME1. RSTTIME1 is a timer that counts down to zero at a rate equal to the high frequency system input clock CLK\_M\_OSC. This allows external devices to be held in reset for some time after the AM335x comes out of reset.

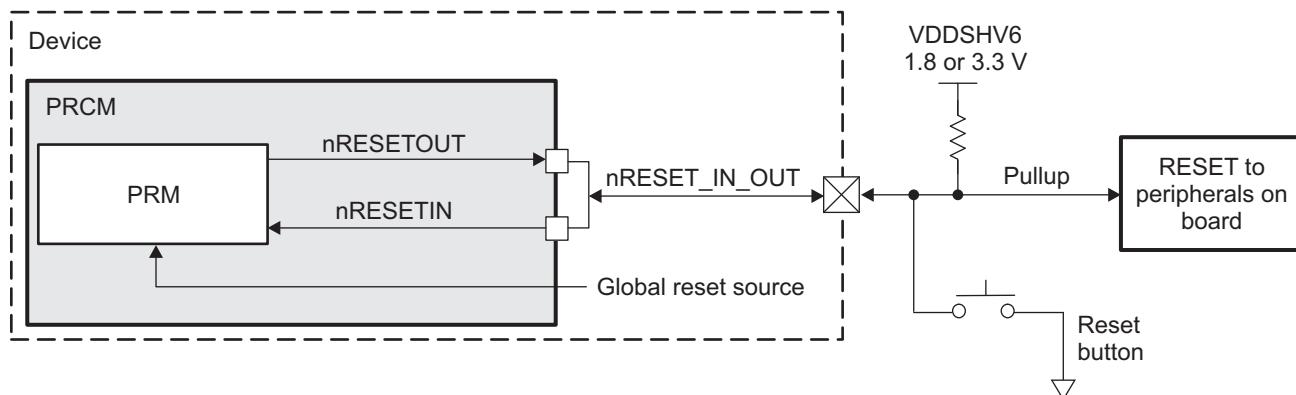

Caution must be used when implementing the nRESETIN\_OUT as an bi-directional reset signal. Because of the short maximum time allowed using RSTTIME1, it does not supply an adequate debounce time for an external push button circuit. The processor could potentially start running while external components are still in reset. It is recommended that this signal be used as input only (do not connect to other devices as a reset) to implement a push button reset circuit to the AM335x, or an output only to be able to reset other devices after an AM335x reset completes.

#### 8.1.7.4.1.1 Warm Reset Input/Reset Output (nRESETIN\_OUT)

Any global reset source (internal or external) causes nRESETIN\_OUT to be driven and maintained at the boundary of the device for at least the amount of time configured in the PRCM.PRM\_RSTTIME.RSTTIME1 bit field. This ensures that the device and its related peripherals are reset together. The nRESETIN\_OUT output buffer is configured as an open-drain; consequently, an external pull-up resistor is required.

After the de-assertion, the bi-directional pin nRESETIN\_OUT is tri-stated to allow for assertion from off chip source (externally).

**Figure 8-19. External System Reset**

Note: It is recommended to implement warm reset as an input only (for example, push button) or an output only (to reset external peripherals), not both.

The device will have one pin nRESETIN\_OUT which reflects chip reset status. This output will always assert asynchronously when any chip watchdog timer reset occurs if any of the following reset events occurs:

- POR (only internal stretched portion of reset event after bootstrap is latched)
- External Warm reset (nRESETIN\_OUT pin, only internal stretched portion of reset event after bootstrap is latched)
- Emulation reset (Cold or warm from ICEPICK)
- Reset requestor
- SW cold/warm reset

This output will remain asserted as long as PRCM keeps reset to the host processor asserted.

**Note:** TRST does not cause RSTOUTn assertion

#### 8.1.7.4.1.2 Warm Reset Sequence

1. nRESETIN\_OUT pin at chip boundary gets asserted (goes low). NOTE: For Warm Reset sequence to work as described, it is expected that PORz pin is always inactive, otherwise you will get PORz functionality as described in previous section.
2. All IOs (except test and emulation) will go to tri-state immediately.
3. Chip clocks are not affected as both PLL and dividers are intact.
4. nRESETIN\_OUT gets de-asserted after 30 cycles
5. PRCM de-asserts reset to the host processor and all other peripherals without local CPUs.
6. Note that all IPs with local CPUs will have local reset asserted by default at Warm Reset and reset de-assertion would require host processor to write to respective registers in PRCM.

Figure 8-20 shows the nRESETIN\_OUT waveform when using nRESETIN\_OUT as warm reset source. For the duration when external warm reset switch is closed, both the device and chip will be driving zero.

**Figure 8-20. nRESETIN\_OUT Waveform as Warm Reset Source**

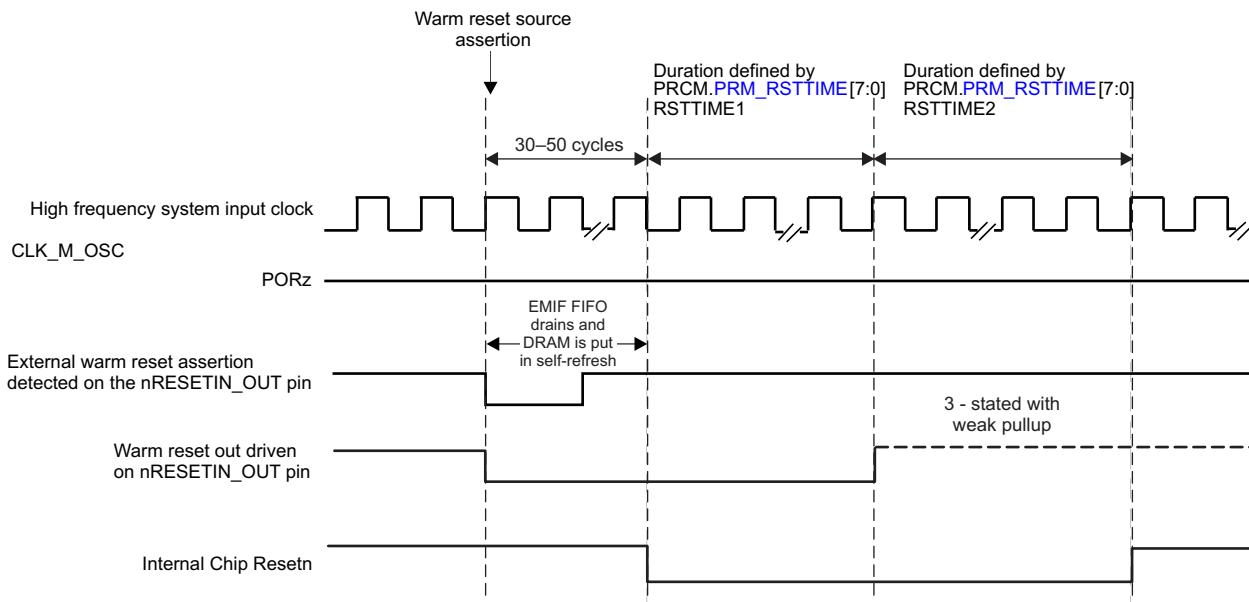

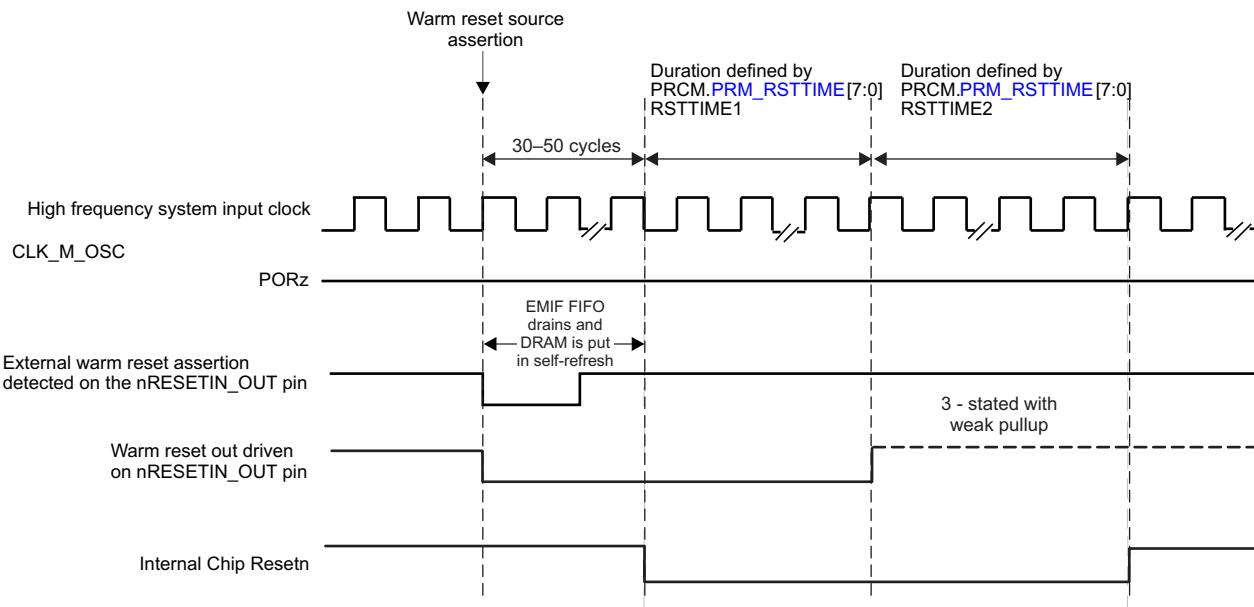

Figure 8-21 shows the nRESETIN\_OUT waveform when any one of the warm reset sources captured except using nRESETIN\_OUT itself as warm reset source.

**Figure 8-21. nRESETIN\_OUT Waveform Not as Warm Reset Source**

#### 8.1.7.4.2 Watchdog Timer

There is one watchdog timer on the device. The reset is not blockable.

#### 8.1.7.4.3 Global Warm Software Reset (GLOBAL\_SW\_WARM\_RST)

#### 8.1.7.4.4 Test Reset (TRSTz)

This reset is triggered from TRSTz pin on JTAG interface. This is a non-blockable reset and it resets test and emulation logic.

**NOTE:** A PORz reset assertion should cause entire device to reset including all test and emulation logic regardless of the state of TRSTz. Therefore, PORz assertion will achieve full reset of the device even if TRSTz pin is pulled permanently high and no special toggling of TRSTz pin is required during power ramp to achieve full POR reset to the device. Further, it is acceptable for TRSTz input to be pulled permanently low during normal functional usage of the device in the end-system to ensure that all test and emulation logic is kept in reset.

### 8.1.7.5 Reset Characteristics

The following table shows characteristic of each reset source.

**Table 8-23. Reset Sources**

| Characteristic                              | Cold Reset Sources |                  |                  | Warm Reset sources |                  |                  |       |
|---|--------------------|------------------|------------------|--------------------|------------------|------------------|-------|
|   | Pin PORz           | SW Cold Reset    | Bad Device       | Pin Warm Reset     | Watchdog Timer   | SW Warm Reset    | TRSTz |
| Boot pins latched                           | Y                  | N                | N                | N                  | N                | N                | N     |
| Resets Standard Efuses                      | Y                  | N                | N                | N                  | N                | N                | N     |
| Resets Customer Efuses                      | Y                  | Y                | Y                | Y                  | Y                | Y                | N     |
| DRAM contents preserved                     | N                  | N                | N                | Y <sup>(1)</sup>   | Y <sup>(1)</sup> | Y <sup>(1)</sup> | Y     |
| Resets PLLs <sup>(2)</sup>                  | Y                  | Y                | Y                | N                  | N                | N                | N     |
| Resets Clock Dividers <sup>(2)</sup>        | Y                  | Y                | Y                | N                  | N                | N                | N     |
| PLLs enter bypass mode <sup>(2)</sup>       | Y                  | Y                | Y                | Y                  | Y                | Y                | N     |
| Reset source blockable by emulation         | N                  | N                | N                | Y                  | Y                | Y                | Y     |
| Resets test and emulation logic             | Y                  | Y                | Y                | N                  | N                | N                | N     |

<sup>(1)</sup> The ROM software does not utilize this feature of DRAM content preservation. Hence, the AM335x re-boots like a cold boot for warm reset as well.

<sup>(2)</sup> CORE PLL is an exception when EMAC switch reset isolation is enabled

<sup>(3)</sup> Only true if GMAC switch reset isolation is enabled in control registers, otherwise will be reset.

<sup>(4)</sup> There are exception details in control module & PRCM registers which are captured in the register specifications in [Chapter 8](#) and [Chapter 9](#). This includes some pinmux registers which are warm reset in-sensitive.

<sup>(5)</sup> Some special IOs/Muxing registers like test, emulation, GEMAC Switch (When under reset isolation mode), etc related will not be affected under warm reset conditions.

**Note:** The Bandgap macros for the LDOs will be reset on PORz only.

#### 8.1.7.6 EMAC Switch Reset Isolation

The device will support reset isolation for the Ethernet Switch IP. This allows the device to undergo a warm reset without disrupting the switch or traffic being routed through the switch during the reset condition.

If configured by registers in control module that EMAC reset isolation is active, then behavior is as follows:

Any "Warm" reset source(except the software warm reset) will be blocked to the EMAC switch logic in the IP (the IP has two reset inputs to support such isolation) and to PLL (and its control bits) which is sourcing the EMAC switch clocks as required by the IP (50- or 125-MHz reference clocks). Also, the EMAC switch related IO pins must retain their pin muxing and not glitch (continuously controlled by the EMAC switch IP) by blocking reset to the controlling register bits.

If configured by registers in control module that EMAC reset isolation is NOT active (default state), then the warm reset sources are allowed to propagate as normal including to the EMAC Switch IP (both reset inputs to the IP).

All cold or POR resets will always propagate to the EMAC switch IP as normal (as otherwise defined in this document).

#### 8.1.7.7 Reset Priority

If more than one of these reset sources are asserted simultaneously then the following priority order should be used:

1. POR
2. TRSTz
3. External warm reset
4. Emulation
5. Reset requestors
6. Software resets

#### 8.1.7.8 Trace Functionality Across Reset

Other than POR, TRSTz and SW cold reset, none of the other resets will affect trace functionality. This requires that Debug\_SS has required reset isolation for the trace logic. Also the los and muxing control (if any) for trace los should not get affected by any other reset. Since none of the PLLs getting reset with other resets, clocks will be any way stable.

#### 8.1.7.9 RTC PORz

AM335x supports RTC only mode by supplying dedicated power to RTC module. The RTC module has a dedicated PORz signal (RTC\_PORz) to reset RTC logic and circuitry during powerup. RTC\_PORz is expected to be driven low when the RTC power supply is ramping up. After the power supply reaches its stable value, the RTC\_PORz can be de-asserted. The RTC module is not affected by the device PORz. Similarly RTC\_PORz does not affect the device reset.

If the RTC-only mode is not required, then PORz and RTC\_PORz needs to be shorted. For power-up sequencing with respect to RTC\_PORz, see the device specific datasheet.

### 8.1.8 Power-Up/Down Sequence

Each power domain has dedicated warm and cold reset.

Warm reset gets asserted each time there is any warm reset source requesting reset. Warm reset is also asserted when power domain moves from ON to OFF state.

Cold reset for the domain is asserted in response to cold reset sources. When domain moves from OFF to ON state then also cold reset gets asserted as this is similar to power-up condition for that domain.

### 8.1.9 IO State

All IOs except for JTAG i/f and Reset output (and any special cases mentioned in pinlist) should have their output drivers tri-state and internal pulls enabled during assertion of all reset sources. JTAG i/f IO is affected only by TRSTz.

**Note:** The PRUs and Cortex M3 processor are held under reset after global warm reset by assertion of software source of reset. Other domains are held under reset after global warm reset until the MPU software enables their respective interface clock.

### 8.1.10 Voltage and Power Domains

The following table shows how the device core logic is partitioned into two core logic voltage domains and four power domains. The table lists which voltage and power domain a functional module belongs.

**Table 8-24. Core Logic Voltage and Power Domains**

| Logic Voltage Domain Name | Module           |
|---------------------------|------------------|
| CORE                      | All Core Modules |
| RTC                       | RTC              |

### 8.1.10.1 Voltage Domains

The core logic is divided into two voltage domains: VDD\_CORE and VDD\_RTC.

### 8.1.10.2 Power Domains

In order to reduce power due to leakage, the core logic supply voltage to 4 of these power domains can be turned OFF with internal power switches. The internal power switches are controlled through memory mapped registers in Control Module.

In a use case whereby all the modules within a power domain are not used that power domain can be placed in the OFF state.

Error: Reference source not found shows the allowable combination power domain ON/OFF states and which power domains are switched via internal power switches. At power-on-reset, all domains except always-on will be in the power domain OFF state.

**Table 8-25. Power Domain State Table**

| MODE                       | POWER DOMAIN |            |            |            |            |            |
|----------------------------|--------------|------------|------------|------------|------------|------------|
|                            | WAKEUP       | MPU        | GFX        | PER        | RTC        | EFUSE      |
| No Voltage Supply          | N/A          | N/A        | N/A        | N/A        | N/A        | N/A        |
| Power On Reset             | ON           | OFF        | OFF        | OFF        | OFF        | OFF        |
| ALL OTHER FUNCTIONAL MODES | ON           | DON'T CARE |
| Internal Power Switch      | NO           | YES        | YES        | YES        | YES        | YES        |

### 8.1.11 Device Modules and Power Management Attributes List

### 8.1.11.1 Power Domain Power Down Sequence

The following sequence of steps happen during the power down of a power domain

All IPs (belonging to a power domain) with STANDBY interface will assert STANDBY. STANDBY assertion should get triggered by IP based on its activity on OCP initiator port. IP should assert STANDBY whenever initiator port is IDLE. Some of the IPs may not have this feature and they will require SW write to standby-mode register to get STANDBY assertion from IP.

1. SW will request all modules in given power domain to go to disable state by programming module control register inside PRCM.
2. PRCM will start and wait for completion of power management handshake with IPs (IdleReq/IdleAck).
3. PRCM will gate-off all the clocks to the power domain.
4. SW will request all clock domains in given power domain to go to “force sleep” mode by programming functional clock domain register in PRCM. Note that PRCM has already gated-off clocks and this register programming may look redundant.
5. SW will request PRCM to take this power domain to OFF state by programming PWRSTCTRL register. Note that this step can be skipped if PWRSTCTRL is permanently programmed to OFF state. When this is done, functional clock domain register decides when power domain will be taken to OFF state. Only reason not to have OFF state in PWRSTCTRL is to take power domain to just clock gate state without power gating.
6. PSCON specific to this power domain will assert isolation enable for the domain.
7. PRCM will assert warm and cold reset to the power domain.
8. PSCON will assert control signals to switch-off power using on-die switches.
9. On-die switches will send acknowledge back to PSCON.

### 8.1.11.2 Power Domain Power-Up Sequence

The following sequence of steps occurs during power-up of a power domain. This sequence is not relevant to always-on domain as this domain will never go to OFF state as long as the device is powered. This sequence will be repeated each time a domain is taken to ON state from OFF (including first time power-up). Note that some of the details are intentionally taken out here to simplify things.

There can be multiple reasons to start power-up sequence for a domain. For example it can be due to an interrupt from one of the IPs which is powered-up.

1. SW will request required clock domains inside this power domain to go to force wake-up state by programming functional clock domain register.
2. PRCM will enable clocks to the required clock domains.
3. PSCON specific to this power domain will assert control signal to un-gate the power.
4. Once power is un-gated, on die switches will send acknowledge back to PSCON.
5. PRCM will de-assert cold and warm reset to the power domain.
6. PRCM will turn-off isolation cells.
7. SW will request PRCM to enable required module in the power domain by programming module control register.
8. PRCM will initiate and wait for completion of PM protocol to enable the modules (IdleReq/IdleAck).

## 8.1.12 Clock Module Registers

### 8.1.12.1 CM\_PER Registers

Table 8-27 lists the memory-mapped registers for the CM\_PER. All register offset addresses not listed in Table 8-27 should be considered as reserved locations and the register contents should not be modified.

**Table 8-27. CM\_PER REGISTERS**

| Offset | Acronym                 | Register Name | Section                             |

### 8.1.12.1.1 CM\_PER\_L4LS\_CLKSTCTRL Register (offset = 0h) [reset = C0102h]

CM\_PER\_L4LS\_CLKSTCTRL is shown in [Figure 8-22](#) and described in [Table 8-28](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-PER and ON-INPER states. It also hold one status bit per clock input of the domain.

**Figure 8-22. CM\_PER\_L4LS\_CLKSTCTRL Register**

### 8.1.12.1.8 CM\_PER\_TPTC0\_CLKCTRL Register (offset = 24h) [reset = 70000h]

CM\_PER\_TPTC0\_CLKCTRL is shown in [Figure 8-29](#) and described in [Table 8-35](#).

This register manages the TPTC clocks.

**Figure 8-29. CM\_PER\_TPTC0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-35. CM\_PER\_TPTC0\_CLKCTRL Register Field Descriptions**

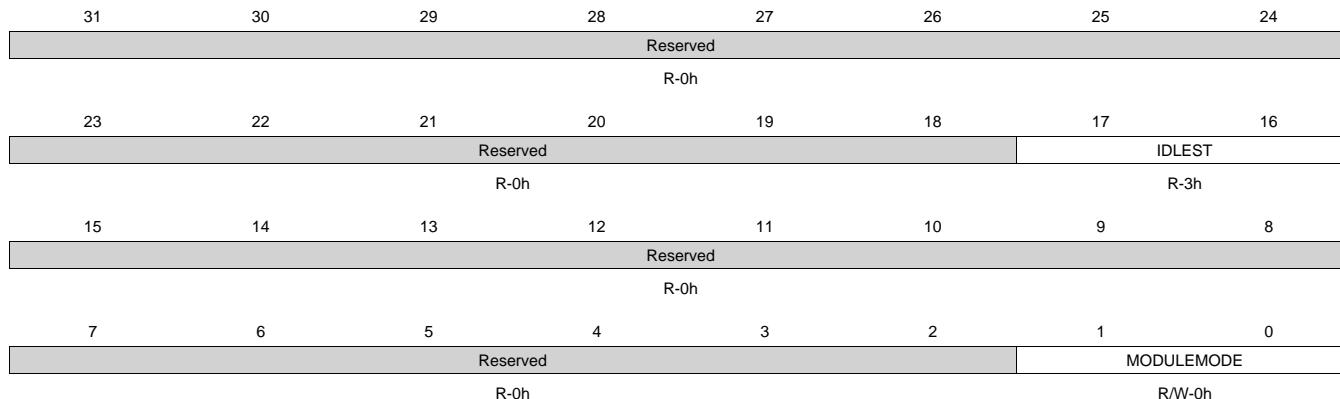

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-19 | Reserved   | R    | 0h    |   |
| 18    | STBYST     | R    | 1h    | Module standby status.<br>0x0 = Func : Module is functional (not in standby)<br>0x1 = Standby : Module is in standby  |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |

Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.9 CM\_PER\_EMIF\_CLKCTRL Register (offset = 28h) [reset = 30000h]

CM\_PER\_EMIF\_CLKCTRL is shown in [Figure 8-30](#) and described in [Table 8-36](#).

This register manages the EMIF clocks.

**Figure 8-30. CM\_PER\_EMIF\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-36. CM\_PER\_EMIF\_CLKCTRL Register Field Descriptions**

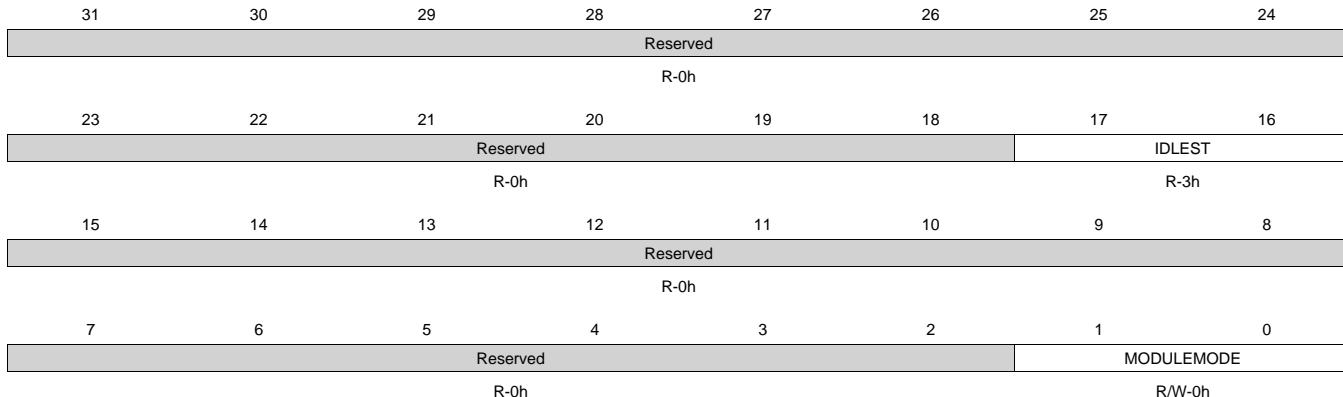

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.10 CM\_PER\_OCMCRAM\_CLKCTRL Register (offset = 2Ch) [reset = 30000h]

CM\_PER\_OCMCRAM\_CLKCTRL is shown in [Figure 8-31](#) and described in [Table 8-37](#).

This register manages the OCMC clocks.

**Figure 8-31. CM\_PER\_OCMCRAM\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-37. CM\_PER\_OCMCRAM\_CLKCTRL Register Field Descriptions**

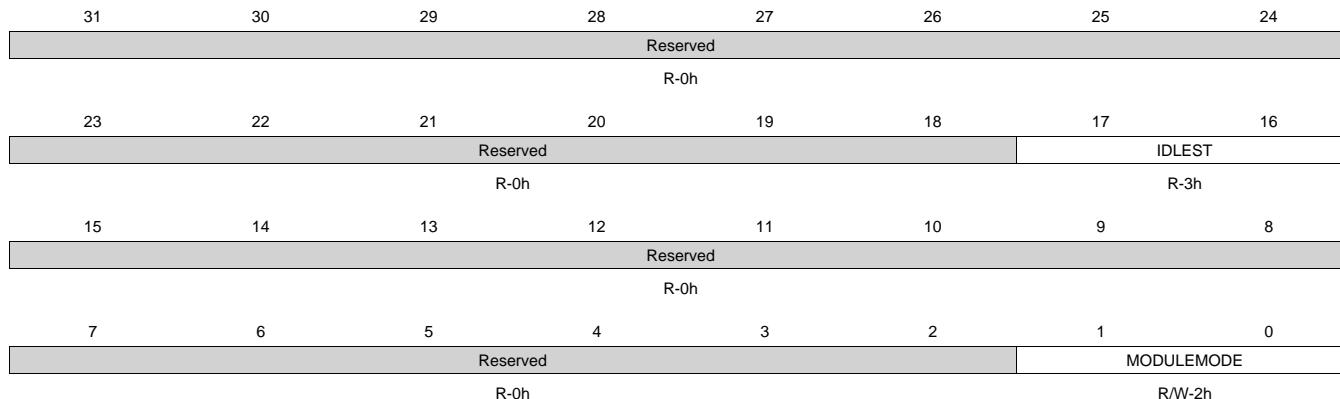

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.11 CM\_PER\_GPMC\_CLKCTRL Register (offset = 30h) [reset = 30002h]

CM\_PER\_GPMC\_CLKCTRL is shown in [Figure 8-32](#) and described in [Table 8-38](#).

This register manages the GPMC clocks.

**Figure 8-32. CM\_PER\_GPMC\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-38. CM\_PER\_GPMC\_CLKCTRL Register Field Descriptions**

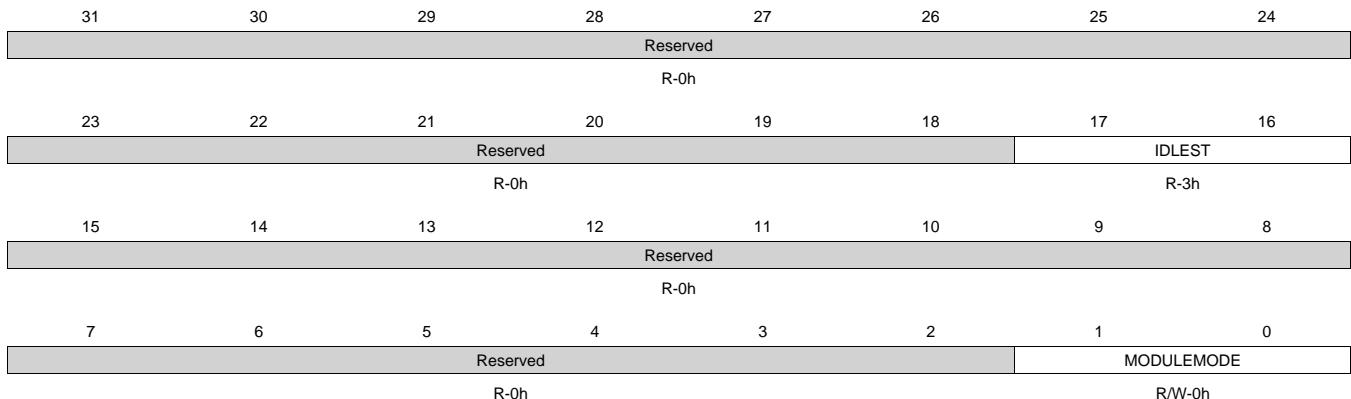

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 2h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.12 CM\_PER\_MCASP0\_CLKCTRL Register (offset = 34h) [reset = 30000h]

CM\_PER\_MCASP0\_CLKCTRL is shown in [Figure 8-33](#) and described in [Table 8-39](#).

This register manages the MCASP0 clocks.

**Figure 8-33. CM\_PER\_MCASP0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-39. CM\_PER\_MCASP0\_CLKCTRL Register Field Descriptions**

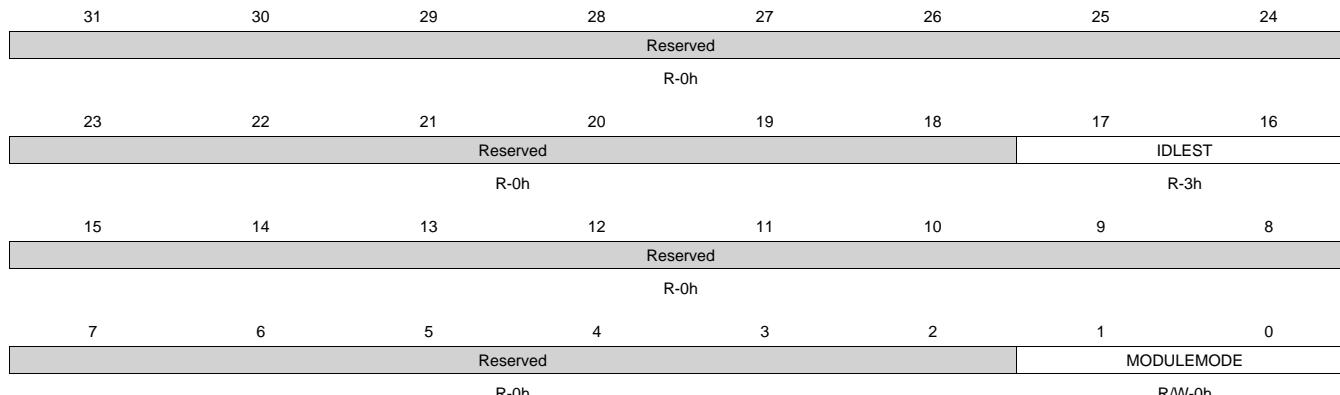

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. ### 8.1.12.1.13 CM\_PER\_UART5\_CLKCTRL Register (offset = 38h) [reset = 30000h]

CM\_PER\_UART5\_CLKCTRL is shown in [Figure 8-34](#) and described in [Table 8-40](#).

This register manages the UART5 clocks.

**Figure 8-34. CM\_PER\_UART5\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-40. CM\_PER\_UART5\_CLKCTRL Register Field Descriptions**

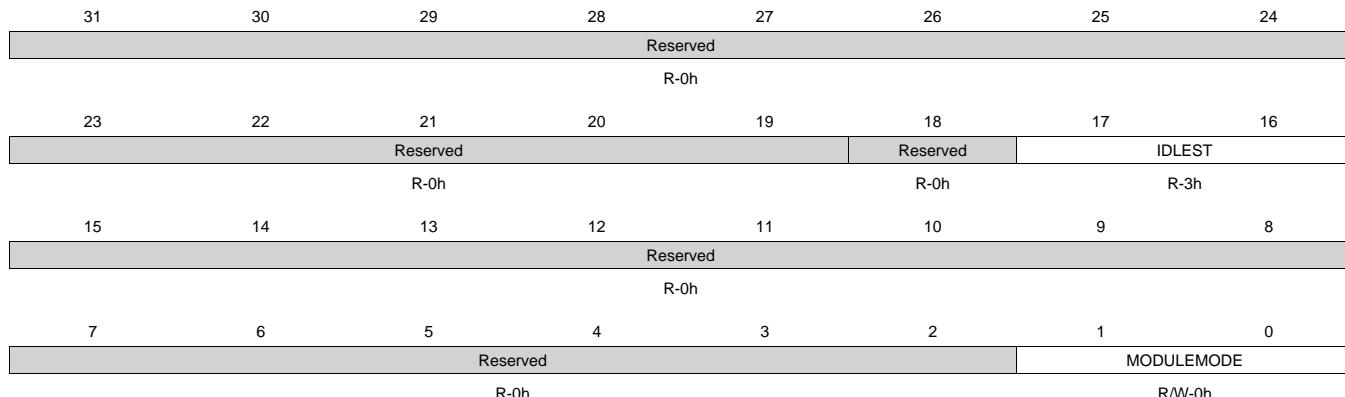

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.14 CM\_PER\_MMC0\_CLKCTRL Register (offset = 3Ch) [reset = 30000h]

CM\_PER\_MMC0\_CLKCTRL is shown in [Figure 8-35](#) and described in [Table 8-41](#).

This register manages the MMC0 clocks.

**Figure 8-35. CM\_PER\_MMC0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-41. CM\_PER\_MMC0\_CLKCTRL Register Field Descriptions**

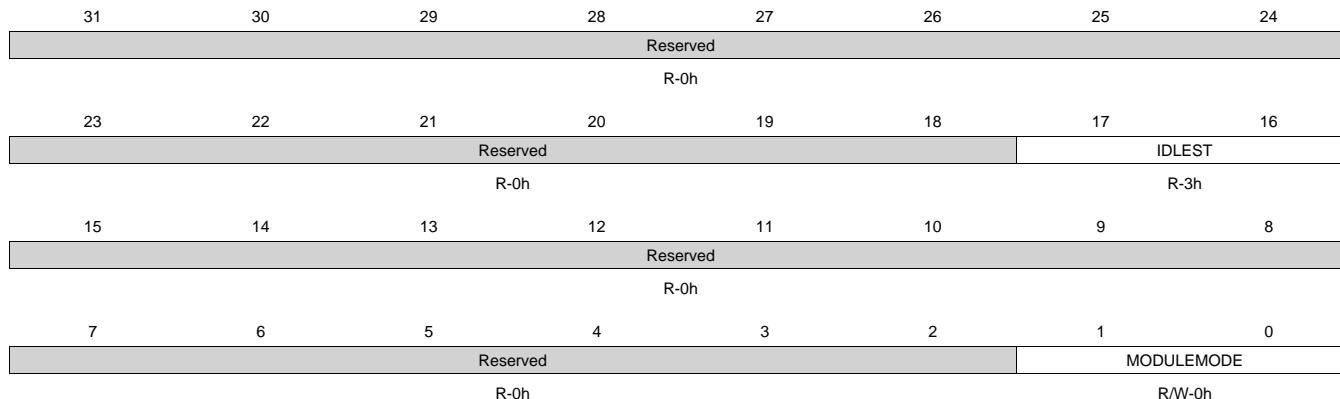

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-19 | Reserved   | R    | 0h    |   |
| 18    | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.15 CM\_PER\_ELM\_CLKCTRL Register (offset = 40h) [reset = 30000h]

CM\_PER\_ELM\_CLKCTRL is shown in [Figure 8-36](#) and described in [Table 8-42](#).

This register manages the ELM clocks.

**Figure 8-36. CM\_PER\_ELM\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-42. CM\_PER\_ELM\_CLKCTRL Register Field Descriptions**

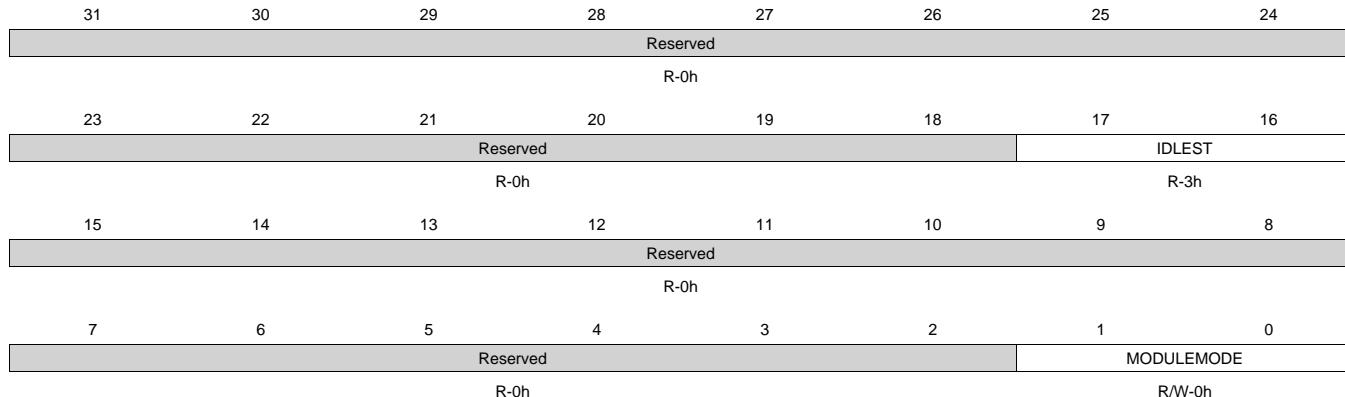

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.16 CM\_PER\_I2C2\_CLKCTRL Register (offset = 44h) [reset = 30000h]

CM\_PER\_I2C2\_CLKCTRL is shown in [Figure 8-37](#) and described in [Table 8-43](#).

This register manages the I2C2 clocks.

**Figure 8-37. CM\_PER\_I2C2\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-43. CM\_PER\_I2C2\_CLKCTRL Register Field Descriptions**

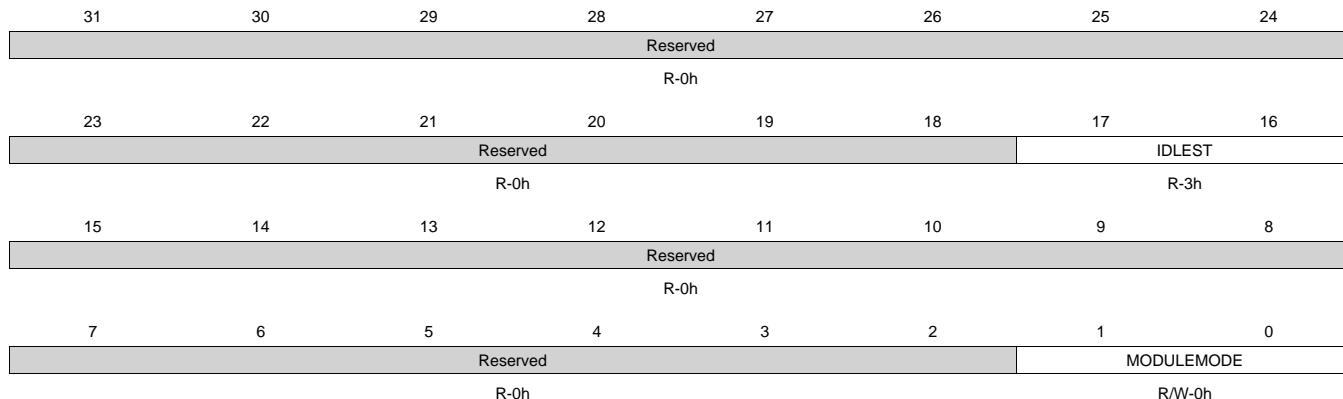

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.18 CM\_PER\_SPI0\_CLKCTRL Register (offset = 4Ch) [reset = 30000h]

CM\_PER\_SPI0\_CLKCTRL is shown in [Figure 8-39](#) and described in [Table 8-45](#).

This register manages the SPI0 clocks.

**Figure 8-39. CM\_PER\_SPI0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-45. CM\_PER\_SPI0\_CLKCTRL Register Field Descriptions**

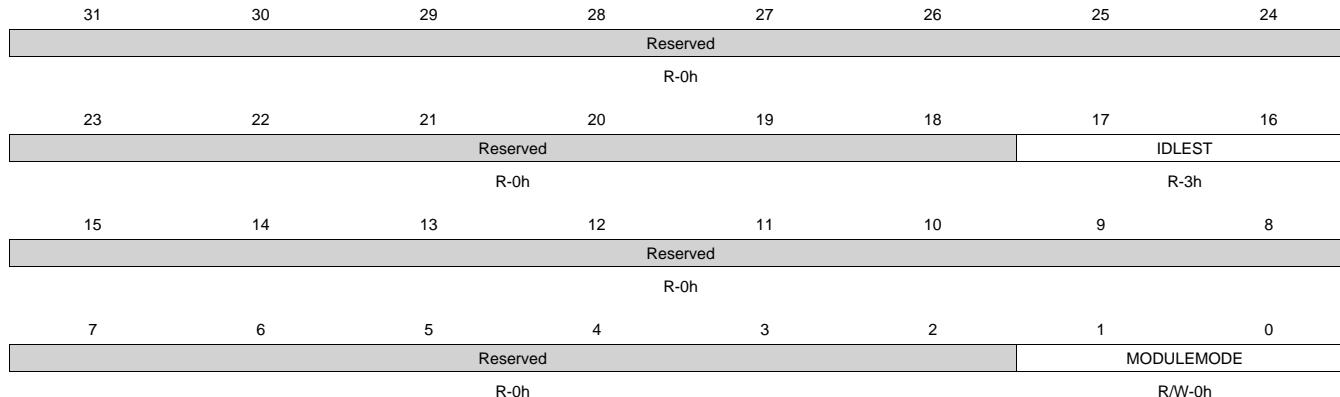

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.19 CM\_PER\_SPI1\_CLKCTRL Register (offset = 50h) [reset = 30000h]

CM\_PER\_SPI1\_CLKCTRL is shown in [Figure 8-40](#) and described in [Table 8-46](#).

This register manages the SPI1 clocks.

**Figure 8-40. CM\_PER\_SPI1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-46. CM\_PER\_SPI1\_CLKCTRL Register Field Descriptions**

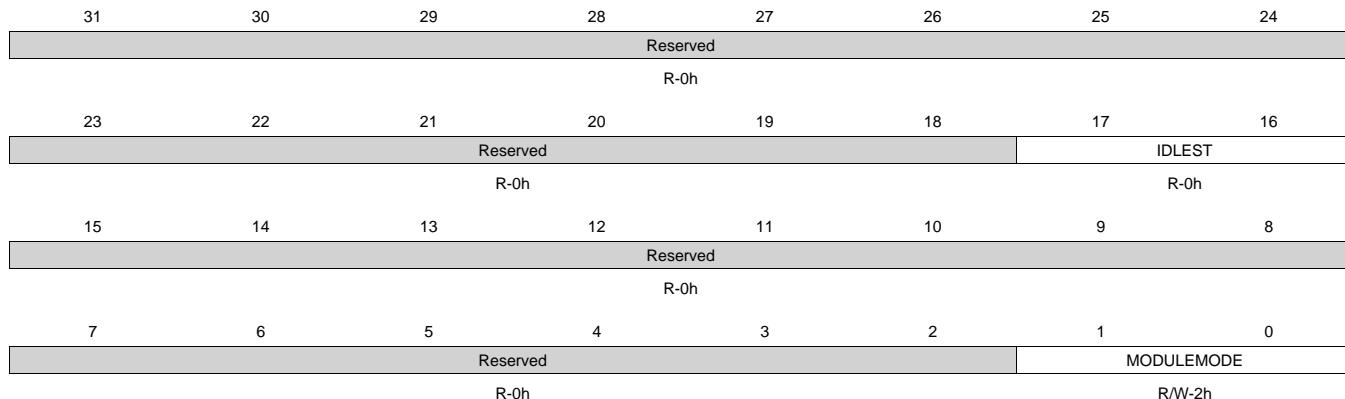

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.20 CM\_PER\_L4LS\_CLKCTRL Register (offset = 60h) [reset = 2h]

CM\_PER\_L4LS\_CLKCTRL is shown in [Figure 8-41](#) and described in [Table 8-47](#).

This register manages the L4LS clocks.

**Figure 8-41. CM\_PER\_L4LS\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-47. CM\_PER\_L4LS\_CLKCTRL Register Field Descriptions**

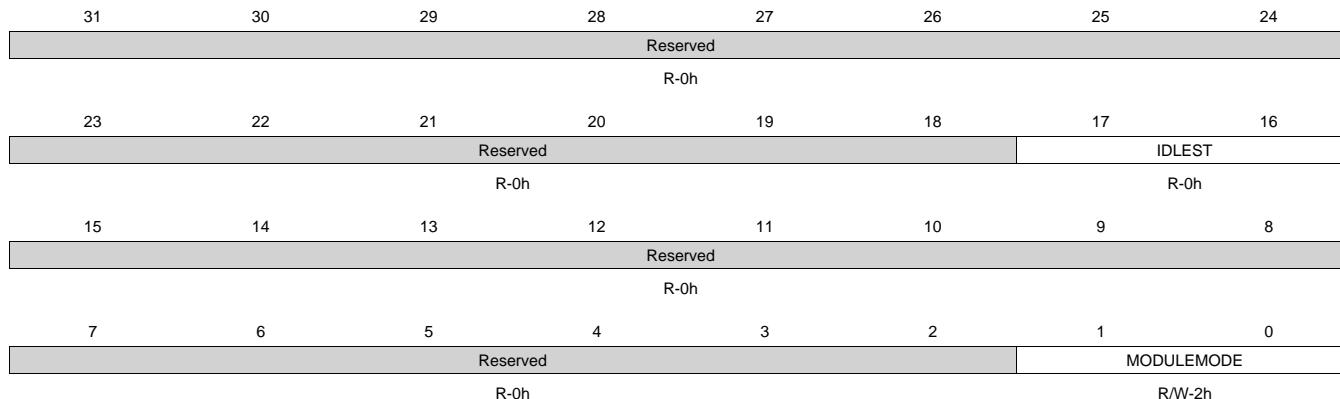

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 0h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 2h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.21 CM\_PER\_L4FW\_CLKCTRL Register (offset = 64h) [reset = 2h]

CM\_PER\_L4FW\_CLKCTRL is shown in [Figure 8-42](#) and described in [Table 8-48](#).

This register manages the L4FW clocks.

**Figure 8-42. CM\_PER\_L4FW\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-48. CM\_PER\_L4FW\_CLKCTRL Register Field Descriptions**

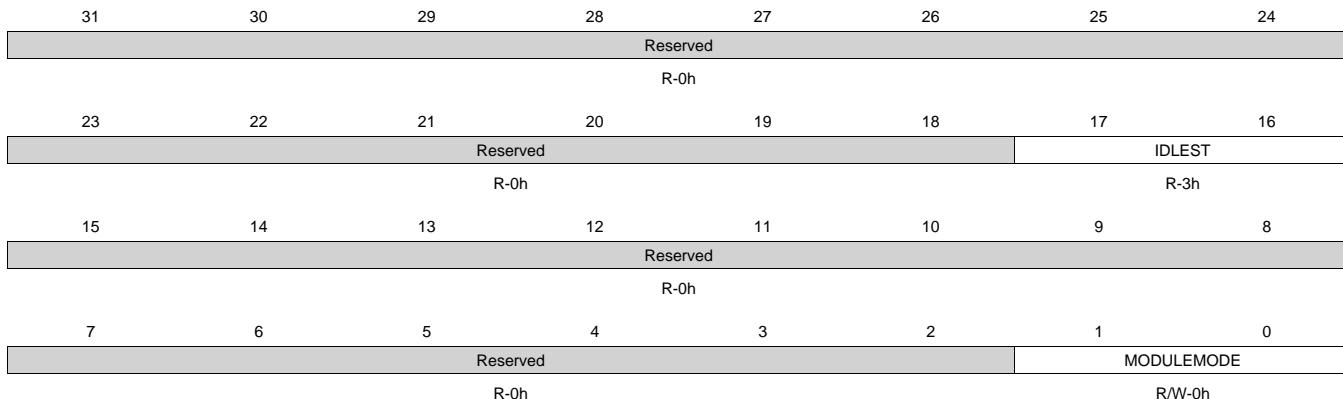

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 0h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 2h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.22 CM\_PER\_MCASP1\_CLKCTRL Register (offset = 68h) [reset = 30000h]

CM\_PER\_MCASP1\_CLKCTRL is shown in [Figure 8-43](#) and described in [Table 8-49](#).

This register manages the MCASP1 clocks.

**Figure 8-43. CM\_PER\_MCASP1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-49. CM\_PER\_MCASP1\_CLKCTRL Register Field Descriptions**

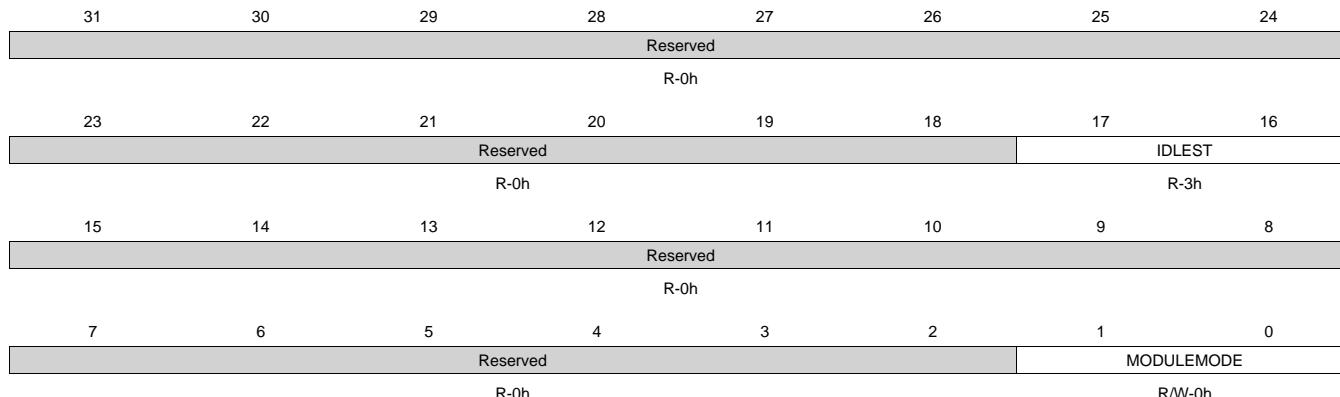

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.23 CM\_PER\_UART1\_CLKCTRL Register (offset = 6Ch) [reset = 30000h]

CM\_PER\_UART1\_CLKCTRL is shown in [Figure 8-44](#) and described in [Table 8-50](#).

This register manages the UART1 clocks.

**Figure 8-44. CM\_PER\_UART1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-50. CM\_PER\_UART1\_CLKCTRL Register Field Descriptions**

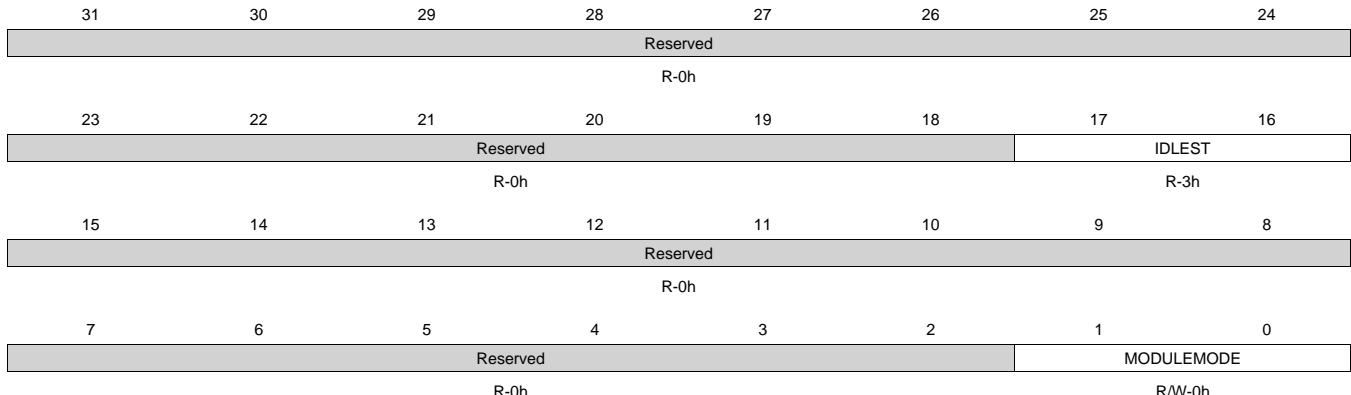

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.24 CM\_PER\_UART2\_CLKCTRL Register (offset = 70h) [reset = 30000h]

CM\_PER\_UART2\_CLKCTRL is shown in [Figure 8-45](#) and described in [Table 8-51](#).

This register manages the UART2 clocks.

**Figure 8-45. CM\_PER\_UART2\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-51. CM\_PER\_UART2\_CLKCTRL Register Field Descriptions**

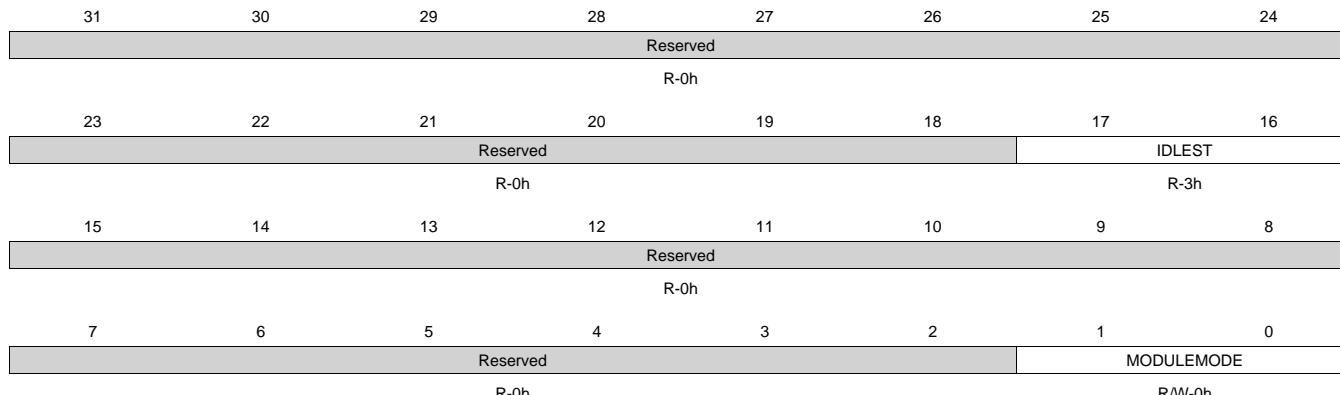

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.25 CM\_PER\_UART3\_CLKCTRL Register (offset = 74h) [reset = 30000h]

CM\_PER\_UART3\_CLKCTRL is shown in [Figure 8-46](#) and described in [Table 8-52](#).

This register manages the UART3 clocks.

**Figure 8-46. CM\_PER\_UART3\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-52. CM\_PER\_UART3\_CLKCTRL Register Field Descriptions**

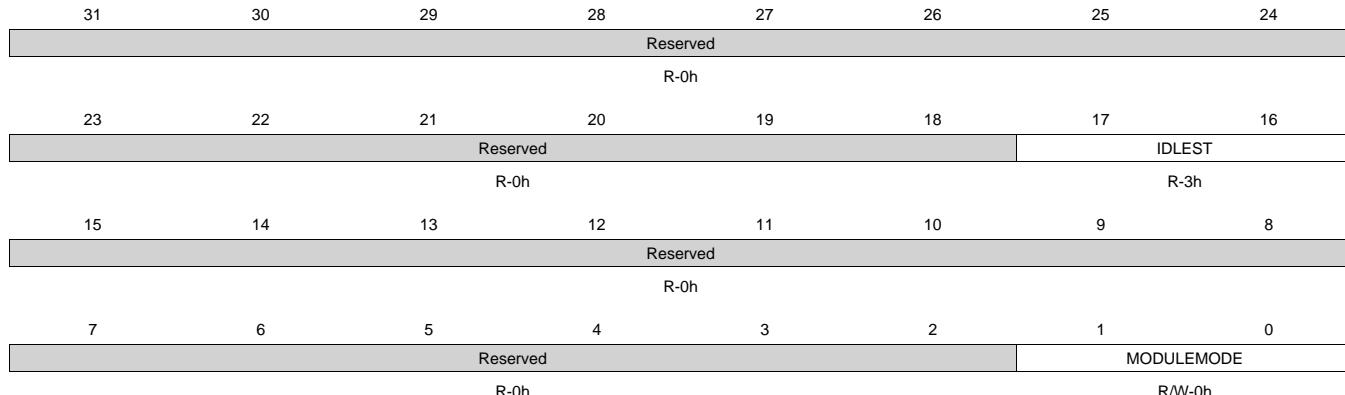

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.26 CM\_PER\_UART4\_CLKCTRL Register (offset = 78h) [reset = 30000h]

CM\_PER\_UART4\_CLKCTRL is shown in [Figure 8-47](#) and described in [Table 8-53](#).

This register manages the UART4 clocks.

**Figure 8-47. CM\_PER\_UART4\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-53. CM\_PER\_UART4\_CLKCTRL Register Field Descriptions**

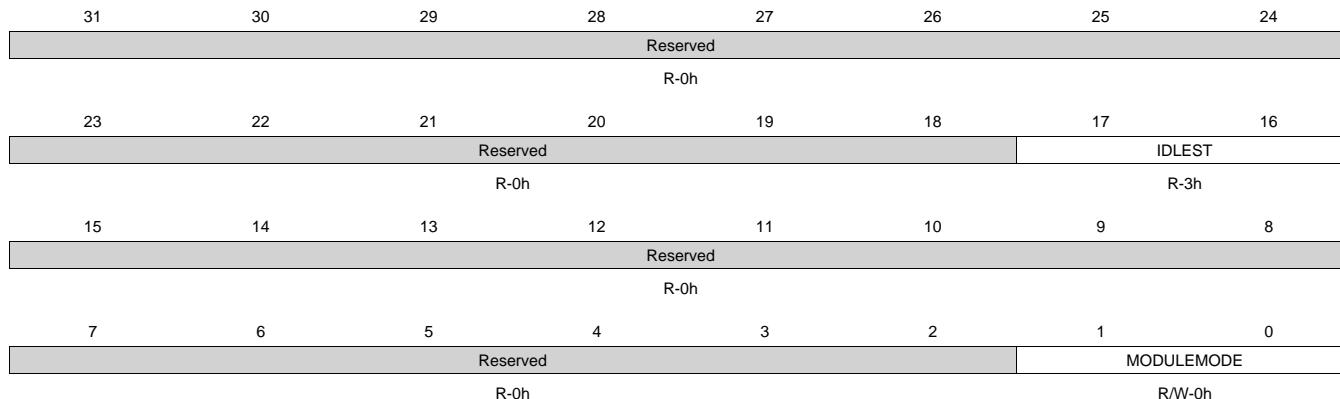

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.27 CM\_PER\_TIMER7\_CLKCTRL Register (offset = 7Ch) [reset = 30000h]

CM\_PER\_TIMER7\_CLKCTRL is shown in [Figure 8-48](#) and described in [Table 8-54](#).

This register manages the TIMER7 clocks.

**Figure 8-48. CM\_PER\_TIMER7\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-54. CM\_PER\_TIMER7\_CLKCTRL Register Field Descriptions**

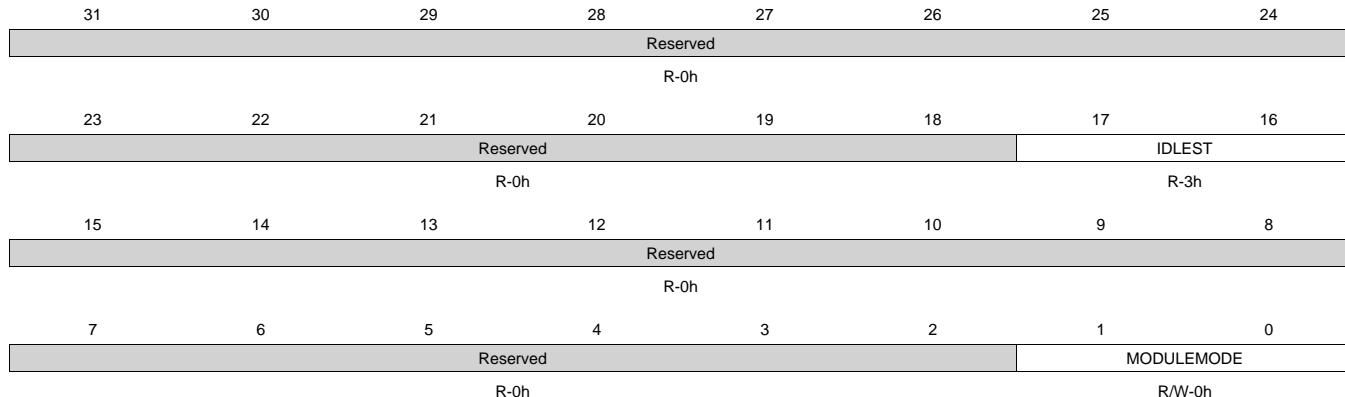

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.28 CM\_PER\_TIMER2\_CLKCTRL Register (offset = 80h) [reset = 30000h]

CM\_PER\_TIMER2\_CLKCTRL is shown in [Figure 8-49](#) and described in [Table 8-55](#).

This register manages the TIMER2 clocks.

**Figure 8-49. CM\_PER\_TIMER2\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-55. CM\_PER\_TIMER2\_CLKCTRL Register Field Descriptions**

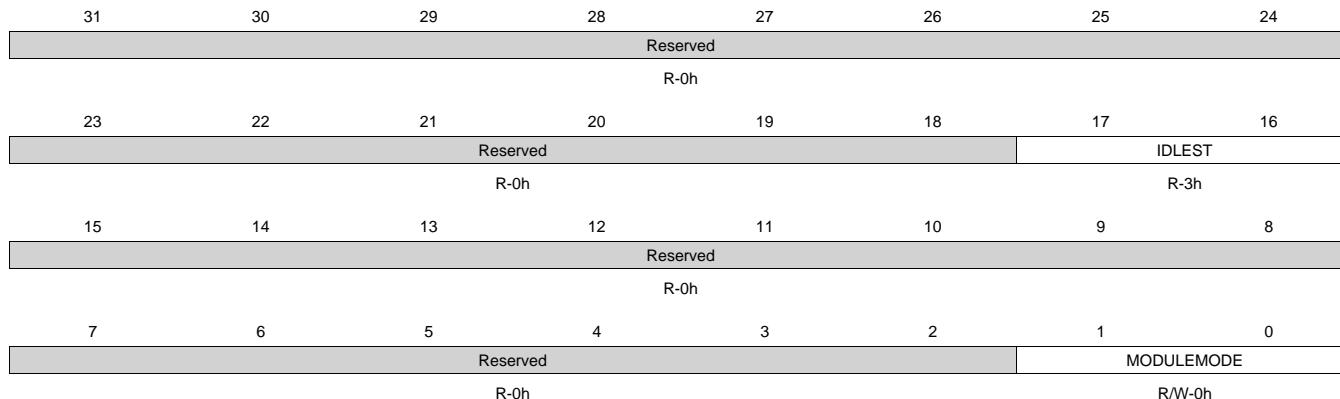

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.29 CM\_PER\_TIMER3\_CLKCTRL Register (offset = 84h) [reset = 30000h]

CM\_PER\_TIMER3\_CLKCTRL is shown in [Figure 8-50](#) and described in [Table 8-56](#).

This register manages the TIMER3 clocks.

**Figure 8-50. CM\_PER\_TIMER3\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-56. CM\_PER\_TIMER3\_CLKCTRL Register Field Descriptions**

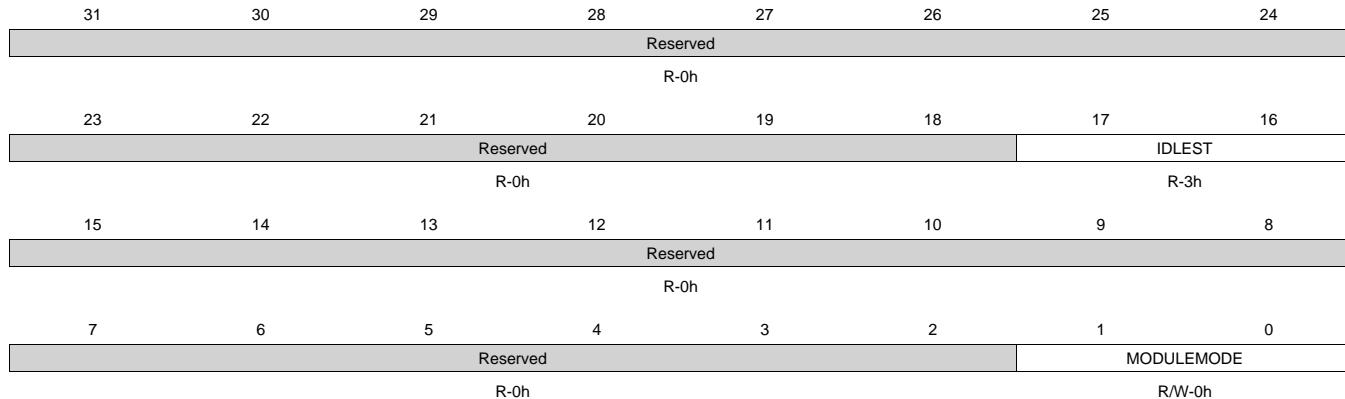

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.30 CM\_PER\_TIMER4\_CLKCTRL Register (offset = 88h) [reset = 30000h]

CM\_PER\_TIMER4\_CLKCTRL is shown in [Figure 8-51](#) and described in [Table 8-57](#).

This register manages the TIMER4 clocks.

**Figure 8-51. CM\_PER\_TIMER4\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-57. CM\_PER\_TIMER4\_CLKCTRL Register Field Descriptions**

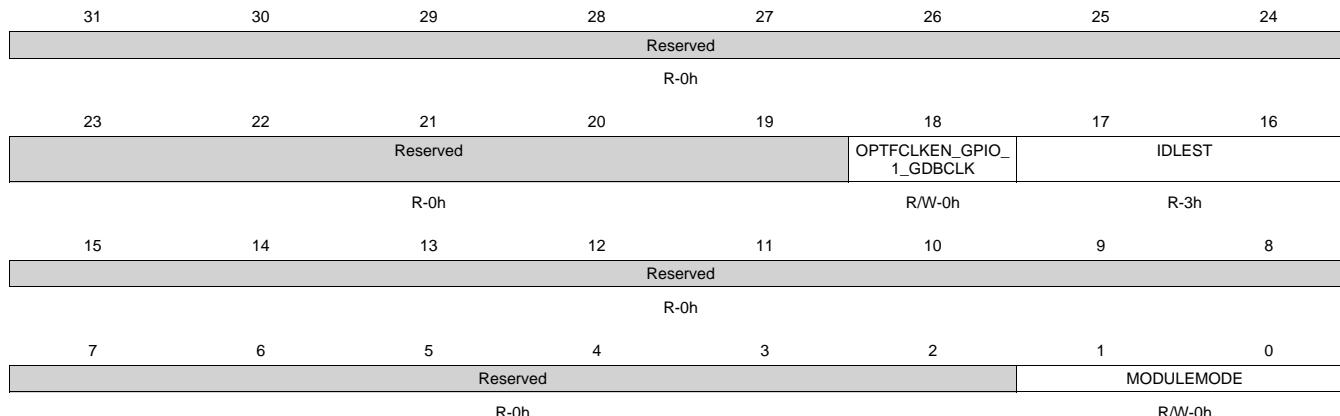

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.31 CM\_PER\_GPIO1\_CLKCTRL Register (offset = ACh) [reset = 30000h]

CM\_PER\_GPIO1\_CLKCTRL is shown in [Figure 8-52](#) and described in [Table 8-58](#).

This register manages the GPIO1 clocks.

**Figure 8-52. CM\_PER\_GPIO1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-58. CM\_PER\_GPIO1\_CLKCTRL Register Field Descriptions**

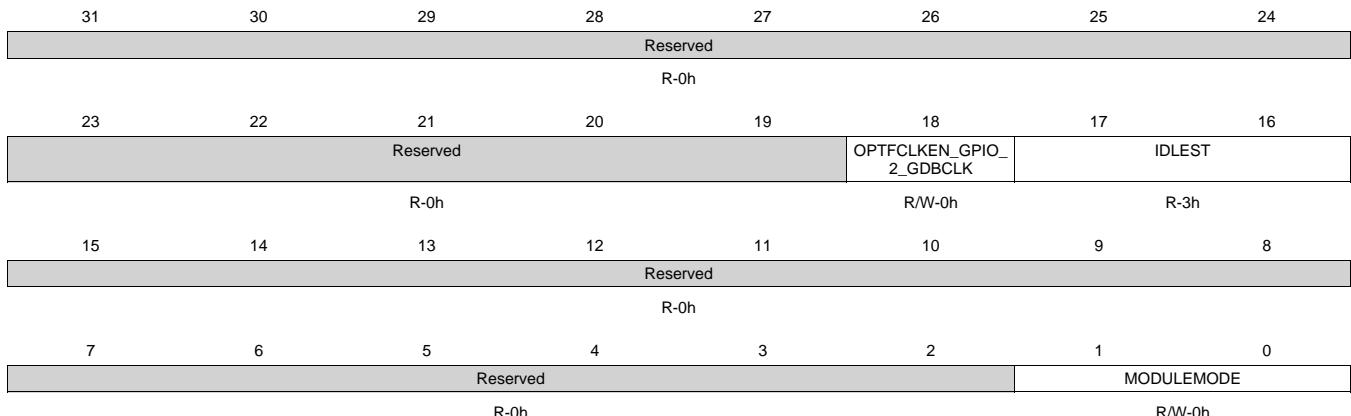

| Bit   | Field                   | Type | Reset | Description   |
|-------|-------------------------|------|-------|---|
| 31-19 | Reserved                | R    | 0h    |   |
| 18    | OPTFCLKEN_GPIO_1_GDBCLK | R/W  | 0h    | Optional functional clock control.<br>0x0 = FCLK_DIS : Optional functional clock is disabled<br>0x1 = FCLK_EN : Optional functional clock is enabled  |
| 17-16 | IDLEST                  | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved                | R    | 0h    |   |

Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.32 CM\_PER\_GPIO2\_CLKCTRL Register (offset = B0h) [reset = 30000h]

CM\_PER\_GPIO2\_CLKCTRL is shown in [Figure 8-53](#) and described in [Table 8-59](#).

This register manages the GPIO2 clocks.

**Figure 8-53. CM\_PER\_GPIO2\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-59. CM\_PER\_GPIO2\_CLKCTRL Register Field Descriptions**

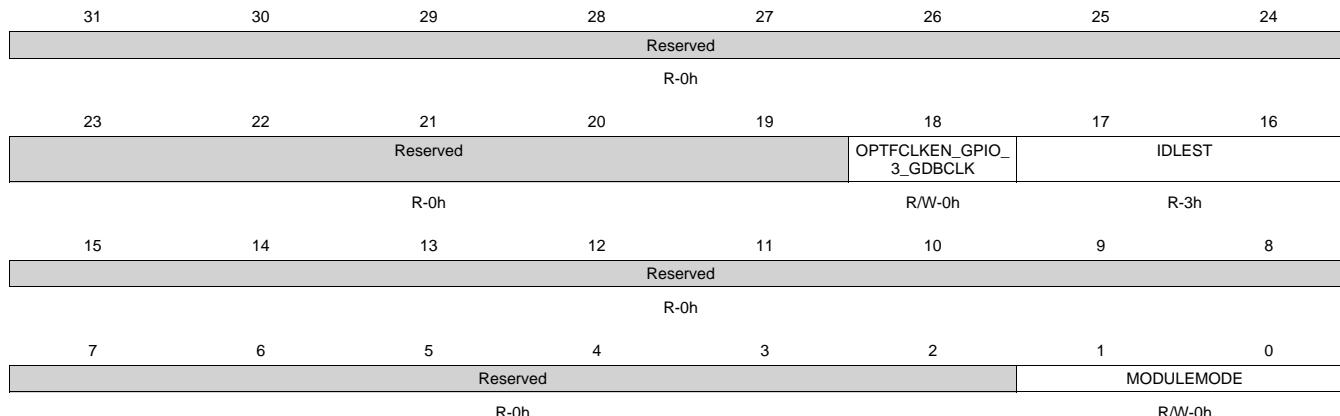

| Bit   | Field                   | Type | Reset | Description   |
|-------|-------------------------|------|-------|---|

### 8.1.12.1.33 CM\_PER\_GPIO3\_CLKCTRL Register (offset = B4h) [reset = 30000h]

CM\_PER\_GPIO3\_CLKCTRL is shown in [Figure 8-54](#) and described in [Table 8-60](#).

This register manages the GPIO3 clocks.

**Figure 8-54. CM\_PER\_GPIO3\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-60. CM\_PER\_GPIO3\_CLKCTRL Register Field Descriptions**

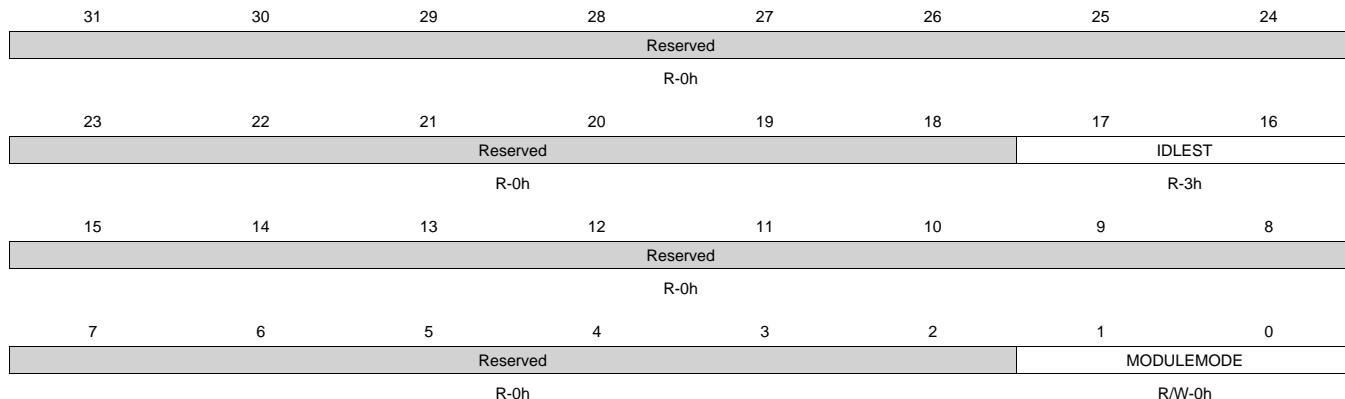

| Bit   | Field                   | Type | Reset | Description   |

### 8.1.12.1.34 CM\_PER\_TPCC\_CLKCTRL Register (offset = BCh) [reset = 30000h]

CM\_PER\_TPCC\_CLKCTRL is shown in [Figure 8-55](#) and described in [Table 8-61](#).

This register manages the TPCC clocks.

**Figure 8-55. CM\_PER\_TPCC\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-61. CM\_PER\_TPCC\_CLKCTRL Register Field Descriptions**

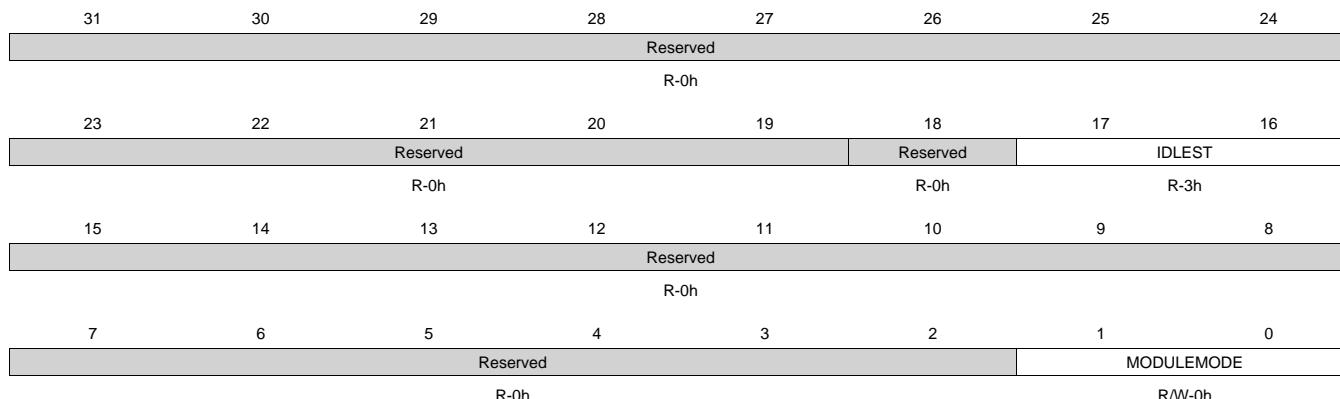

| Bit   | Field      | Type | Reset | Description  |

### 8.1.12.1.35 CM\_PER\_DCANO\_CLKCTRL Register (offset = C0h) [reset = 30000h]

CM\_PER\_DCANO\_CLKCTRL is shown in [Figure 8-56](#) and described in [Table 8-62](#).

This register manages the DCAN0 clocks.

**Figure 8-56. CM\_PER\_DCANO\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-62. CM\_PER\_DCANO\_CLKCTRL Register Field Descriptions**

### 8.1.12.1.37 CM\_PER\_EPWMSS1\_CLKCTRL Register (offset = CCh) [reset = 30000h]

CM\_PER\_EPWMSS1\_CLKCTRL is shown in Figure 8-58 and described in Table 8-64.

This register manages the PWMSS1 clocks.

**Figure 8-58. CM\_PER\_EPWMSS1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-64. CM\_PER\_EPWMSS1\_CLKCTRL Register Field Descriptions**

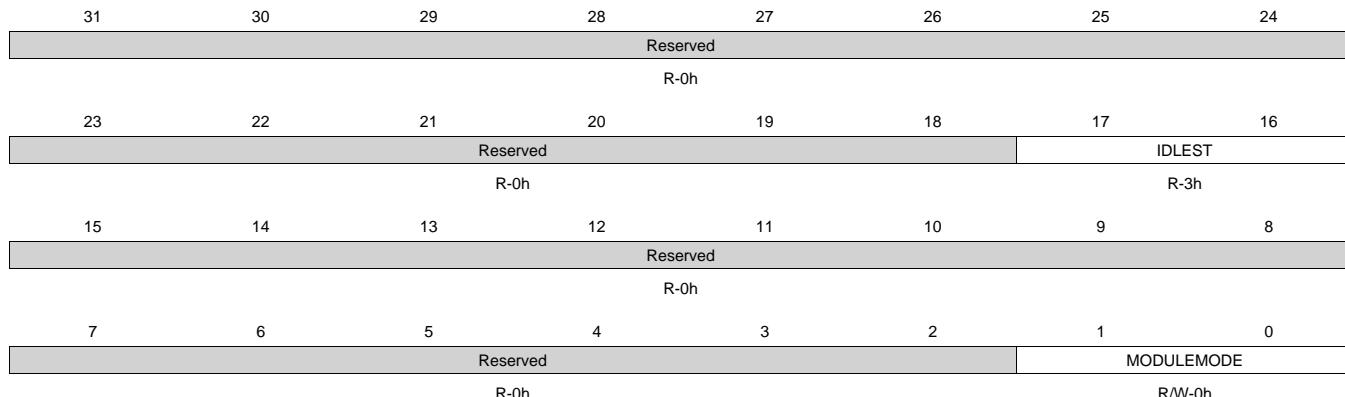

| Bit   | Field      | Type | Reset | Description   |

It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.1.38 CM\_PER\_EMIF\_FW\_CLKCTRL Register (offset = D0h) [reset = 30000h]

CM\_PER\_EMIF\_FW\_CLKCTRL is shown in [Figure 8-59](#) and described in [Table 8-65](#).

This register manages the EMIF Firewall clocks.

**Figure 8-59. CM\_PER\_EMIF\_FW\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-65. CM\_PER\_EMIF\_FW\_CLKCTRL Register Field Descriptions**

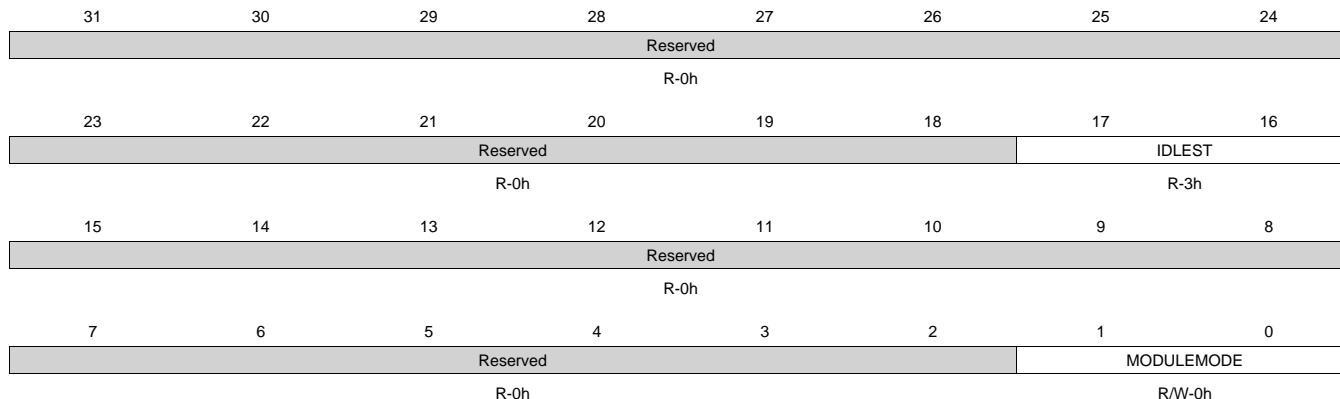

| Bit   | Field      | Type | Reset | Description  |

Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.1.39 CM\_PER\_EPWMSS0\_CLKCTRL Register (offset = D4h) [reset = 30000h]

CM\_PER\_EPWMSS0\_CLKCTRL is shown in Figure 8-60 and described in Table 8-66.

This register manages the PWMSS0 clocks.

**Figure 8-60. CM\_PER\_EPWMSS0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-66. CM\_PER\_EPWMSS0\_CLKCTRL Register Field Descriptions**

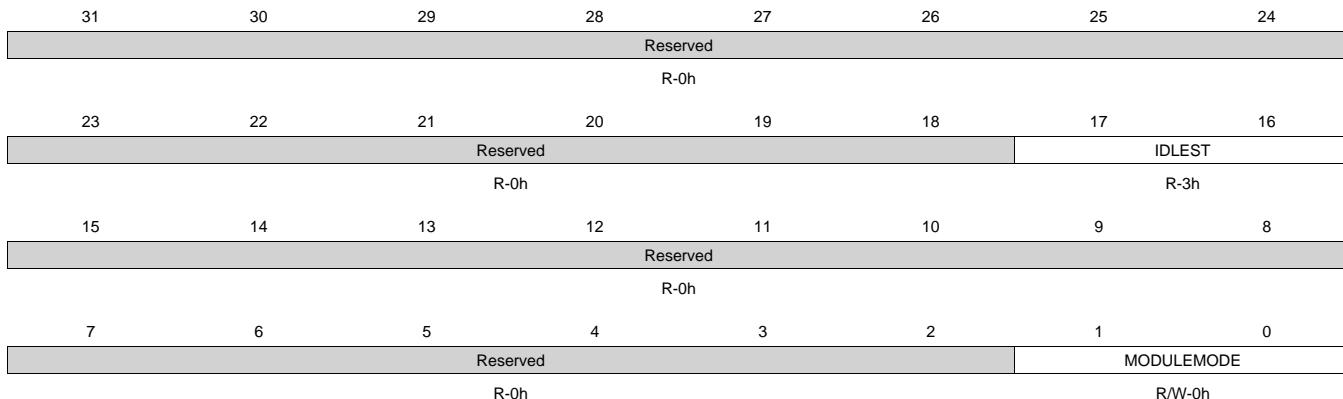

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |

It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

#### 8.1.12.1.40 CM\_PER\_EPWMSS2\_CLKCTRL Register (offset = D8h) [reset = 30000h]

CM\_PER\_EPWMSS2\_CLKCTRL is shown in [Figure 8-61](#) and described in [Table 8-67](#).

This register manages the PWMSS2 clocks.

**Figure 8-61. CM\_PER\_EPWMSS2\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-67. CM\_PER\_EPWMSS2\_CLKCTRL Register Field Descriptions**

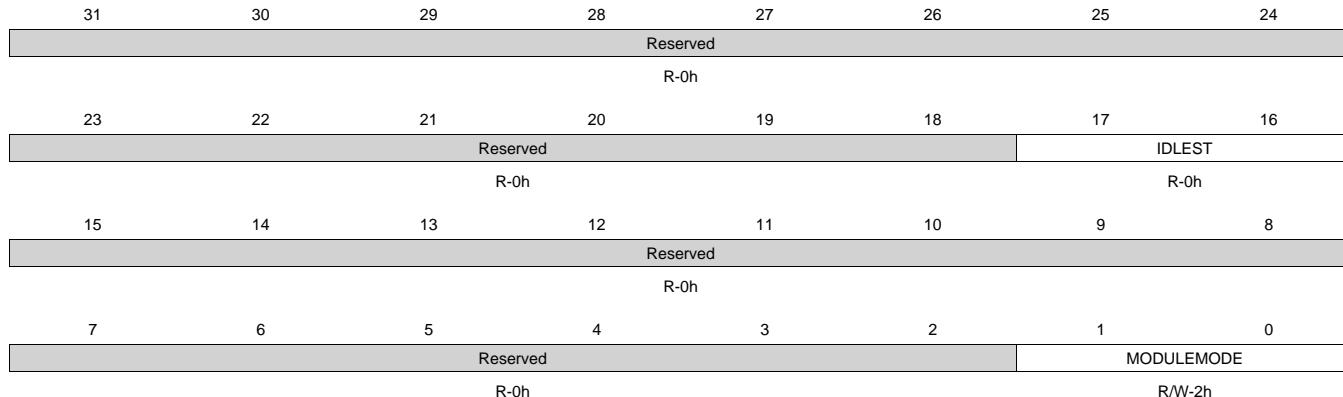

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

#### **8.1.12.1.41 CM\_PER\_L3\_INSTR\_CLKCTRL Register (offset = DCh) [reset = 2h]**

CM\_PER\_L3\_INSTR\_CLKCTRL is shown in [Figure 8-62](#) and described in [Table 8-68](#).

This register manages the L3 INSTR clocks.

**Figure 8-62. CM\_PER\_L3\_INSTR\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-68. CM\_PER\_L3\_INSTR\_CLKCTRL Register Field Descriptions**

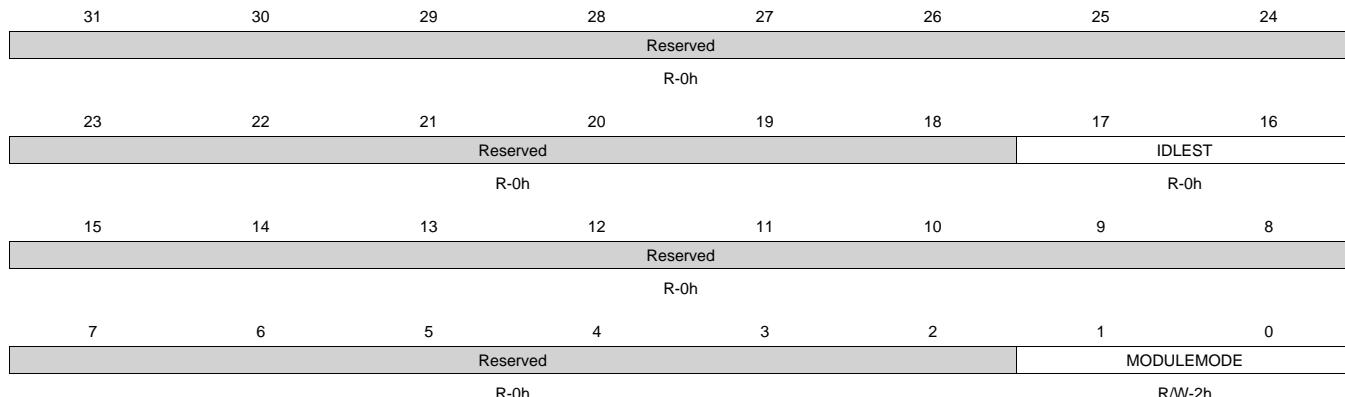

| Bit   | Field      | Type | Reset | Description   |

### 8.1.12.1.47 CM\_PER\_MMC1\_CLKCTRL Register (offset = F4h) [reset = 30000h]

CM\_PER\_MMC1\_CLKCTRL is shown in [Figure 8-68](#) and described in [Table 8-74](#).

This register manages the MMC1 clocks.

**Figure 8-68. CM\_PER\_MMC1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-74. CM\_PER\_MMC1\_CLKCTRL Register Field Descriptions**

### 8.1.12.1.51 CM\_PER\_SPINLOCK\_CLKCTRL Register (offset = 10Ch) [reset = 30000h]

CM\_PER\_SPINLOCK\_CLKCTRL is shown in [Figure 8-72](#) and described in [Table 8-78](#).

This register manages the SPINLOCK clocks.

**Figure 8-72. CM\_PER\_SPINLOCK\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-78. CM\_PER\_SPINLOCK\_CLKCTRL Register Field Descriptions**

### 8.1.12.1.52 CM\_PER\_MAILBOX0\_CLKCTRL Register (offset = 110h) [reset = 30000h]

CM\_PER\_MAILBOX0\_CLKCTRL is shown in Figure 8-73 and described in Table 8-79.

This register manages the MAILBOX0 clocks.

**Figure 8-73. CM\_PER\_MAILBOX0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-79. CM\_PER\_MAILBOX0\_CLKCTRL Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description  |

### 8.1.12.1.53 CM\_PER\_L4HS\_CLKSTCTRL Register (offset = 11Ch) [reset = 7Ah]

CM\_PER\_L4HS\_CLKSTCTRL is shown in [Figure 8-74](#) and described in [Table 8-80](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-74. CM\_PER\_L4HS\_CLKSTCTRL Register**

|          |                            |                             |                              |                       |          |           |    |

### 8.1.12.1.57 CM\_PER\_PRU\_ICSS\_CLKSTCTRL Register (offset = 140h) [reset = 2h]

CM\_PER\_PRU\_ICSS\_CLKSTCTRL is shown in [Figure 8-78](#) and described in [Table 8-84](#).

This register enables the clock domain state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-78. CM\_PER\_PRU\_ICSS\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-84. CM\_PER\_PRU\_ICSS\_CLKSTCTRL Register Field Descriptions**

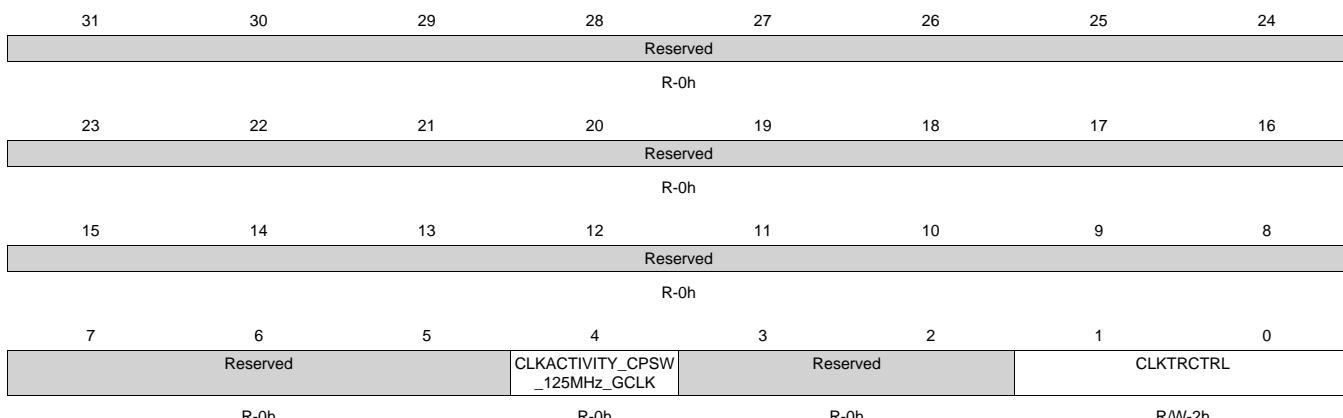

| Bit  | Field                          | Type | Reset | Description  |

### 8.1.12.1.58 CM\_PER\_CPSW\_CLKSTCTRL Register (offset = 144h) [reset = 2h]

CM\_PER\_CPSW\_CLKSTCTRL is shown in [Figure 8-79](#) and described in [Table 8-85](#).

This register enables the clock domain state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-79. CM\_PER\_CPSW\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-85. CM\_PER\_CPSW\_CLKSTCTRL Register Field Descriptions**

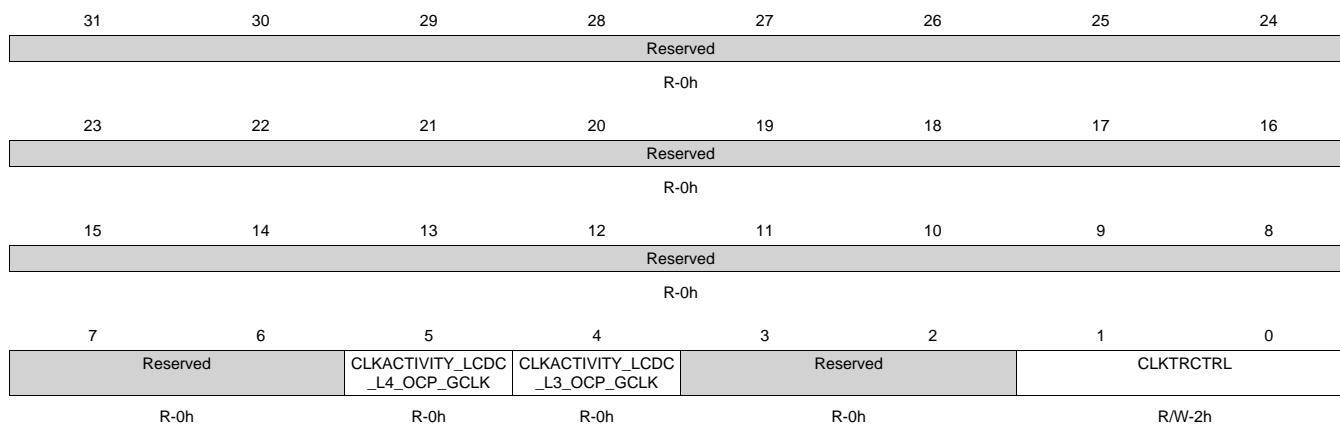

| Bit  | Field                        | Type | Reset | Description  |
|------|------------------------------|------|-------|--|

### 8.1.12.1.59 CM\_PER\_LCDC\_CLKSTCTRL Register (offset = 148h) [reset = 2h]

CM\_PER\_LCDC\_CLKSTCTRL is shown in [Figure 8-80](#) and described in [Table 8-86](#).

This register enables the clock domain state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-80. CM\_PER\_LCDC\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-86. CM\_PER\_LCDC\_CLKSTCTRL Register Field Descriptions**

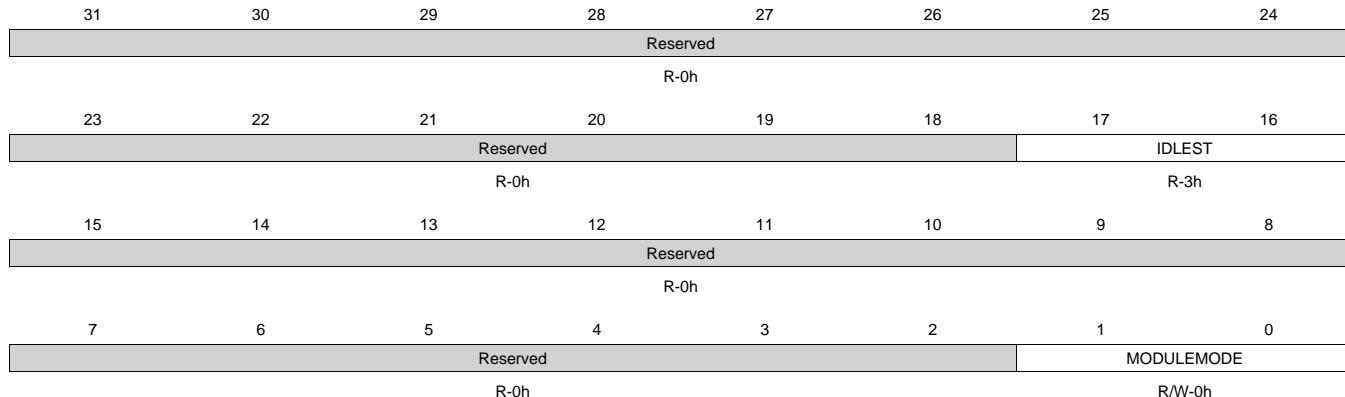

| Bit  | Field                        | Type | Reset | Description  |

Wakeup transition may however occur.<br>0x1 = SW_SLEEP : SW_SLEEP: Start a software forced sleep transition on the domain.<br>0x2 = SW_WKUP : SW_WKUP: Start a software forced wake-up transition on the domain.<br>0x3 = Reserved : Reserved. |

### 8.1.12.1.60 CM\_PER\_CLKDIV32K\_CLKCTRL Register (offset = 14Ch) [reset = 30000h]

CM\_PER\_CLKDIV32K\_CLKCTRL is shown in [Figure 8-81](#) and described in [Table 8-87](#).

This register manages the CLKDIV32K clocks.

**Figure 8-81. CM\_PER\_CLKDIV32K\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-87. CM\_PER\_CLKDIV32K\_CLKCTRL Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|

### 8.1.12.1.61 CM\_PER\_CLK\_24MHZ\_CLKSTCTRL Register (offset = 150h) [reset = 2h]

CM\_PER\_CLK\_24MHZ\_CLKSTCTRL is shown in [Figure 8-82](#) and described in [Table 8-88](#).

This register enables the clock domain state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-82. CM\_PER\_CLK\_24MHZ\_CLKSTCTRL Register**

### 8.1.12.2 CM\_WKUP Registers

[Table 8-89](#) lists the memory-mapped registers for the CM\_WKUP. All register offset addresses not listed in [Table 8-89](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-89. CM\_WKUP REGISTERS**

| Offset | Acronym                 | Register Name   | Section                            |
|--------|-------------------------|---|------------------------------------|
| 0h     | CM_WKUP_CLKSTCTRL       | This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain. | <a href="#">Section 8.1.12.2.1</a> |
| 4h     | CM_WKUP_CONTROL_CLKCTRL | This register manages the Control Module clocks.  | <a href="#">Section 8.1.12.2.2</a> |
| 8h     | CM_WKUP_GPIO0_CLKCTRL   | This register manages the GPIO0 clocks.   | <a href="#">Section 8.1.12.2.3</a> |

**Table 8-89. CM\_WKUP REGISTERS (continued)**

| Offset | Acronym                    | Register Name   | Section                             |
|--------|----------------------------|---|-------------------------------------|
| Ch     | CM_WKUP_L4WKUP_CLKCTRL     | This register manages the L4WKUP clocks.  | <a href="#">Section 8.1.12.2.4</a>  |
| 10h    | CM_WKUP_TIMER0_CLKCTRL     | This register manages the TIMER0 clocks.  | <a href="#">Section 8.1.12.2.5</a>  |

### 8.1.12.2.1 CM\_WKUP\_CLKSTCTRL Register (offset = 0h) [reset = 6h]

CM\_WKUP\_CLKSTCTRL is shown in [Figure 8-83](#) and described in [Table 8-90](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-83. CM\_WKUP\_CLKSTCTRL Register**

Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.2.7 CM\_L3\_AON\_CLKSTCTRL Register (offset = 18h) [reset = 1Ah]

CM\_L3\_AON\_CLKSTCTRL is shown in [Figure 8-89](#) and described in [Table 8-96](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-89. CM\_L3\_AON\_CLKSTCTRL Register**

### 8.1.12.2.18 CM\_AUTOIDLE\_DPLL\_DISP Register (offset = 44h) [reset = 0h]

CM\_AUTOIDLE\_DPLL\_DISP is shown in [Figure 8-100](#) and described in [Table 8-107](#).

This register provides automatic control over the DPLL activity.

**Figure 8-100. CM\_AUTOIDLE\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-107. CM\_AUTOIDLE\_DPLL\_DISP Register Field Descriptions**

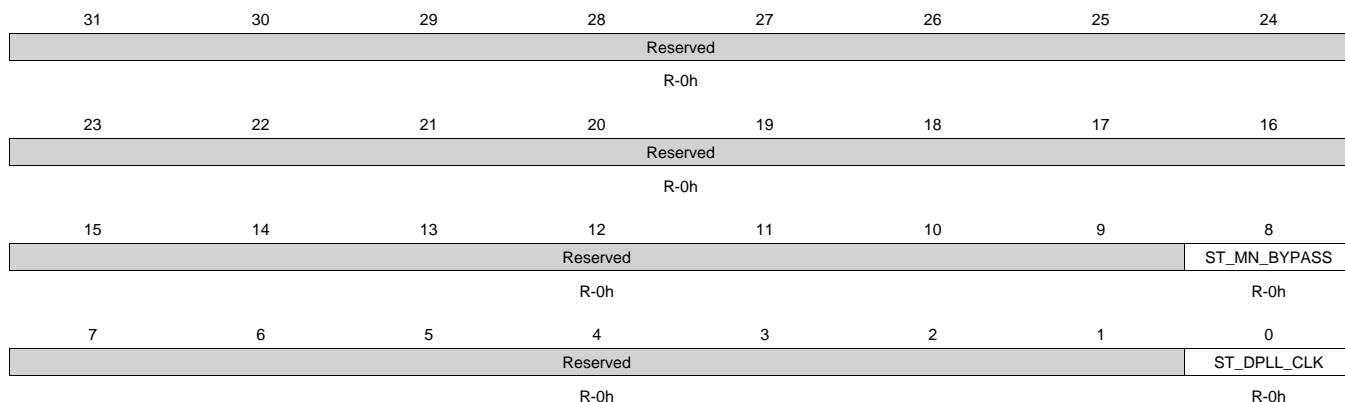

| Bit  | Field          | Type | Reset | Description                      |
|------|----------------|------|-------|----------------------------------|
| 31-3 | Reserved       | R    | 0h    |                                  |
| 2-0  | AUTO_DPLL_MODE | R/W  | 0h    | AUTO_DPLL_MODE is not supported. |

### 8.1.12.2.19 CM\_IDLEST\_DPLL\_DISP Register (offset = 48h) [reset = 0h]

CM\_IDLEST\_DPLL\_DISP is shown in [Figure 8-101](#) and described in [Table 8-108](#).

This register allows monitoring the master clock activity. This register is read only and automatically updated. [warm reset insensitive]

**Figure 8-101. CM\_IDLEST\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-108. CM\_IDLEST\_DPLL\_DISP Register Field Descriptions**

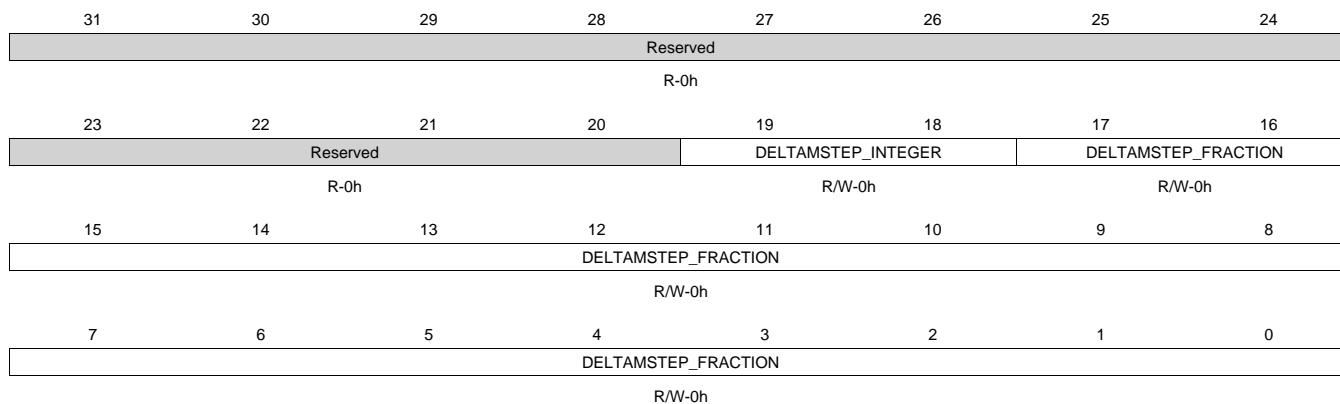

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-9 | Reserved     | R    | 0h    |   |
| 8    | ST_MN_BYPASS | R    | 0h    | DPLL MN_BYPASS status<br>0x0 = NO_MNBYPASS : DPLL is not in MN_Bypass<br>0x1 = MN_BYPASS : DPLL is in MN_Bypass                   |
| 7-1  | Reserved     | R    | 0h    |   |
| 0    | ST_DPLL_CLK  | R    | 0h    | DPLL clock activity<br>0x0 = DPLL_UNLOCKED : DPLL is either in bypass mode or in stop mode.<br>0x1 = DPLL_LOCKED : DPLL is LOCKED |

### 8.1.12.2.20 CM\_SSC\_DELTAMSTEP\_DPLL\_DISP Register (offset = 4Ch) [reset = 0h]

CM\_SSC\_DELTAMSTEP\_DPLL\_DISP is shown in [Figure 8-102](#) and described in [Table 8-109](#).

Control the DeltaMStep parameter for Spread Spectrum Clocking technique DeltaMStep is split into fractional and integer part. [warm reset insensitive]

**Figure 8-102. CM\_SSC\_DELTAMSTEP\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-109. CM\_SSC\_DELTAMSTEP\_DPLL\_DISP Register Field Descriptions**

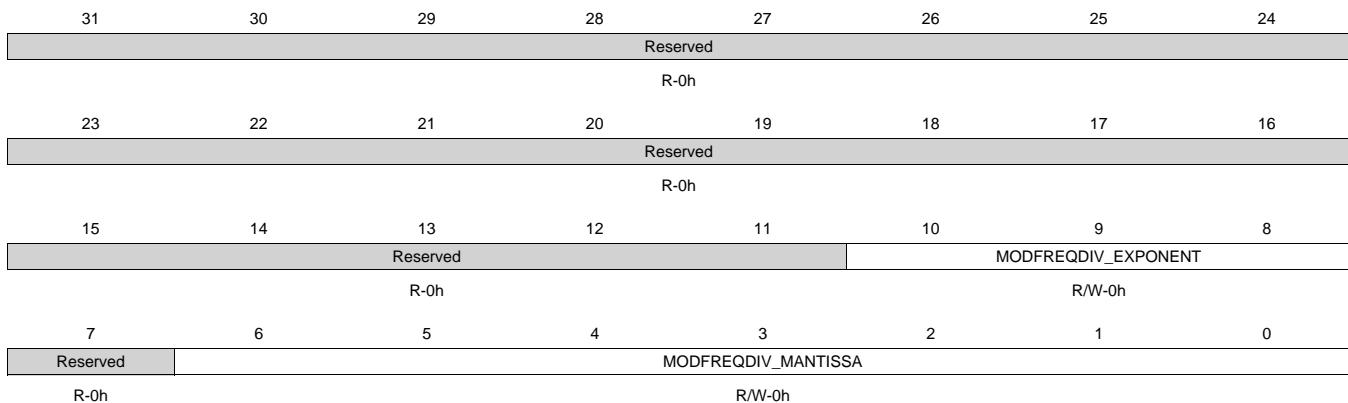

| Bit   | Field               | Type | Reset | Description                                 |
|-------|---------------------|------|-------|---|
| 31-20 | Reserved            | R    | 0h    |   |
| 19-18 | DELTAMSTEP_INTEGER  | R/W  | 0h    | Integer part for DeltaM coefficient         |
| 17-0  | DELTAMSTEP_FRACTION | R/W  | 0h    | Fractional setting for DeltaMStep parameter |

### 8.1.12.2.21 CM\_SSC\_MODFREQDIV\_DPLL\_DISP Register (offset = 50h) [reset = 0h]

CM\_SSC\_MODFREQDIV\_DPLL\_DISP is shown in [Figure 8-103](#) and described in [Table 8-110](#).

Control the Modulation Frequency (Fm) for Spread Spectrum Clocking technique by defining it as a ratio of DPLL\_REFCLK/4 Fm = [DPLL\_REFCLK/4]/MODFREQDIV MODFREQDIV = MODFREQDIV\_MANTISSA \* 2^MODFREQDIV\_EXPONENT [warm reset insensitive]

**Figure 8-103. CM\_SSC\_MODFREQDIV\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-110. CM\_SSC\_MODFREQDIV\_DPLL\_DISP Register Field Descriptions**

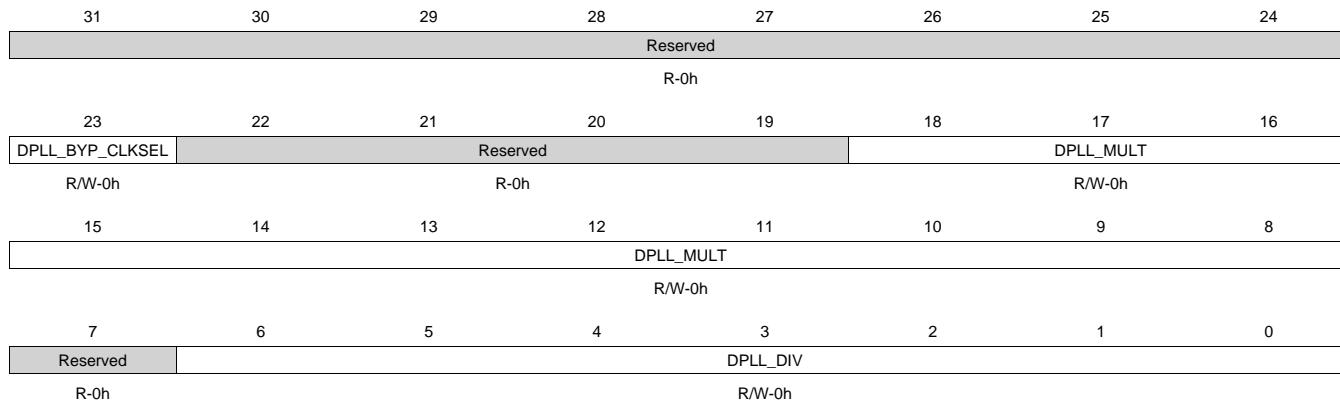

| Bit   | Field               | Type | Reset | Description                                     |
|-------|---------------------|------|-------|---|
| 31-11 | Reserved            | R    | 0h    |   |
| 10-8  | MODFREQDIV_EXPONENT | R/W  | 0h    | Set the Exponent component of MODFREQDIV factor |
| 7     | Reserved            | R    | 0h    |   |
| 6-0   | MODFREQDIV_MANTISSA | R/W  | 0h    | Set the Mantissa component of MODFREQDIV factor |

### 8.1.12.2.22 CM\_CLKSEL\_DPLL\_DISP Register (offset = 54h) [reset = 0h]

CM\_CLKSEL\_DPLL\_DISP is shown in [Figure 8-104](#) and described in [Table 8-111](#).

This register provides controls over the DPLL.

**Figure 8-104. CM\_CLKSEL\_DPLL\_DISP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-111. CM\_CLKSEL\_DPLL\_DISP Register Field Descriptions**

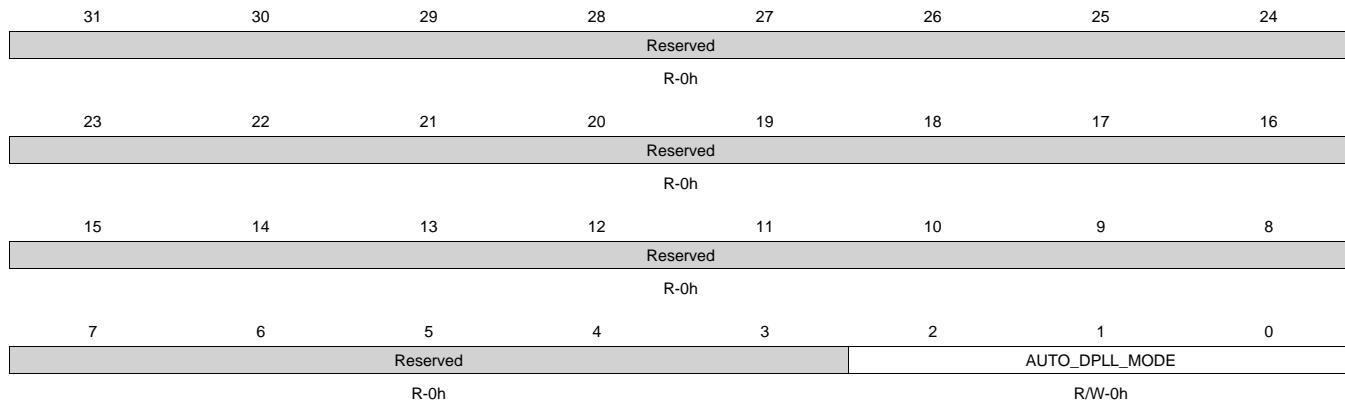

| Bit   | Field           | Type | Reset | Description   |
|-------|-----------------|------|-------|---|
| 31-24 | Reserved        | R    | 0h    |   |
| 23    | DPLL_BYP_CLKSEL | R/W  | 0h    | Select CLKINP or CLKINPULOW as bypass clock<br>0x0 = Sel0 : Selects CLKINP Clock as BYPASS Clock<br>0x1 = Sel1 : Selects CLKINPULOW as Bypass Clock   |
| 22-19 | Reserved        | R    | 0h    |   |
| 18-8  | DPLL_MULT       | R/W  | 0h    | DPLL multiplier factor (2 to 2047).<br>This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN Bypass mode.<br>M=2 to<br>2047 => DPLL multiplies by M).<br>0x0 = 0 : Reserved<br>0x1 = 1 : Reserved |
| 7     | Reserved        | R    | 0h    |   |
| 6-0   | DPLL_DIV        | R/W  | 0h    | DPLL divider factor (0 to 127) (equal to input N of DPLL<br>actual division factor is N+1).   |

### 8.1.12.2.23 CM\_AUTOIDLE\_DPLL\_CORE Register (offset = 58h) [reset = 0h]

CM\_AUTOIDLE\_DPLL\_CORE is shown in [Figure 8-105](#) and described in [Table 8-112](#).

This register provides automatic control over the DPLL activity.

**Figure 8-105. CM\_AUTOIDLE\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-112. CM\_AUTOIDLE\_DPLL\_CORE Register Field Descriptions**

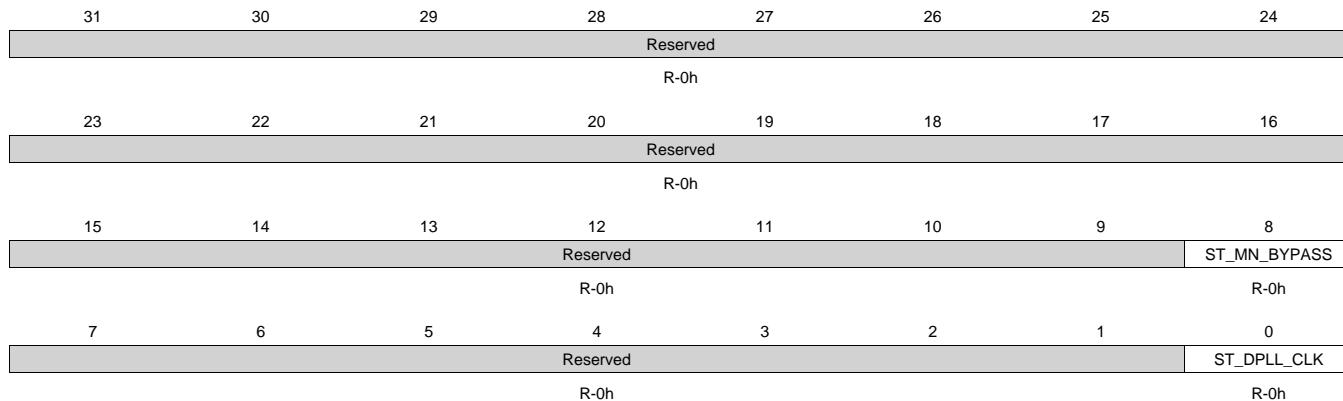

| Bit  | Field          | Type | Reset | Description                    |
|------|----------------|------|-------|--------------------------------|
| 31-3 | Reserved       | R    | 0h    |                                |
| 2-0  | AUTO_DPLL_MODE | R/W  | 0h    | This feature is not supported. |

### 8.1.12.2.24 CM\_IDLEST\_DPLL\_CORE Register (offset = 5Ch) [reset = 0h]

CM\_IDLEST\_DPLL\_CORE is shown in [Figure 8-106](#) and described in [Table 8-113](#).

This register allows monitoring the master clock activity. This register is read only and automatically updated. [warm reset insensitive]

**Figure 8-106. CM\_IDLEST\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-113. CM\_IDLEST\_DPLL\_CORE Register Field Descriptions**

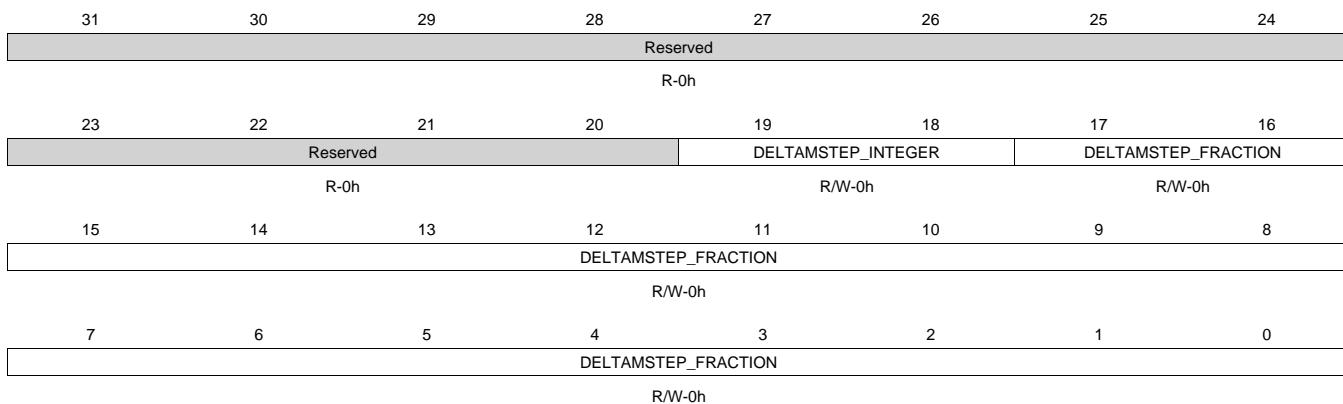

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-9 | Reserved     | R    | 0h    |   |
| 8    | ST_MN_BYPASS | R    | 0h    | DPLL MN_BYPASS status<br>0x0 = NO_MNBYPASS : DPLL is not in MN_Bypass<br>0x1 = MN_BYPASS : DPLL is in MN_Bypass                   |
| 7-1  | Reserved     | R    | 0h    |   |
| 0    | ST_DPLL_CLK  | R    | 0h    | DPLL clock activity<br>0x0 = DPLL_UNLOCKED : DPLL is either in bypass mode or in stop mode.<br>0x1 = DPLL_LOCKED : DPLL is LOCKED |

### 8.1.12.2.25 CM\_SSC\_DELTAMSTEP\_DPLL\_CORE Register (offset = 60h) [reset = 0h]

CM\_SSC\_DELTAMSTEP\_DPLL\_CORE is shown in [Figure 8-107](#) and described in [Table 8-114](#).

Control the DeltaMStep parameter for Spread Spectrum Clocking technique DeltaMStep is split into fractional and integer part. [warm reset insensitive]

**Figure 8-107. CM\_SSC\_DELTAMSTEP\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-114. CM\_SSC\_DELTAMSTEP\_DPLL\_CORE Register Field Descriptions**

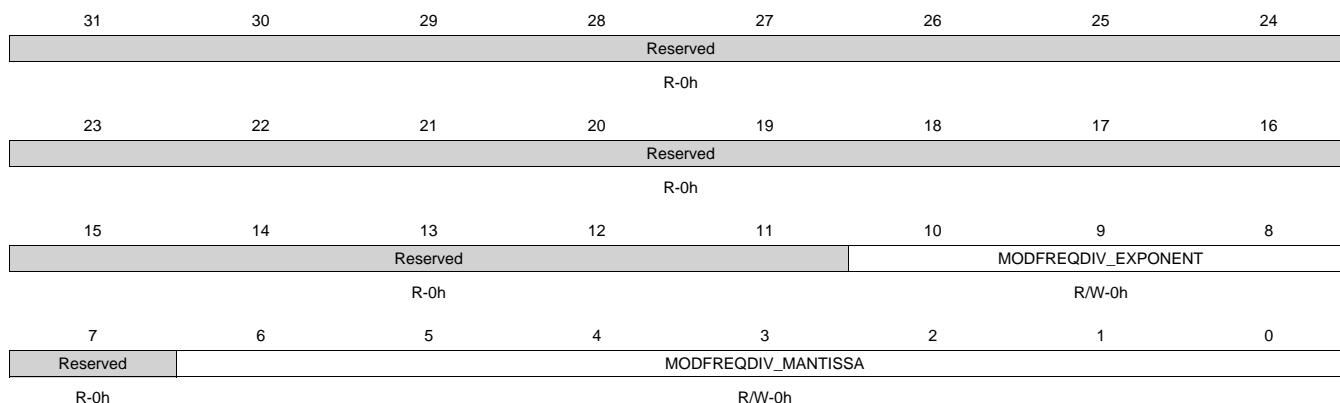

| Bit   | Field               | Type | Reset | Description                                 |
|-------|---------------------|------|-------|---|
| 31-20 | Reserved            | R    | 0h    |   |
| 19-18 | DELTAMSTEP_INTEGER  | R/W  | 0h    | Integer part for DeltaM coefficient         |
| 17-0  | DELTAMSTEP_FRACTION | R/W  | 0h    | Fractional setting for DeltaMStep parameter |

### 8.1.12.2.26 CM\_SSC\_MODFREQDIV\_DPLL\_CORE Register (offset = 64h) [reset = 0h]

CM\_SSC\_MODFREQDIV\_DPLL\_CORE is shown in [Figure 8-108](#) and described in [Table 8-115](#).

Control the Modulation Frequency (Fm) for Spread Spectrum Clocking technique by defining it as a ratio of DPLL\_REFCLK/4 Fm = [DPLL\_REFCLK/4]/MODFREQDIV MODFREQDIV = MODFREQDIV\_MANTISSA \* 2^MODFREQDIV\_EXPONENT [warm reset insensitive]

**Figure 8-108. CM\_SSC\_MODFREQDIV\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-115. CM\_SSC\_MODFREQDIV\_DPLL\_CORE Register Field Descriptions**

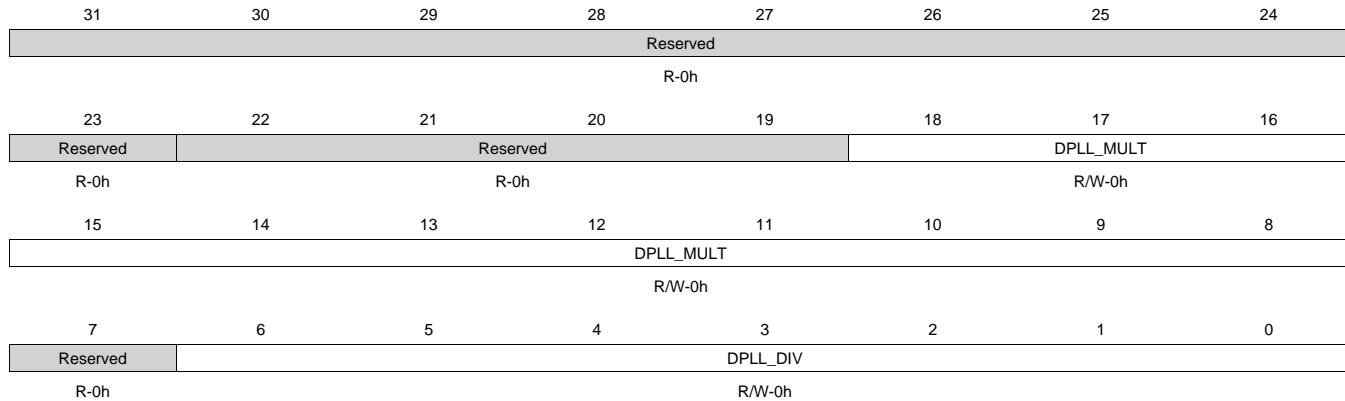

| Bit   | Field               | Type | Reset | Description                                     |
|-------|---------------------|------|-------|---|
| 31-11 | Reserved            | R    | 0h    |   |
| 10-8  | MODFREQDIV_EXPONENT | R/W  | 0h    | Set the Exponent component of MODFREQDIV factor |
| 7     | Reserved            | R    | 0h    |   |
| 6-0   | MODFREQDIV_MANTISSA | R/W  | 0h    | Set the Mantissa component of MODFREQDIV factor |

### 8.1.12.2.27 CM\_CLKSEL\_DPLL\_CORE Register (offset = 68h) [reset = 0h]

CM\_CLKSEL\_DPLL\_CORE is shown in [Figure 8-109](#) and described in [Table 8-116](#).

This register provides controls over the DPLL.

**Figure 8-109. CM\_CLKSEL\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-116. CM\_CLKSEL\_DPLL\_CORE Register Field Descriptions**

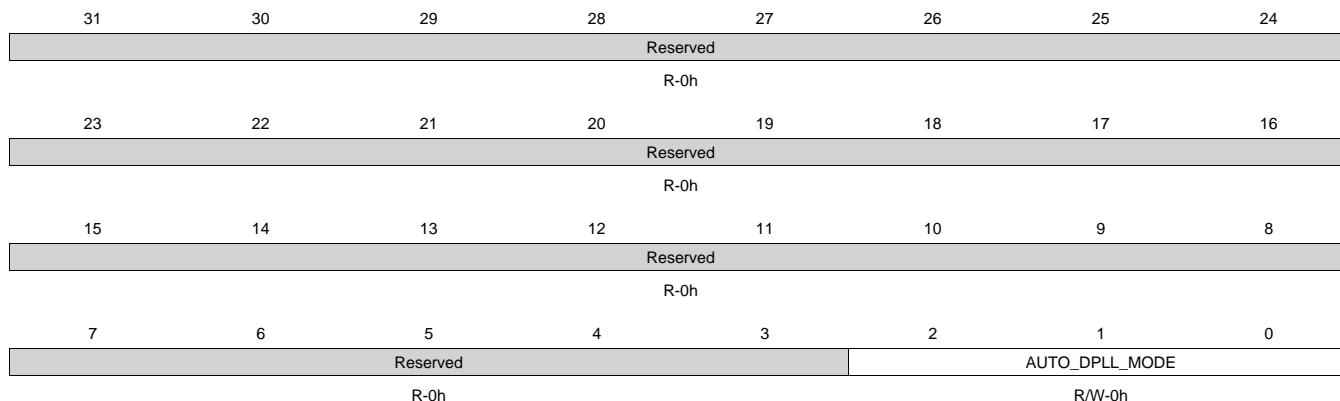

| Bit   | Field     | Type | Reset | Description   |
|-------|-----------|------|-------|---|
| 31-23 | Reserved  | R    | 0h    |   |
| 22-19 | Reserved  | R    | 0h    |   |
| 18-8  | DPLL_MULT | R/W  | 0h    | DPLL multiplier factor (2 to 2047).<br>This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN Bypass mode.<br>M=2 to<br>2047 => DPLL multiplies by M<br>0x0 = Reserved_0 : Reserved<br>0x1 = Reserved_1 : Reserved |
| 7     | Reserved  | R    | 0h    |   |
| 6-0   | DPLL_DIV  | R/W  | 0h    | DPLL divider factor (0 to 127) (equal to input N of DPLL actual division factor is N+1).  |

### 8.1.12.2.28 CM\_AUTOIDLE\_DPLL\_PER Register (offset = 6Ch) [reset = 0h]

CM\_AUTOIDLE\_DPLL\_PER is shown in [Figure 8-110](#) and described in [Table 8-117](#).

This register provides automatic control over the DPLL activity.

**Figure 8-110. CM\_AUTOIDLE\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-117. CM\_AUTOIDLE\_DPLL\_PER Register Field Descriptions**

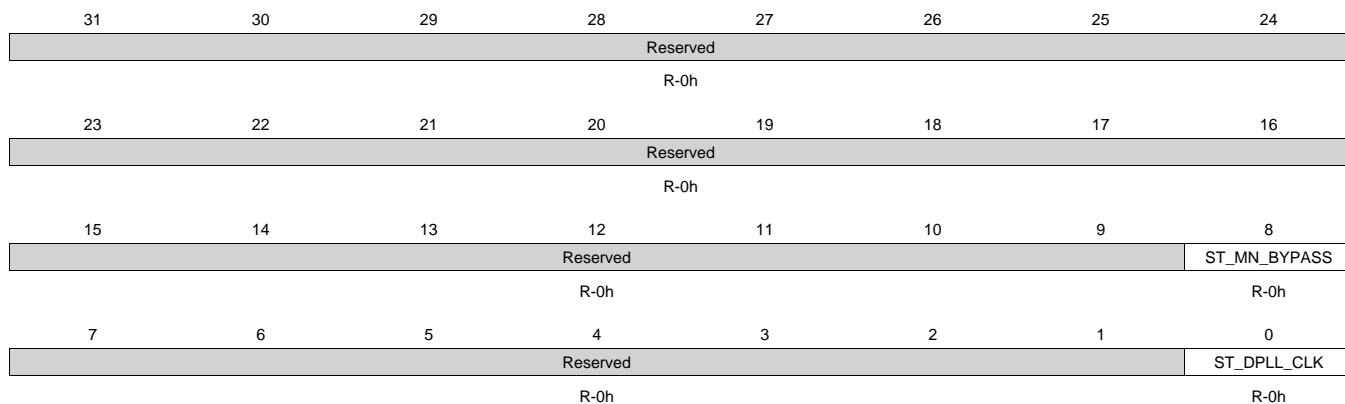

| Bit  | Field          | Type | Reset | Description                      |
|------|----------------|------|-------|----------------------------------|
| 31-3 | Reserved       | R    | 0h    |                                  |
| 2-0  | AUTO_DPLL_MODE | R/W  | 0h    | AUTO_DPLL_MODE is not supported. |

### 8.1.12.2.29 CM\_IDLEST\_DPLL\_PER Register (offset = 70h) [reset = 0h]

CM\_IDLEST\_DPLL\_PER is shown in [Figure 8-111](#) and described in [Table 8-118](#).

This register allows monitoring the master clock activity. This register is read only and automatically updated. [warm reset insensitive]

**Figure 8-111. CM\_IDLEST\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-118. CM\_IDLEST\_DPLL\_PER Register Field Descriptions**

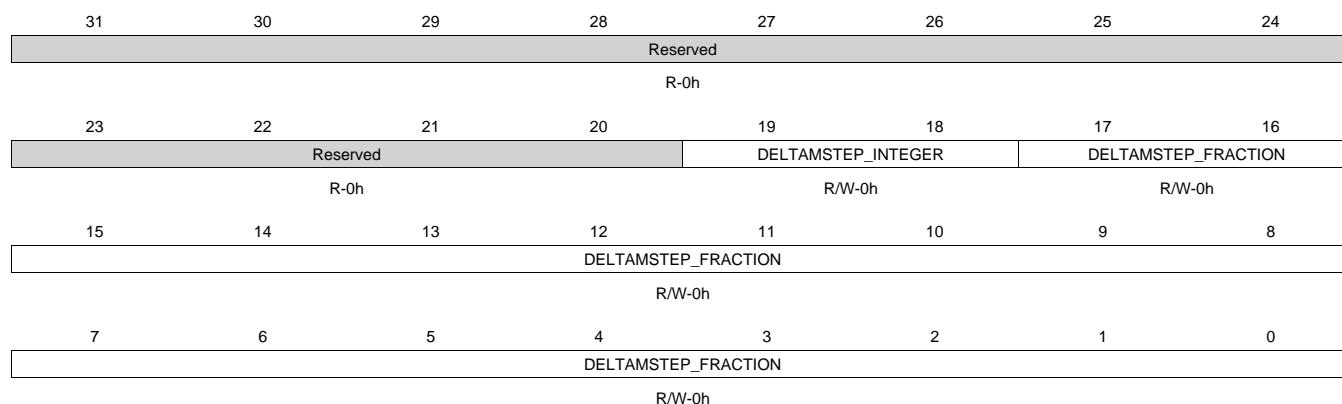

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-9 | Reserved     | R    | 0h    |   |
| 8    | ST_MN_BYPASS | R    | 0h    | DPLL MN_BYPASS status<br>0x0 = NO_MNBYPASS : DPLL is not in MN_Bypass<br>0x1 = MN_BYPASS : DPLL is in MN_Bypass                   |
| 7-1  | Reserved     | R    | 0h    |   |
| 0    | ST_DPLL_CLK  | R    | 0h    | DPLL clock activity<br>0x0 = DPLL_UNLOCKED : DPLL is either in bypass mode or in stop mode.<br>0x1 = DPLL_LOCKED : DPLL is LOCKED |

### 8.1.12.2.30 CM\_SSC\_DELTAMSTEP\_DPLL\_PER Register (offset = 74h) [reset = 0h]

CM\_SSC\_DELTAMSTEP\_DPLL\_PER is shown in [Figure 8-112](#) and described in [Table 8-119](#).

Control the DeltaMStep parameter for Spread Spectrum Clocking technique DeltaMStep is split into fractional and integer part. [warm reset insensitive]

**Figure 8-112. CM\_SSC\_DELTAMSTEP\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

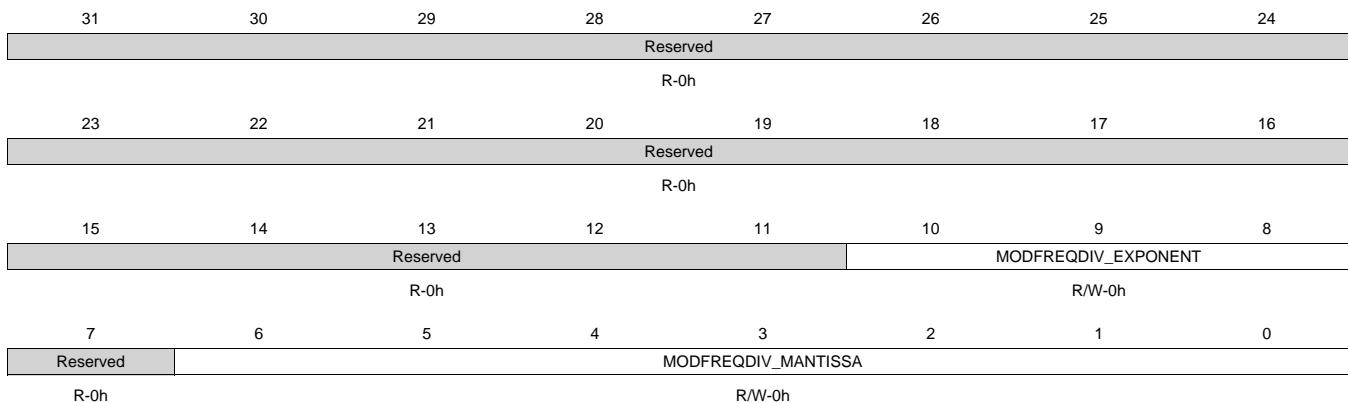

**Table 8-119. CM\_SSC\_DELTAMSTEP\_DPLL\_PER Register Field Descriptions**

| Bit   | Field               | Type | Reset | Description                                 |
|-------|---------------------|------|-------|---|
| 31-20 | Reserved            | R    | 0h    |   |
| 19-18 | DELTAMSTEP_INTEGER  | R/W  | 0h    | Integer part for DeltaM coefficient         |
| 17-0  | DELTAMSTEP_FRACTION | R/W  | 0h    | Fractional setting for DeltaMStep parameter |

**8.1.12.2.31 CM\_SSC\_MODFREQDIV\_DPLL\_PER Register (offset = 78h) [reset = 0h]**

CM\_SSC\_MODFREQDIV\_DPLL\_PER is shown in [Figure 8-113](#) and described in [Table 8-120](#).

Control the Modulation Frequency (Fm) for Spread Spectrum Clocking technique by defining it as a ratio of DPLL\_REFCLK/4 Fm = [DPLL\_REFCLK/4]/MODFREQDIV MODFREQDIV = MODFREQDIV\_MANTISSA \* 2^MODFREQDIV\_EXPONENT [warm reset insensitive]

**Figure 8-113. CM\_SSC\_MODFREQDIV\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-120. CM\_SSC\_MODFREQDIV\_DPLL\_PER Register Field Descriptions**

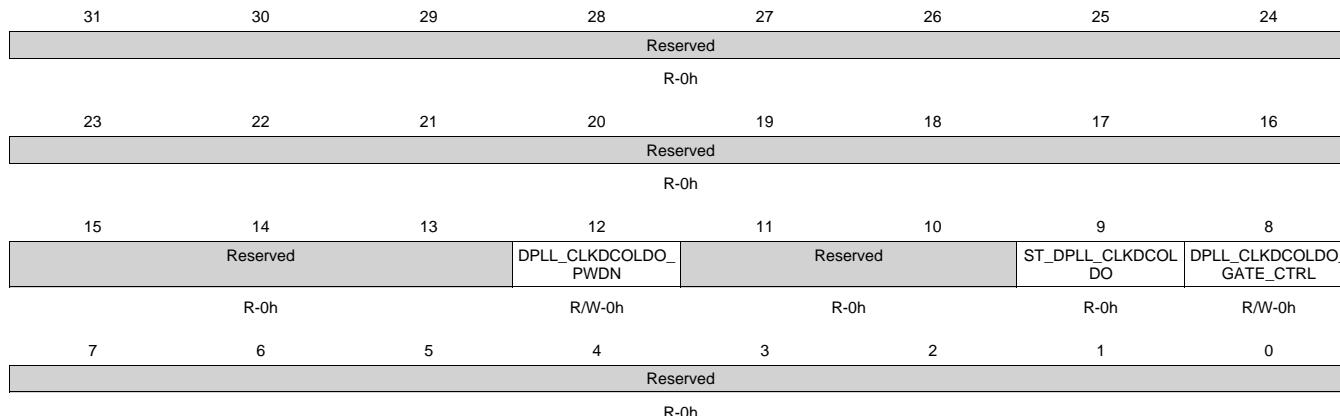

| Bit   | Field               | Type | Reset | Description                                     |
|-------|---------------------|------|-------|---|
| 31-11 | Reserved            | R    | 0h    |   |
| 10-8  | MODFREQDIV_EXPONENT | R/W  | 0h    | Set the Exponent component of MODFREQDIV factor |
| 7     | Reserved            | R    | 0h    |   |
| 6-0   | MODFREQDIV_MANTISSA | R/W  | 0h    | Set the Mantissa component of MODFREQDIV factor |

### 8.1.12.2.32 CM\_CLKDCOLDO\_DPLL\_PER Register (offset = 7Ch) [reset = 0h]

CM\_CLKDCOLDO\_DPLL\_PER is shown in [Figure 8-114](#) and described in [Table 8-121](#).

This register provides controls over the digitally controlled oscillator output of the PER DPLL.

**Figure 8-114. CM\_CLKDCOLDO\_DPLL\_PER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-121. CM\_CLKDCOLDO\_DPLL\_PER Register Field Descriptions**

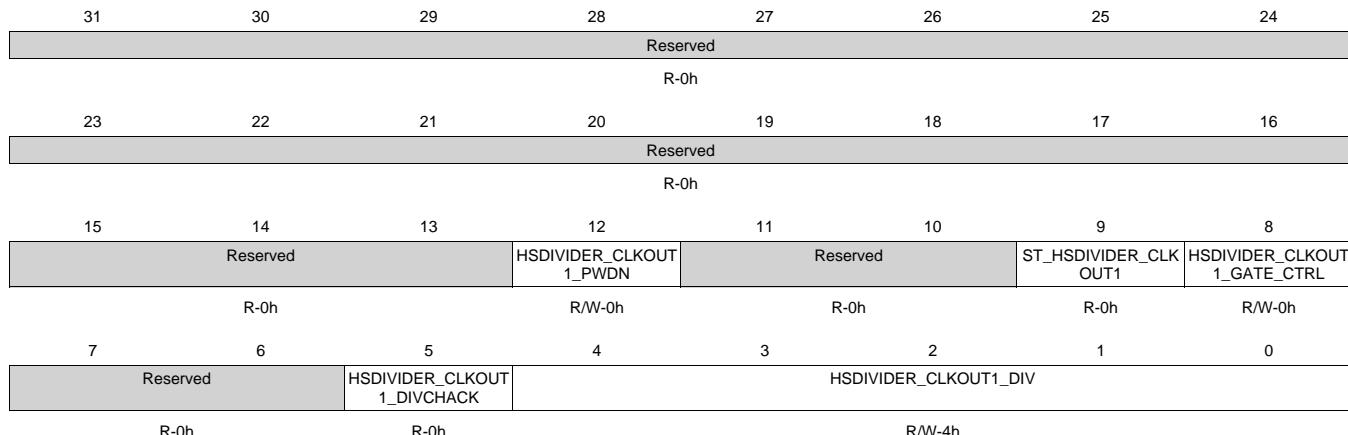

| Bit   | Field                    | Type | Reset | Description  |
|-------|--------------------------|------|-------|--|
| 31-13 | Reserved                 | R    | 0h    |  |
| 12    | DPLL_CLKDCOLDO_PWDN      | R/W  | 0h    | Automatic power down for CLKDCOLDO o/p when it is gated<br>0x0 = ALWAYS_ACTIVE : Keep CLKDCOLDO o/p powered on even when it is gated<br>0x1 = AUTO_PWDN : Automatically power down CLKDCOLDO o/p when it is gated. |
| 11-10 | Reserved                 | R    | 0h    |  |
| 9     | ST_DPLL_CLKDCOLDO        | R    | 0h    | DPLL CLKDCOLDO status<br>0x0 = CLK_ENABLED : The clock output is enabled<br>0x1 = CLK_GATED : The clock output is gated  |
| 8     | DPLL_CLKDCOLDO_GATE_CTRL | R/W  | 0h    | Control gating of DPLL CLKDCOLDO<br>0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it<br>0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request       |
| 7-0   | Reserved                 | R    | 0h    |  |

### 8.1.12.2.33 CM\_DIV\_M4\_DPLL\_CORE Register (offset = 80h) [reset = 4h]

CM\_DIV\_M4\_DPLL\_CORE is shown in [Figure 8-115](#) and described in [Table 8-122](#).

This register provides controls over the CLKOUT1 o/p of the HSDIVIDER.

**Figure 8-115. CM\_DIV\_M4\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-122. CM\_DIV\_M4\_DPLL\_CORE Register Field Descriptions**

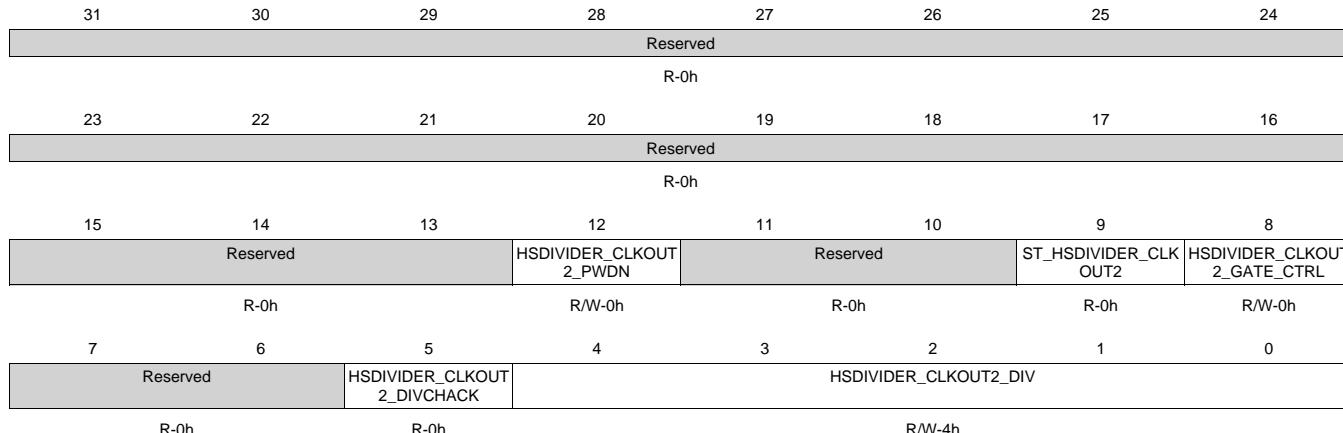

| Bit   | Field                       | Type | Reset | Description   |
|-------|-----------------------------|------|-------|---|
| 31-13 | Reserved                    | R    | 0h    |   |
| 12    | HSDIVIDER_CLKOUT1_PWDN      | R/W  | 0h    | Automatic power down for HSDIVIDER M4 divider and hence CLKOUT1 output when the o/p clock is gated.<br>0x0 = ALWAYS_ACTIVE : Keep M4 divider powered on even when CLKOUT1 is gated.<br>0x1 = AUTO_PWDN : Automatically power down M4 divider when CLKOUT1 is gated. |
| 11-10 | Reserved                    | R    | 0h    |   |
| 9     | ST_HSDIVIDER_CLKOUT1        | R    | 0h    | HSDIVIDER CLKOUT1 status<br>0x0 = CLK_ENABLED : The clock output is enabled<br>0x1 = CLK_GATED : The clock output is gated  |
| 8     | HSDIVIDER_CLKOUT1_GATE_CTRL | R/W  | 0h    | Control gating of HSDIVIDER CLKOUT1<br>0x0 = CLK_AUTOGATE : Automatically gate this clock when there is no dependency for it<br>0x1 = CLK_ENABLE : Force this clock to stay enabled even if there is no request   |
| 7-6   | Reserved                    | R    | 0h    |   |
| 5     | HSDIVIDER_CLKOUT1_DIVCHACK  | R    | 0h    | Toggle on this status bit after changing HSDIVIDER_CLKOUT1_DIV indicates that the change in divider value has taken effect  |
| 4-0   | HSDIVIDER_CLKOUT1_DIV       | R/W  | 4h    | DPLL post-divider factor, M4, for internal clock generation.<br>Divide values from 1 to 31.   |

### 8.1.12.2.34 CM\_DIV\_M5\_DPLL\_CORE Register (offset = 84h) [reset = 4h]

CM\_DIV\_M5\_DPLL\_CORE is shown in [Figure 8-116](#) and described in [Table 8-123](#).

This register provides controls over the CLKOUT2 o/p of the HSDIVIDER.

**Figure 8-116. CM\_DIV\_M5\_DPLL\_CORE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-123. CM\_DIV\_M5\_DPLL\_CORE Register Field Descriptions**

| Bit   | Field                       | Type | Reset | Description   |
|-------|-----------------------------|------|-------|---|
| 31-13 | Reserved                    | R    | 0h    |   |

### 8.1.12.2.35 CM\_CLKMODE\_DPLL\_MPU Register (offset = 88h) [reset = 4h]

CM\_CLKMODE\_DPLL\_MPU is shown in [Figure 8-117](#) and described in [Table 8-124](#).

This register allows controlling the DPLL modes.

**Figure 8-117. CM\_CLKMODE\_DPLL\_MPU Register**

### 8.1.12.2.38 CM\_CLKMODE\_DPLL\_DDR Register (offset = 94h) [reset = 4h]

CM\_CLKMODE\_DPLL\_DDR is shown in [Figure 8-120](#) and described in [Table 8-127](#).

This register allows controlling the DPLL modes.

**Figure 8-120. CM\_CLKMODE\_DPLL\_DDR Register**

#### 8.1.12.2.45 CM\_WKUP\_WKUP\_M3\_CLKCTRL Register (offset = B0h) [reset = 2h]

CM\_WKUP\_WKUP\_M3\_CLKCTRL is shown in Figure 8-127 and described in Table 8-134.

This register manages the WKUP M3 clocks.

**Figure 8-127. CM\_WKUP\_WKUP\_M3\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-134. CM\_WKUP\_WKUP\_M3\_CLKCTRL Register Field Descriptions**

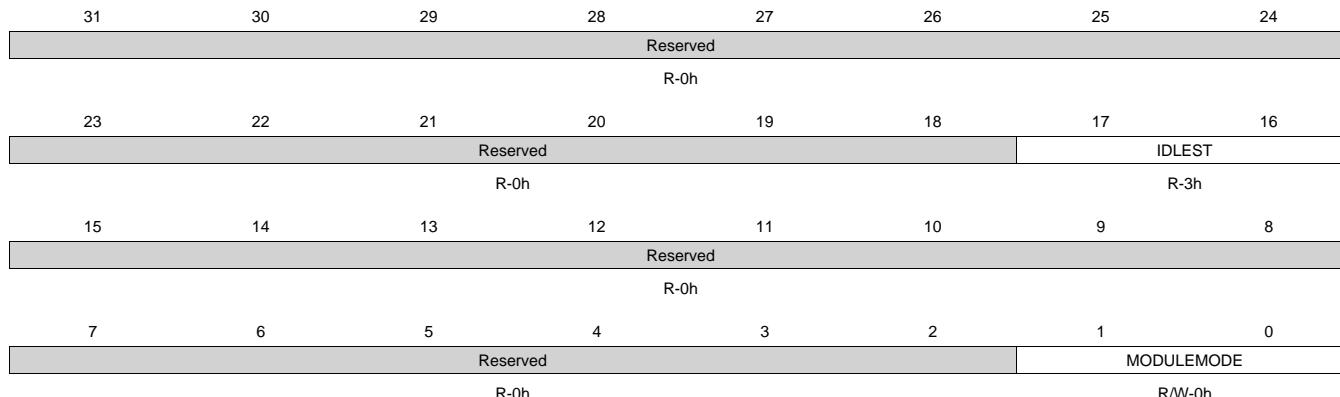

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|

It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 0h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.2.47 CM\_WKUP\_I2C0\_CLKCTRL Register (offset = B8h) [reset = 30000h]

CM\_WKUP\_I2C0\_CLKCTRL is shown in [Figure 8-129](#) and described in [Table 8-136](#).

This register manages the I2C0 clocks.

**Figure 8-129. CM\_WKUP\_I2C0\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-136. CM\_WKUP\_I2C0\_CLKCTRL Register Field Descriptions**

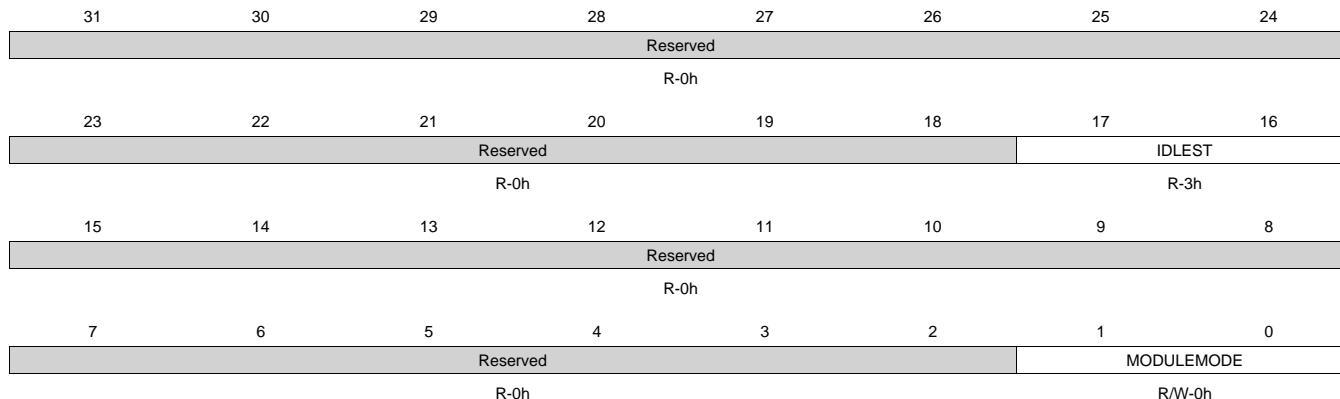

| Bit   | Field      | Type | Reset | Description  |

### 8.1.12.2.51 CM\_WKUP\_SMARTREFLEX1\_CLKCTRL Register (offset = C8h) [reset = 30000h]

CM\_WKUP\_SMARTREFLEX1\_CLKCTRL is shown in [Figure 8-133](#) and described in [Table 8-140](#).

This register manages the SmartReflex1 clocks.

**Figure 8-133. CM\_WKUP\_SMARTREFLEX1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-140. CM\_WKUP\_SMARTREFLEX1\_CLKCTRL Register Field Descriptions**

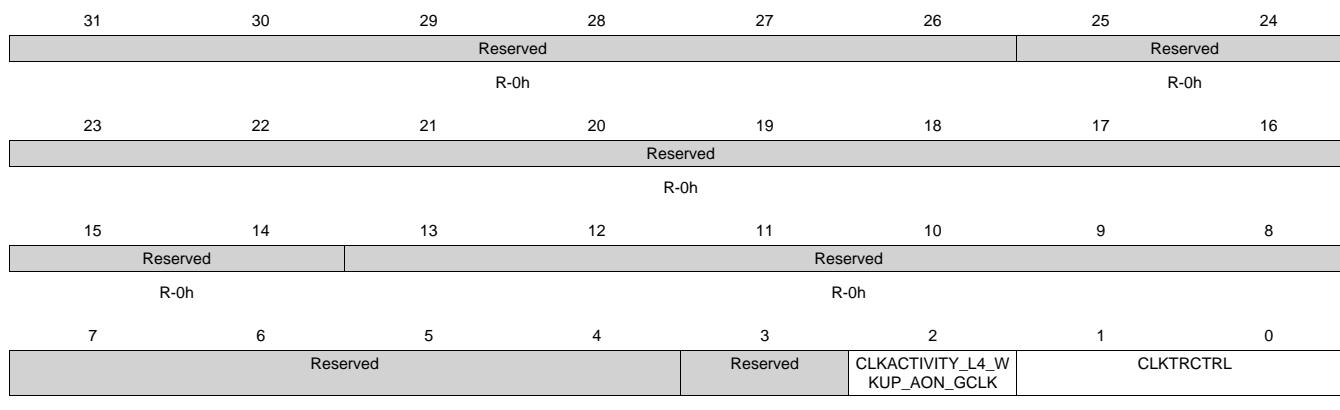

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-18 | Reserved   | R    | 0h    |  |
| 17-16 | IDLEST     | R    | 3h    | <p>Module idle status.</p> <p>0x0 = Func : Module is fully functional, including OCP</p> <p>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion</p> <p>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock</p> <p>0x3 = Disable : Module is disabled and cannot be accessed</p>  |
| 15-2  | Reserved   | R    | 0h    |  |
| 1-0   | MODULEMODE | R/W  | 0h    | <p>Control the way mandatory clocks are managed.</p> <p>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).</p> <p>0x1 = RESERVED_1 : Reserved</p> <p>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.</p> <p>0x3 = RESERVED : Reserved</p> |

### 8.1.12.2.52 CM\_L4\_WKUP\_AON\_CLKSTCTRL Register (offset = CCh) [reset = 6h]

CM\_L4\_WKUP\_AON\_CLKSTCTRL is shown in [Figure 8-134](#) and described in [Table 8-141](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-134. CM\_L4\_WKUP\_AON\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-141. CM\_L4\_WKUP\_AON\_CLKSTCTRL Register Field Descriptions**

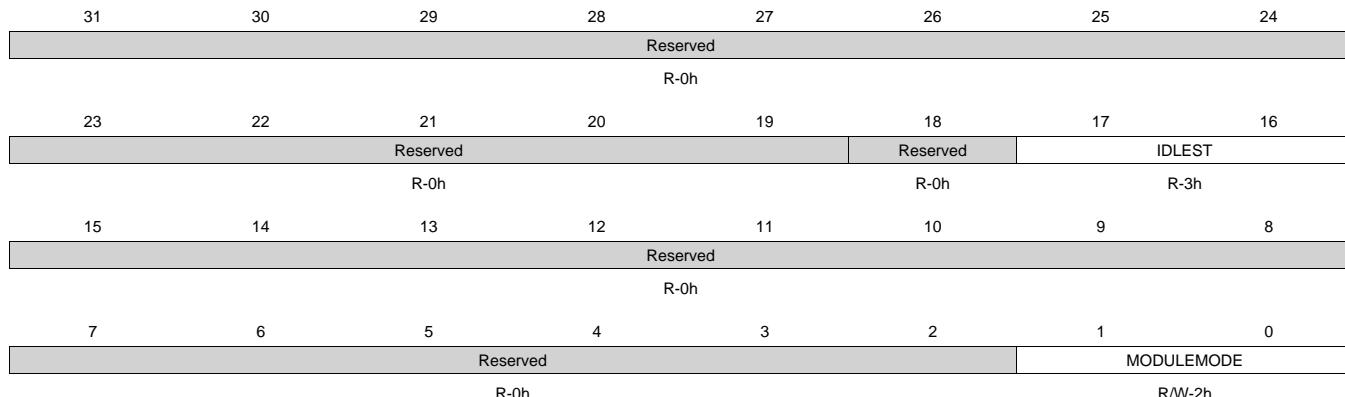

| Bit   | Field                        | Type | Reset | Description   |
|-------|------------------------------|------|-------|---|
| 31-26 | Reserved                     | R    | 0h    |   |

| 2     | CLKACTIVITY_L4_WKUP_AON_GCLK | R    | 1h    | This field indicates the state of the L4_WKUP clock in the domain.<br>0x0 = Inact : Corresponding clock is gated<br>0x1 = Act : Corresponding clock is active   |
| 1-0   | CLKTRCTRL                    | R/W  | 2h    | Controls the clock state transition of the always on L4 clock domain.<br>0x0 = NO_SLEEP : Sleep transition cannot be initiated. Wakeup transition may however occur.<br>0x1 = SW_SLEEP : Start a software forced sleep transition on the domain.<br>0x2 = SW_WKUP : Start a software forced wake-up transition on the domain.<br>0x3 = Reserved : Reserved. |

### 8.1.12.2.53 CM\_WKUP\_WDT1\_CLKCTRL Register (offset = D4h) [reset = 30002h]

CM\_WKUP\_WDT1\_CLKCTRL is shown in [Figure 8-135](#) and described in [Table 8-142](#).

This register manages the WDT1 clocks.

**Figure 8-135. CM\_WKUP\_WDT1\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-142. CM\_WKUP\_WDT1\_CLKCTRL Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description   |

Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.2.54 CM\_DIV\_M6\_DPLL\_CORE Register (offset = D8h) [reset = 4h]

CM\_DIV\_M6\_DPLL\_CORE is shown in [Figure 8-136](#) and described in [Table 8-143](#).

This register provides controls over the CLKOUT3 o/p of the HSDIVIDER. [warm reset insensitive]

**Figure 8-136. CM\_DIV\_M6\_DPLL\_CORE Register**

|          |    |                            |                       |    |                      |                             |    |

| 4-0   | HSDIVIDER_CLKOUT3_DIV       | R/W  | 4h    | DPLL post-divider factor, M6, for internal clock generation.<br>Divide values from 1 to 31.   |

### 8.1.12.3 CM\_DPLL Registers

[Table 8-144](#) lists the memory-mapped registers for the CM\_DPLL. All register offset addresses not listed in [Table 8-144](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-144. CM\_DPLL REGISTERS**

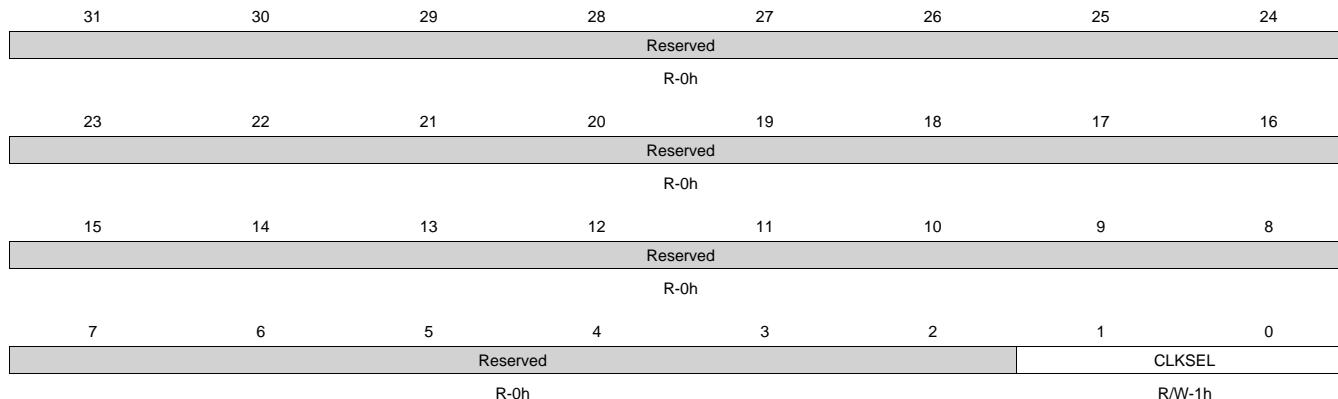

| Offset | Acronym                 | Register Name   | Section                             |
|--------|-------------------------|---|-------------------------------------|
| 4h     | CLKSEL_TIMER7_CLK       | Selects the Mux select line for TIMER7 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.1</a>  |
| 8h     | CLKSEL_TIMER2_CLK       | Selects the Mux select line for TIMER2 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.2</a>  |
| Ch     | CLKSEL_TIMER3_CLK       | Selects the Mux select line for TIMER3 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.3</a>  |
| 10h    | CLKSEL_TIMER4_CLK       | Selects the Mux select line for TIMER4 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.4</a>  |
| 14h    | CM_MAC_CLKSEL           | Selects the clock divide ration for MII clock [warm reset insensitive]        | <a href="#">Section 8.1.12.3.5</a>  |
| 18h    | CLKSEL_TIMER5_CLK       | Selects the Mux select line for TIMER5 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.6</a>  |
| 1Ch    | CLKSEL_TIMER6_CLK       | Selects the Mux select line for TIMER6 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.7</a>  |
| 20h    | CM_CPTS_RFT_CLKSEL      | Selects the Mux select line for CPTS RFT clock [warm reset insensitive]       | <a href="#">Section 8.1.12.3.8</a>  |
| 28h    | CLKSEL_TIMER1MS_CLK     | Selects the Mux select line for TIMER1 clock [warm reset insensitive]         | <a href="#">Section 8.1.12.3.9</a>  |
| 2Ch    | CLKSEL_GFX_FCLK         | Selects the divider value for GFX clock [warm reset insensitive]              | <a href="#">Section 8.1.12.3.10</a> |
| 30h    | CLKSEL_PRU_ICSS_OCP_CLK | Controls the Mux select line for PRU-ICSS OCP clock [warm reset insensitive]  | <a href="#">Section 8.1.12.3.11</a> |
| 34h    | CLKSEL_LCDC_PIXEL_CLK   | Controls the Mux select line for LCDC PIXEL clock [warm reset insensitive]    | <a href="#">Section 8.1.12.3.12</a> |
| 38h    | CLKSEL_WDT1_CLK         | Selects the Mux select line for Watchdog1 clock [warm reset insensitive]      | <a href="#">Section 8.1.12.3.13</a> |
| 3Ch    | CLKSEL_GPIO0_DBCLK      | Selects the Mux select line for GPIO0 debounce clock [warm reset insensitive] | <a href="#">Section 8.1.12.3.14</a> |

### 8.1.12.3.1 CLKSEL\_TIMER7\_CLK Register (offset = 4h) [reset = 1h]

CLKSEL\_TIMER7\_CLK is shown in [Figure 8-137](#) and described in [Table 8-145](#).

Selects the Mux select line for TIMER7 clock [warm reset insensitive]

**Figure 8-137. CLKSEL\_TIMER7\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-145. CLKSEL\_TIMER7\_CLK Register Field Descriptions**

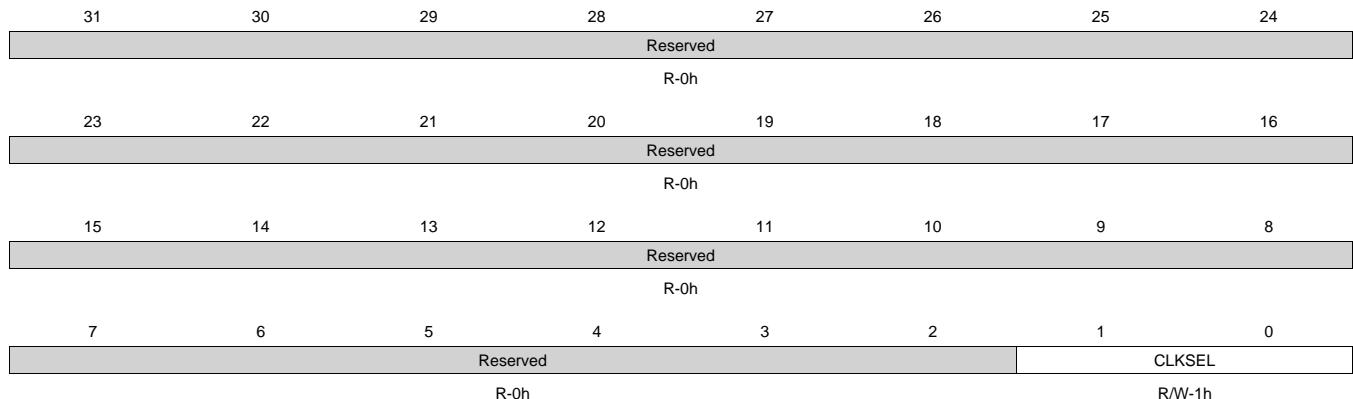

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    |  |
| 1-0  | CLKSEL   | R/W  | 1h    | Selects the Mux select line for TIMER7 clock [warm reset insensitive]<br>0x0 = SEL1 : Select TCLKIN clock<br>0x1 = SEL2 : Select CLK_M_OSC clock<br>0x2 = SEL3 : Select CLK_32KHZ clock<br>0x3 = SEL4 : Reserved |

### 8.1.12.3.2 CLKSEL\_TIMER2\_CLK Register (offset = 8h) [reset = 1h]

CLKSEL\_TIMER2\_CLK is shown in [Figure 8-138](#) and described in [Table 8-146](#).

Selects the Mux select line for TIMER2 clock [warm reset insensitive]

**Figure 8-138. CLKSEL\_TIMER2\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-146. CLKSEL\_TIMER2\_CLK Register Field Descriptions**

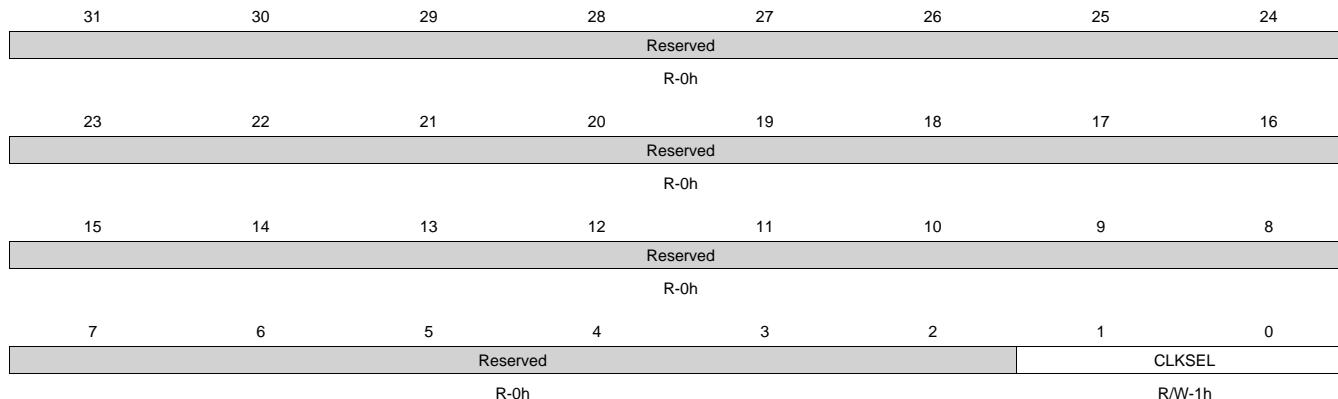

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    |  |
| 1-0  | CLKSEL   | R/W  | 1h    | Selects the Mux select line for TIMER2 clock [warm reset insensitive]<br>0x0 = SEL1 : Select TCLKIN clock<br>0x1 = SEL2 : Select CLK_M_OSC clock<br>0x2 = SEL3 : Select CLK_32KHZ clock<br>0x3 = SEL4 : Reserved |

### 8.1.12.3.3 CLKSEL\_TIMER3\_CLK Register (offset = Ch) [reset = 1h]

CLKSEL\_TIMER3\_CLK is shown in [Figure 8-139](#) and described in [Table 8-147](#).

Selects the Mux select line for TIMER3 clock [warm reset insensitive]

**Figure 8-139. CLKSEL\_TIMER3\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-147. CLKSEL\_TIMER3\_CLK Register Field Descriptions**

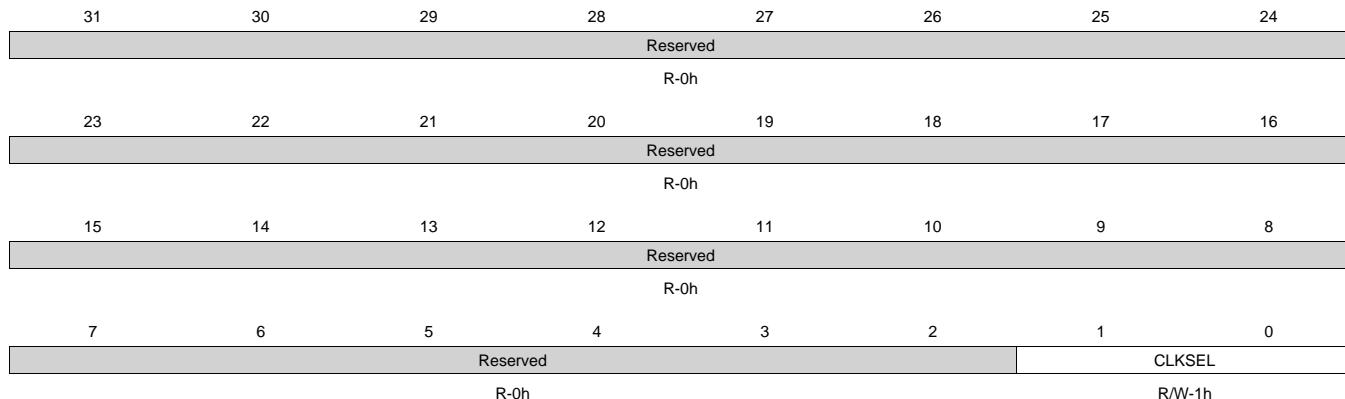

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    |  |
| 1-0  | CLKSEL   | R/W  | 1h    | Selects the Mux select line for TIMER3 clock [warm reset insensitive]<br>0x0 = SEL1 : Select TCLKIN clock<br>0x1 = SEL2 : Select CLK_M_OSC clock<br>0x2 = SEL3 : Select CLK_32KHZ clock<br>0x3 = SEL4 : Reserved |

#### 8.1.12.3.4 CLKSEL\_TIMER4\_CLK Register (offset = 10h) [reset = 1h]

CLKSEL\_TIMER4\_CLK is shown in [Figure 8-140](#) and described in [Table 8-148](#).

Selects the Mux select line for TIMER4 clock [warm reset insensitive]

**Figure 8-140. CLKSEL\_TIMER4\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-148. CLKSEL\_TIMER4\_CLK Register Field Descriptions**

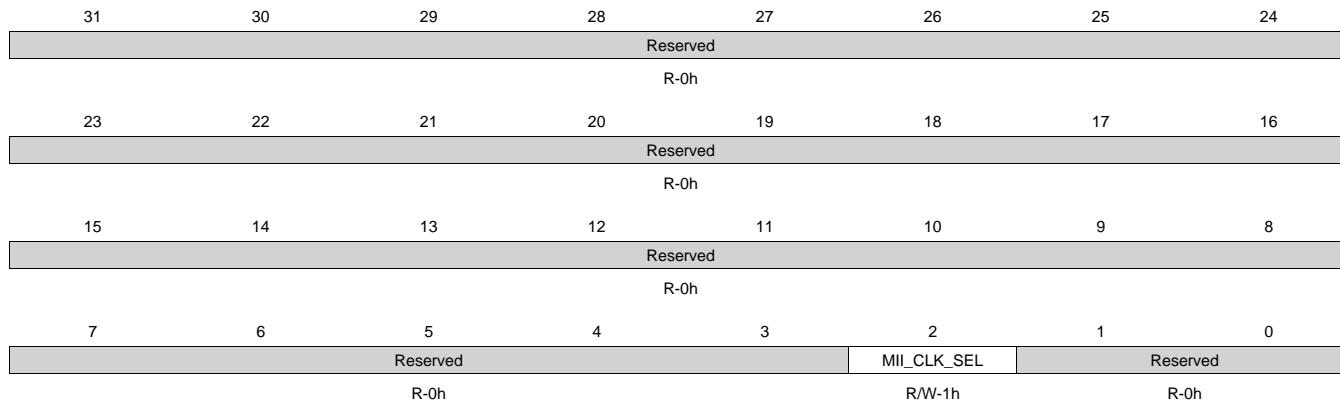

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    |  |
| 1-0  | CLKSEL   | R/W  | 1h    | Selects the Mux select line for TIMER4 clock [warm reset insensitive]<br>0x0 = SEL1 : Select TCLKIN clock<br>0x1 = SEL2 : Select CLK_M_OSC clock<br>0x2 = SEL3 : Select CLK_32KHZ clock<br>0x3 = SEL4 : Reserved |

### 8.1.12.3.5 CM\_MAC\_CLKSEL Register (offset = 14h) [reset = 4h]

CM\_MAC\_CLKSEL is shown in [Figure 8-141](#) and described in [Table 8-149](#).

Selects the clock divide ration for MII clock [warm reset insensitive]

**Figure 8-141. CM\_MAC\_CLKSEL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-149. CM\_MAC\_CLKSEL Register Field Descriptions**

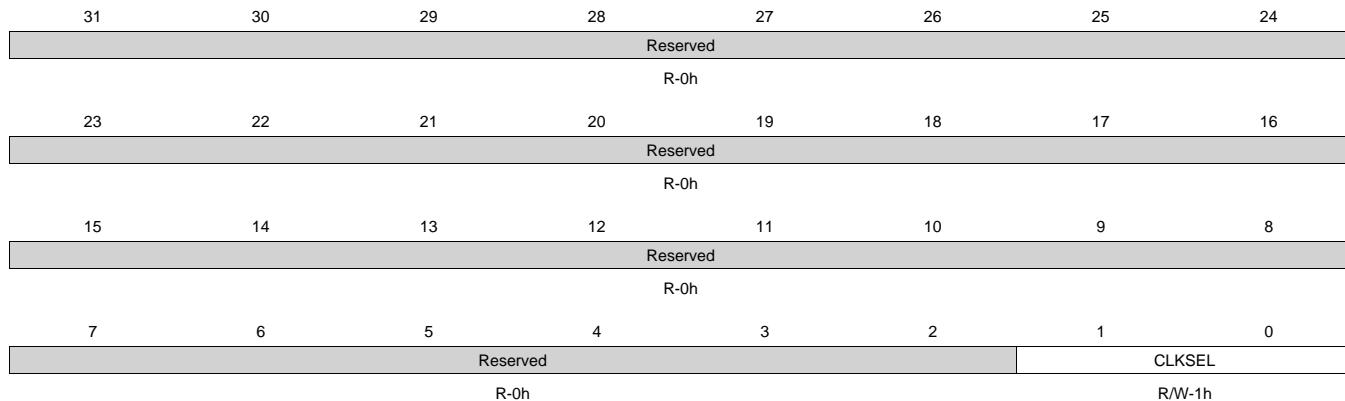

| Bit  | Field       | Type | Reset | Description  |

| 31-3 | Reserved    | R    | 0h    |  |
| 2    | MII_CLK_SEL | R/W  | 1h    | MII Clock Divider Selection.<br>This bit is warm reset insensitive when CPSW RESET_ISO is enabled<br>0x0 = SEL0 : Selects 1/2 divider of SYSCLK2<br>0x1 = SEL1 : Selects 1/5 divide ratio of SYSCLK2 |
| 1-0  | Reserved    | R    | 0h    |  |

### 8.1.12.3.6 CLKSEL\_TIMER5\_CLK Register (offset = 18h) [reset = 1h]

CLKSEL\_TIMER5\_CLK is shown in [Figure 8-142](#) and described in [Table 8-150](#).

Selects the Mux select line for TIMER5 clock [warm reset insensitive]

**Figure 8-142. CLKSEL\_TIMER5\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-150. CLKSEL\_TIMER5\_CLK Register Field Descriptions**

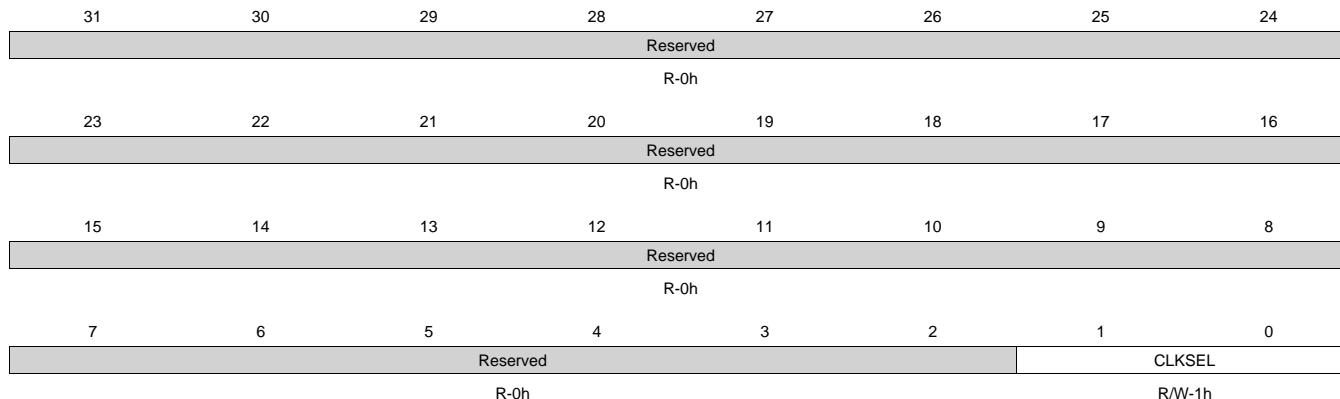

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    |  |
| 1-0  | CLKSEL   | R/W  | 1h    | Selects the Mux select line for TIMER5 clock [warm reset insensitive]<br>0x0 = SEL1 : Select TCLKIN clock<br>0x1 = SEL2 : Select CLK_M_OSC clock<br>0x2 = SEL3 : Select CLK_32KHZ clock<br>0x3 = SEL4 : Reserved |

### 8.1.12.3.7 CLKSEL\_TIMER6\_CLK Register (offset = 1Ch) [reset = 1h]

CLKSEL\_TIMER6\_CLK is shown in [Figure 8-143](#) and described in [Table 8-151](#).

Selects the Mux select line for TIMER6 clock [warm reset insensitive]

**Figure 8-143. CLKSEL\_TIMER6\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-151. CLKSEL\_TIMER6\_CLK Register Field Descriptions**

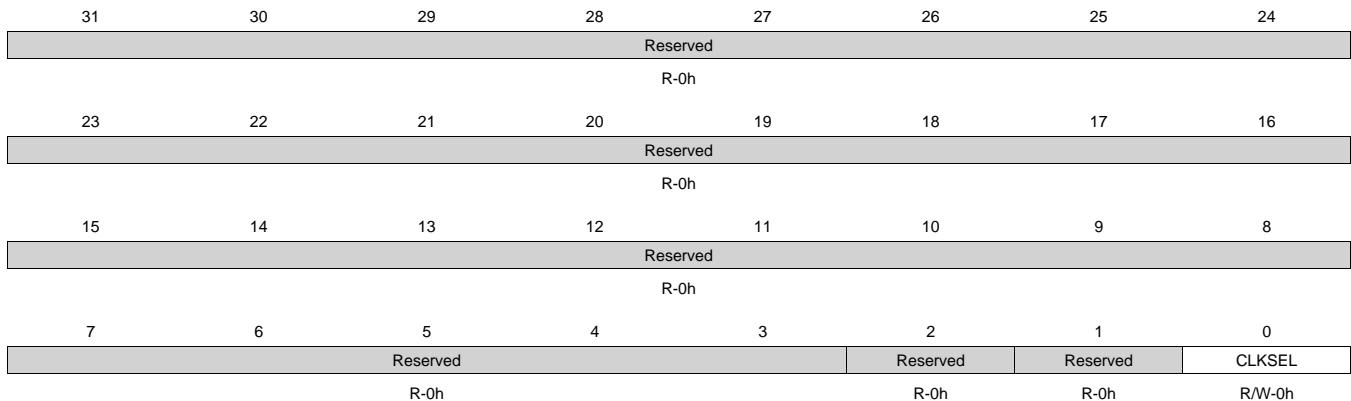

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-2 | Reserved | R    | 0h    |  |
| 1-0  | CLKSEL   | R/W  | 1h    | Selects the Mux select line for TIMER6 clock [warm reset insensitive]<br>0x0 = SEL1 : Select TCLKIN clock<br>0x1 = SEL2 : Select CLK_M_OSC clock<br>0x2 = SEL3 : Select CLK_32KHZ clock<br>0x3 = SEL4 : Reserved |

#### 8.1.12.3.8 CM\_CPTS\_RFT\_CLKSEL Register (offset = 20h) [reset = 0h]

CM\_CPTS\_RFT\_CLKSEL is shown in [Figure 8-144](#) and described in [Table 8-152](#).

Selects the Mux select line for CPTS RFT clock [warm reset insensitive]

**Figure 8-144. CM\_CPTS\_RFT\_CLKSEL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-152. CM\_CPTS\_RFT\_CLKSEL Register Field Descriptions**

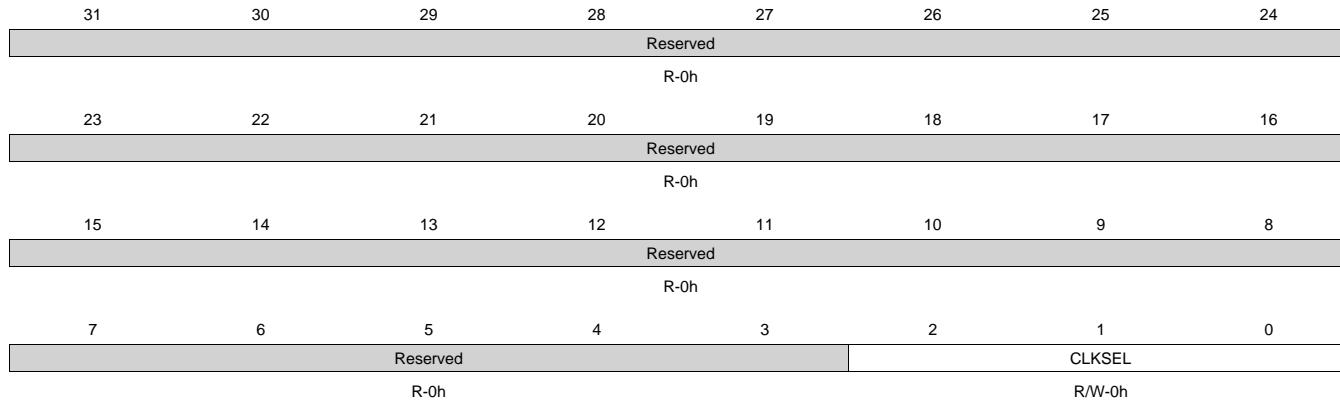

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-3 | Reserved | R    | 0h    |   |
| 2    | Reserved | R    | 0h    |   |
| 1    | Reserved | R    | 0h    |   |
| 0    | CLKSEL   | R/W  | 0h    | Selects the Mux select line for cpgmac rft clock [warm reset insensitive]<br>0x0 = SEL1 : Selects CORE_CLKOUTM5<br>0x1 = SEL2 : Selects CORE_CLKOUTM4 |

### 8.1.12.3.9 CLKSEL\_TIMER1MS\_CLK Register (offset = 28h) [reset = 0h]

CLKSEL\_TIMER1MS\_CLK is shown in [Figure 8-145](#) and described in [Table 8-153](#).

Selects the Mux select line for TIMER1 clock [warm reset insensitive]

**Figure 8-145. CLKSEL\_TIMER1MS\_CLK Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-153. CLKSEL\_TIMER1MS\_CLK Register Field Descriptions**

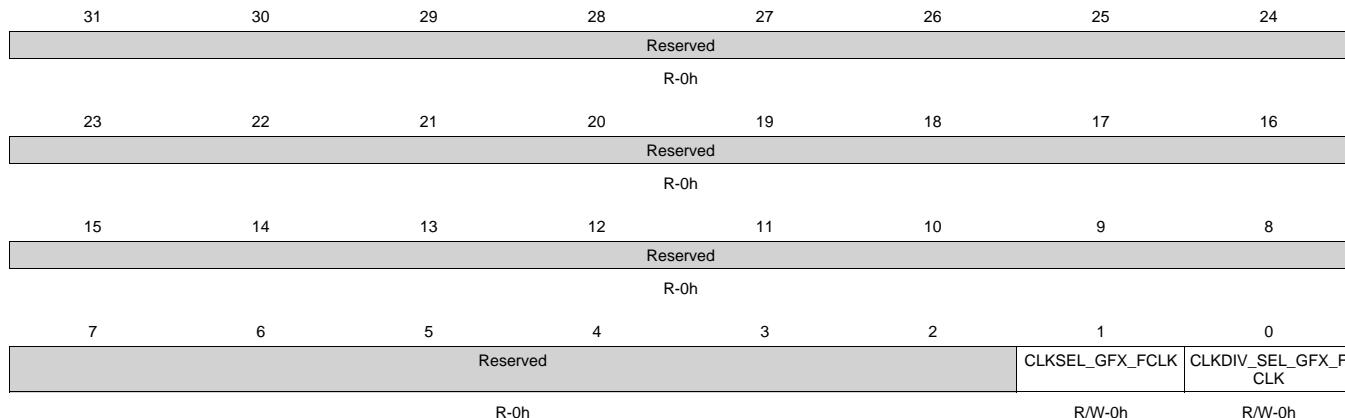

| Bit  | Field    | Type | Reset | Description  |

#### 8.1.12.4 CM\_MPU Registers

[Table 8-159](#) lists the memory-mapped registers for the CM\_MPU. All register offset addresses not listed in [Table 8-159](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-159. CM\_MPU REGISTERS**

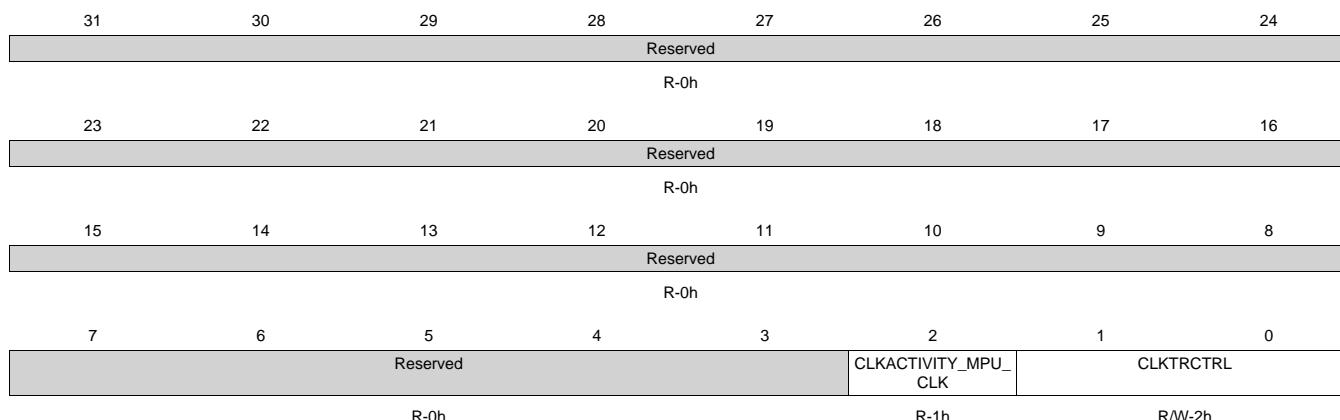

| Offset | Acronym           | Register Name  | Section                            |
|--------|-------------------|--|------------------------------------|
| 0h     | CM_MPU_CLKSTCTRL  | This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states.<br>It also hold one status bit per clock input of the domain. | <a href="#">Section 8.1.12.4.1</a> |
| 4h     | CM_MPU_MPUCLKCTRL | This register manages the MPU clocks.  | <a href="#">Section 8.1.12.4.2</a> |

#### 8.1.12.4.1 CM\_MPU\_CLKSTCTRL Register (offset = 0h) [reset = 6h]

CM\_MPU\_CLKSTCTRL is shown in [Figure 8-151](#) and described in [Table 8-160](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-151. CM\_MPU\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-160. CM\_MPU\_CLKSTCTRL Register Field Descriptions**

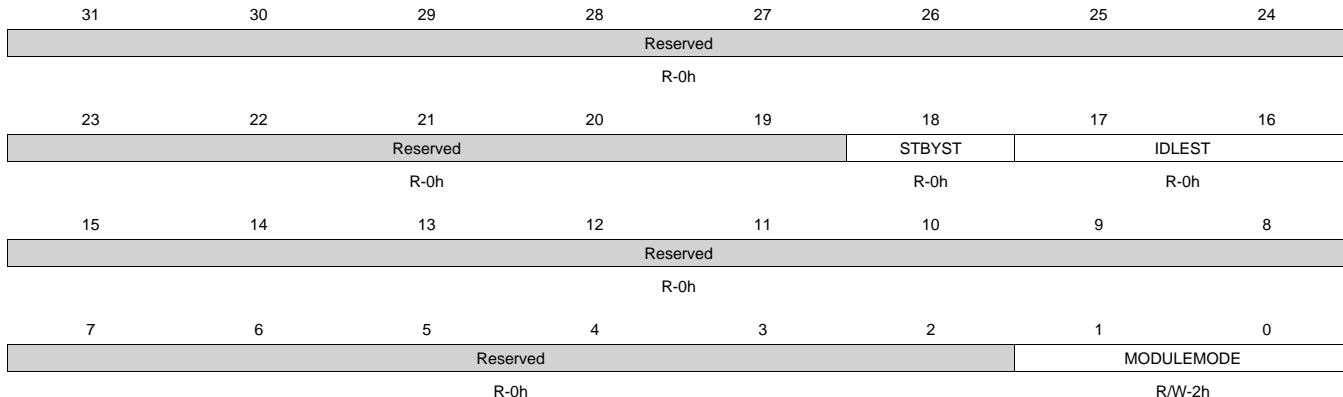

| Bit  | Field               | Type | Reset | Description   |
|------|---------------------|------|-------|---|
| 31-3 | Reserved            | R    | 0h    |   |
| 2    | CLKACTIVITY_MPU_CLK | R    | 1h    | This field indicates the state of the MPU Clock<br>0x0 = Inact : Corresponding clock is gated<br>0x1 = Act : Corresponding clock is active  |
| 1-0  | CLKTRCTRL           | R/W  | 2h    | Controls the clock state transition of the MPU clock domains.<br>0x0 = NO_SLEEP : NO_SLEEP: Sleep transition cannot be initiated.<br>Wakeups may however occur.<br>0x1 = SW_SLEEP : SW_SLEEP: Start a software forced sleep transition on the domain.<br>0x2 = SW_WKUP : SW_WKUP: Start a software forced wake-up transition on the domain.<br>0x3 = Reserved : Reserved. |

### 8.1.12.4.2 CM\_MPU\_MPU\_CLKCTRL Register (offset = 4h) [reset = 2h]

CM\_MPU\_MPU\_CLKCTRL is shown in [Figure 8-152](#) and described in [Table 8-161](#).

This register manages the MPU clocks.

**Figure 8-152. CM\_MPU\_MPU\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-161. CM\_MPU\_MPU\_CLKCTRL Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-19 | Reserved   | R    | 0h    |   |
| 18    | STBYST     | R    | 0h    | Module standby status.<br>0x0 = Func : Module is functional (not in standby)<br>0x1 = Standby : Module is in standby  |
| 17-16 | IDLEST     | R    | 0h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 2h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.5 CM\_DEVICE Registers

[Table 8-162](#) lists the memory-mapped registers for the CM\_DEVICE. All register offset addresses not listed in [Table 8-162](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-162. CM\_DEVICE REGISTERS**

| Offset | Acronym        | Register Name  | Section                            |
|--------|----------------|--|------------------------------------|
| 0h     | CM_CLKOUT_CTRL | This register provides the control over CLKOUT2 output | <a href="#">Section 8.1.12.5.1</a> |

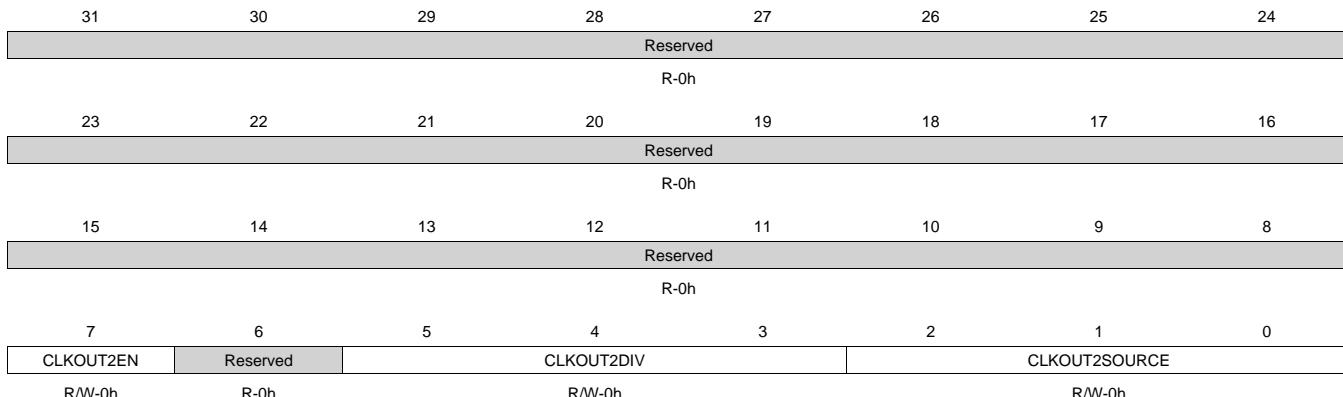

### 8.1.12.5.1 CM\_CLKOUT\_CTRL Register (offset = 0h) [reset = 0h]

CM\_CLKOUT\_CTRL is shown in [Figure 8-153](#) and described in [Table 8-163](#).

This register provides the control over CLKOUT2 output

**Figure 8-153. CM\_CLKOUT\_CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-163. CM\_CLKOUT\_CTRL Register Field Descriptions**

| Bit  | Field         | Type | Reset | Description   |
|------|---------------|------|-------|---|
| 31-8 | Reserved      | R    | 0h    |   |
| 7    | CLKOUT2EN     | R/W  | 0h    | This bit controls the external clock activity<br>0x0 = DIS : SYS_CLKOUT2 is disabled<br>0x1 = EN : SYS_CLKOUT2 is enabled   |
| 6    | Reserved      | R    | 0h    |   |
| 5-3  | CLKOUT2DIV    | R/W  | 0h    | This field controls the external clock divisor factor<br>0x0 = DIV1 : SYS_CLKOUT2/1<br>0x1 = DIV2 : SYS_CLKOUT2/2<br>0x2 = DIV3 : SYS_CLKOUT2/3<br>0x3 = DIV4 : SYS_CLKOUT2/4<br>0x4 = DIV5 : SYS_CLKOUT2/5<br>0x5 = DIV6 : SYS_CLKOUT2/6<br>0x6 = DIV7 : SYS_CLKOUT2/7<br>0x7 = DIV8 : SYS_CLKOUT2/8 |
| 2-0  | CLKOUT2SOURCE | R/W  | 0h    | This field selects the external output clock source<br>0x0 = SEL0 : Select 32KHz Oscillator O/P<br>0x1 = SEL1 : Select L3 Clock<br>0x2 = SEL2 : Select DDR PHY Clock<br>0x3 = SEL4 : Select 192Mhz clock from PER PLL<br>0x4 = SEL5 : Select LCD Pixel Clock  |

### 8.1.12.6 CM\_RTC Registers

[Table 8-164](#) lists the memory-mapped registers for the CM\_RTC. All register offset addresses not listed in [Table 8-164](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-164. CM\_RTC REGISTERS**

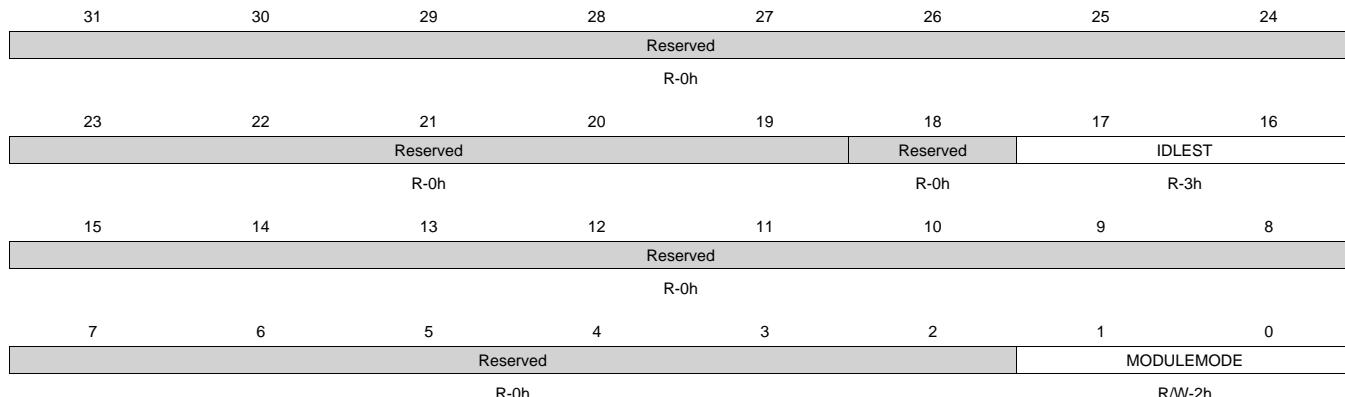

| <b>Offset</b> | <b>Acronym</b>     | <b>Register Name</b>  | <b>Section</b>                     |
|---------------|--------------------|---|------------------------------------|
| 0h            | CM_RTC_RTC_CLKCTRL | This register manages the RTC clocks.   | <a href="#">Section 8.1.12.6.1</a> |
| 4h            | CM_RTC_CLKSTCTRL   | This register enables the domain power state transition.<br>It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states.<br>It also hold one status bit per clock input of the domain. | <a href="#">Section 8.1.12.6.2</a> |

### 8.1.12.6.1 CM\_RTC\_RTC\_CLKCTRL Register (offset = 0h) [reset = 30002h]

CM\_RTC\_RTC\_CLKCTRL is shown in Figure 8-154 and described in Table 8-165.

This register manages the RTC clocks.

**Figure 8-154. CM\_RTC\_RTC\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-165. CM\_RTC\_RTC\_CLKCTRL Register Field Descriptions**

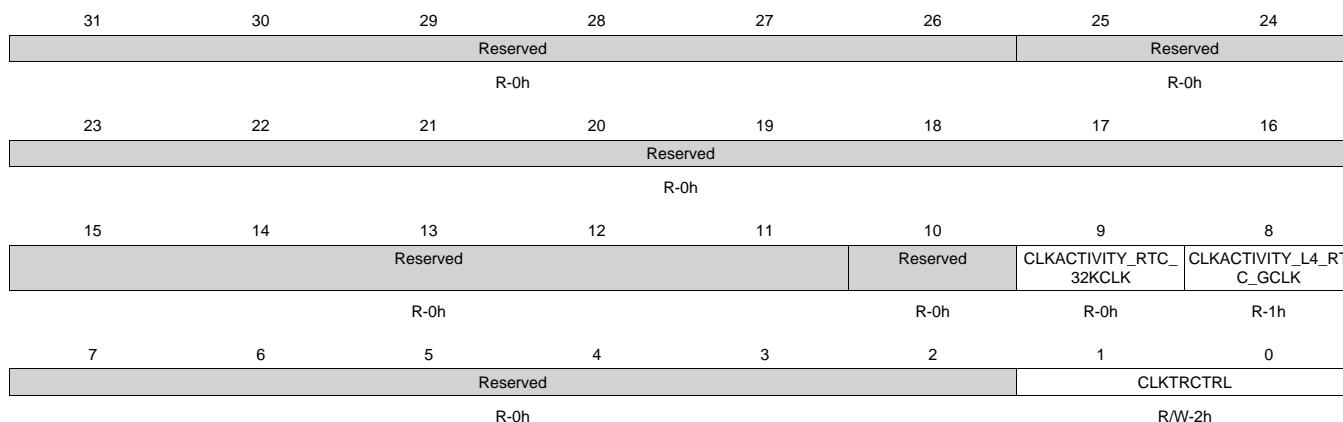

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-19 | Reserved   | R    | 0h    |   |
| 18    | Reserved   | R    | 0h    |   |
| 17-16 | IDLEST     | R    | 3h    | Module idle status.<br>0x0 = Func : Module is fully functional, including OCP<br>0x1 = Trans : Module is performing transition: wakeup, or sleep, or sleep abortion<br>0x2 = Idle : Module is in Idle mode (only OCP part). It is functional if using separate functional clock<br>0x3 = Disable : Module is disabled and cannot be accessed  |
| 15-2  | Reserved   | R    | 0h    |   |
| 1-0   | MODULEMODE | R/W  | 2h    | Control the way mandatory clocks are managed.<br>0x0 = DISABLED : Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

### 8.1.12.6.2 CM\_RTC\_CLKSTCTRL Register (offset = 4h) [reset = 102h]

CM\_RTC\_CLKSTCTRL is shown in [Figure 8-155](#) and described in [Table 8-166](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-155. CM\_RTC\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-166. CM\_RTC\_CLKSTCTRL Register Field Descriptions**

| Bit   | Field                   | Type | Reset | Description  |
|-------|-------------------------|------|-------|--|
| 31-26 | Reserved                | R    | 0h    |  |
| 25-11 | Reserved                | R    | 0h    |  |
| 10    | Reserved                | R    | 0h    |  |
| 9     | CLKACTIVITY_RTC_32KCLK  | R    | 0h    | This field indicates the state of the 32K RTC clock in the domain.<br>0x0 = Inact<br>0x1 = Act   |

### 8.1.12.7.1 CM\_GFX\_L3\_CLKSTCTRL Register (offset = 0h) [reset = 2h]

CM\_GFX\_L3\_CLKSTCTRL is shown in [Figure 8-156](#) and described in [Table 8-168](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-156. CM\_GFX\_L3\_CLKSTCTRL Register**

|          |    |    |    |    |    |                      |                         |

### 8.1.12.7.3 CM\_GFX\_L4LS\_GFX\_CLKSTCTRL Register (offset = Ch) [reset = 102h]

CM\_GFX\_L4LS\_GFX\_CLKSTCTRL is shown in [Figure 8-158](#) and described in [Table 8-170](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-158. CM\_GFX\_L4LS\_GFX\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-170. CM\_GFX\_L4LS\_GFX\_CLKSTCTRL Register Field Descriptions**

#### 8.1.12.7.4 CM\_GFX\_MMUCFG\_CLKCTRL Register (offset = 10h) [reset = 30000h]

CM\_GFX\_MMUCFG\_CLKCTRL is shown in [Figure 8-159](#) and described in [Table 8-171](#).

This register manages the MMU CFG clocks.

**Figure 8-159. CM\_GFX\_MMUCFG\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-171. CM\_GFX\_MMUCFG\_CLKCTRL Register Field Descriptions**

### 8.1.12.7.5 CM\_GFX\_MMUDATA\_CLKCTRL Register (offset = 14h) [reset = 30000h]

CM\_GFX\_MMUDATA\_CLKCTRL is shown in [Figure 8-160](#) and described in [Table 8-172](#).

This register manages the MMU clocks.

**Figure 8-160. CM\_GFX\_MMUDATA\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-172. CM\_GFX\_MMUDATA\_CLKCTRL Register Field Descriptions**

### 8.1.12.8.1 CM\_CEFUSE\_CLKSTCTRL Register (offset = 0h) [reset = 2h]

CM\_CEFUSE\_CLKSTCTRL is shown in [Figure 8-161](#) and described in [Table 8-174](#).

This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

**Figure 8-161. CM\_CEFUSE\_CLKSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-174. CM\_CEFUSE\_CLKSTCTRL Register Field Descriptions**

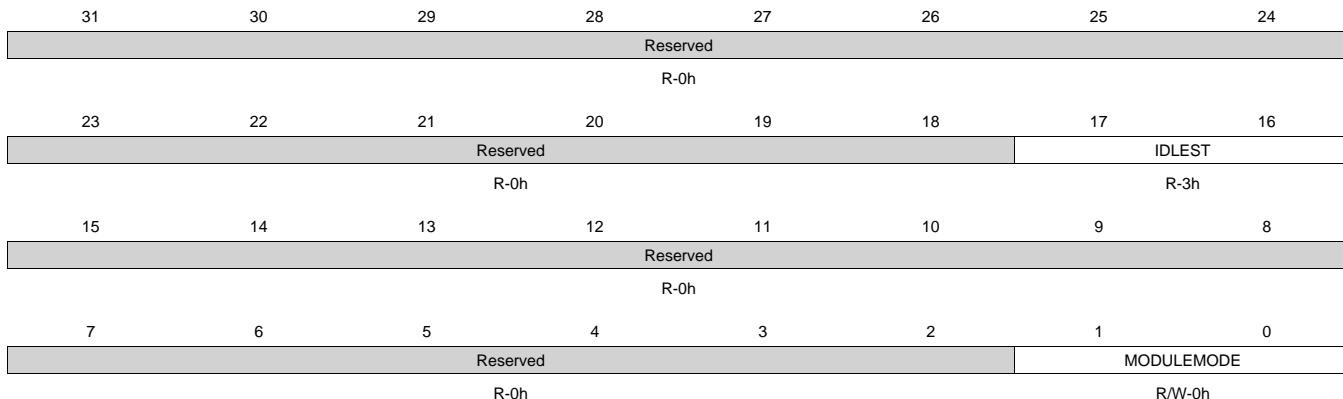

| Bit   | Field                              | Type | Reset | Description  |
|-------|------------------------------------|------|-------|--|
| 31-10 | Reserved                           | R    | 0h    |  |

| 1-0   | CLKTRCTRL                          | R/W  | 2h    | Controls the clock state transition of the clock domain in customer efuse power domain.<br>0x0 = NO_SLEEP : NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur.<br>0x1 = SW_SLEEP : SW_SLEEP: Start a software forced sleep transition on the domain.<br>0x2 = SW_WKUP : SW_WKUP: Start a software forced wake-up transition on the domain.<br>0x3 = Reserved : Reserved. |

### 8.1.12.8.2 CM\_CEFUSE\_CEFUSE\_CLKCTRL Register (offset = 20h) [reset = 30000h]

CM\_CEFUSE\_CEFUSE\_CLKCTRL is shown in Figure 8-162 and described in Table 8-175.

This register manages the CEFUSE clocks.

**Figure 8-162. CM\_CEFUSE\_CEFUSE\_CLKCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-175. CM\_CEFUSE\_CEFUSE\_CLKCTRL Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31-18 | Reserved   | R    | 0h    |   |

Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup).<br>0x1 = RESERVED_1 : Reserved<br>0x2 = ENABLE : Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen.<br>0x3 = RESERVED : Reserved |

## **8.1.13 Power Management Registers**

### **8.1.13.1 PRM\_IRQ Registers**

**Table 8-176** lists the memory-mapped registers for the PRM\_IRQ. All register offset addresses not listed in **Table 8-176** should be considered as reserved locations and the register contents should not be modified.

**Table 8-176. PRM\_IRQ REGISTERS**

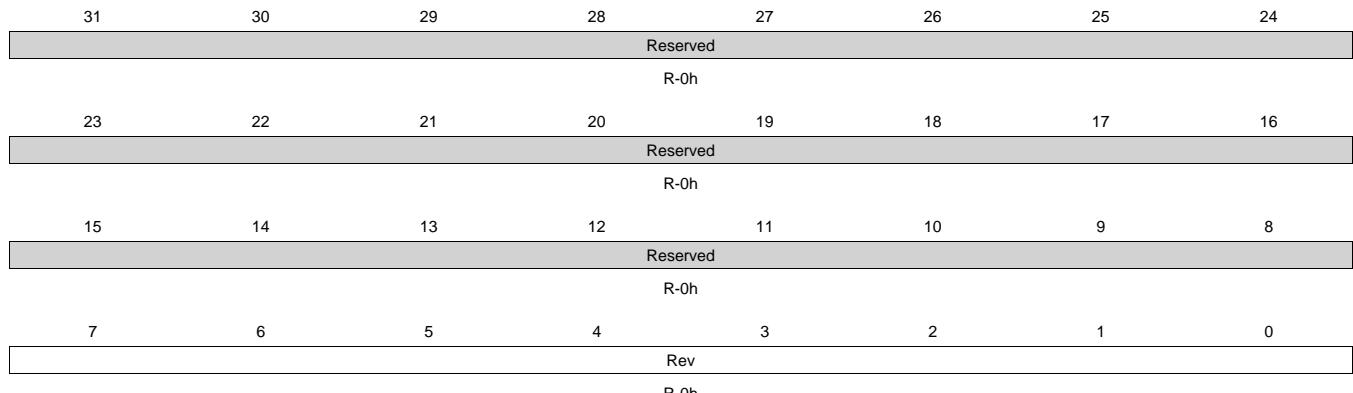

| Offset | Acronym           | Register Name   | Section                            |
|--------|-------------------|---|------------------------------------|
| 0h     | REVISION_PRM      | This register contains the IP revision code for the PRCM  | <a href="#">Section 8.1.13.1.1</a> |
| 4h     | PRM_IRQSTATUS_MPU | This register provides status on MPU interrupt events.<br>An event is logged whether interrupt generation for the event is enabled or not.<br>SW is required to clear a set bit by writing a '1' into the bit-position to be cleared. | <a href="#">Section 8.1.13.1.2</a> |
| 8h     | PRM_IRQENABLE_MPU | This register is used to enable and disable events used to trigger MPU interrupt activation.  | <a href="#">Section 8.1.13.1.3</a> |
| Ch     | PRM_IRQSTATUS_M3  | This register provides status on MPU interrupt events.<br>An event is logged whether interrupt generation for the event is enabled or not.<br>SW is required to clear a set bit by writing a '1' into the bit-position to be cleared. | <a href="#">Section 8.1.13.1.4</a> |
| 10h    | PRM_IRQENABLE_M3  | This register is used to enable and disable events used to trigger MPU interrupt activation.  | <a href="#">Section 8.1.13.1.5</a> |

### 8.1.13.1.1 REVISION\_PRM Register (offset = 0h) [reset = 0h]

REVISION\_PRM is shown in [Figure 8-163](#) and described in [Table 8-177](#).

This register contains the IP revision code for the PRCM

**Figure 8-163. REVISION\_PRM Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-177. REVISION\_PRM Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    | Reads returns 0.   |
| 7-0  | Rev      | R    | 0h    | IP revision [<br>7:4] Major revision [<br>3:0] Minor revision Examples: 0x10 for 1.0, 0x21 for 2.1 |

### 8.1.13.1.2 PRM\_IRQSTATUS\_MPU Register (offset = 4h) [reset = 0h]

PRM\_IRQSTATUS\_MPU is shown in [Figure 8-164](#) and described in [Table 8-178](#).

This register provides status on MPU interrupt events. An event is logged whether interrupt generation for the event is enabled or not. SW is required to clear a set bit by writing a '1' into the bit-position to be cleared.

**Figure 8-164. PRM\_IRQSTATUS\_MPU Register**

|                   |                   |                    |                    |                   |              |          |               |

### 8.1.13.1.3 PRM\_IRQENABLE\_MPU Register (offset = 8h) [reset = 0h]

PRM\_IRQENABLE\_MPU is shown in [Figure 8-165](#) and described in [Table 8-179](#).

This register is used to enable and disable events used to trigger MPU interrupt activation.

**Figure 8-165. PRM\_IRQENABLE\_MPU Register**

| 31                 | 30                | 29                | 28                 | 27                | 26           | 25       | 24            |

#### 8.1.13.1.4 PRM\_IRQSTATUS\_M3 Register (offset = Ch) [reset = 0h]

PRM\_IRQSTATUS\_M3 is shown in [Figure 8-166](#) and described in [Table 8-180](#).

This register provides status on MPU interrupt events. An event is logged whether interrupt generation for the event is enabled or not. SW is required to clear a set bit by writing a '1' into the bit-position to be cleared.

**Figure 8-166. PRM\_IRQSTATUS\_M3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-180. PRM\_IRQSTATUS\_M3 Register Field Descriptions**

### 8.1.13.1.5 PRM\_IRQENABLE\_M3 Register (offset = 10h) [reset = 0h]

PRM\_IRQENABLE\_M3 is shown in [Figure 8-167](#) and described in [Table 8-181](#).

This register is used to enable and disable events used to trigger MPU interrupt activation.

**Figure 8-167. PRM\_IRQENABLE\_M3 Register**

### **8.1.13.2 PRM\_PER Registers**

**Table 8-182** lists the memory-mapped registers for the PRM\_PER. All register offset addresses not listed in [Table 8-182](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-182. PRM\_PER REGISTERS**

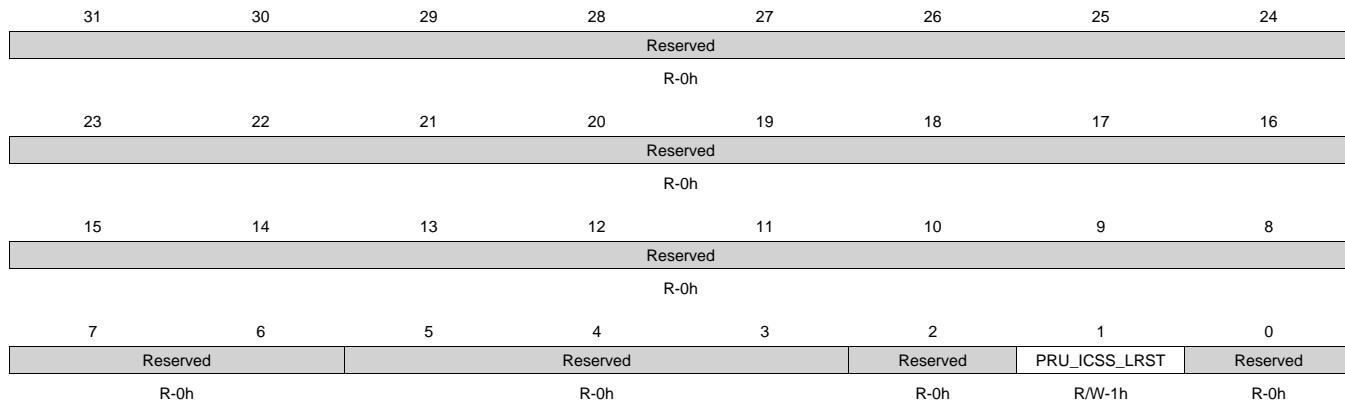

| Offset | Acronym          | Register Name  | Section                            |
|--------|------------------|--|------------------------------------|
| 0h     | RM_PER_RSTCTRL   | This register controls the release of the PER Domain resets.                                       | <a href="#">Section 8.1.13.2.1</a> |
| 8h     | PM_PER_PWRSTST   | This register provides a status on the current PER power domain state.<br>[warm reset insensitive] | <a href="#">Section 8.1.13.2.2</a> |
| Ch     | PM_PER_PWRSTCTRL | Controls the power state of PER power domain   | <a href="#">Section 8.1.13.2.3</a> |

### 8.1.13.2.1 RM\_PER\_RSTCTRL Register (offset = 0h) [reset = 2h]

RM\_PER\_RSTCTRL is shown in [Figure 8-168](#) and described in [Table 8-183](#).

This register controls the release of the PER Domain resets.

**Figure 8-168. RM\_PER\_RSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

### 8.1.13.3 PRM\_WKUP Registers

**Table 8-186** lists the memory-mapped registers for the PRM\_WKUP. All register offset addresses not listed in **Table 8-186** should be considered as reserved locations and the register contents should not be modified.

**Table 8-186. PRM\_WKUP REGISTERS**

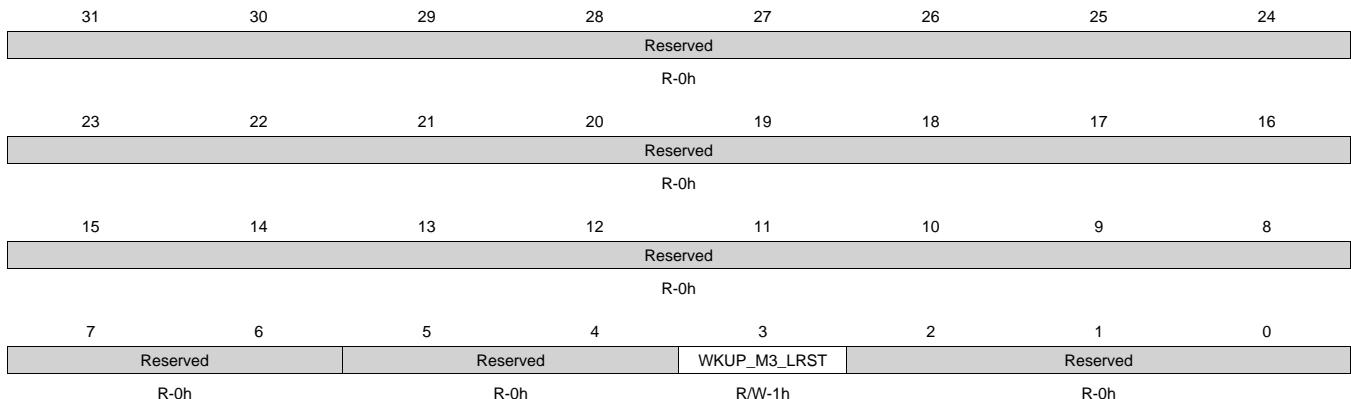

| Offset | Acronym           | Register Name   | Section                            |
|--------|-------------------|---|------------------------------------|
| 0h     | RM_WKUP_RSTCTRL   | This register controls the release of the ALWAYS ON Domain resets.  | <a href="#">Section 8.1.13.3.1</a> |
| 4h     | PM_WKUP_PWRSTCTRL | Controls power state of WKUP power domain   | <a href="#">Section 8.1.13.3.2</a> |
| 8h     | PM_WKUP_PWRSTST   | This register provides a status on the current WKUP power domain state.<br>[warm reset insensitive]   | <a href="#">Section 8.1.13.3.3</a> |
| Ch     | RM_WKUP_RSTST     | This register logs the different reset sources of the ALWON domain.<br>Each bit is set upon release of the domain reset signal.<br>Must be cleared by software.<br>[warm reset insensitive] | <a href="#">Section 8.1.13.3.4</a> |

### 8.1.13.3.1 RM\_WKUP\_RSTCTRL Register (offset = 0h) [reset = 8h]

RM\_WKUP\_RSTCTRL is shown in [Figure 8-171](#) and described in [Table 8-187](#).

This register controls the release of the ALWAYS ON Domain resets.

**Figure 8-171. RM\_WKUP\_RSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-187. RM\_WKUP\_RSTCTRL Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-6 | Reserved     | R    | 0h    |   |
| 5-4  | Reserved     | R    | 0h    |   |
| 3    | WKUP_M3_LRST | R/W  | 1h    | Assert Reset to WKUP_M3<br>0x0 = CLEAR : Reset is cleared for the M3<br>0x1 = ASSERT : Reset is asserted for the M3 by A8 |
| 2-0  | Reserved     | R    | 0h    |   |

### 8.1.13.3.2 PM\_WKUP\_PWRSTCTRL Register (offset = 4h) [reset = 8h]

PM\_WKUP\_PWRSTCTRL is shown in [Figure 8-172](#) and described in [Table 8-188](#).

Controls power state of WKUP power domain

**Figure 8-172. PM\_WKUP\_PWRSTCTRL Register**

#### 8.1.13.4.1 PM\_MPU\_PWRSTCTRL Register (offset = 0h) [reset = 1FF0007h]

PM\_MPU\_PWRSTCTRL is shown in [Figure 8-175](#) and described in [Table 8-192](#).

This register controls the MPU power state to reach upon mpu domain sleep transition

**Figure 8-175. PM\_MPU\_PWRSTCTRL Register**

### 8.1.13.5.1 PRM\_RSTCTRL Register (offset = 0h) [reset = 0h]

PRM\_RSTCTRL is shown in [Figure 8-178](#) and described in [Table 8-196](#).

Global software cold and warm reset control. This register is auto-cleared. Only write 1 is possible. A read returns 0 only.

**Figure 8-178. PRM\_RSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-196. PRM\_RSTCTRL Register Field Descriptions**

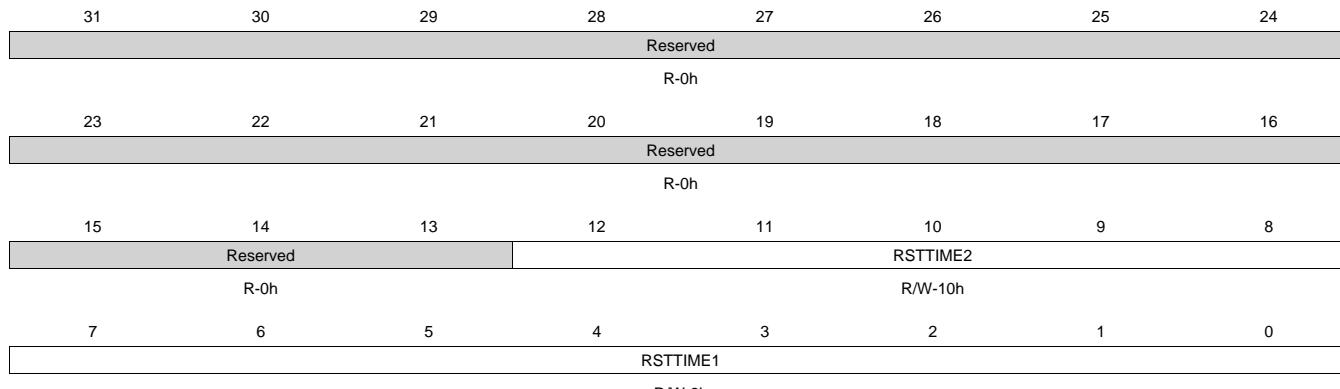

| Bit  | Field              | Type | Reset | Description   |
|------|--------------------|------|-------|---|
| 31-2 | Reserved           | R    | 0h    |   |
| 1    | RST_GLOBAL_COLD_SW | R/W  | 0h    | Global COLD software reset control.<br>This bit is reset only upon a global cold source of reset.<br>Read returns 0.<br>0x0 = 0x0 : Global COLD software reset is cleared.<br>0x1 = 0x1 : Asserts a global COLD software reset. The software must ensure the SDRAM is properly put in self-refresh mode before applying this reset. |
| 0    | RST_GLOBAL_WARM_SW | R/W  | 0h    | Global WARM software reset control.<br>This bit is reset upon any global source of reset (warm and cold).<br>Read returns 0.<br>0x0 = 0x0 : Global warm software reset is cleared.<br>0x1 = 0x1 : Asserts a global warm software reset.   |

### 8.1.13.5.2 PRM\_RSTTIME Register (offset = 4h) [reset = 1006h]

PRM\_RSTTIME is shown in [Figure 8-179](#) and described in [Table 8-197](#).

Reset duration control. [warm reset insensitive]

**Figure 8-179. PRM\_RSTTIME Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-197. PRM\_RSTTIME Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description  |
|-------|----------|------|-------|--|
| 31-13 | Reserved | R    | 0h    |  |
| 12-8  | RSTTIME2 | R/W  | 10h   | (Power domain) reset duration 2 (number of CLK_M_OSC clock cycles) |
| 7-0   | RSTTIME1 | R/W  | 6h    | (Global) reset duration 1 (number of CLK_M_OSC clock cycles)       |

### 8.1.13.5.3 PRM\_RSTST Register (offset = 8h) [reset = 1h]

PRM\_RSTST is shown in [Figure 8-180](#) and described in [Table 8-198](#).

This register logs the global reset sources. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

**Figure 8-180. PRM\_RSTST Register**

|          |                   |          |          |          |                    |                 |        |

| 0     | RETMODE_ENABLE     | R/W  | 0h    | Control if the SRAM LDO retention mode is used or not.<br>0x0 = Disabled : SRAM LDO is not allowed to go to RET mode<br>0x1 = Enabled : SRAM LDO go to RET mode when all memory of voltage domain are OFF or RET |

### 8.1.13.6 PRM\_RTC Registers

[Table 8-204](#) lists the memory-mapped registers for the PRM\_RTC. All register offset addresses not listed in [Table 8-204](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-204. PRM\_RTC REGISTERS**

| Offset | Acronym          | Register Name   | Section                            |
|--------|------------------|---|------------------------------------|
| 0h     | PM_RTC_PWRSTCTRL | This register controls the RTC power state to reach upon mpu domain sleep transition                | <a href="#">Section 8.1.13.6.1</a> |
| 4h     | PM_RTC_PWRSTST   | This register provides a status on the current RTC power domain state0.<br>[warm reset insensitive] | <a href="#">Section 8.1.13.6.2</a> |

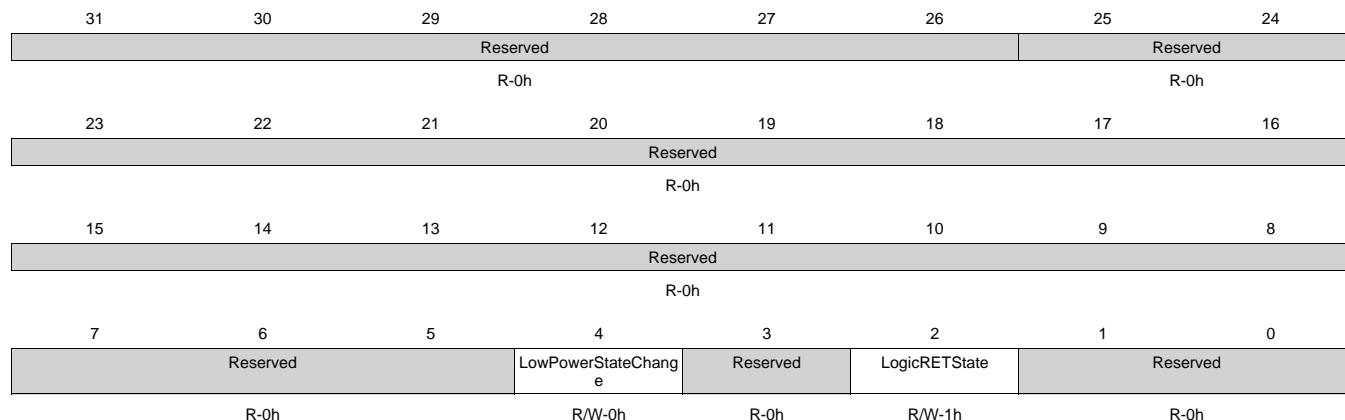

### 8.1.13.6.1 PM\_RTC\_PWRSTCTRL Register (offset = 0h) [reset = 4h]

PM\_RTC\_PWRSTCTRL is shown in [Figure 8-186](#) and described in [Table 8-205](#).

This register controls the RTC power state to reach upon mpu domain sleep transition

**Figure 8-186. PM\_RTC\_PWRSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-205. PM\_RTC\_PWRSTCTRL Register Field Descriptions**

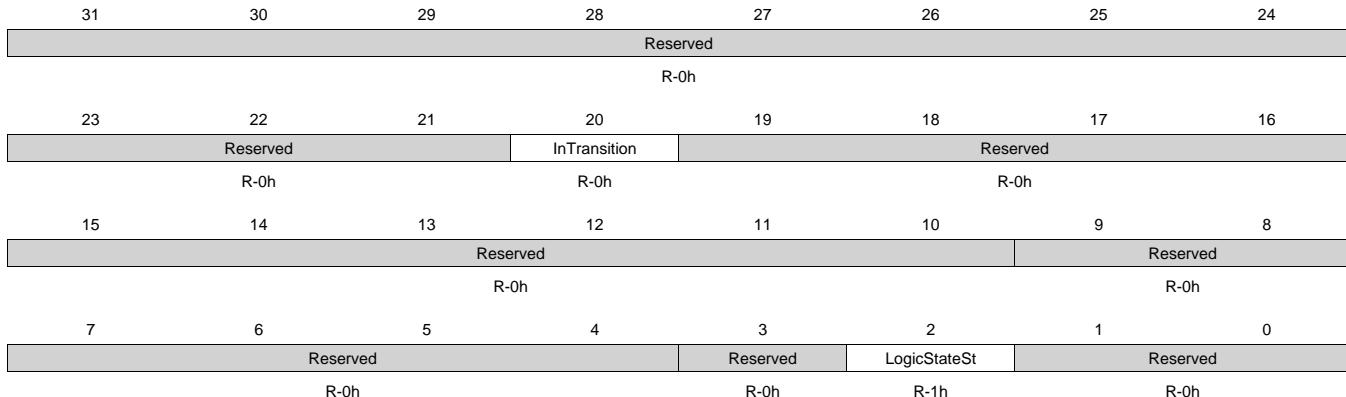

| Bit   | Field               | Type | Reset | Description   |
|-------|---------------------|------|-------|---|

### 8.1.13.6.2 PM\_RTC\_PWRSTST Register (offset = 4h) [reset = 4h]

PM\_RTC\_PWRSTST is shown in [Figure 8-187](#) and described in [Table 8-206](#).

This register provides a status on the current RTC power domain state0. [warm reset insensitive]

**Figure 8-187. PM\_RTC\_PWRSTST Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-206. PM\_RTC\_PWRSTST Register Field Descriptions**

| Bit   | Field        | Type | Reset | Description  |
|-------|--------------|------|-------|--|
| 31-21 | Reserved     | R    | 0h    |  |
| 20    | InTransition | R    | 0h    | Domain transition status<br>0x0 = No : No on-going transition on power domain<br>0x1 = Ongoing : Power domain transition is in progress. |

### 8.1.13.7 PRM\_GFX Registers

[Table 8-207](#) lists the memory-mapped registers for the PRM\_GFX. All register offset addresses not listed in [Table 8-207](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-207. PRM\_GFX REGISTERS**

| Offset | Acronym          | Register Name   | Section                            |
|--------|------------------|---|------------------------------------|
| 0h     | PM_GFX_PWRSTCTRL | This register controls the GFX power state to reach upon a domain sleep transition.   | <a href="#">Section 8.1.13.7.1</a> |
| 4h     | RM_GFX_RSTCTRL   | This register controls the release of the GFX Domain resets.  | <a href="#">Section 8.1.13.7.2</a> |
| 10h    | PM_GFX_PWRSTST   | This register provides a status on the current GFX power domain state.<br>[warm reset insensitive]  | <a href="#">Section 8.1.13.7.3</a> |
| 14h    | RM_GFX_RSTST     | This register logs the different reset sources of the GFX domain.<br>Each bit is set upon release of the domain reset signal.<br>Must be cleared by software.<br>[warm reset insensitive] | <a href="#">Section 8.1.13.7.4</a> |

### 8.1.13.7.1 PM\_GFX\_PWRSTCTRL Register (offset = 0h) [reset = 60044h]

PM\_GFX\_PWRSTCTRL is shown in [Figure 8-188](#) and described in [Table 8-208](#).

This register controls the GFX power state to reach upon a domain sleep transition.

**Figure 8-188. PM\_GFX\_PWRSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-208. PM\_GFX\_PWRSTCTRL Register Field Descriptions**

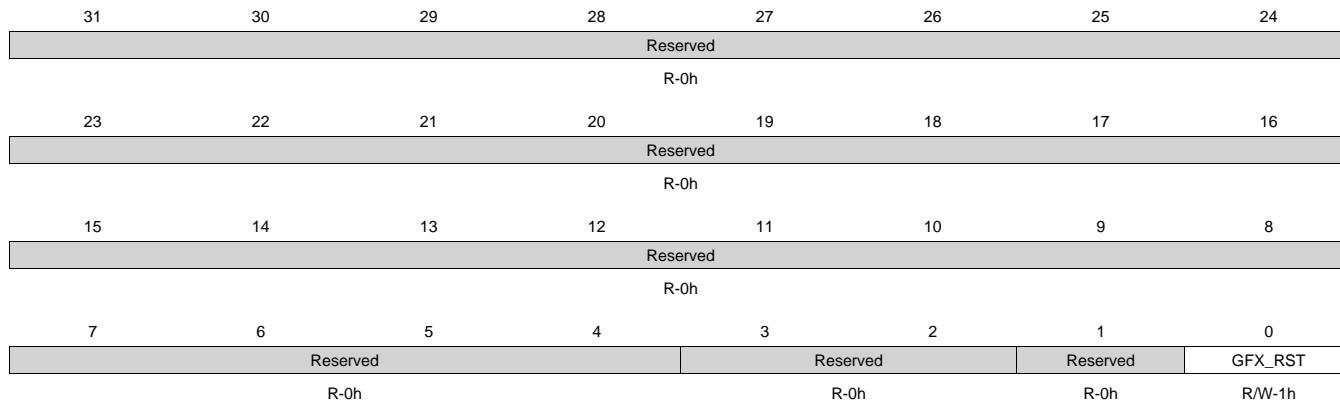

| Bit   | Field               | Type | Reset | Description   |
|-------|---------------------|------|-------|---|
| 31-19 | Reserved            | R    | 0h    |   |
| 18-17 | GFX_MEM_ONState     | R    | 3h    | GFX memory state when domain is ON.   |
| 16-7  | Reserved            | R    | 0h    |   |
| 6     | GFX_MEM_RETState    | R/W  | 1h    |   |
| 5     | Reserved            | R    | 0h    |   |
| 4     | LowPowerStateChange | R/W  | 0h    | Power state change request when domain has already performed a sleep transition.<br>Allows going into deeper low power state without waking up the power domain.<br>0x0 = DIS : Do not request a low power state change.<br>0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON. |
| 3     | Reserved            | R    | 0h    |   |
| 2     | LogicRETState       | R/W  | 1h    | Logic state when power domain is RETENTION<br>0x0 = logic_off : Only retention registers are retained and remaining logic is off when the domain is in RETENTION state.<br>0x1 = logic_ret : Whole logic is retained when domain is in RETENTION state.   |

#### 8.1.13.8 PRM\_CEFUSE Registers

[Table 8-212](#) lists the memory-mapped registers for the PRM\_CEFUSE. All register offset addresses not listed in [Table 8-212](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-212. PRM\_CEFUSE REGISTERS**

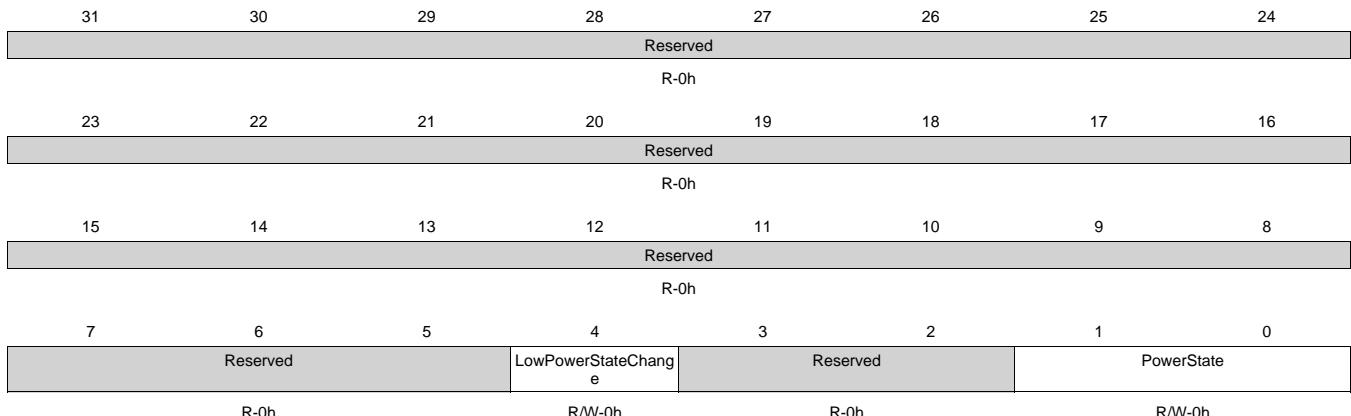

| Offset | Acronym             | Register Name   | Section                            |
|--------|---------------------|---|------------------------------------|
| 0h     | PM_CEFUSE_PWRSTCTRL | This register controls the CEFUSE power state to reach upon a domain sleep transition                 | <a href="#">Section 8.1.13.8.1</a> |
| 4h     | PM_CEFUSE_PWRSTST   | This register provides a status on the current CEFUSE power domain state.<br>[warm reset insensitive] | <a href="#">Section 8.1.13.8.2</a> |

### 8.1.13.8.1 PM\_CEFUSE\_PWRSTCTRL Register (offset = 0h) [reset = 0h]

PM\_CEFUSE\_PWRSTCTRL is shown in [Figure 8-192](#) and described in [Table 8-213](#).

This register controls the CEFUSE power state to reach upon a domain sleep transition

**Figure 8-192. PM\_CEFUSE\_PWRSTCTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 8-213. PM\_CEFUSE\_PWRSTCTRL Register Field Descriptions**

| Bit  | Field               | Type | Reset | Description   |
|------|---------------------|------|-------|---|
| 31-5 | Reserved            | R    | 0h    |   |
| 4    | LowPowerStateChange | R/W  | 0h    | Power state change request when domain has already performed a sleep transition.<br>Allows going into deeper low power state without waking up the power domain.<br>0x0 = DIS : Do not request a low power state change.<br>0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON. |
| 3-2  | Reserved            | R    | 0h    |   |
| 1-0  | PowerState          | R/W  | 0h    | Power state control<br>0x0 = OFF : OFF state<br>0x1 = Reserved : Reserved<br>0x2 = INACT : INACTIVE state<br>0x3 = ON : ON State  |

### 8.1.13.8.2 PM\_CEFUSE\_PWRSTST Register (offset = 4h) [reset = 7h]

PM\_CEFUSE\_PWRSTST is shown in [Figure 8-193](#) and described in [Table 8-214](#).

This register provides a status on the current CEFUSE power domain state. [warm reset insensitive]

**Figure 8-193. PM\_CEFUSE\_PWRSTST Register**

|          |    |              |    |              |    |                       |    |
|----------|----|--------------|----|--------------|----|-----------------------|----|
| 31       | 30 | 29           | 28 | 27           | 26 | 25                    | 24 |

**Control Module**

This chapter describes the control module of the device.

| Topic                                     | Page       |
|---|------------|
| 9.1 <b>Introduction</b> .....             | <b>743</b> |
| 9.2 <b>Functional Description</b> .....   | <b>743</b> |
| 9.3 <b>CONTROL_MODULE Registers</b> ..... | <b>753</b> |

## 9.1 Introduction

The control module includes status and control logic not addressed within the peripherals or the rest of the device infrastructure. This module provides interface to control the following areas of the device:

- Functional I/O multiplexing
- Emulation controls
- Device control and status
- DDR PHY control and IO control registers
- EDMA event multiplexing control registers

**Note:** For writing to the control module registers, the Cortex A8 MPU will need to be in privileged mode of operation and writes will not work from user mode.

## 9.2 Functional Description

### 9.2.1 Control Module Initialization

The control module responds only to the internal POR and device type. At power on, reset values for the registers define the safe state for the device. In the initialization mode, only modules to be used at boot time are associated with the pads. Other module inputs are internally tied and output pads are turned off. After POR, software sets the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration.

General-purpose (GP) devices include features that are inaccessible or unavailable. These inaccessible registers define the default or fixed device configuration or behavior.

The CONTROL\_STATUS[7:0] SYS\_BOOT bit field reflects the state of the sys\_boot pins captured at POR in the PRCM module.

### 9.2.2 Pad Control Registers

The Pad Control Registers are 32-bit registers to control the signal muxing and other aspects of each I/O pad. After POR, software must set the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration. The configuration is controlled by pads or by a group of pads. Each configurable pin has its own configuration register for pullup/down control and for the assignment to a given module.

The following table shows the generic Pad Control Register Description.

**Table 9-1. Pad Control Register Field Descriptions**

| Bit  | Field       | Value  | Description  |
|------|-------------|--------|--|
| 31-7 | Reserved    |        | Reserved. Read returns 0.  |
| 6    | SLEWCTRL    | 0<br>1 | Select between faster or slower slew rate.<br>Fast<br>Slow <sup>(1)</sup>  |
| 5    | RXACTIVE    | 0<br>1 | Input enable value for the Pad. Set to 0 for output only. Set to 1 for input or output.<br>Receiver disabled<br>Receiver enabled |
| 4    | PULLTYPESEL | 0<br>1 | Pad pullup/pulldown type selection<br>Pulldown selected<br>Pullup selected   |
| 3    | PULLUDEN    | 0<br>1 | Pad Pullup/pulldown enable<br>Pullup/pulldown enabled.<br>Pullup/pulldown disabled.  |
| 2-0  | MUXMODE     |        | Pad functional signal mux select   |

<sup>(1)</sup> Some peripherals do not support slow slew rate. To determine which interfaces support each slew rate, see AM335x ARM Cortex-A8 Microprocessors (MPUs) (literature number [SPRS717](#)).

### 9.2.2.1 Mode Selection

The MUXMODE field in the pad control registers defines the multiplexing mode applied to the pad. Modes are referred to by their decimal (from 0 to 7) or binary (from 0b000 to 0b111) representation. For most pads, the reset value for the MUXMODE field in the registers is 0b111. The exceptions are pads to be used at boot time to transfer data from selected peripherals to the external flash memory.

**Table 9-2. Mode Selection**

| MUXMODE | Selected Mode         |
|---------|-----------------------|
| 000b    | Primary Mode = Mode 0 |
| 001b    | Mode 1                |
| 010b    | Mode 2                |
| 011b    | Mode 3                |
| 100b    | Mode 4                |
| 101b    | Mode 5                |
| 110b    | Mode 6                |
| 111b    | Mode 7                |

Mode 0 is the primary mode. When mode 0 is set, the function mapped to the pin corresponds to the name of the pin. Mode 1 to mode 7 are possible modes for alternate functions. On each pin, some modes are used effectively for alternate functions, while other modes are unused and correspond to no functional configuration.

### 9.2.2.2 Pull Selection

There is no automatic gating control to ensure that internal weak pull-down/pull up resistors on a pad are disconnected whenever the pad is configured as output. If a pad is always configured in output mode, it is recommended for user software to disable any internal pull resistor tied to it, to avoid unnecessary consumption. The following table summarizes the various possible combinations of PULLTYPESEL and PULLUDEN fields of PAD control register.

**Table 9-3. Pull Selection**

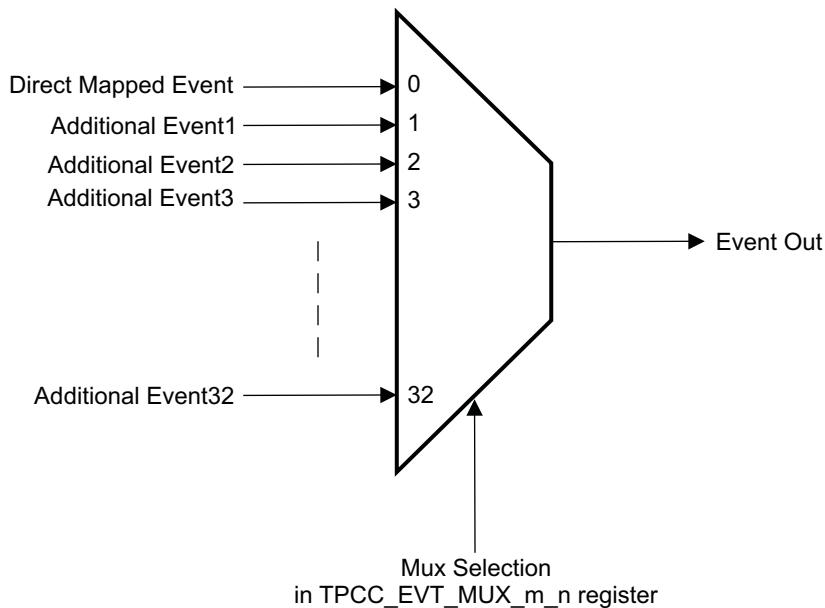

| PULL TYPE   |              | Pin Behavior                        |
|-------------|--------------|-------------------------------------|
| PULLTYPESEL | PULLUDENABLE |                                     |
| 0b          | 0b           | Pulldown selected and activated     |
| 0b          | 1b           | Pulldown selected but not activated |
| 1b          | 0b           | Pullup selected and activated       |
| 1b          | 1b           | Pullup selected but not activated   |

### 9.2.2.3 RX Active

The RXACTIVE bit is used to enable and disable the input buffer. This control can be used to help with power leakage or device isolation through the I/O. The characteristic of the signal is ultimately dictated by the mux mode the pad is put into.

### 9.2.3 EDMA Event Multiplexing

The device has more DMA events than can be accommodated by the TPCC's maximum number of events, which is 64. To overcome the device has one crossbar at the top level. This module will multiplex the extra events with all of the direct mapped events. Mux control registers are defined in the Control Module to select the event to be routed to the TPCC. Direct mapped event is the default (mux selection set to '0').

**Figure 9-1. Event Crossbar**

For every EDMA event there is a cross bar implemented in the design as shown in the figure. The direct mapped event/interrupt will be always connected to Mux input[0], The additional events will be connected to Mux input[1], Mux input[2].etc as defined in EDMA event table. The Mux selection value is programmed into the corresponding TPCC\_EVT\_MUX\_n register. The EVT\_MUX value can take a value from 1 to 32. Other values are reserved. By default the MUX\_selection value is written to 0, which means the direct mapped event is connected to the Event output.

When the additional event is selected through the Cross bar programming the direct mapped event cannot be used.

For example, when TINT0 (Timer Interrupt 0) event, which is not directly mapped to the DMA event source needs to be connected to EDMA channel no 24 (which is directly mapped to SDTXEVT0 event). The user has to program the EVT\_MUX\_24 field in TPCC\_EVT\_MUX\_24\_27 register to 22 (value corresponding to TINT0 interrupt in crossbar mapping). When this is set, TINT0 interrupt event will trigger the channel 24.

Please note that once this is set. The SDTXEVT0 can no longer be handled by EDMA. The user has to allocate the correct DMA event number for crossbar mapped events so that there is no compromise on the channel allocation for the used event numbers.

## 9.2.4 Device Control and Status

### 9.2.4.1 Control and Boot Status

The device configuration is set during power on or hardware reset (PORz sequence) by the configuration input pins (SYSBOOT[15:0]).The CONTROL\_STATUS register reflects the system boot and the device type configuration values as sampled when the power-on reset (PORz) signal is asserted. The Configuration input pins are sampled continuously during the PORz active period and the final sampled value prior to the last rising edge is latched in the register. The CONTROL\_STATUS register gives the status of the device boot process.

### 9.2.4.2 Interprocessor Communication

The control module has the IPC\_MSG\_REG (7:0) registers which is for sharing messages between Cortex M3 and the Cortex A8 MPU. The M3 TX end of event (M3\_TXEV\_EOI) register provides the mechanism to clear/enable the TX Event from Cortex M3 to Cortex A8 MPU Subsystem. See the M3\_TXEV\_EOI register description for further detail.

### 9.2.4.3 Initiator Priority Control

The control module provides the registers to control the bus interconnect priority and the EMIF priority.

#### 9.2.4.3.1 Initiator Priority Control for Interconnect

The INIT\_PRIORITY\_n register controls the infrastructure priority at the bus interconnects. This can be used for dynamic priority escalation. There are bit fields that control the interconnect priority for each bus initiator. By default all the initiators are given equal priority and the allocation is done on a round robin basis.

The priority can take a value from 0 to 3. The following table gives the valid set of priority values.

**Table 9-4. Interconnect Priority Values**

| Interconnect Priority Value | Remarks         |
|-----------------------------|-----------------|
| 00                          | Low priority    |
| 01                          | Medium priority |
| 10                          | Reserved        |
| 11                          | High priority   |

#### 9.2.4.3.2 Initiator Priority at EMIF

The MREQPRI0 register provides an interface to change the access priorities for the various masters accessing the EMIF(DDR). Software can make use of this register to set the requestor priorities for required EMIF arbitration. The EMIF priority can take a value from 000b to 111b where 000b will be the highest priority and 111b will be lowest priority.

### 9.2.4.4 Peripheral Control and Status

#### 9.2.4.4.1 USB Control and Status

The USB\_CTRLn and USB\_STSn registers reflect the Control and Status of the USB instances. The USB IO lines can be used as UART TX and RX lines the USB Control register bit field GPIO MODE has settings that configures the USB lines as GPIO lines. The other USB PHY control settings for controlling the OTG settings and PHY are part of the USB\_CTRLn register.

The USB\_STSn register gives the status of the USB PHY module. See the USB\_STSn register description for further details.

See [Section 16.2.4, USB GPIO Details](#), for more information.

#### 9.2.4.4.2 USB Charger Detect

Each USB PHY contains circuitry which can automatically detect the presence of a charger attached to the USB port. The charger detection circuitry is compliant to the Battery Charging Specification Revision 1.1 from the USB Implementers Forum, which can be found at [www.usb.org](http://www.usb.org). See this document for more details on USB charger implementation.

#### 9.2.4.4.2.1 Features

The charger detection circuitry of each PHY has the following features:

- Contains a state machine which can automatically detect the presence of a Charging Downstream Port or a Dedicated Charging Port (see the Battery Charging Specification for the definition of these terms)
- Outputs a charger enable signal (3.3 V level active high CMOS driver) when a charger is present.
- Allows you to enable/disable the circuitry to save power
- The detection circuitry requires only a 3.3-V supply to be present to operate.
- The charger detection also has a manual mode which allows the user to implement the battery charging specification in software.

### 9.2.4.4.2.2 Operation

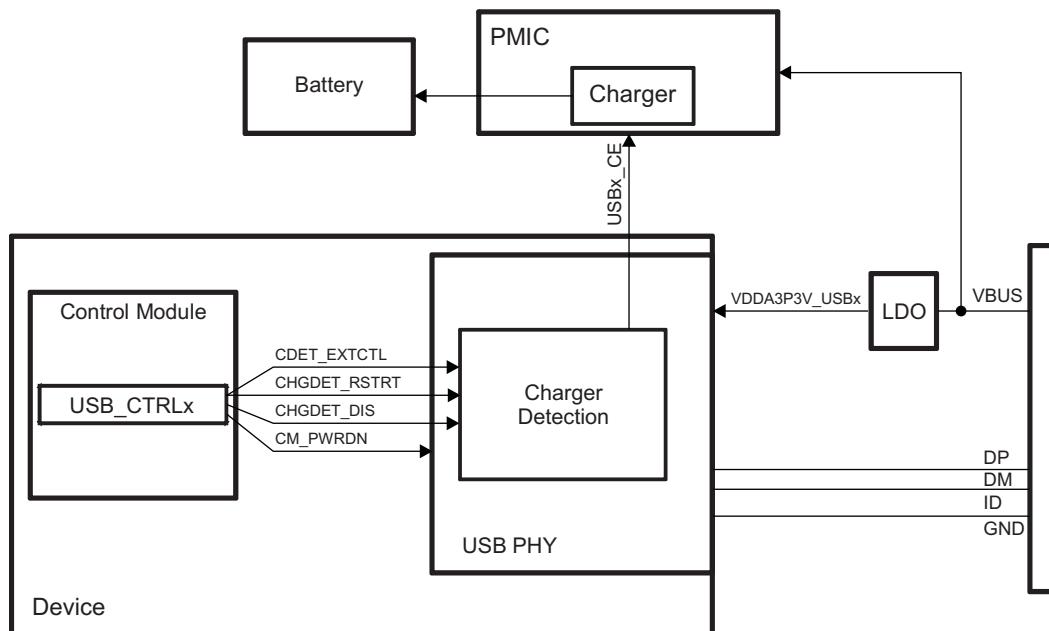

The control module gives the following interface to control the automatic charger detection circuitry:

- **USB\_CTRLx.CDET\_EXTCTL**: Turns the automatic detection on/off. Keep this bit 0 to keep the automatic detection on. Changing this to 1 enables the manual mode.
- **USB\_CTRLx.CHGDET\_RSTRT**: Restarts the charger detection state machine. To initiate the charger detection, change this bit from 1 to 0. If this bit is 1, the charger enable output (CE) is disabled.
- **USB\_CTRLx.CHGDET\_DIS**: Enables/disables the charger detection circuitry. Keep this bit 0 to keep this charger detection enabled. Setting this bit to 1 will power down the charger detection circuitry.
- **USB\_CTRLx.CM\_PWRDN**: Powers up/down the PHY which contains the charger detection circuitry. Clear this bit to 0 to enable power to the PHY.

To start the charger detection during normal operation, ensure that the PHY and charger are enabled and the automatic detection is turned on. Then, initiate a charger detection cycle by transitioning CHGDET\_RSTRT from 1 to 0. If a Charging Downstream Port or a Dedicated Charging Port is detected, the charger enable signal (USBx\_CE) will be driven high and remain high until the charger is disabled by either CHGDET\_DIS = 1 or CHGDET\_RSTRT=1. If the port remains unconnected after initiating the charger detect cycle, it will continue the detection until a charger is detected or an error condition occurs. Note that USBx\_CE is not an open drain output.

To disable the charger after successful detection, you must disable the charger detect circuitry with CHGDET\_DIS or CHGDET\_RSTRT, even if the charger is physically disconnected.

**Figure 9-2. USB Charger Detection**

Charger detection can be automatically started with no power to the rest of AM335x. If VDDA3P3V\_USBx is present, via an LDO powered by VBUS connected to a host, the charger detection state machine will automatically start and perform detection. If a charger is detected, USBx\_CE will be driven high, otherwise it will be driven low.

The charger detection circuitry performs the following steps of the Battery Charging specification v1.1:

1. VBUS Detect
2. Data Contact Detect
3. Primary Detection

Secondary Detection (to distinguish between a Charging Downstream Port and a Dedicated Charging Port) is a newly added feature of the v1.2 spec and is not implemented in the charger detection state machine.

#### 9.2.4.4.3 Ethernet MII Mode Selection

The control module provides a mechanism to select the Mode of operation of Ethernet MII interface. The GMII\_SEL register has register bit fields to select the MII/RMII/RGMII modes, clock sources, and delay mode.

#### 9.2.4.4.4 Ethernet Module Reset Isolation Control

This feature allows the device to undergo a warm reset without disrupting the switch or traffic being routed through the switch during the reset condition. The CPSW Reset Isolation register (RESET\_ISO) has an ISO\_CONTROL field which controls the reset isolation feature.

If the reset isolation is enabled, any warm reset source will be blocked to the EMAC switch. If the EMAC reset isolation is NOT active (default state), then the warm reset sources are allowed to propagate as normal including to the EMAC Switch module (both reset inputs to the IP). All cold or POR resets will always propagate to the EMAC switch module as normal.

When RESET\_ISO is enabled, the following registers will not be disturbed by a warm reset:

- GMII\_SEL
- CONF\_GPMC\_A[11:0]
- CONF\_GPMC\_WAIT0
- CONF\_GPMC\_WPN
- CONF\_GPMC\_BEN1
- CONF\_MII1\_COL
- CONF\_MII1\_CRS
- CONF\_MII1\_RX\_ER
- CONF\_MII1\_TX\_EN
- CONF\_MII1\_RX\_DV
- CONF\_MII1\_TXD[3:0]
- CONF\_MII1\_TX\_CLK
- CONF\_MII1\_RX\_CLK
- CONF\_MII1\_RXD[3:0]
- CONF\_RMII1\_REF\_CLK
- CONF\_MDIO\_DATA
- CONF\_MDIO\_CLK

#### 9.2.4.4.5 Timer/eCAP Event Capture Control

The Timer 5, 6, 7 events and the eCAP0, 1, 2 events can be selected using the TIMER\_EVT\_CAPTURE and ECAP\_EVT\_CAPTURE registers. The following table lists the available sources for those events.

**Table 9-5. Available Sources for Timer[5–7] and eCAP[0–2] Events**

| Event No. | Source module                                  | Interrupt Name/Pin |
|-----------|--|--------------------|
| 0         | For Timer 5 MUX input from IO signal<br>TIMER5 | TIMER5 IO pin      |
|           | For Timer 6 MUX input from IO signal<br>TIMER6 | TIMER6 IO pin      |
|           | For Timer 7 MUX input from IO signal<br>TIMER7 | TIMER7 IO pin      |
|           | For eCAP 0 MUX input from IO signal<br>eCAP0   | eCAP0 IO pin       |
|           | For eCAP 1 MUX input from IO signal<br>eCAP1   | eCAP1 IO pin       |
|           | For eCAP 2 MUX input from IO signal<br>eCAP2   | eCAP2 IO pin       |
| 1         | UART0  | UART0INT           |
| 2         | UART1  | UART1INT           |
| 3         | UART2  | UART2INT           |
| 4         | UART3  | UART3INT           |
| 5         | UART4  | UART4INT           |
| 6         | UART5  | UART5INT           |
| 7         | 3PGSW  | 3PGSWRXTTHR0       |
| 8         | 3PGSW  | 3PGSWRXINT0        |
| 9         | 3PGSW  | 3PGSWTXINT0        |
| 10        | 3PGSW  | 3PGSWMISC0         |
| 11        | McASP0   | MCATXINT0          |
| 12        | McASP0   | MCARXINT0          |
| 13        | McASP1   | MCATXINT1          |
| 14        | McASP1   | MCARXINT1          |
| 15        | Reserved                                       | Reserved           |
| 16        | Reserved                                       | Reserved           |
| 17        | GPIO 0   | GPIOINT0A          |
| 18        | GPIO 0   | GPIOINT0B          |
| 19        | GPIO 1   | GPIOINT1A          |
| 20        | GPIO 1   | GPIOINT1B          |
| 21        | GPIO 2   | GPIOINT2A          |
| 22        | GPIO 2   | GPIOINT2B          |
| 23        | GPIO 3   | GPIOINT3A          |
| 24        | GPIO 3   | GPIOINT3B          |
| 25        | DCAN0  | DCAN0_INT0         |
| 26        | DCAN0  | DCAN0_INT1         |
| 27        | DCAN0  | DCAN0_PARITY       |
| 28        | DCAN1  | DCAN1_INT0         |
| 29        | DCAN1  | DCAN1_INT1         |
| 30        | DCAN1  | DCAN1_PARITY       |

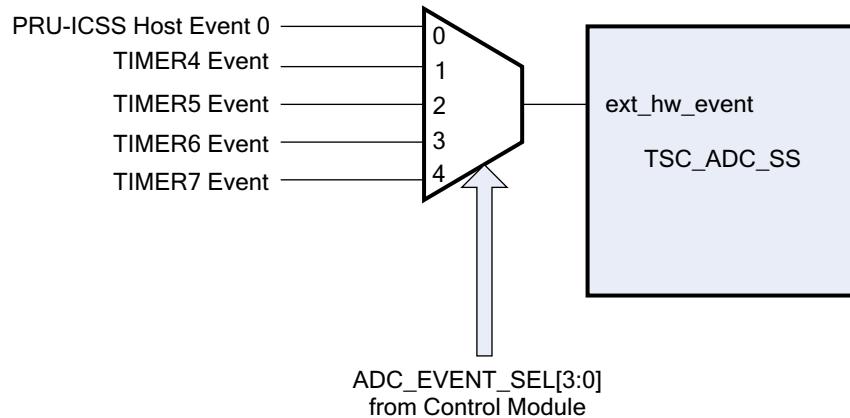

#### 9.2.4.4.6 ADC Capture Control

The following chip level events can be connected through the software-controlled multiplexer to the TSC\_ADC module.

1. PRU-ICSS Host Event 0
2. Timer 4 Event
3. Timer 5 Event
4. Timer 6 Event
5. Timer 7 Event

This pin is the external hardware trigger to start the ADC channel conversion. The ADC\_EVT\_CAPT register needs to be programmed to select the proper source for this conversion.

**Figure 9-3. Timer Events**

The following table contains the value to be programmed in the selection mux.

**Table 9-6. Selection Mux Values**

| ADC_EVENT_SEL Value | ADC External event selected |
|---------------------|-----------------------------|
| 000                 | PRU-ICSS Host Event 0       |
| 001                 | Timer 4 Event               |
| 010                 | Timer 5 Event               |
| 011                 | Timer 6 Event               |
| 100                 | Timer 7 Event               |
| 101-111             | Reserved                    |

## 9.2.5 DDR PHY

**Table 9-7. DDR Slew Rate Control Settings<sup>(1)(2)</sup>**

| sr0 | sr1 | Turn-on Time Level | Interface | Turn-on Time for Drv8 Setting (ps) <sup>(3)</sup> | Max Noise on IO Supply for Drv8 Setting <sup>(4)</sup> |
|-----|-----|--------------------|-----------|---|--|
| 0   | 0   | Fastest            | 1.5 V     | 117   | 0.43   |
|     |     |                    | 1.8 V     | 116   | 0.6  |
| 0   | 1   | Fast               | 1.5 V     | 430   | 0.17   |
|     |     |                    | 1.8 V     | 443   | 0.24   |
| 1   | 0   | Slow               | 1.5 V     | 530   | 0.15   |
|     |     |                    | 1.8 V     | 567   | 0.21   |
| 1   | 1   | Slowest            | 1.5 V     | 790   | 0.13   |
|     |     |                    | 1.8 V     | 815   | 0.18   |

<sup>(1)</sup> These values are programmed in the following registers: ddr\_cmd0\_ioctrl, ddr\_cmd1\_ioctrl, ddr\_cmd2\_ioctrl, ddr\_data0\_ioctrl, ddr\_data1\_ioctrl.

<sup>(2)</sup> Values for DDR\_CMDx\_IOCCTRL.io\_config\_sr\_clk should be programmed to the same value.

<sup>(3)</sup> Value is obtained at nominal PTV.

<sup>(4)</sup> Value is the average across PTVs.

**Table 9-8. DDR Impedance Control Settings<sup>(1)(2)</sup>**

| I2 | I1 | I0 | Drive Setting Name | Output Impedance (R <sub>on</sub> ) | Drive Strength  I <sub>OHL</sub>  ,  I <sub>OL</sub> | Example: R <sub>on</sub> for R <sub>ext</sub> = 50 ohms | Example:  I <sub>OHL</sub>  ,  I <sub>OL</sub>   for R <sub>ext</sub> = 50 ohms |
|----|----|----|--------------------|-------------------------------------|--|---|---|
| 0  | 0  | 0  | Drv5               | 1.6*R <sub>ext</sub>                | 0.625*I <sub>out</sub>                               | 80 ohms   | 5 mA  |
| 0  | 0  | 1  | Drv6               | 1.33*R <sub>ext</sub>               | 0.75*I <sub>out</sub>                                | 67 ohms   | 6 mA  |
| 0  | 1  | 0  | Drv7               | 1.14*R <sub>ext</sub>               | 0.875*I <sub>out</sub>                               | 57 ohms   | 7 mA  |
| 0  | 1  | 1  | Drv8               | R <sub>ext</sub>                    | I <sub>out</sub>                                     | 50 ohms   | 8 mA  |
| 1  | 0  | 0  | Drv9               | 0.88*R <sub>ext</sub>               | 1.125*I <sub>out</sub>                               | 44 ohms   | 9 mA  |
| 1  | 0  | 1  | Drv10              | 0.8*R <sub>ext</sub>                | 1.250*I <sub>out</sub>                               | 40 ohms   | 10 mA   |
| 1  | 1  | 0  | Drv11              | 0.73*R <sub>ext</sub>               | 1.375*I <sub>out</sub>                               | 36 ohms   | 11 mA   |
| 1  | 1  | 1  | Drv12              | 0.67*R <sub>ext</sub>               | 1.5*I <sub>out</sub>                                 | 33 ohms   | 12 mA   |

<sup>(1)</sup> These values are programmed in the following registers: ddr\_cmd0\_ioctrl, ddr\_cmd1\_ioctrl, ddr\_cmd2\_ioctrl, ddr\_data0\_ioctrl, ddr\_data1\_ioctrl.

<sup>(2)</sup> Values for DDR\_CMDx\_IOCCTRL.io\_config\_i\_clk should be programmed to the same value.

### 9.2.5.1 DDR PHY to IO Pin Mapping

The following table describes the DDR PHY to IO pin mapping.

**Table 9-9. DDR PHY to IO Pin Mapping**

| Macro Pin | CMD0    | CMD1     | CMD2       | DATA0    | DATA1    |
|-----------|---------|----------|------------|----------|----------|
| 0         | ddr_ba2 | Unconn   | ddr_cke    | ddr_d8   | ddr_d0   |
| 1         | ddr_wen | ddr_a15  | ddr_resetn | ddr_d9   | ddr_d1   |
| 2         | ddr_ba0 | ddr_a2   | ddr_odt    | ddr_d10  | ddr_d2   |
| 3         | ddr_a5  | ddr_a12  | Unconn     | ddr_d11  | ddr_d3   |
| 4         | ddr_ck  | ddr_a7   | ddr_a14    | ddr_d12  | ddr_d4   |
| 5         | ddr_ckn | ddr_ba1  | ddr_a13    | ddr_d13  | ddr_d5   |
| 6         | ddr_a3  | ddr_a10  | ddr_csn0   | ddr_d14  | ddr_d6   |
| 7         | ddr_a4  | ddr_a0   | Unconn     | ddr_d15  | ddr_d7   |
| 8         | ddr_a8  | ddr_a11  | ddr_a1     | ddr_dqm1 | ddr_dqm0 |
| 9         | ddr_a9  | ddr_casn | Unconn     | ddr_dqs1 | ddr_dqs0 |

**Table 9-9. DDR PHY to IO Pin Mapping (continued)**

| Macro Pin | CMD0   | CMD1     | CMD2   | DATA0     | DATA1     |
|-----------|--------|----------|--------|-----------|-----------|
| 10        | ddr_a6 | ddr_rasn | Unconn | ddr_dqsn1 | ddr_dqsn0 |

### 9.3 CONTROL\_MODULE Registers

**Table 9-10** lists the memory-mapped registers for the CONTROL\_MODULE. All other register offset addresses not listed in **Table 9-10** should be considered as reserved locations and the register contents should not be modified.

**Table 9-10. CONTROL\_MODULE REGISTERS**

| Offset | Acronym                   | Register Description | Section                        |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-16. control\_emif\_sdram\_config Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-29 | SDRAM_TYPE | R/W  | 0h    | SDRAM Type selection<br>000 – Reserved<br>001 – LPDDR1<br>010 – DDR2<br>011 – DDR3<br>100 – Reserved<br>101 – Reserved<br>110 – Reserved<br>111 – Reserved   |
| 28-27 | IBANK_POS  | R/W  | 0h    | Internal bank position.<br>00 - All Bank Address bits assigned from OCP address above column address bits.<br>01 – Bank Address bits [1:0] assigned from OCP address above column address bits and bit [2] from OCP address bits above row address bits.<br>10 – Bank Address bit [0] assigned from OCP address above column address bits and bit [2:1] from OCP address bits above row address bits.<br>11 – All Bank Address bits assigned from OCP address bits above row address bits. |
| 26-24 | DDR_TERM   | R/W  | 0h    | DDR2 and DDR3 termination resistor value. Set to 0 to disable termination.<br>For DDR2, set to 1 for 75 ohm, set to 2 for 150 ohm, and set to 3 for 50 ohm.<br>For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8.<br>All other values are reserved.  |
| 23    | Reserved   | R    | 0h    | Reserved. Read returns 0.  |
| 22-21 | DYN_ODT    | R/W  | 0h    | DDR3 Dynamic ODT.<br>Set to 0 to turn off dynamic ODT.<br>Set to 1 for RZQ/4 and set to 2 for RZQ/2.<br>All other values are reserved.   |

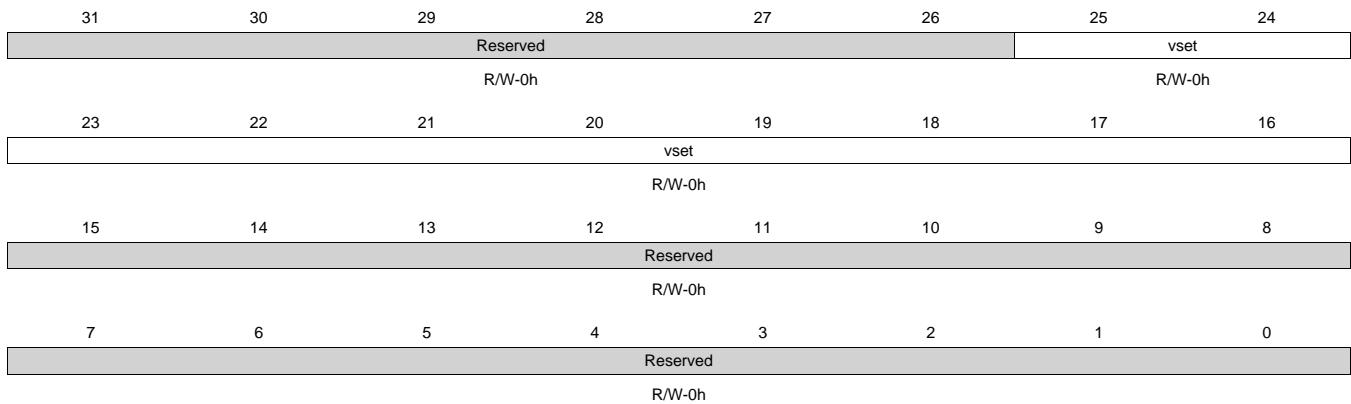

**Table 9-16. control\_emif\_sdram\_config Register Field Descriptions (continued)**

| Bit   | Field       | Type | Reset | Description   |
|-------|-------------|------|-------|---|
| 20    | Reserved    | R    | 0h    | Reserved. Read returns 0.   |
| 19-18 | SDRAM_DRIVE | R/W  | 0h    | SDRAM drive strength.<br>For DDR2, set to 0 for normal, and set to 1 for weak drive strength.<br>For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7.<br>All other values are reserved.   |
| 17-16 | CWL         | R/W  | 0h    | DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.  |
| 15-14 | NARROW_MODE | R/W  | 0h    | SDRAM data bus width. set to 1 for 32-bit, and set to 2 for 16-bit. All other values are reserved.  |
| 13-10 | CL          | R/W  | 0h    | CAS Latency. The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Value of 2, 3, 4, and 5 (CAS latency of 2, 3, 4, and 5) are supported for DDR2. Value of 2, 4, 6, 8, 10, 12, and 14 (CAS latency of 5, 6, 7, 8, 9, 10, and 11) are supported for DDR3. All other values are reserved.   |
| 9-7   | ROWSIZE     | R/W  | 0h    | Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, set to 1 for 10 row bits, set to 2 for 11 row bits, set to 3 for 12 row bits, set to 4 for 13 row bits, set to 5 for 14 row bits, set to 6 for 15 row bits, and set to 7 for 16 row bits. This field is only used when ibank_pos field in SDRAM Config register is set to 1, 2, or 3. |
| 6-4   | IBANK       | R/W  | 0h    | Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, set to 1 for 2 banks, set to 2 for 4 banks, and set to 3 for 8 banks. All other values are reserved.  |
| 3     | EBANK       | R/W  | 0h    | External chip select setup. Defines whether SDRAM accesses will use 1 or 2 chip select lines. Set to 0 to use pad_cs_o_n[0] only. Set to 1 to use pad_cs_o_n[1:0].  |
| 2-0   | PAGESIZE    | R/W  | 0h    | Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), set to 1 for 512-word page (9 column bits), set to 2 for 1024-word page (10 column bits), and set to 3 for 2048-word page (11 column bits). All other values are reserved.  |

### 9.3.7 core\_sldo\_ctrl Register (offset = 428h) [reset = 0h]

core\_sldo\_ctrl is shown in [Figure 9-10](#) and described in [Table 9-17](#).

**Figure 9-10. core\_sldo\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

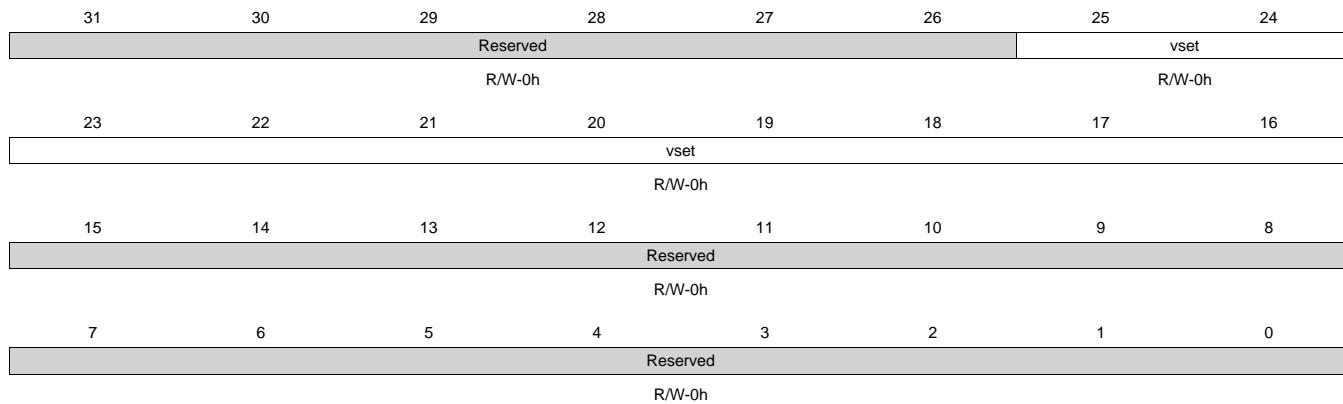

**Table 9-17. core\_sldo\_ctrl Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description |
|-------|----------|------|-------|-------------|
| 31-26 | Reserved | R/W  | 0h    |             |
| 25-16 | vset     | R/W  | 0h    | Trims VDDAR |
| 15-0  | Reserved | R/W  | 0h    |             |

### **9.3.8 mpu\_sldo\_ctrl Register (offset = 42Ch) [reset = 0h]**

mpu\_sldo\_ctrl is shown in [Figure 9-11](#) and described in [Table 9-18](#).

**Figure 9-11. mpu\_sldo\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

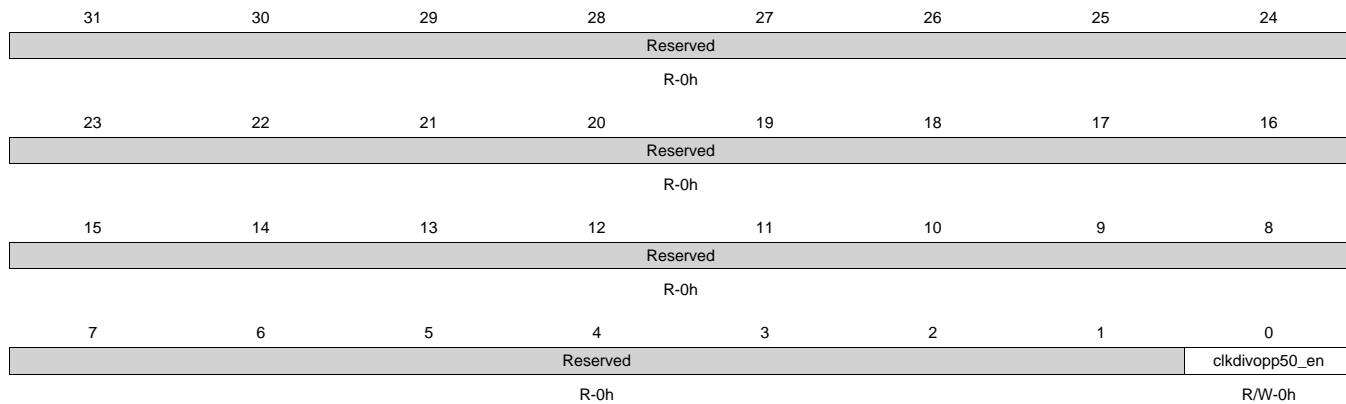

**Table 9-18. mpu\_sldo\_ctrl Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description |
|-------|----------|------|-------|-------------|
| 31-26 | Reserved | R/W  | 0h    |             |
| 25-16 | vset     | R/W  | 0h    | Trims VDDAR |
| 15-0  | Reserved | R/W  | 0h    |             |

### 9.3.9 clk32kdivratio\_ctrl Register (offset = 444h) [reset = 0h]

clk32kdivratio\_ctrl is shown in [Figure 9-12](#) and described in [Table 9-19](#).

**Figure 9-12. clk32kdivratio\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

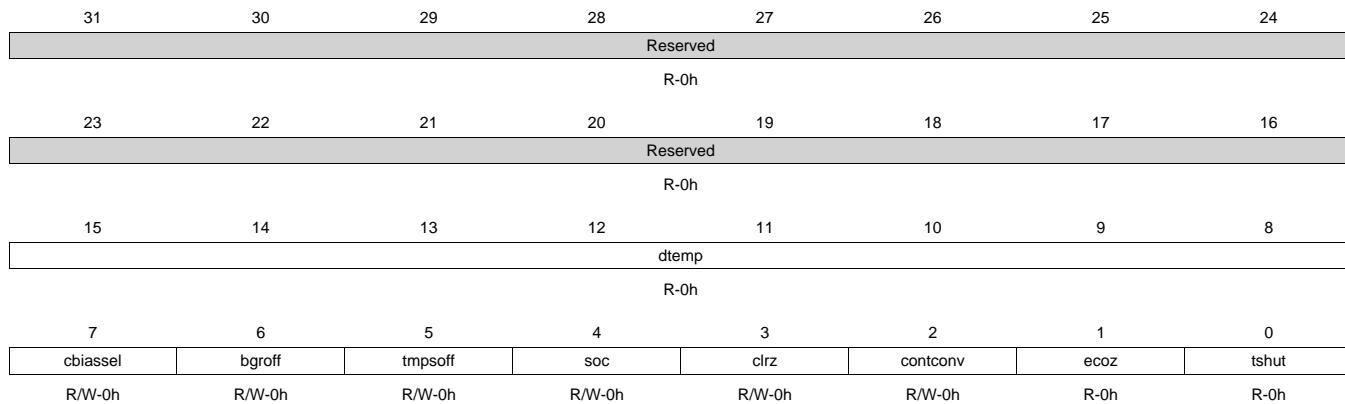

**Table 9-19. clk32kdivratio\_ctrl Register Field Descriptions**

| Bit  | Field          | Type | Reset | Description   |
|------|----------------|------|-------|---|
| 31-1 | Reserved       | R    | 0h    |   |
| 0    | clkdivopp50_en | R/W  | 0h    | 0 : OPP100 operation, use ratio for 24MHz to 32KHz division<br>1 : OPP50 operation, use ratio for 12MHz to 32KHz division |

### 9.3.10 bandgap\_ctrl Register (offset = 448h) [reset = 0h]

bandgap\_ctrl is shown in [Figure 9-13](#) and described in [Table 9-20](#).

**Figure 9-13. bandgap\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-20. bandgap\_ctrl Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description  |
|-------|----------|------|-------|--|
| 31-16 | Reserved | R    | 0h    |  |
| 15-8  | dtemp    | R    | 0h    | Temperature data from ADC.<br>To be used when end of conversion (EOCZ) is 0.         |
| 7     | cbiasel  | R/W  | 0h    | 0: Select bandgap voltage as reference<br>1: Select resistor divider as reference    |
| 6     | bgroff   | R/W  | 0h    | 0: Normal operation<br>1: Bandgap is OFF (OFF Mode)                                  |
| 5     | tmpsoff  | R/W  | 0h    | 0: Normal operation<br>1: Temperature sensor is off and thermal shutdown in OFF mode |
| 4     | soc      | R/W  | 0h    | ADC start of conversion.<br>Transition to high starts a new ADC conversion cycle.    |
| 3     | clrz     | R/W  | 0h    | 0: Resets the digital outputs  |
| 2     | contconv | R/W  | 0h    | 0: ADC single conversion mode<br>1: ADC continuous conversion mode                   |
| 1     | ecoz     | R    | 0h    | ADC end of conversion<br>0: End of conversion<br>1: Conversion in progress           |
| 0     | tshut    | R    | 0h    | 0: Normal operation<br>1: Thermal shutdown event (greater than 147C)                 |

### 9.3.11 bandgap\_trim Register (offset = 44Ch) [reset = 0h]

bandgap\_trim is shown in [Figure 9-14](#) and described in [Table 9-21](#).

**Figure 9-14. bandgap\_trim Register**

|           |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| dtrbgapc  |    |    |    |    |    |    |    |
| R/W-0h    |    |    |    |    |    |    |    |
| 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| dtrgapv   |    |    |    |    |    |    |    |
| R/W-0h    |    |    |    |    |    |    |    |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| dtrtemp   |    |    |    |    |    |    |    |
| R/W-0h    |    |    |    |    |    |    |    |
| 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| dtrtempsc |    |    |    |    |    |    |    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

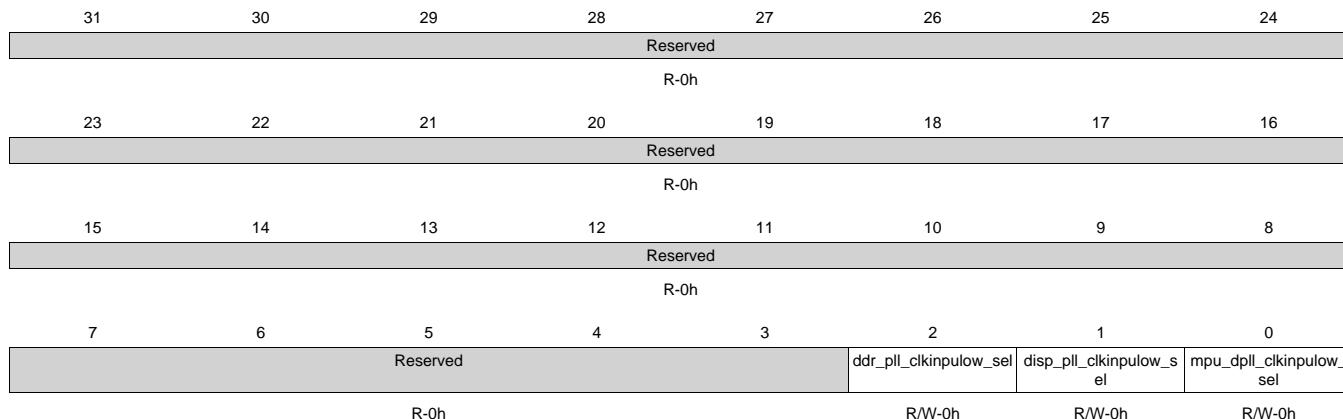

**Table 9-21. bandgap\_trim Register Field Descriptions**

| Bit   | Field     | Type | Reset | Description                        |
|-------|-----------|------|-------|------------------------------------|
| 31-24 | dtrbgapc  | R/W  | 0h    | trim the output voltage of bandgap |
| 23-16 | dtrgapv   | R/W  | 0h    | trim the output voltage of bandgap |
| 15-8  | dtrtemp   | R/W  | 0h    | trim the temperature sensor        |
| 7-0   | dtrtempsc | R/W  | 0h    | trim the temperature sensor        |

### **9.3.12 pll\_clkinpulow\_ctrl Register (offset = 458h) [reset = 0h]**

pll\_clkinpulow\_ctrl is shown in [Figure 9-15](#) and described in [Table 9-22](#).

**Figure 9-15. pll\_clkinpulow\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

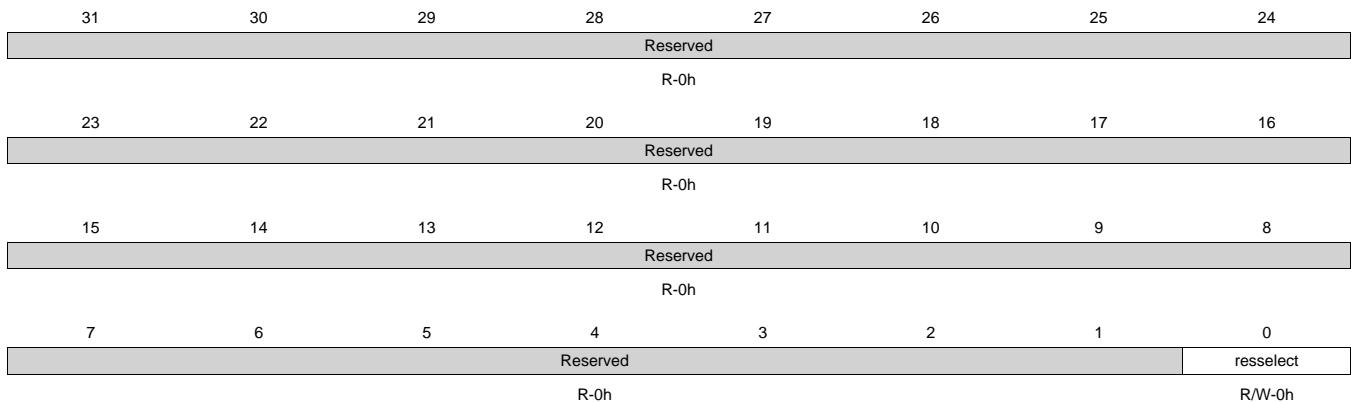

**Table 9-22. pll\_clkinpulow\_ctrl Register Field Descriptions**

| Bit  | Field                   | Type | Reset | Description   |
|------|-------------------------|------|-------|---|
| 31-3 | Reserved                | R    | 0h    |   |
| 2    | ddr_pll_clkinpulow_sel  | R/W  | 0h    | 0 : Select CORE_CLKOUT_M6 clock as CLKINPULOW<br>1 : Select PER_CLKOUT_M2 clock as CLKINPULOW |
| 1    | disp_pll_clkinpulow_sel | R/W  | 0h    | 0 : Select CORE_CLKOUT_M6 clock as CLKINPULOW<br>1 : Select PER_CLKOUT_M2 clock as CLKINPULOW |
| 0    | mpu_dpll_clkinpulow_sel | R/W  | 0h    | 0 : Select CORE_CLKOUT_M6 clock as CLKINPULOW<br>1 : Select PER_CLKOUT_M2 clock as CLKINPULOW |

### 9.3.13 mosc\_ctrl Register (offset = 468h) [reset = 0h]

mosc\_ctrl is shown in [Figure 9-16](#) and described in [Table 9-23](#).

**Figure 9-16. mosc\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

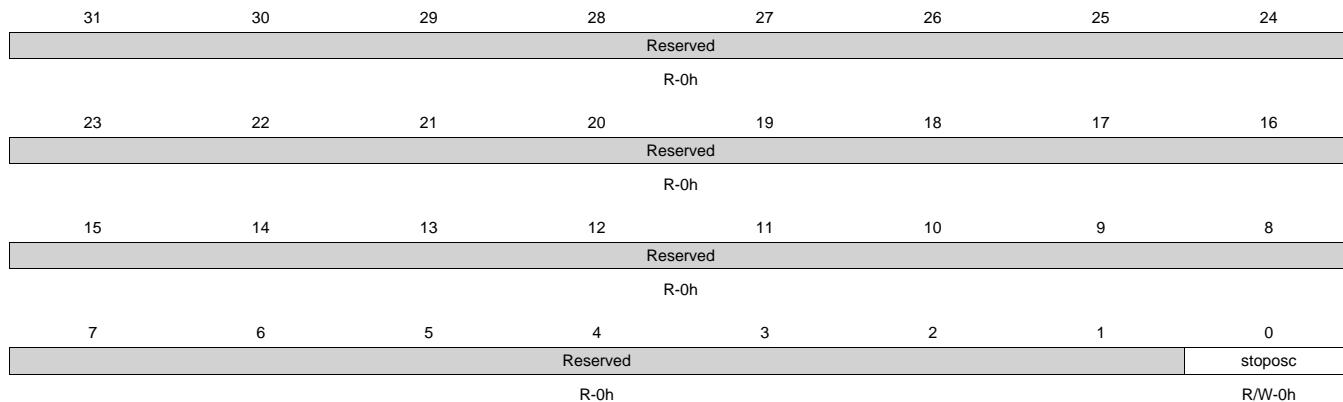

**Table 9-23. mosc\_ctrl Register Field Descriptions**

| Bit  | Field     | Type | Reset | Description  |
|------|-----------|------|-------|--|
| 31-1 | Reserved  | R    | 0h    |  |
| 0    | resselect | R/W  | 0h    | For oscillation with a crystal while RESSELECT is 1, an external resistor must be connected between padxi and padxo to provide bias.<br>0: 1-MHz ohm resistor is connected between padxi and padxo for oscillator bias<br>1: Internal resistor is disconnected |

### **9.3.14 rcosc\_ctrl Register (offset = 46Ch) [reset = 0h]**

rcosc\_ctrl is shown in [Figure 9-17](#) and described in [Table 9-24](#).

**Figure 9-17. rcosc\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

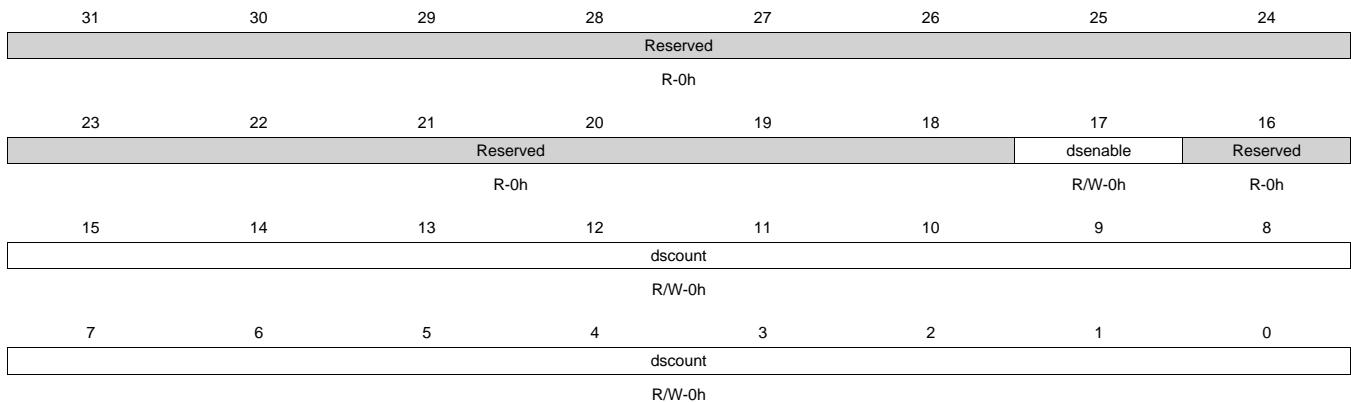

**Table 9-24. rcosc\_ctrl Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-1 | Reserved | R    | 0h    |   |
| 0    | stoposc  | R/W  | 0h    | 0: Oscillator is active<br>1: Oscillator is disabled (power down). Oscillator core output is kept high. |

### 9.3.15 deepsleep\_ctrl Register (offset = 470h) [reset = 0h]

deepsleep\_ctrl is shown in Figure 9-18 and described in Table 9-25.

**Figure 9-18. deepsleep\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-25. deepsleep\_ctrl Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description   |
|-------|----------|------|-------|---|
| 31-18 | Reserved | R    | 0h    |   |
| 17    | dsenable | R/W  | 0h    | Deep sleep enable<br>0: Normal operation<br>1: Master oscillator output is gated                |
| 16    | Reserved | R    | 0h    |   |
| 15-0  | dscount  | R/W  | 0h    | Programmable count of how many CLK_M_OSC clocks needs to be seen before exiting deep sleep mode |

### 9.3.16 dev\_feature Register (offset = 604h) [reset = 0h]

dev\_feature is shown in [Figure 9-19](#) and described in [Table 9-26](#).

**Figure 9-19. dev\_feature Register**

| 31       | 30 | 29       | 28 | 27       | 26             | 25             | 24 |

### 9.3.25 mac\_id0\_lo Register (offset = 630h) [reset = 0h]

mac\_id0\_lo is shown in [Figure 9-28](#) and described in [Table 9-35](#).

**Figure 9-28. mac\_id0\_lo Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

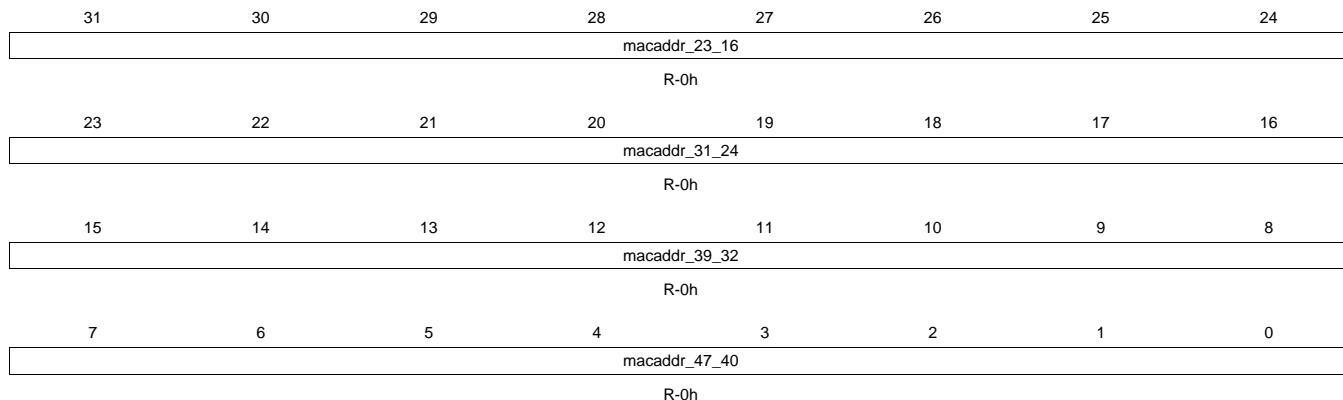

**Table 9-35. mac\_id0\_lo Register Field Descriptions**

| Bit   | Field        | Type | Reset | Description   |
|-------|--------------|------|-------|---|
| 31-16 | Reserved     | R    | 0h    |   |
| 15-8  | macaddr_7_0  | R    | 0h    | MAC0 Address - Byte 0<br>Reset value is device-dependent. |
| 7-0   | macaddr_15_8 | R    | 0h    | MAC0 Address - Byte 1<br>Reset value is device-dependent. |

### 9.3.26 mac\_id0\_hi Register (offset = 634h) [reset = 0h]

mac\_id0\_hi is shown in [Figure 9-29](#) and described in [Table 9-36](#).

**Figure 9-29. mac\_id0\_hi Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

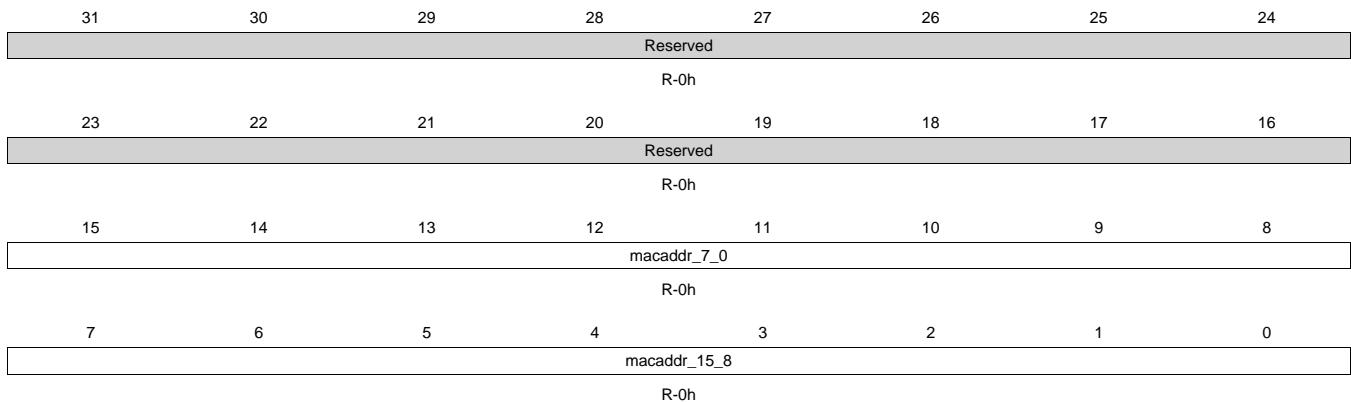

**Table 9-36. mac\_id0\_hi Register Field Descriptions**

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-24 | macaddr_23_16 | R    | 0h    | MAC0 Address - Byte 2<br>Reset value is device-dependent. |
| 23-16 | macaddr_31_24 | R    | 0h    | MAC0 Address - Byte 3<br>Reset value is device-dependent. |
| 15-8  | macaddr_39_32 | R    | 0h    | MAC0 Address - Byte 4<br>Reset value is device-dependent. |
| 7-0   | macaddr_47_40 | R    | 0h    | MAC0 Address - Byte 5<br>Reset value is device-dependent. |

### 9.3.27 mac\_id1\_lo Register (offset = 638h) [reset = 0h]

mac\_id1\_lo is shown in [Figure 9-30](#) and described in [Table 9-37](#).

**Figure 9-30. mac\_id1\_lo Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

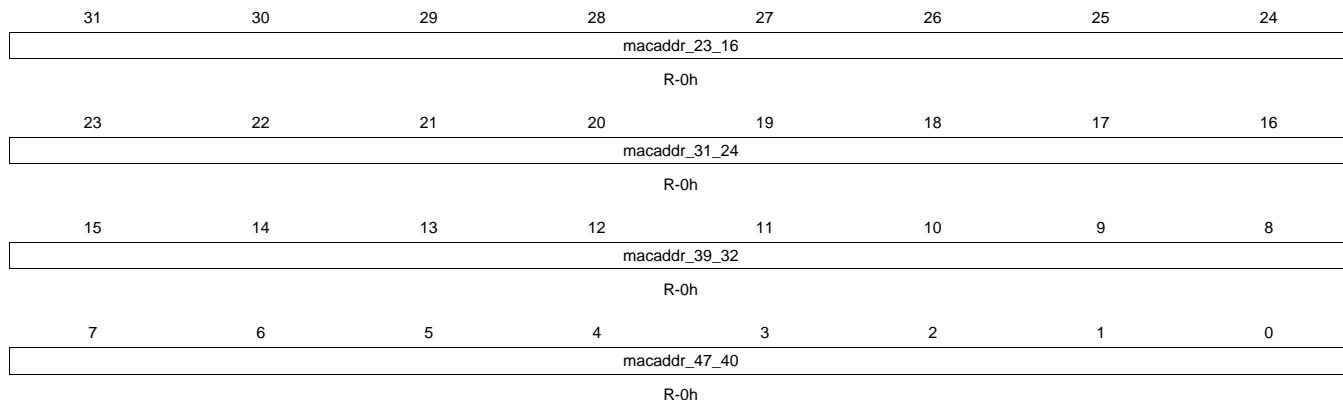

**Table 9-37. mac\_id1\_lo Register Field Descriptions**

| Bit   | Field        | Type | Reset | Description   |
|-------|--------------|------|-------|---|
| 31-16 | Reserved     | R    | 0h    |   |
| 15-8  | macaddr_7_0  | R    | 0h    | MAC0 Address - Byte 0<br>Reset value is device-dependent. |
| 7-0   | macaddr_15_8 | R    | 0h    | MAC0 Address - Byte 1<br>Reset value is device-dependent. |

### **9.3.28 mac\_id1\_hi Register (offset = 63Ch) [reset = 0h]**

mac\_id1\_hi is shown in [Figure 9-31](#) and described in [Table 9-38](#).

**Figure 9-31. mac\_id1\_hi Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

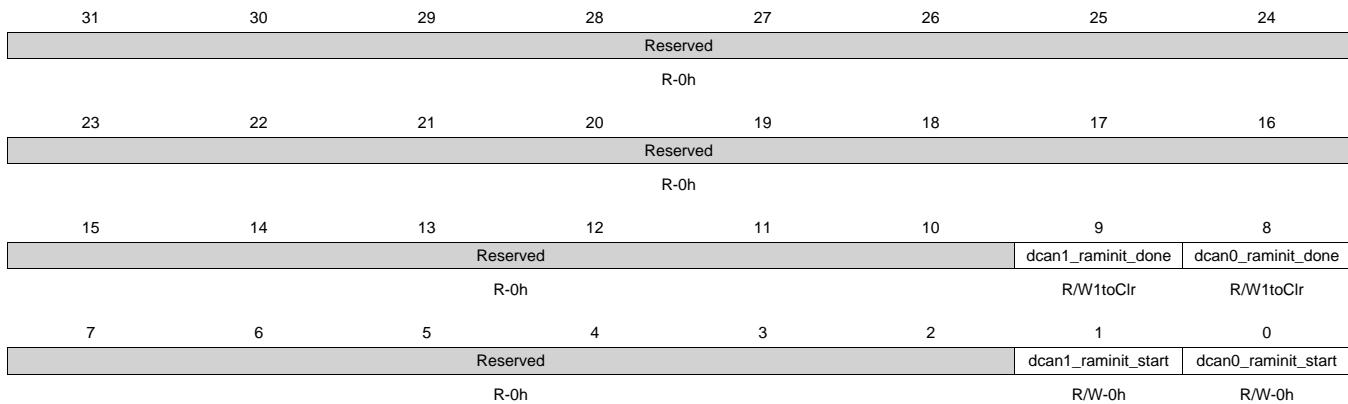

**Table 9-38. mac\_id1\_hi Register Field Descriptions**

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-24 | macaddr_23_16 | R    | 0h    | MAC0 Address - Byte 2<br>Reset value is device-dependent. |
| 23-16 | macaddr_31_24 | R    | 0h    | MAC0 Address - Byte 3<br>Reset value is device-dependent. |
| 15-8  | macaddr_39_32 | R    | 0h    | MAC0 Address - Byte 4<br>Reset value is device-dependent. |
| 7-0   | macaddr_47_40 | R    | 0h    | MAC0 Address - Byte 5<br>Reset value is device-dependent. |

### 9.3.29 dcan\_raminit Register (offset = 644h) [reset = 0h]

dcan\_raminit is shown in [Figure 9-32](#) and described in [Table 9-39](#).

**Figure 9-32. dcan\_raminit Register**

LEGEND: R/W = Read/Write; R = Read only; W1toClr = Write 1 to clear bit; -n = value after reset

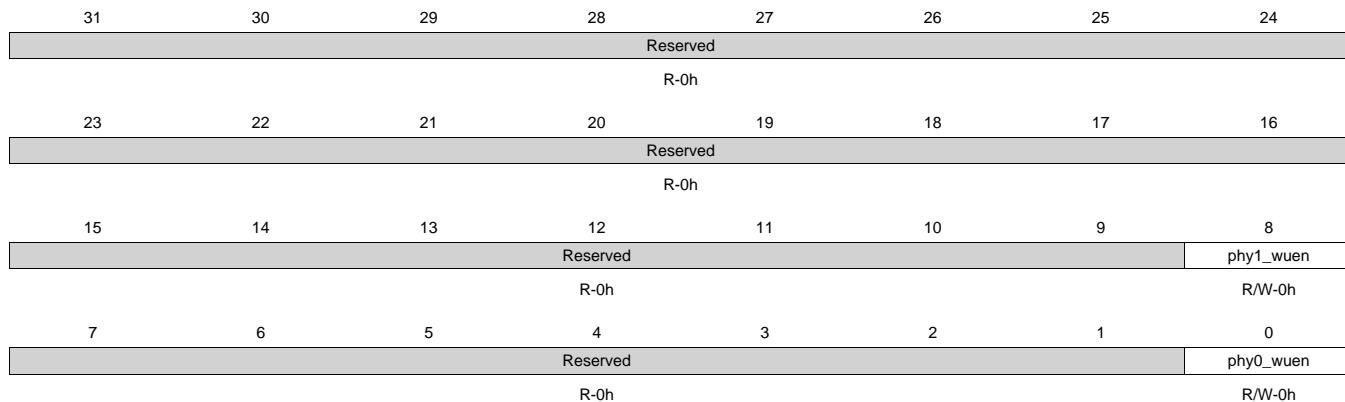

**Table 9-39. dcan\_raminit Register Field Descriptions**

| Bit   | Field               | Type      | Reset | Description  |
|-------|---------------------|-----------|-------|--|
| 31-10 | Reserved            | R         | 0h    |  |
| 9     | dcan1_raminit_done  | R/W1toClr | 0h    | 0: DCAN1 RAM Initialization NOT complete<br>1: DCAN1 RAM Initialization complete |
| 8     | dcan0_raminit_done  | R/W1toClr | 0h    | 0: DCAN0 RAM Initialization NOT complete<br>1: DCAN0 RAM Initialization complete |
| 7-2   | Reserved            | R         | 0h    |  |
| 1     | dcan1_raminit_start | R/W       | 0h    | A transition from 0 to 1 will start DCAN1 RAM initialization sequence.           |
| 0     | dcan0_raminit_start | R/W       | 0h    | A transition from 0 to 1 will start DCAN0 RAM initialization sequence.           |

### **9.3.30 usb\_wkup\_ctrl Register (offset = 648h) [reset = 0h]**

usb\_wkup\_ctrl is shown in [Figure 9-33](#) and described in [Table 9-40](#).

**Figure 9-33. usb\_wkup\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

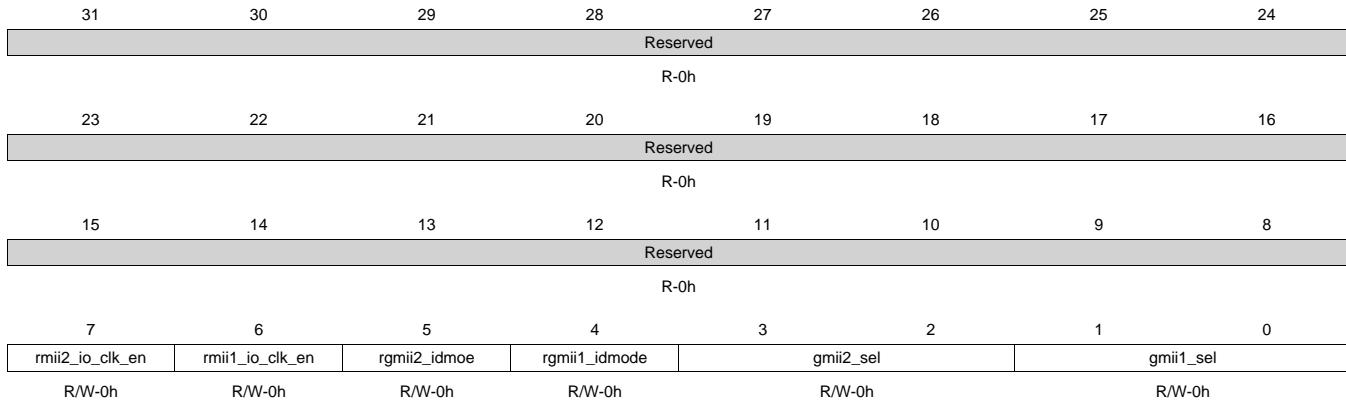

**Table 9-40. usb\_wkup\_ctrl Register Field Descriptions**

| Bit  | Field     | Type | Reset | Description  |
|------|-----------|------|-------|--|
| 31-9 | Reserved  | R    | 0h    |  |
| 8    | phy1_wuen | R/W  | 0h    | PHY1 Wakeup Enable.<br>Write to 1 enables WKUP from USB PHY1 |
| 7-1  | Reserved  | R    | 0h    |  |
| 0    | phy0_wuen | R/W  | 0h    | PHY0 Wakeup Enable.<br>Write to 1 enables WKUP from USB PHY0 |

### 9.3.31 gmii\_sel Register (offset = 650h) [reset = 0h]

gmii\_sel is shown in [Figure 9-34](#) and described in [Table 9-41](#).

**Figure 9-34. gmii\_sel Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

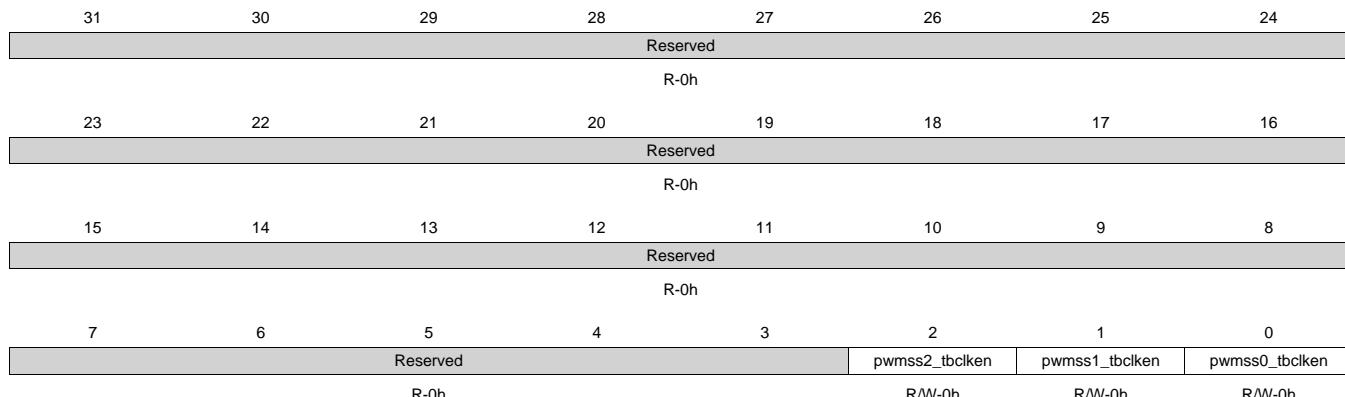

**Table 9-41. gmii\_sel Register Field Descriptions**

| Bit  | Field           | Type | Reset | Description   |
|------|-----------------|------|-------|---|
| 31-8 | Reserved        | R    | 0h    |   |
| 7    | rmii2_io_clk_en | R/W  | 0h    | 1: Enable RMII clock to be sourced from chip pin<br>0: Enable RMII clock to be sourced from PLL |
| 6    | rmii1_io_clk_en | R/W  | 0h    | 1: Enable RMII clock to be sourced from chip pin<br>0: Enable RMII clock to be sourced from PLL |

### 9.3.35 hw\_event\_sel\_grp1 Register (offset = 690h) [reset = 0h]

hw\_event\_sel\_grp1 is shown in [Figure 9-38](#) and described in [Table 9-45](#).

**Figure 9-38. hw\_event\_sel\_grp1 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

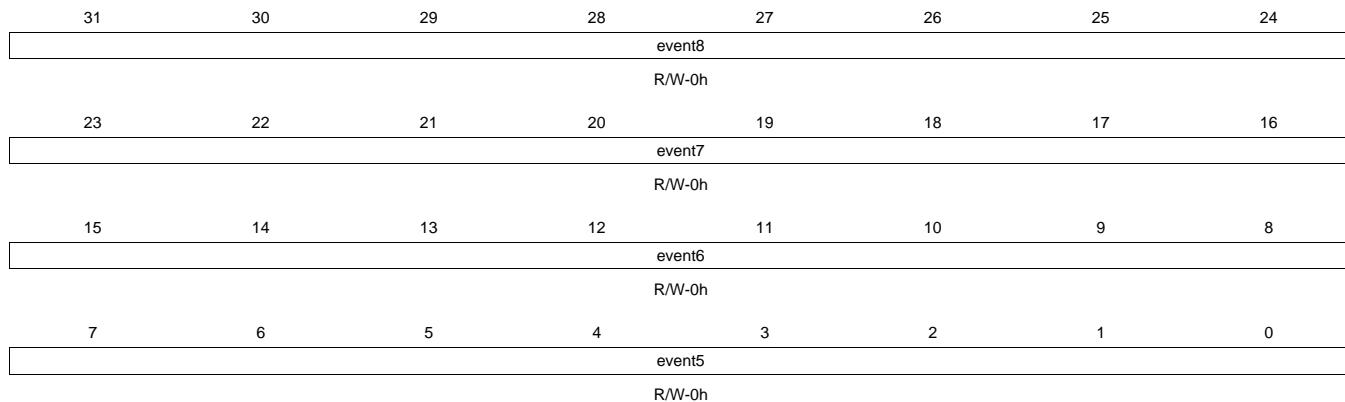

**Table 9-45. hw\_event\_sel\_grp1 Register Field Descriptions**

| Bit   | Field  | Type | Reset | Description                         |
|-------|--------|------|-------|-------------------------------------|
| 31-24 | event4 | R/W  | 0h    | Select 4th trace event from group 1 |
| 23-16 | event3 | R/W  | 0h    | Select 3rd trace event from group 1 |
| 15-8  | event2 | R/W  | 0h    | Select 2nd trace event from group 1 |
| 7-0   | event1 | R/W  | 0h    | Select 1st trace event from group 1 |

### **9.3.36 hw\_event\_sel\_grp2 Register (offset = 694h) [reset = 0h]**

hw\_event\_sel\_grp2 is shown in [Figure 9-39](#) and described in [Table 9-46](#).

**Figure 9-39. hw\_event\_sel\_grp2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

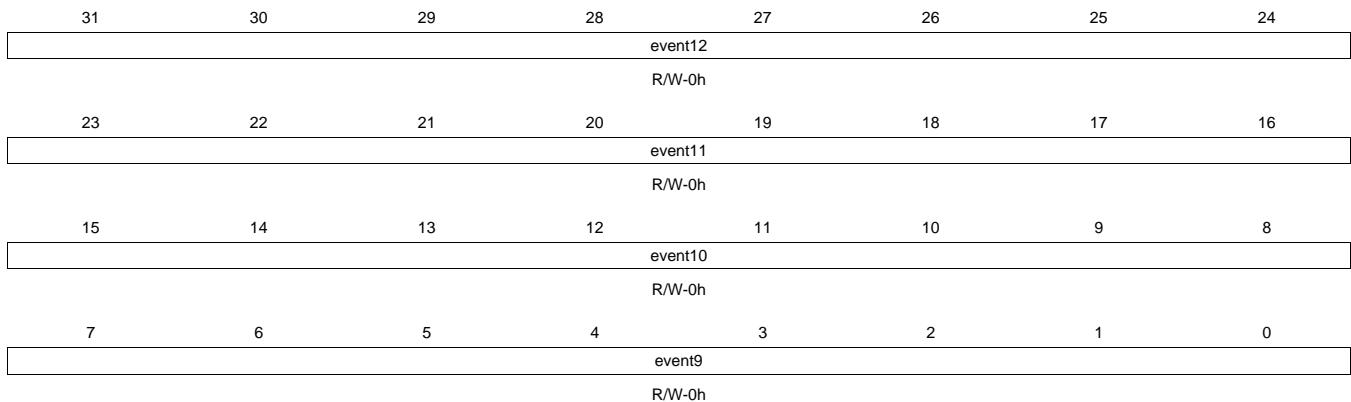

**Table 9-46. hw\_event\_sel\_grp2 Register Field Descriptions**

| Bit   | Field  | Type | Reset | Description                         |
|-------|--------|------|-------|-------------------------------------|
| 31-24 | event8 | R/W  | 0h    | Select 8th trace event from group 2 |
| 23-16 | event7 | R/W  | 0h    | Select 7th trace event from group 2 |
| 15-8  | event6 | R/W  | 0h    | Select 6th trace event from group 2 |
| 7-0   | event5 | R/W  | 0h    | Select 5th trace event from group 2 |

### 9.3.37 hw\_event\_sel\_grp3 Register (offset = 698h) [reset = 0h]

hw\_event\_sel\_grp3 is shown in [Figure 9-40](#) and described in [Table 9-47](#).

**Figure 9-40. hw\_event\_sel\_grp3 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

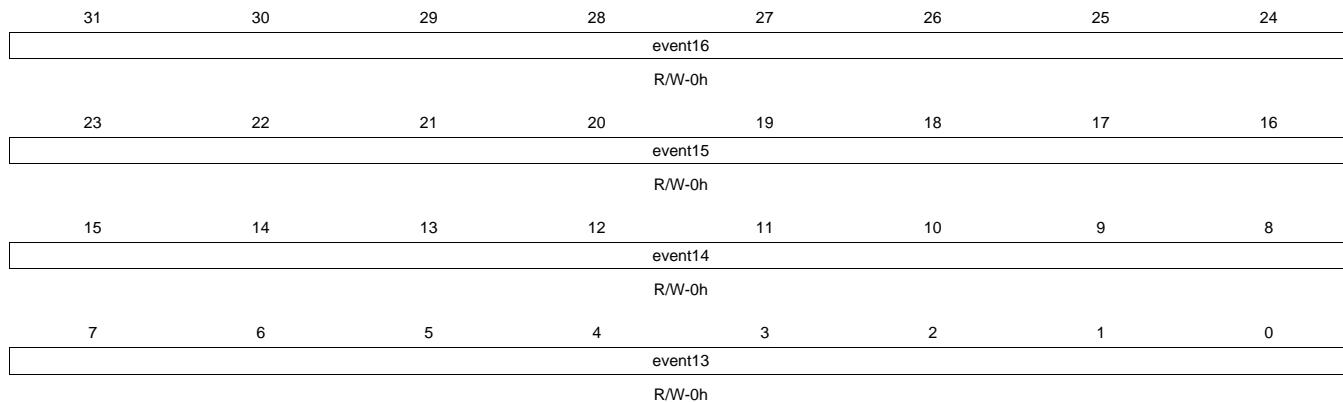

**Table 9-47. hw\_event\_sel\_grp3 Register Field Descriptions**

| Bit   | Field   | Type | Reset | Description                          |
|-------|---------|------|-------|--------------------------------------|
| 31-24 | event12 | R/W  | 0h    | Select 12th trace event from group 3 |
| 23-16 | event11 | R/W  | 0h    | Select 11th trace event from group 3 |
| 15-8  | event10 | R/W  | 0h    | Select 10th trace event from group 3 |
| 7-0   | event9  | R/W  | 0h    | Select 9th trace event from group 3  |

### **9.3.38 hw\_event\_sel\_grp4 Register (offset = 69Ch) [reset = 0h]**

hw\_event\_sel\_grp4 is shown in [Figure 9-41](#) and described in [Table 9-48](#).

**Figure 9-41. hw\_event\_sel\_grp4 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

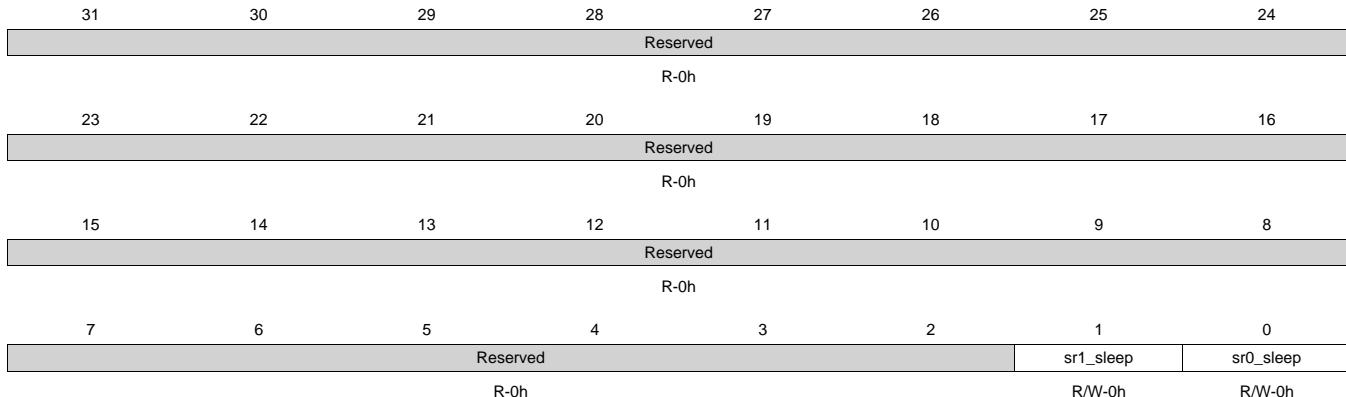

**Table 9-48. hw\_event\_sel\_grp4 Register Field Descriptions**

| Bit   | Field   | Type | Reset | Description                          |
|-------|---------|------|-------|--------------------------------------|
| 31-24 | event16 | R/W  | 0h    | Select 16th trace event from group 4 |
| 23-16 | event15 | R/W  | 0h    | Select 15th trace event from group 4 |
| 15-8  | event14 | R/W  | 0h    | Select 14th trace event from group 4 |
| 7-0   | event13 | R/W  | 0h    | Select 13th trace event from group 4 |

### 9.3.39 smrt\_ctrl Register (offset = 6A0h) [reset = 0h]

smrt\_ctrl is shown in [Figure 9-42](#) and described in [Table 9-49](#).

**Figure 9-42. smrt\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

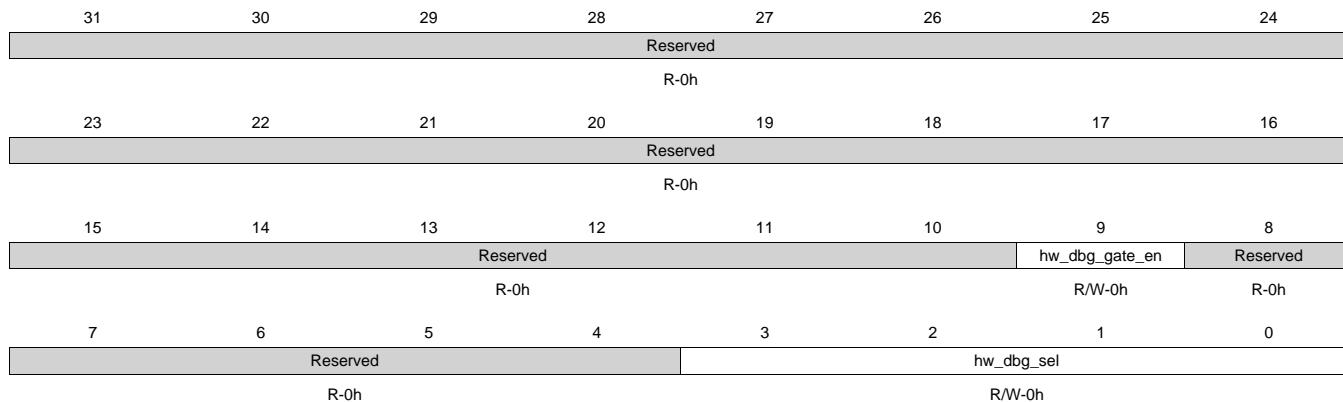

**Table 9-49. smrt\_ctrl Register Field Descriptions**

| Bit  | Field     | Type | Reset | Description  |
|------|-----------|------|-------|--|
| 31-2 | Reserved  | R    | 0h    |  |
| 1    | sr1_sleep | R/W  | 0h    | 0: Disable sensor (SRSLEEP on sensor driven to 1)<br>1: Enable sensor (SRSLEEP on sensor driven to 0). |
| 0    | sr0_sleep | R/W  | 0h    | 0: Disable sensor (SRSLEEP on sensor driven to 1)<br>1: Enable sensor (SRSLEEP on sensor driven to 0). |

### 9.3.40 mpuss\_hw\_debug\_sel Register (offset = 6A4h) [reset = 0h]

mpuss\_hw\_debug\_sel is shown in [Figure 9-43](#) and described in [Table 9-50](#).

**Figure 9-43. mpuss\_hw\_debug\_sel Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

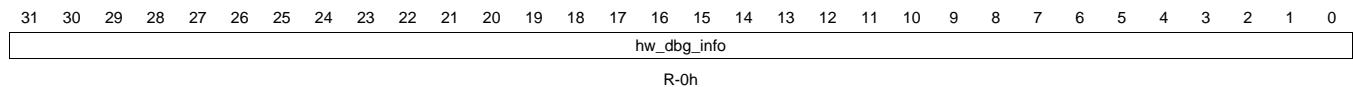

**Table 9-50. mpuss\_hw\_debug\_sel Register Field Descriptions**

| Bit   | Field          | Type | Reset | Description   |

### 9.3.49 *usb\_vid\_pid* Register (offset = 7F4h) [reset = 4516141h]

*usb\_vid\_pid* is shown in [Figure 9-52](#) and described in [Table 9-59](#).

**Figure 9-52. *usb\_vid\_pid* Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-59. *usb\_vid\_pid* Register Field Descriptions**

| Bit   | Field   | Type | Reset  | Description    |
|-------|---------|------|--------|----------------|
| 31-16 | usb_vid | R    | 0x451  | USB Vendor ID  |
| 15-0  | usb_pid | R    | 0x6141 | USB Product ID |

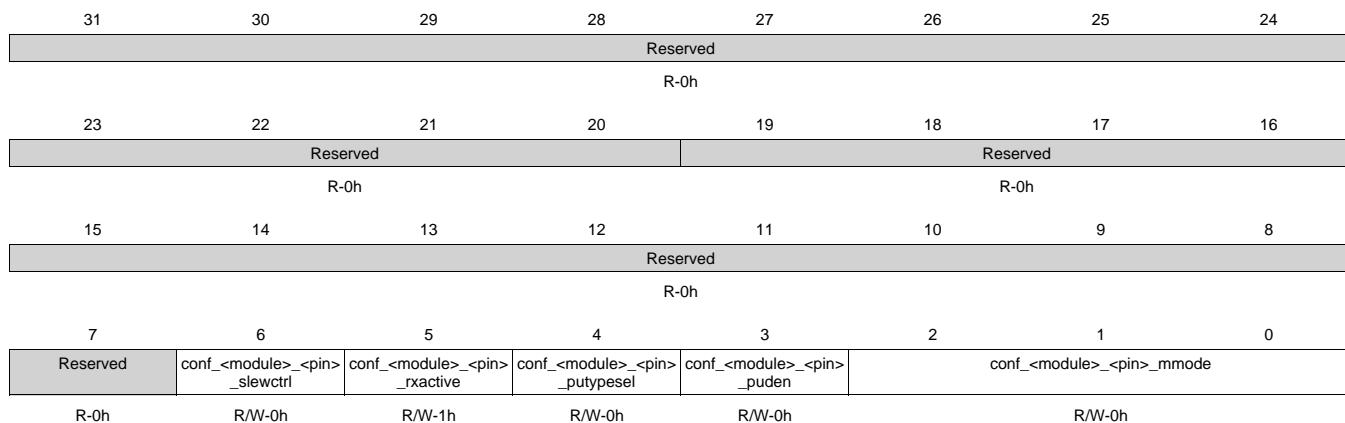

### 9.3.50 conf\_<module>\_<pin> Register (offset = 800h–A34h)

See the device datasheet for information on default pin mux configurations. Note that the device ROM may change the default pin mux for certain pins based on the SYSBOOT mode settings.

See [Table 9-10, Control Module Registers Table](#), for the full list of offsets for each module/pin configuration.

conf\_<module>\_<pin> is shown in [Figure 9-53](#) and described in [Table 9-60](#).

**Figure 9-53. conf\_<module>\_<pin> Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-60. conf\_<module>\_<pin> Register Field Descriptions**

| Bit   | Field                         | Type | Reset | Description  |

### 9.3.71 timer\_evt\_capt Register (offset = FD0h) [reset = 0h]

timer\_evt\_capt is shown in Figure 9-74 and described in Table 9-81.

**Figure 9-74. timer\_evt\_capt Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

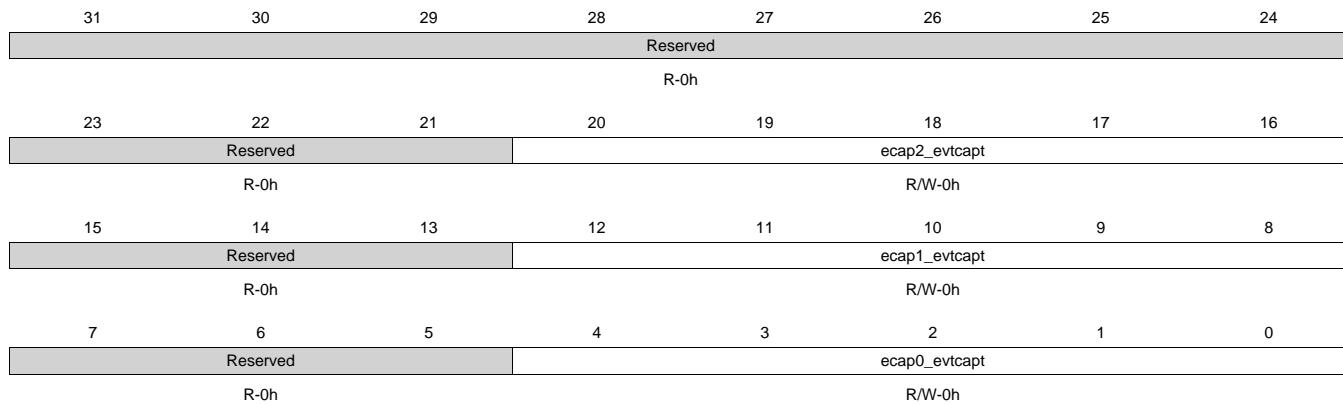

**Table 9-81. timer\_evt\_capt Register Field Descriptions**

| Bit   | Field          | Type | Reset | Description               |
|-------|----------------|------|-------|---------------------------|
| 31-21 | Reserved       | R    | 0h    |                           |
| 20-16 | timer7_evtcapt | R/W  | 0h    | Timer 7 event capture mux |
| 15-13 | Reserved       | R    | 0h    |                           |
| 12-8  | timer6_evtcapt | R/W  | 0h    | Timer 6 event capture mux |
| 7-5   | Reserved       | R    | 0h    |                           |
| 4-0   | timer5_evtcapt | R/W  | 0h    | Timer 5 event capture mux |

### 9.3.72 ecap\_evt\_capt Register (offset = FD4h) [reset = 0h]

ecap\_evt\_capt is shown in Figure 9-75 and described in Table 9-82.

**Figure 9-75. ecap\_evt\_capt Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

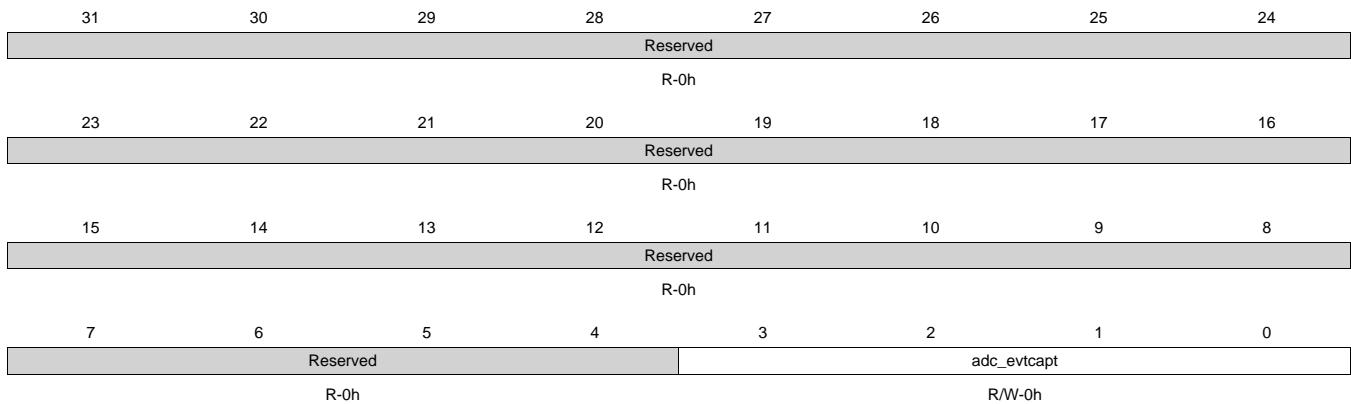

**Table 9-82. ecap\_evt\_capt Register Field Descriptions**

| Bit   | Field         | Type | Reset | Description             |
|-------|---------------|------|-------|-------------------------|
| 31-21 | Reserved      | R    | 0h    |                         |
| 20-16 | ecap2_evtcapt | R/W  | 0h    | ECAP2 event capture mux |
| 15-13 | Reserved      | R    | 0h    |                         |
| 12-8  | ecap1_evtcapt | R/W  | 0h    | ECAP1 event capture mux |
| 7-5   | Reserved      | R    | 0h    |                         |
| 4-0   | ecap0_evtcapt | R/W  | 0h    | ECAP0 event capture mux |

### 9.3.73 adc\_evt\_capt Register (offset = FD8h) [reset = 0h]

adc\_evt\_capt is shown in Figure 9-76 and described in Table 9-83.

**Figure 9-76. adc\_evt\_capt Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

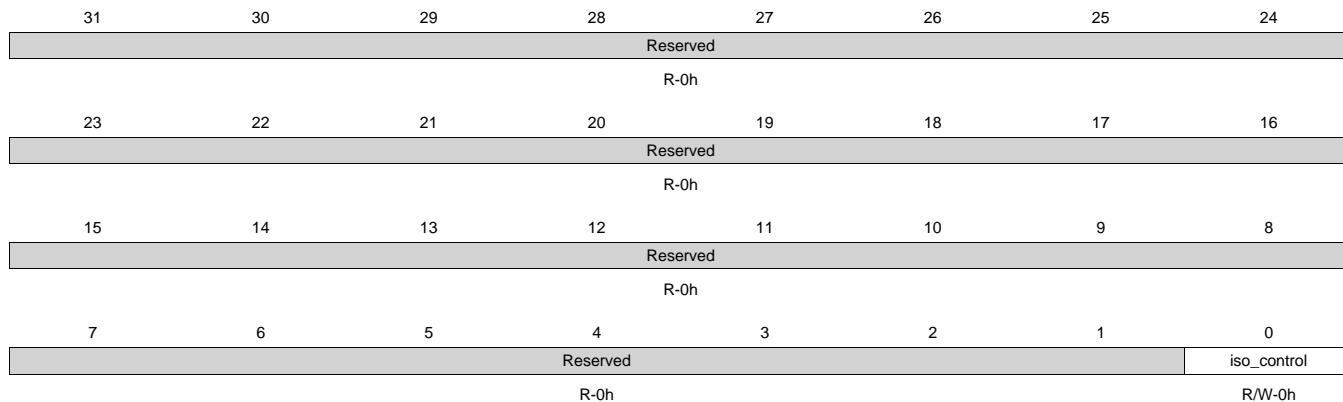

**Table 9-83. adc\_evt\_capt Register Field Descriptions**

| Bit  | Field       | Type | Reset | Description             |
|------|-------------|------|-------|-------------------------|
| 31-4 | Reserved    | R    | 0h    |                         |
| 3-0  | adc_evtcapt | R/W  | 0h    | ECAP0 event capture mux |

### **9.3.74 reset\_iso Register (offset = 1000h) [reset = 0h]**

reset\_iso is shown in [Figure 9-77](#) and described in [Table 9-84](#).

**Figure 9-77. reset\_iso Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

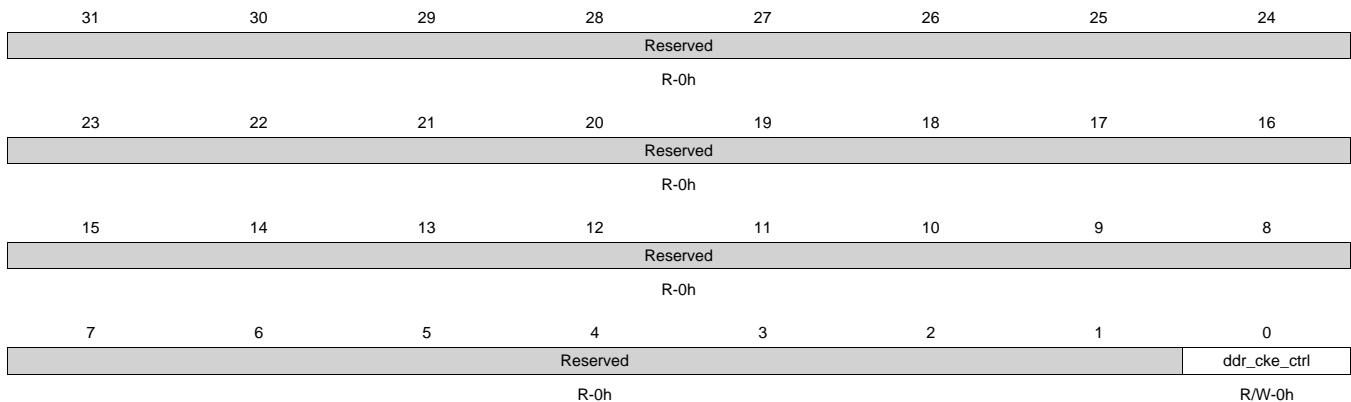

**Table 9-84. reset\_iso Register Field Descriptions**

| Bit  | Field       | Type | Reset | Description  |
|------|-------------|------|-------|--|
| 31-1 | Reserved    | R    | 0h    |  |
| 0    | iso_control | R/W  | 0h    | 0 : Ethernet Switch is not isolated<br>1 : Ethernet Switch is isolated |

### 9.3.75 ddr\_cke\_ctrl Register (offset = 131Ch) [reset = 0h]

ddr\_cke\_ctrl is shown in [Figure 9-78](#) and described in [Table 9-85](#).

**Figure 9-78. ddr\_cke\_ctrl Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

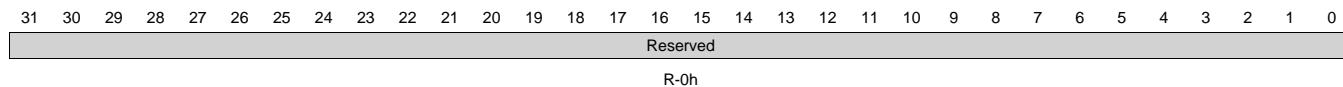

**Table 9-85. ddr\_cke\_ctrl Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-1 | Reserved     | R    | 0h    |   |
| 0    | ddr_cke_ctrl | R/W  | 0h    | CKE from EMIF/DDDRPHY is ANDed with this bit.<br>0: CKE to memories gated off to zero. External DRAM memories will not able to register DDR commands from device<br>1: Normal operation. CKE is now controlled by EMIF/DDR PHY. |

### **9.3.76 sma2 Register (offset = 1320h) [reset = 0h]**

sma2 is shown in [Figure 9-79](#) and described in [Table 9-86](#).

**Figure 9-79. sma2 Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

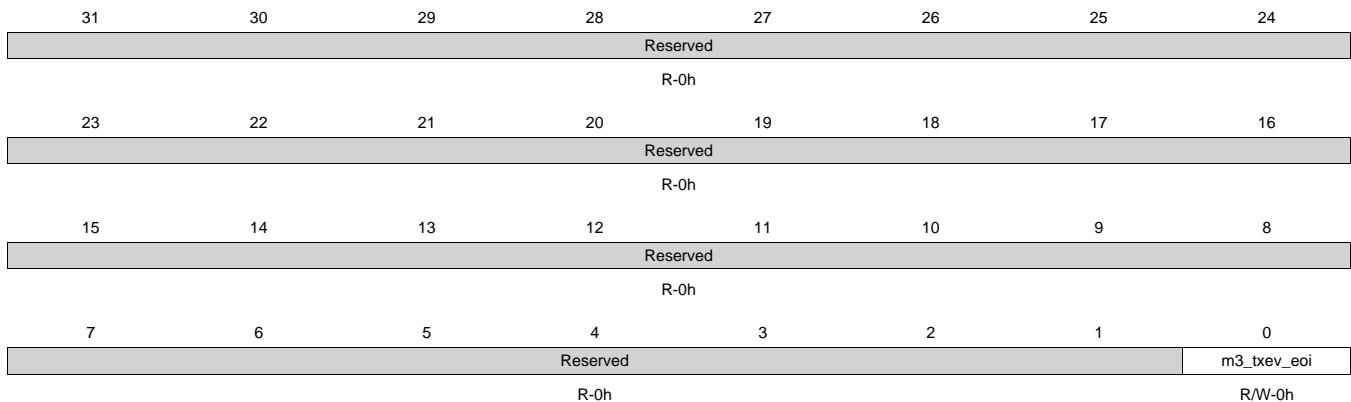

**Table 9-86. sma2 Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description |
|------|----------|------|-------|-------------|
| 31-0 | Reserved | R    | 0h    |             |

### 9.3.77 m3\_txev\_eoi Register (offset = 1324h) [reset = 0h]

m3\_txev\_eoi is shown in [Figure 9-80](#) and described in [Table 9-87](#).

**Figure 9-80. m3\_txev\_eoi Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 9-87. m3\_txev\_eoi Register Field Descriptions**

| Bit  | Field       | Type | Reset | Description  |
|------|-------------|------|-------|--|
| 31-1 | Reserved    | R    | 0h    |  |
| 0    | m3_txev_eoi | R/W  | 0h    | <p>TXEV (Event) from M3 processor is a pulse signal connected as interrupt to MPU IRQ[78]. Since MPU expects level signals. The TXEV pulse from M3 is converted to a level in glue logic. The logic works as follows:</p> <ul style="list-style-type: none"> <li>-On a 0-1 transition on TXEV, the IRQ[78] is set.</li> <li>-For clearing the interrupt, S/W must do the following:<br/>S/W must clear the IRQ[78] by writing a 1 to M3_TXEV_EOI bit in this register.<br/>This bit is sticky and for re-arming the IRQ[78], S/W must write a 0 to this field in the ISR.</li> </ul> |

### **9.3.78 ipc\_msg\_reg0 Register (offset = 1328h) [reset = 0h]**

ipc\_msg\_reg0 is shown in [Figure 9-81](#) and described in [Table 9-88](#). This register is typically used for messaging between Cortex A8 and CortexM3 (WKUP). The contents of this register is user defined.

**Figure 9-81. ipc\_msg\_reg0 Register**

| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

**Interconnects**

This chapter describes the interconnects of the device.

| Topic                          | Page       |
|--------------------------------|------------|
| <b>10.1 Introduction .....</b> | <b>858</b> |

## 10.1 Introduction

The system interconnect is based on a 2-level hierarchical architecture (L3, L4) driven by system performance. The L4 interconnect is based on a fully native OCP infrastructure, directly complying with the OCPIP2.2 reference standard.

### 10.1.1 Terminology

The following is a brief explanation of some terms used in this document:

**Initiator:** Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).

**Target:** Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers). **Note:** A module can have several separate ports; therefore, a module can be an initiator and a target.

**Agent:** Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).

**Interconnect:** The decoding, routing, and arbitration logic that enable the connection between multiple initiator modules and multiple target modules connected on it.

**Register Target (RT):** Special TA used to access the interconnect internal configuration registers.

**Data-flow Signal:** Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behavior is defined by the protocol semantics.

**Sideband Signal:** Any signal whose behavior is not associated to a precise transaction or data flow.

**Command Slot:** A command slot is a subset of the command list. It is the memory buffer for a single command. A total of 32 command slots exist.

**Out-of-band Error:** Any signal whose behavior is associated to a device error-reporting scheme, as opposed to in-band errors. Note: Interrupt requests and DMA requests are not routed by the interconnect in the device.

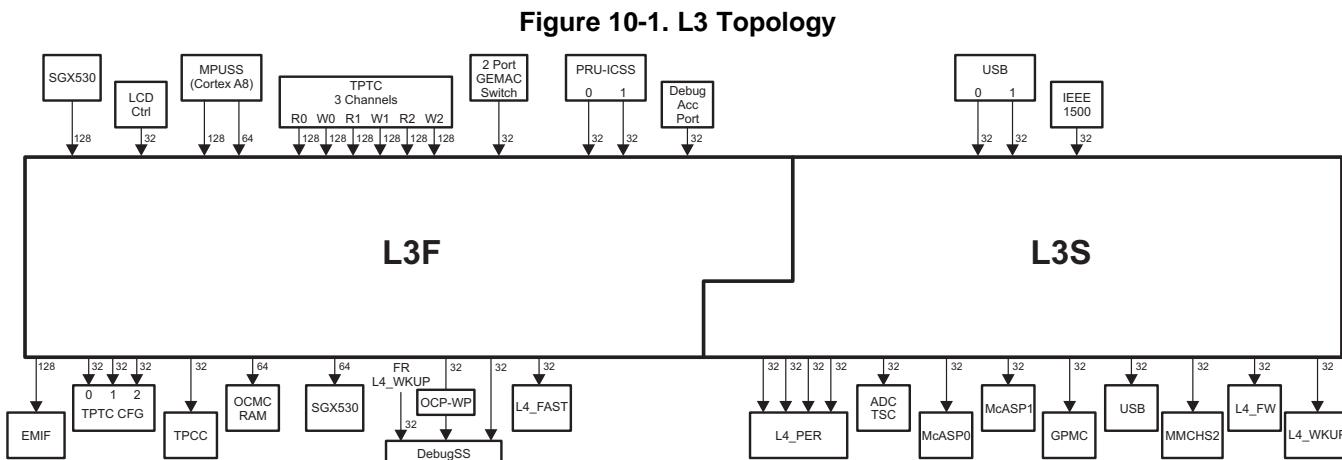

**ConnID:** Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for error-logging mechanism.

### 10.1.2 L3 Interconnect

The L3 high-performance interconnect is based on a Network-On-Chip (NoC) interconnect infrastructure. The NoC uses an internal packet-based protocol for forward (read command, write command with data payload) and backward (read response with data payload, write response) transactions. All exposed interfaces of this NoC interconnect, both for Targets and Initiators; comply with the OCPIP2.2 reference standard.

#### 10.1.2.1 L3 Topology

The L3 topology is driven by performance requirements, bus types, and clocking structure. The main L3 paths are shown in [Figure 10-1](#). Arrows indicate the master/slave relationship not data flow. L3 is partitioned into two separate clock domains: L3F corresponds to L3 Fast clock domain and L3S corresponds to L3 Slow clock domain.

### 10.1.2.2 L3 Port Mapping

Each initiator and target core is connected to the L3 interconnect through a Network Interface Unit (NIU). The NIUs act as entry and exit points to the L3 Network on Chip – converting between the IP's OCP protocol and the NoC's internal protocol, and also include various programming registers. All ports are single threaded with tags used to enable pipelined transactions. The interconnect includes:

#### Initiator Ports:

- L3F
  - Cortex A8 MPUSS 128-bit initiator port0 and 64-bit initiator port1
  - SGX530 128-bit initiator port
  - 3 TPTC 128-bit read initiator ports
  - 3 TPTC 128-bit write initiator ports
  - LCD 32-bit initiator port
  - 2 PRU-ICSS1 32-bit initiator ports
  - 2 port Gigabit Ethernet Switch (2PGSW) 32-bit initiator port
  - Debug Subsystem 32-bit initiator port
- L3S
  - USB 32-bit CPPI DMA initiator port
  - USB 32-bit Queue Manager initiator port
  - P1500 32-bit initiator port

#### Target Ports:

- L3F
  - EMIF 128-bit target port
  - 3 TPTC CFG 32-bit target ports
  - TPCC CFG 32-bit target port
  - OCM RAM0 64-bit target port
  - DebugSS 32-bit target port
  - SGX530 64-bit target port
  - L4\_FAST 32-bit target port
- L3S
  - 4 L4\_PER peripheral 32-bit target ports
  - GPMC 32-bit target port
  - McASP0 32-bit target port

- McASP1 32-bit target port
- ADC\_TSC 32-bit target port
- USB 32-bit target port
- MMHCS2 32-bit target port
- L4\_WKUP wakeup 32-bit target port

### 10.1.2.3 Interconnect Requirements

The required L3 connections between bus masters and slave ports are shown in [Table 10-1](#). The L3 interconnect will return an address-hole error if any initiator attempts to access a target to which it has no connection.

**Table 10-1. L3 Master — Slave Connectivity**

| Master ID | Masters            | Slaves           |                  |                  |             |                  |   |                  |             |                                 |  |  |  |                  |                             |                            |                            |                            |                  |                                 |  |   |   |   |  |

### 10.1.2.4 ConnID Assignment

Each L3 initiator includes a unique 6-bit master connection identifier (MConnID) that is used to identify the source of a transfer request. Since AM335x contains more than 16 unique masters some masters will appear identical to target firewalls.

**Table 10-2. MConnID Assignment**

| Initiator          | 6-bit MConnID (Debug) | Instrumentation | Comment               |
|--------------------|-----------------------|-----------------|-----------------------|
| MPUSS M1 (128-bit) | 0x00                  | 0               | Connects only to EMIF |
| MPUSS M2 (64-bit)  | 0x01                  | SW              |                       |

<sup>(1)</sup> These MConnIDs are generated within the OCP-WP module based on the H0, H1, and H2 configuration parameters.

---

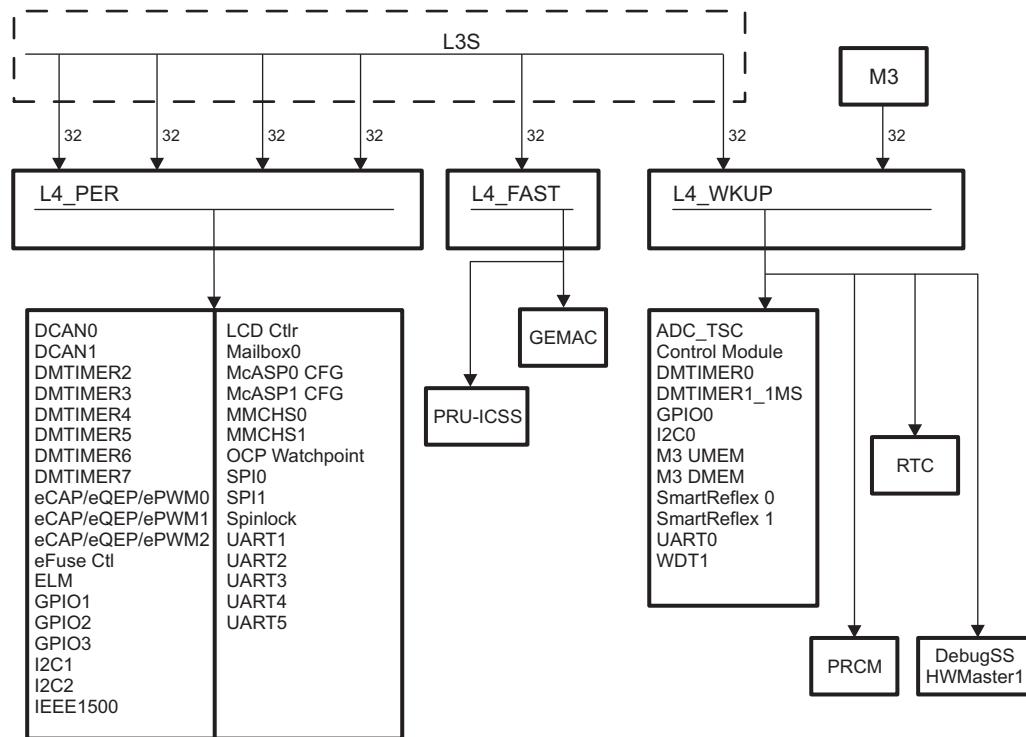

**NOTE:** Instrumentation refers to debug type. SW instrumentation means that the master can write data to be logged to the STM (similar to a printf()). HW indicates debug data captured automatically by hardware. A '0' entry indicates no debug capability.

---

### 10.1.3 L4 Interconnect

The L4 interconnect is a non-blocking peripheral interconnect that provides low latency access to a large number of low bandwidth, physically dispersed target cores. The L4 can handle incoming traffic from up to four initiators and can distribute those communication requests to and collect related responses from up to 63 targets.

AM335x provides three interfaces with L3 interconnect for High Speed Peripheral, Standard Peripheral, and Wakeup Peripherals. . [Figure 10-2](#) shows the L4 bus architecture and memory-mapped peripherals.

**Figure 10-2. L4 Topology**

## ***Enhanced Direct Memory Access (EDMA)***

This chapter describes the EDMA of the device.

## 11.1 Introduction

The enhanced direct memory access (EDMA3) controller's primary purpose is to service user-programmed data transfers between two memory-mapped slave endpoints on the device.

Typical usage includes, but is not limited to the following:

- Servicing software-driven paging transfers (e.g., transfers from external memory, such as DDR2 to internal device memory).
- Servicing event-driven peripherals, such as a serial port.
- Performing sorting or sub-frame extraction of various data structures.
- Offloading data transfers from the main device CPU(s).

The EDMA3 controller consists of two principal blocks:

- EDMA3 channel controller (EDMA3CC).
- EDMA3 transfer controller(s) (EDMA3TC).

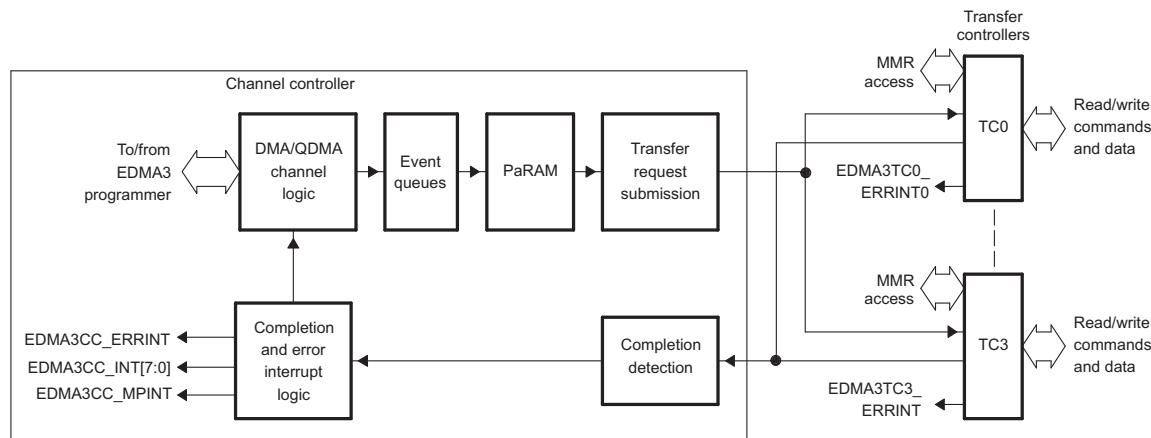

The EDMA3 channel controller serves as the user interface for the EDMA3 controller. The EDMA3CC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMA3CC serves to prioritize incoming software requests or events from peripherals and submits transfer requests (TRs) to the transfer controller.

The EDMA3 transfer controllers are slaves to the EDMA3 channel controller that is responsible for data movement. The transfer controller issues read/write commands to the source and destination addresses that are programmed for a given transfer. The operation is transparent to user.

### 11.1.1 EDMA3 Controller Block Diagram

Figure 11-1 shows a block diagram for the EDMA3 controller.

**Figure 11-1. EDMA3 Controller Block Diagram**

### 11.1.2 Third-Party Channel Controller (TPCC) Overview

#### 11.1.2.1 TPCC Features

The general features of the TPCC module are:

- Up to 64 DMA Channels
  - Channels triggered by:
    - Event Synchronization
    - Manual Synchronization (CPU write to 'Event Set Register')
    - Chain Synchronization (completion of one transfer chains to the next)
  - Parameterizable support for programmable DMA Channel to PaRAM mapping

- Up to 8 QDMA Channels
  - QDMA Channels are triggered automatically upon writing to PaRAM
  - Support for programmable QDMA Channel to PaRAM mapping
- Up to 64 Event Inputs
- Up to 8 Interrupt outputs for multi-core support
- Up to 256 PaRAM entries
  - Each PaRAM entry can be used as DMA Entry (up to 64), QDMA Entry (up to 8), or Link Entry (remaining)
- 8 Priority Levels for mapping CC/TC priority relative to priority of other masters in the system.
- Up to 8 Event Queues
- 16 Event Entries per Event Queue
- Supports three-transfer dimensions
  - A-synchronized transfers—one dimension serviced per event
  - AB-synchronized transfers—two dimensions serviced per event
  - Independent Indexes on Source and Destination
  - Does not support direct submission of 3D transfer to TC
  - Chaining feature allows 3D transfer based on single event
- Increment and FIFO transfer addressing modes (TC feature)
- Linking mechanism allows automatic PaRAM Entry update
- Transfer Completion Signaling between TC and CC for Chaining and Interrupt generation.
- Programmable assignment of Priority to TC channel.
- Proxied Memory Protection for TR submission
- Parameterizable support for Active Memory Protection for accesses to PaRAM and registers.
- Queue Watermarking
- Missed Event Detection
- Error and status recording to facilitate debug
- Single Clock domain for all interfaces
- Parameterizable number of Write Completion interfaces (up to 8) (set to number of TC Channels)
- AET Event generation

### 11.1.2.2 Unsupported TPCC Features

This device does not support AET event generation because output is not connected.

### 11.1.3 Third-Party Transfer Controller (TPTC) Overview

#### 11.1.3.1 TPTC Features

The TPTC module includes the following features:

- Up to eight independent channels
- External event control use model (TPCC)
- Read and Write Master ports per Channel 64- or 128-bit configuration.
- Parameterizable FIFO size
- Up to four in-flight Transfer Requests
- Proxied Memory protection for data transfers
- Programmable Priority levels (up to 8)
- Background programmation capability
- Supports 2-dimensional transfers with independent indexes on Source and Destination.

- Support for increment or FIFO-mode transfers
- Interrupt and error support
- Single clock domain for all interfaces

#### 11.1.3.2 Unsupported TPTC Features

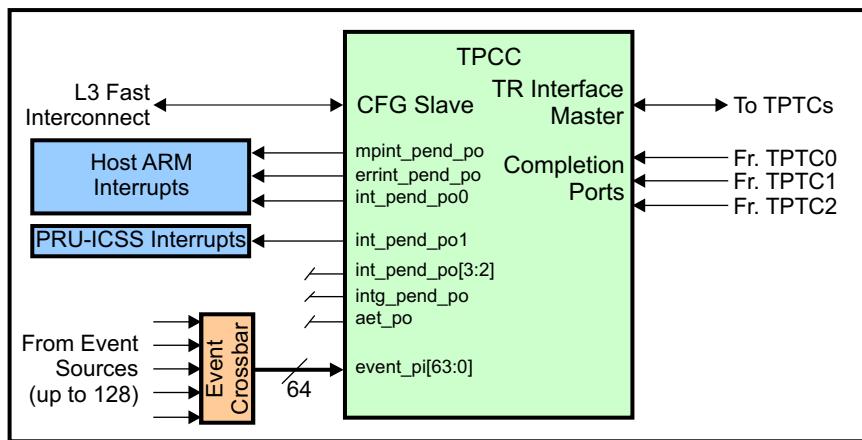

There are no unsupported TPTC features on this device.

## 11.2 Integration

### 11.2.1 Third-Party Channel Controller (TPCC) Integration

This device uses the TPCC peripheral to provide control over its third-party transfer channels (TPTCs). Figure 11-2 shows the integration of the TPCC module.

**Figure 11-2. TPCC Integration**

#### 11.2.1.1 TPCC Connectivity Attributes

The general connectivity attributes of the TPCC are summarized in Table 11-1.

**Table 11-1. TPCC Connectivity Attributes**

| Attributes          | Type  |
|---------------------|---|
| Power domain        | Peripheral Domain   |
| Clock domain        | PD_PER_L3_GCLK  |
| Reset signals       | PER_DOM_RST_N   |
| Idle/Wakeup signals | Smart Idle  |
| Interrupt request   | 4 Regional Completion Interrupts:<br>int_pend_po0 (EDMACOMPINT) – to MPU Subsystem<br>int_pend_po1 (tpcc_int_pend_po1) – to PRU-ICSS<br>Int_pend_po[3:2] - unused<br>Error Interrupt:<br>errint_po (EDMAERRINT) – to MPU Subsystem<br>Memory Protection Error Interrupt:<br>mpint_po (EDMAMPERR) – to MPU Subsystem |
| DMA request         | none  |
| Physical address    | L3 Fast slave port  |

#### 11.2.1.2 TPCC Clock and Reset Management

The TPCC operates from a single clock and runs at the L3\_Fast clock rate.

**Table 11-2. TPCC Clock Signals**

| Clock Signal                                | Max Freq | Reference / Source | Comments                    |
|---|----------|--------------------|-----------------------------|
| tpcc_clk_pi<br>Interface / Functional clock | 200 MHz  | CORE_CLKOUTM4      | pd_per_l3_gclk<br>From PRCM |

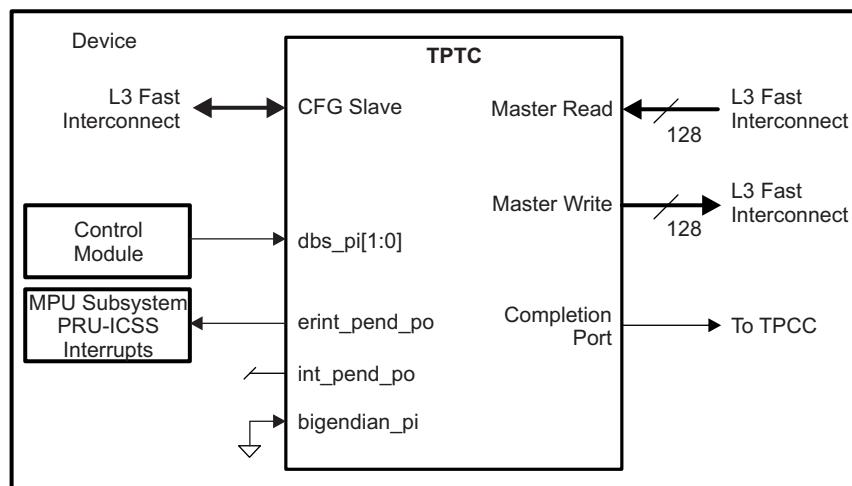

### 11.2.1.3 TPCC Pin List

The TPCC module does not include any external interface pins.

### 11.2.2 Third-Party Transfer Controller (TPTC) Integration

This device uses the three TPTC peripherals (TC0–TC2; TC3 is not supported) to perform EDMA transfers between slave peripherals. The submission of transfer requests to the TPTCs is controlled by the TPCC. [Figure 11-3](#) shows the integration of the TPTC modules

**Figure 11-3. TPTC Integration**

#### 11.2.2.1 TPTC Connectivity Attributes

The general connectivity attributes for the TPTCs are shown in [Table 11-3](#).

**Table 11-3. TPTC Connectivity Attributes**

| Attributes          | Type   |
|---------------------|--|
| Power domain        | Peripheral Domain  |
| Clock domain        | PD_PER_L3_GCLK   |
| Reset signals       | PER_DOM_RST_N  |
| Idle/Wakeup signals | Standby (2 ports)<br>Smart Idle  |
| Interrupt request   | Error interrupt per instance<br>erint_pend_po (TCERRINTx) – to MPU Subsystem and PRU-ICSS (tptc_erint_pend_po, TPTC0 only) |
| DMA request         | none   |
| Physical address    | L3 Fast slave port   |

#### 11.2.2.2 TPTC Clock and Reset Management

The TPTC operates from a single clock and runs at the L3\_Fast clock rate.

**Table 11-4. TPTC Clock Signals**

| Clock Signal                                | Max Freq | Reference / Source | Comments                    |
|---|----------|--------------------|-----------------------------|
| tptc_clk_pi<br>Interface / Functional clock | 200 MHz  | CORE_CLKOUTM4      | pd_per_l3_gclk<br>From PRCM |

### 11.2.2.3 TPTC Pin List

The TPTC module does not include any external interface pins.

## 11.3 Functional Description

This chapter discusses the architecture of the EDMA3 controller.

### 11.3.1 Functional Overview

#### 11.3.1.1 EDMA3 Channel Controller (EDMA3CC)

Figure 11-4 shows a functional block diagram of the EDMA3 channel controller (EDMA3CC).

The main blocks of the EDMA3CC are as follows:

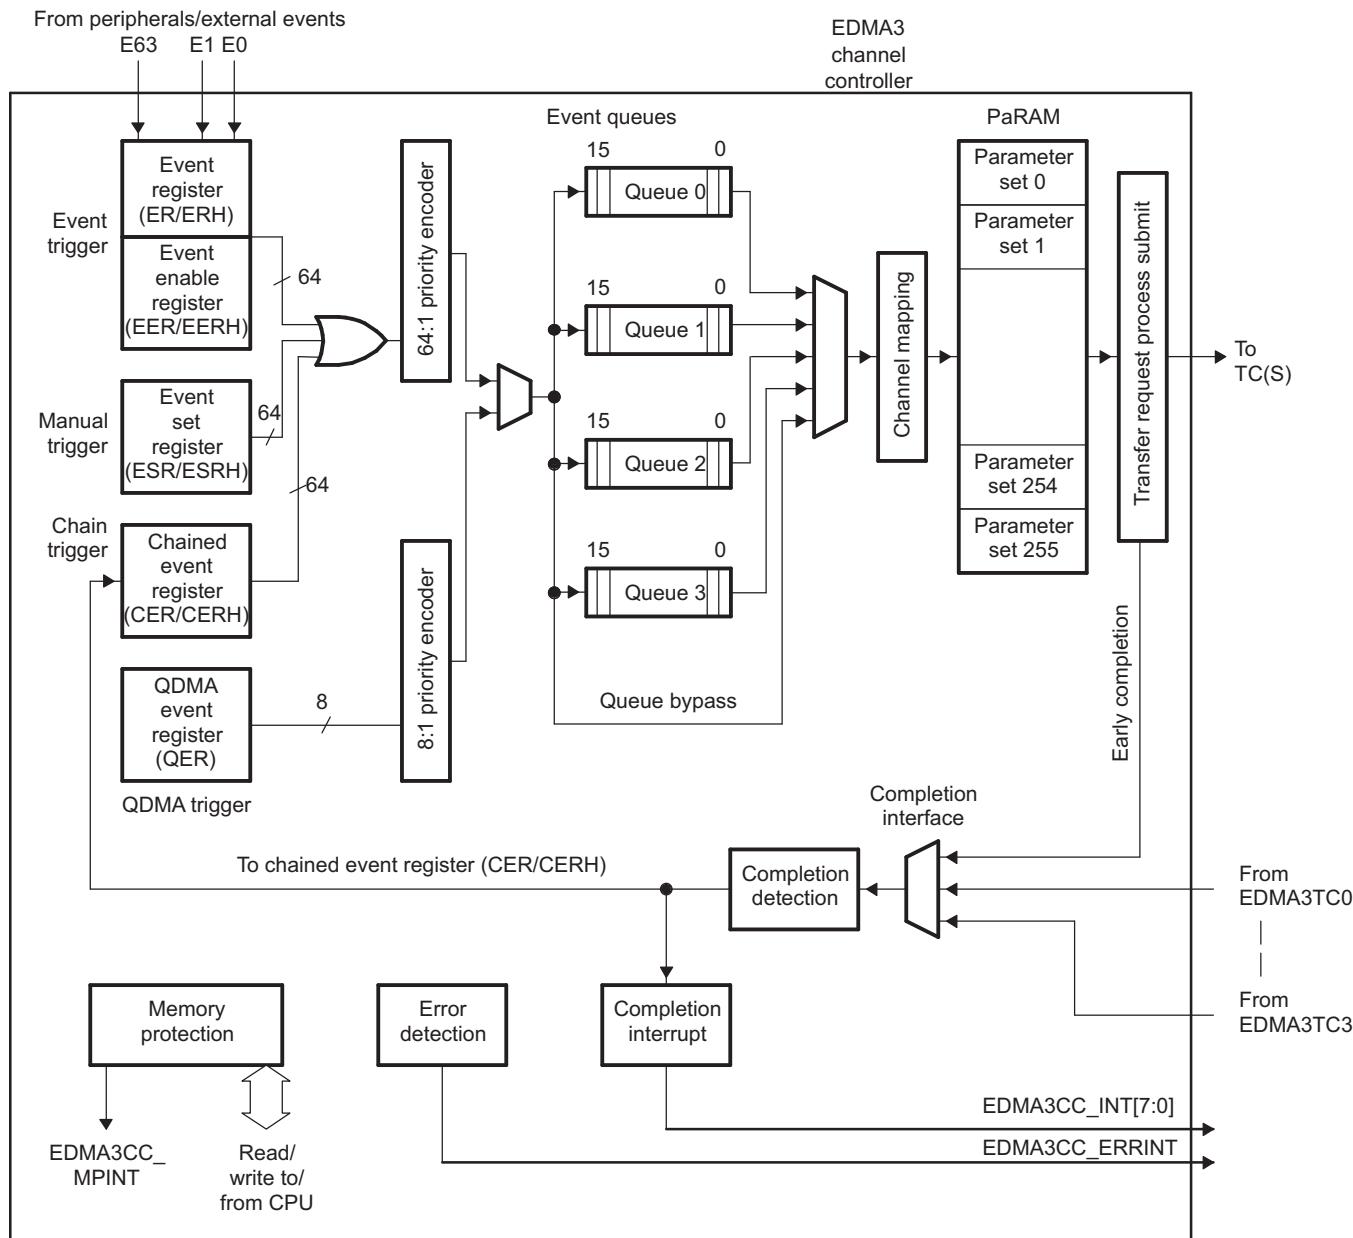

- Parameter RAM (PaRAM): The PaRAM maintains parameter sets for channel and reload parameter sets. You must write the PaRAM with the transfer context for the desired channels and link parameter sets. EDMA3CC processes sets based on a trigger event and submits a transfer request (TR) to the transfer controller.
- EDMA3 event and interrupt processing registers: Allows mapping of events to parameter sets, enable/disable events, enable/disable interrupt conditions, and clearing interrupts.
- Completion detection: The completion detect block detects completion of transfers by the EDMA3TC and/or slave peripherals. You can optionally use completion of transfers to chain trigger new transfers or to assert interrupts.
- Event queues: Event queues form the interface between the event detection logic and the transfer request submission logic.
- Memory protection registers: Memory protection registers define the accesses (privilege level and requestor(s)) that are allowed to access the DMA channel shadow region view(s) and regions of PaRAM.

Other functions include the following:

- Region registers: Region registers allow DMA resources (DMA channels and interrupts) to be assigned to unique regions that different EDMA3 programmers own (for example, ARM).
- Debug registers: Debug registers allow debug visibility by providing registers to read the queue status, controller status, and missed event status.

The EDMA3CC includes two channel types: DMA channels (64 channels) and QDMA channels (8 channels).

Each channel is associated with a given event queue/transfer controller and with a given PaRAM set. The main thing that differentiates a DMA channel from a QDMA channel is the method that the system uses to trigger transfers. See [Section 11.3.4](#).

**Figure 11-4. EDMA3 Channel Controller (EDMA3CC) Block Diagram**

A trigger event is needed to initiate a transfer. A trigger event may be due to an external event, manual write to the event set register, or chained event for DMA channels. QDMA channels auto-trigger when a write to the trigger word that you program occurs on the associated PaRAM set. All such trigger events are logged into appropriate registers upon recognition.

Once a trigger event is recognized, the appropriate event gets queued in the EDMA3CC event queue. The assignment of each DMA/QDMA channel to an event queue is programmable. Each queue is 16 events deep; therefore, you can queue up to 16 events (on a single queue) in the EDMA3CC at a time. Additional pending events that are mapped to a full queue are queued when the event queue space becomes available. See [Section 11.3.11](#).

If events on different channels are detected simultaneously, the events are queued based on a fixed priority arbitration scheme with the DMA channels being higher priority events than the QDMA channels. Among the two groups of channels, the lowest-numbered channel is the highest priority.

Each event in the event queue is processed in FIFO order. When the head of the queue is reached, the PaRAM associated with that channel is read to determine the transfer details. The TR submission logic evaluates the validity of the TR and is responsible for submitting a valid transfer request (TR) to the appropriate EDMA3TC (based on the event queue to the EDMA3TC association, Q0 goes to TC0 , Q1 goes to TC1, Q2 goes to TC2, and Q3 goes to TC3). For more information, refer to [Section 11.3.3](#).

The EDMA3TC receives the request and is responsible for data movement, as specified in the transfer request packet (TRP), other necessary tasks like buffering, and ensuring transfers are carried out in an optimal fashion wherever possible. For more information on EDMA3TC, refer to [Section 11.3.1.2](#).

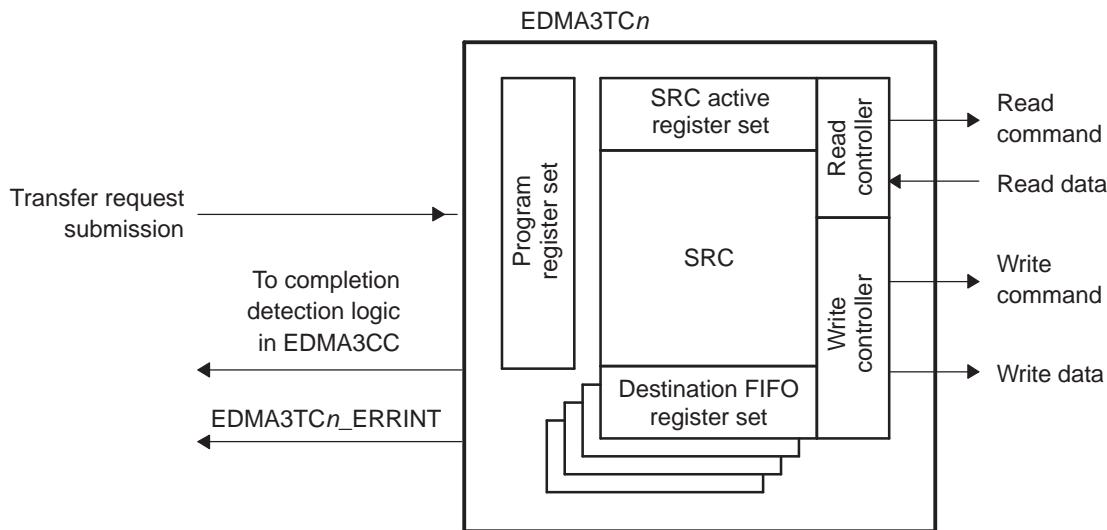

If you have decided to receive an interrupt or to chain to another channel on completion of the current transfer, the EDMA3TC signals completion to the EDMA3CC completion detection logic when the transfer is complete. You can alternately choose to trigger completion when a TR leaves the EDMA3CC boundary, rather than wait for all of the data transfers to complete. Based on the setting of the EDMA3CC interrupt registers, the completion interrupt generation logic is responsible for generating EDMA3CC completion interrupts to the CPU. For more information, refer to [Section 11.3.5](#).

Additionally, the EDMA3CC also has an error detection logic that causes an error interrupt generation on various error conditions (like missed events, exceeding event queue thresholds, etc.). For more information on error interrupts, refer to [Section 11.3.9.4](#).

### 11.3.1.2 EDMA3 Transfer Controller (EDMA3TC)

[Section 11.3.9.4](#) shows a functional block diagram of the EDMA3 transfer controller (EDMA3TC).

**Figure 11-5. EDMA3 Transfer Controller (EDMA3TC) Block Diagram**

The main blocks of the EDMA3TC are:

- DMA program register set: The DMA program register set stores the transfer requests received from the EDMA3 channel controller (EDMA3CC).
- DMA source active register set: The DMA source active register set stores the context for the DMA transfer request currently in progress in the read controller.
- Read controller: The read controller issues read commands to the source address.
- Destination FIFO register set: The destination (DST) FIFO register set stores the context for the DMA transfer request(s) currently in progress in the write controller.
- Write controller: The write controller issues write commands/write data to the destination slave.
- Data FIFO: The data FIFO exists for holding temporary in-flight data.
- Completion interface: The completion interface sends completion codes to the EDMA3CC when a transfer completes, and generates interrupts and chained events (also, see [Section 11.3.1.1](#) for more information on transfer completion reporting).

When the EDMA3TC is idle and receives its first TR, DMA program register set receives the TR, where it transitions to the DMA source active set and the destination FIFO register set immediately. The second TR (if pending from EDMA3CC) is loaded into the DMA program set, ensuring it can start as soon as possible when the active transfer completes. As soon as the current active set is exhausted, the TR is loaded from the DMA program register set into the DMA source active register set as well as to the appropriate entry in the destination FIFO register set.

The read controller issues read commands governed by the rules of command fragmentation and optimization. These are issued only when the data FIFO has space available for the data read. When sufficient data is in the data FIFO, the write controller starts issuing a write command again following the rules for command fragmentation and optimization. For more information on command fragmentation and optimization, refer to [Section 11.3.12.1.1](#).

Depending on the number of entries, the read controller can process up to two or four transfer requests ahead of the destination subject to the amount of free data FIFO.

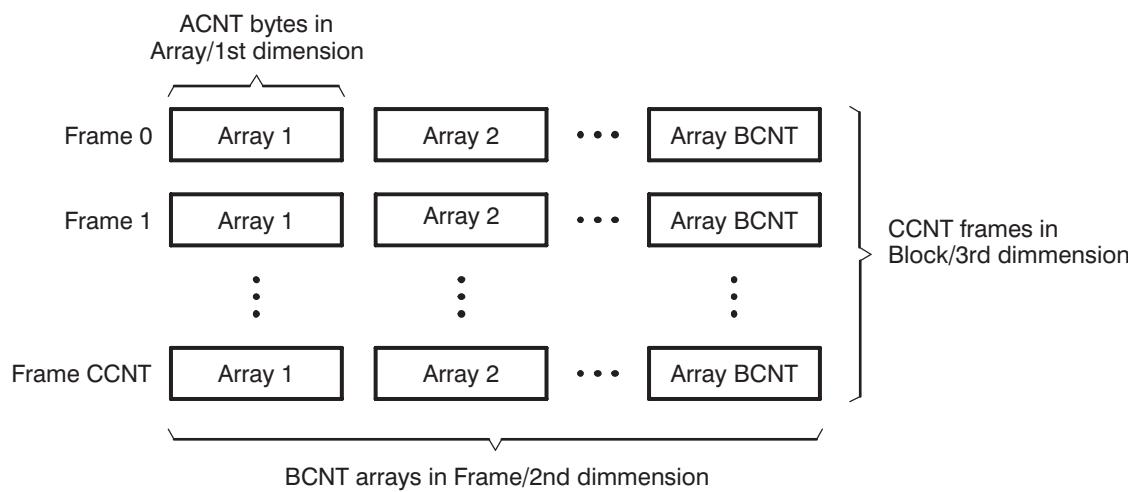

### 11.3.2 Types of EDMA3 Transfers

An EDMA3 transfer is always defined in terms of three dimensions. [Figure 11-6](#) shows the three dimensions used by EDMA3 transfers. These three dimensions are defined as:

- 1st Dimension or Array (A): The 1st dimension in a transfer consists of ACNT contiguous bytes.
- 2nd Dimension or Frame (B): The 2nd dimension in a transfer consists of BCNT arrays of ACNT bytes. Each array transfer in the 2nd dimension is separated from each other by an index programmed using SRCBIDX or DSTBIDX.
- 3rd Dimension or Block (C): The 3rd dimension in a transfer consists of CCNT frames of BCNT arrays of ACNT bytes. Each transfer in the 3rd dimension is separated from the previous by an index programmed using SRCCIDX or DSTCIDX.

Note that the reference point for the index depends on the synchronization type. The amount of data transferred upon receipt of a trigger/synchronization event is controlled by the synchronization types (SYNCDIM bit in OPT). Of the three dimensions, only two synchronization types are supported: A-synchronized transfers and AB-synchronized transfers.

**Figure 11-6. Definition of ACNT, BCNT, and CCNT**

### 11.3.2.1 A-Synchronized Transfers

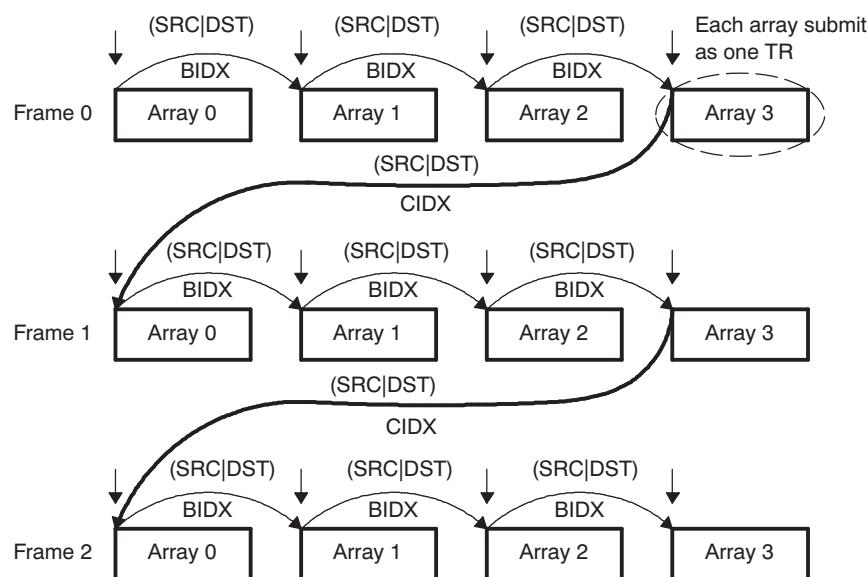

In an A-synchronized transfer, each EDMA3 sync event initiates the transfer of the 1st dimension of ACNT bytes, or one array of ACNT bytes. In other words, each event/TR packet conveys the transfer information for one array only. Thus, BCNT × CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by SRCBIDX and DSTBIDX, as shown in [Figure 11-7](#), where the start address of Array N is equal to the start address of Array N – 1 plus source (SRC) or destination (DST) BIDX.

Frames are always separated by SRCCIDX and DSTCIDX. For A-synchronized transfers, after the frame is exhausted, the address is updated by adding SRCCIDX/DSTCIDX to the beginning address of the last array in the frame. As in [Figure 11-7](#), SRCCIDX/DSTCIDX is the difference between the start of Frame 0 Array 3 to the start of Frame 1 Array 0.

[Figure 11-7](#) shows an A-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 12 sync events (BCNT × CCNT) exhaust a PaRAM set. See [Section 11.3.3.6](#) for details on parameter set updates.

**Figure 11-7. A-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)**

### 11.3.2.2 AB-Synchronized Transfers

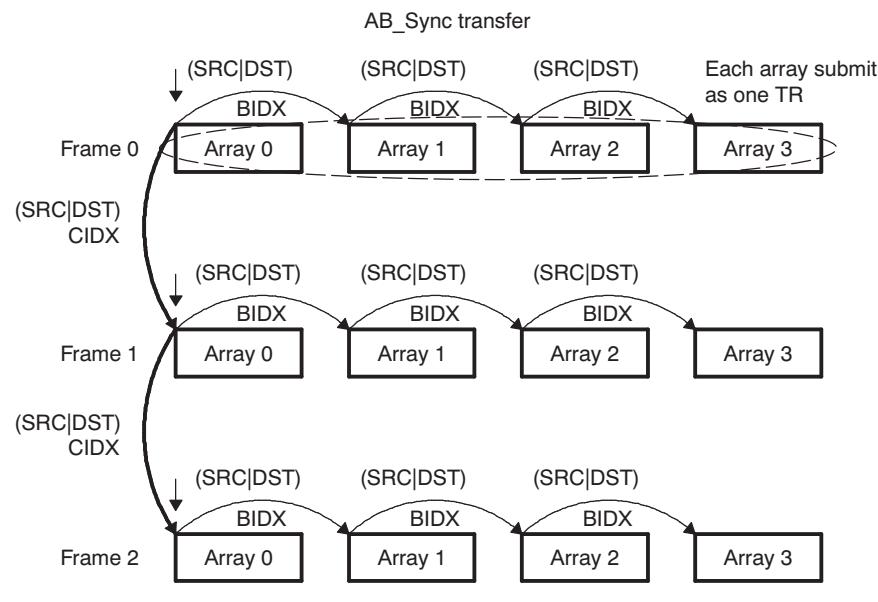

In a AB-synchronized transfer, each EDMA3 sync event initiates the transfer of 2 dimensions or one frame. In other words, each event/TR packet conveys information for one entire frame of BCNT arrays of ACNT bytes. Thus, CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by SRCBIDX and DSTBIDX as shown in [Figure 11-8](#). Frames are always separated by SRCCIDX and DSTCIDX.

Note that for AB-synchronized transfers, after a TR for the frame is submitted, the address update is to add SRCCIDX/DSTCIDX to the beginning address of the beginning array in the frame. This is different from A-synchronized transfers where the address is updated by adding SRCCIDX/DSTCIDX to the start address of the last array in the frame. See [Section 11.3.3.6](#) for details on parameter set updates.

[Figure 11-8](#) shows an AB-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of  $n$  (ACNT) bytes. In this example, a total of 3 sync events (CCNT) exhaust a PaRAM set; that is, a total of 3 transfers of 4 arrays each completes the transfer.

**Figure 11-8. AB-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)**

**NOTE:** ABC-synchronized transfers are not directly supported. But can be logically achieved by chaining between multiple AB-synchronized transfers.

### 11.3.3 Parameter RAM (PaRAM)

The EDMA3 controller is a RAM-based architecture. The transfer context (source/destination addresses, count, indexes, etc.) for DMA or QDMA channels is programmed in a parameter RAM table within EDMA3CC, referred to as PaRAM. The PaRAM table is segmented into multiple PaRAM sets. Each PaRAM set includes eight four-byte PaRAM set entries (32-bytes total per PaRAM set), which includes typical DMA transfer parameters such as source address, destination address, transfer counts, indexes, options, etc.

The PaRAM structure supports flexible ping-pong, circular buffering, channel chaining, and auto-reloading (linking).

The contents of the PaRAM include the following:

- 256 PaRAM sets
- 64 channels that are direct mapped and can be used as link or QDMA sets if not used for DMA channels
- 64 channels remain for link or QDMA sets

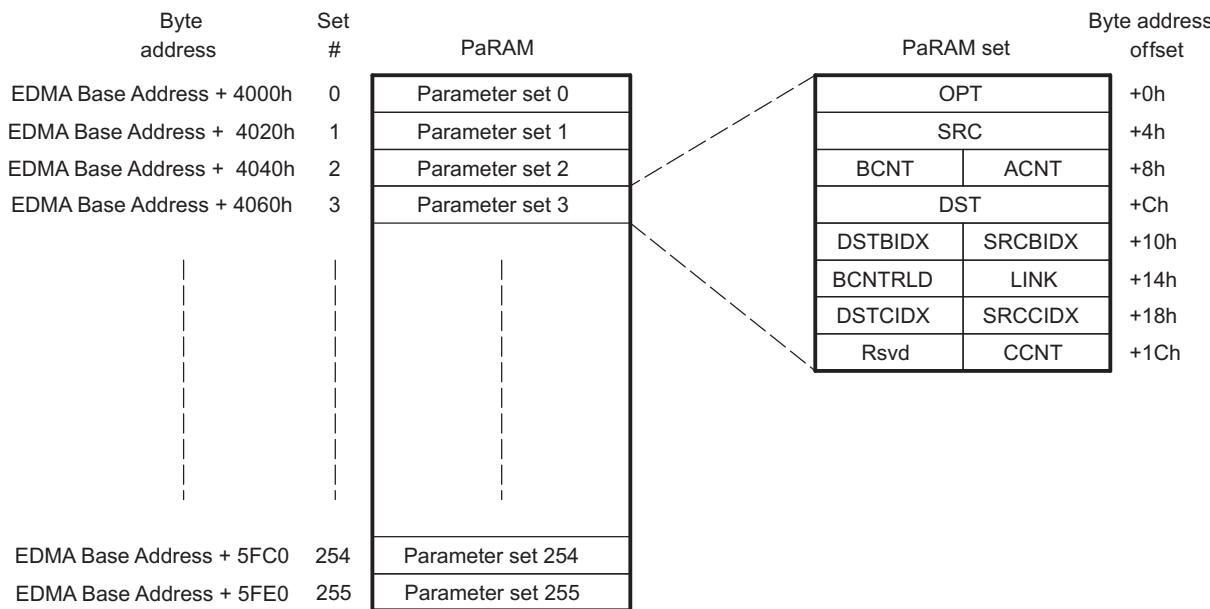

By default, all channels map to PaRAM set to 0. These should be remapped before use. For more information, see [Section 11.4.1.1.4](#) (DCHMAP registers) and [Section 11.4.1.1.5](#) (QCHMAP registers).

**Table 11-5. EDMA3 Parameter RAM Contents**

| PaRAM Set Number | Address  | Parameters    |
|------------------|--|---------------|
| 0                | EDMA Base Address + 4000h to EDMA Base Address + 401Fh | PaRAM set 0   |
| 1                | EDMA Base Address + 4020h to EDMA Base Address + 403Fh | PaRAM set 1   |
| 2                | EDMA Base Address + 4040h to EDMA Base Address + 405Fh | PaRAM set 2   |
| 3                | EDMA Base Address + 4060h to EDMA Base Address + 407Fh | PaRAM set 3   |
| 4                | EDMA Base Address + 4080h to EDMA Base Address + 409Fh | PaRAM set 4   |
| 5                | EDMA Base Address + 40A0h to EDMA Base Address + 40BFh | PaRAM set 5   |
| 6                | EDMA Base Address + 40C0h to EDMA Base Address + 40DFh | PaRAM set 6   |
| 7                | EDMA Base Address + 40E0h to EDMA Base Address + 40FFh | PaRAM set 7   |
| 8                | EDMA Base Address + 4100h to EDMA Base Address + 411Fh | PaRAM set 8   |
| 9                | EDMA Base Address + 4120h to EDMA Base Address + 413Fh | PaRAM set 9   |
| ...              | ...  | ...           |
| 63               | EDMA Base Address + 47E0h to EDMA Base Address + 47FFh | PaRAM set 63  |
| 64               | EDMA Base Address + 4800h to EDMA Base Address + 481Fh | PaRAM set 64  |
| 65               | EDMA Base Address + 4820h to EDMA Base Address + 483Fh | PaRAM set 65  |
| ...              | ...  | ...           |
| 254              | EDMA Base Address + 5FC0h to EDMA Base Address + 5FDKh | PaRAM set 254 |
| 255              | EDMA Base Address + 5FE0h to EDMA Base Address + 5FFFh | PaRAM set 255 |

### 11.3.3.1 PaRAM

Each parameter set of PaRAM is organized into eight 32-bit words or 32 bytes, as shown in [Figure 11-9](#) and described in [Table 11-6](#). Each PaRAM set consists of 16-bit and 32-bit parameters.

**Figure 11-9. PaRAM Set**

**Table 11-6. EDMA3 Channel Parameter Description**

| Offset Address<br>(bytes) | Acronym | Parameter                   | Description  |
|---------------------------|---------|-----------------------------|--|
| 0h                        | OPT     | Channel Options             | Transfer configuration options   |
| 4h                        | SRC     | Channel Source Address      | The byte address from which data is transferred  |
| 8h <sup>(1)</sup>         | ACNT    | Count for 1st Dimension     | Unsigned value specifying the number of contiguous bytes within an array (first dimension of the transfer). Valid values range from 1 to 65 535.   |
|                           | BCNT    | Count for 2nd Dimension     | Unsigned value specifying the number of arrays in a frame, where an array is ACNT bytes. Valid values range from 1 to 65 535.  |
| Ch                        | DST     | Channel Destination Address | The byte address to which data is transferred  |
| 10h <sup>(1)</sup>        | SRCBIDX | Source BCNT Index           | Signed value specifying the byte address offset between source arrays within a frame (2nd dimension). Valid values range from -32 768 and 32 767.  |
|                           | DSTBIDX | Destination BCNT Index      | Signed value specifying the byte address offset between destination arrays within a frame (2nd dimension). Valid values range from -32 768 and 32 767.   |
| 14h <sup>(1)</sup>        | LINK    | Link Address                | The PaRAM address containing the PaRAM set to be linked (copied from) when the current PaRAM set is exhausted. A value of FFFFh specifies a null link.   |
|                           | BCNTRLD | BCNT Reload                 | The count value used to reload BCNT when BCNT decrements to 0 (TR is submitted for the last array in 2nd dimension). Only relevant in A-synchronized transfers.  |
| 18h <sup>(1)</sup>        | SRCCIDX | Source CCNT Index           | Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from -32 768 and 32 767.<br><br>A-synchronized transfers: The byte address offset from the beginning of the last source array in a frame to the beginning of the first source array in the next frame.<br><br>AB-synchronized transfers: The byte address offset from the beginning of the first source array in a frame to the beginning of the first source array in the next frame.                     |
|                           | DSTCIDX | Destination CCNT index      | Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from -32 768 and 32 767.<br><br>A-synchronized transfers: The byte address offset from the beginning of the last destination array in a frame to the beginning of the first destination array in the next frame.<br><br>AB-synchronized transfers: The byte address offset from the beginning of the first destination array in a frame to the beginning of the first destination array in the next frame. |
| 1Ch                       | CCNT    | Count for 3rd Dimension     | Unsigned value specifying the number of frames in a block, where a frame is BCNT arrays of ACNT bytes. Valid values range from 1 to 65 535.  |
|                           | RSVD    | Reserved                    | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |

<sup>(1)</sup> It is recommended to access the parameter set sets as 32-bit words whenever possible.

### 11.3.3.2 EDMA3 Channel PaRAM Set Entry Fields

#### 11.3.3.2.1 Channel Options Parameter (OPT)

The channel options parameter (OPT) is shown in [Figure 11-10](#) and described in [Table 11-7](#).

**Figure 11-10. Channel Options Parameter (OPT)**

| 31    | 30       | 28    | 27     | 24       | 23     | 22       | 21      | 20     | 19       | 18    | 17    | 16 |
|-------|----------|-------|--------|----------|--------|----------|---------|--------|----------|-------|-------|----|
| PRIV  | Reserved |       | PRIVID | ITCCHEN  | TCCHEN | ITCINTEN | TCINTEN |        | Reserved |       | TCC   |    |
| R-0   | R-0      |       | R-0    | R/W-0    | R/W-0  | R/W-0    | R/W-0   | R/W-0  | R/W-0    |       | R/W-0 |    |
| 15    | 12       | 11    | 10     | 8        | 7      |          |         | 4      | 3        | 2     | 1     | 0  |
| TCC   | TCCMOD E | FWID  |        | Reserved |        |          |         | STATIC | SYNCDIM  | DAM   | SAM   |    |
| R/W-0 | R/W-0    | R/W-0 |        | R/W-0    |        |          |         | R/W-0  | R/W-0    | R/W-0 | R/W-0 |    |

**Table 11-7. Channel Options Parameters (OPT) Field Descriptions**

| Bit   | Field    | Value | Description   |
|-------|----------|-------|---|
| 31    | PRIV     | 0     | Privilege level (supervisor versus user) for the host/CPU/DMA that programmed this PaRAM set. This value is set with the EDMA3 master's privilege value when any part of the PaRAM set is written.  |
|       |          | 1     | User level privilege.   |
|       |          | 1     | Supervisor level privilege.   |
| 30-28 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 27-24 | PRIVID   | 0-Fh  | Privilege identification for the external host/CPU/DMA that programmed this PaRAM set. This value is set with the EDMA3 master's privilege identification value when any part of the PaRAM set is written.  |
| 23    | ITCCHEN  | 0     | Intermediate transfer completion chaining enable.   |
|       |          | 1     | Intermediate transfer complete chaining is disabled.  |
|       |          | 1     | Intermediate transfer complete chaining is enabled.   |
|       |          |       | When enabled, the chained event register (CER/CERH) bit is set on every intermediate chained transfer completion (upon completion of every intermediate TR in the PaRAM set, except the final TR in the PaRAM set). The bit (position) set in CER or CERH is the TCC value specified.   |
| 22    | TCCHEN   | 0     | Transfer complete chaining enable.  |
|       |          | 1     | Transfer complete chaining is disabled.   |
|       |          | 1     | Transfer complete chaining is enabled.  |
|       |          |       | When enabled, the chained event register (CER/CERH) bit is set on final chained transfer completion (upon completion of the final TR in the PaRAM set). The bit (position) set in CER or CERH is the TCC value specified.   |
| 21    | ITCINTEN | 0     | Intermediate transfer completion interrupt enable.  |
|       |          | 1     | Intermediate transfer complete interrupt is disabled.   |
|       |          | 1     | Intermediate transfer complete interrupt is enabled.  |
|       |          |       | When enabled, the interrupt pending register (IPR / IPRH) bit is set on every intermediate transfer completion (upon completion of every intermediate TR in the PaRAM set, except the final TR in the PaRAM set). The bit (position) set in IPR or IPRH is the TCC value specified. To generate a completion interrupt to the CPU, the corresponding IER[TCC] / IERH [TCC] bit must be set. |
| 20    | TCINTEN  | 0     | Transfer complete interrupt enable.   |
|       |          | 1     | Transfer complete interrupt is disabled.  |
|       |          | 1     | Transfer complete interrupt is enabled.   |
|       |          |       | When enabled, the interrupt pending register (IPR / IPRH) bit is set on transfer completion (upon completion of the final TR in the PaRAM set). The bit (position) set in IPR or IPRH is the TCC value specified. To generate a completion interrupt to the CPU, the corresponding IER[TCC] / IERH [TCC] bit must be set.   |
| 19-18 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |

**Table 11-7. Channel Options Parameters (OPT) Field Descriptions (continued)**

| Bit   | Field    | Value  | Description  |
|-------|----------|--|--|
| 17-12 | TCC      | 0-3Fh  | Transfer complete code. This 6-bit code sets the relevant bit in the chaining enable register (CER [TCC] /CERH [TCC]) for chaining or in the interrupt pending register (IPR [TCC] / IPRH [TCC]) for interrupts.   |
| 11    | TCCMODE  | 0<br>1   | Transfer complete code mode. Indicates the point at which a transfer is considered completed for chaining and interrupt generation.<br>0 Normal completion: A transfer is considered completed after the data has been transferred.<br>1 Early completion: A transfer is considered completed after the EDMA3CC submits a TR to the EDMA3TC. TC may still be transferring data when the interrupt/chain is triggered.  |
| 10-8  | FWID     | 0-7h<br>0<br>1h<br>2h<br>3h<br>4h<br>5h<br>6h-7h | FIFO Width. Applies if either SAM or DAM is set to constant addressing mode.<br>0 FIFO width is 8-bit.<br>1h FIFO width is 16-bit.<br>2h FIFO width is 32-bit.<br>3h FIFO width is 64-bit.<br>4h FIFO width is 128-bit.<br>5h FIFO width is 256-bit.<br>Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.                        |
| 7-4   | Reserved | 0  | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 3     | STATIC   | 0<br>1   | Static set.<br>0 Set is not static. The PaRAM set is updated or linked after a TR is submitted. A value of 0 should be used for DMA channels and for non-final transfers in a linked list of QDMA transfers.<br>1 Set is static. The PaRAM set is not updated or linked after a TR is submitted. A value of 1 should be used for isolated QDMA transfers or for the final transfer in a linked list of QDMA transfers. |
| 2     | SYNCDIM  | 0<br>1   | Transfer synchronization dimension.<br>0 A-synchronized. Each event triggers the transfer of a single array of ACNT bytes.<br>1 AB-synchronized. Each event triggers the transfer of BCNT arrays of ACNT bytes.  |
| 1     | DAM      | 0<br>1   | Destination address mode.<br>0 Increment (INCR) mode. Destination addressing within an array increments. Destination is not a FIFO.<br>1 Constant addressing (CONST) mode. Destination addressing within an array wraps around upon reaching FIFO width.   |
| 0     | SAM      | 0<br>1   | Source address mode.<br>0 Increment (INCR) mode. Source addressing within an array increments. Source is not a FIFO.<br>1 Constant addressing (CONST) mode. Source addressing within an array wraps around upon reaching FIFO width.   |

### 11.3.3.2.2 Channel Source Address (SRC)

The 32-bit source address parameter specifies the starting byte address of the source. For SAM in increment mode, there are no alignment restrictions imposed by EDMA3. For SAM in constant addressing mode, you must program the source address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). The EDMA3TC will signal an error, if this rule is violated. See [Section 11.3.12.3](#) for additional details.

### 11.3.3.2.3 Channel Destination Address (DST)

The 32-bit destination address parameter specifies the starting byte address of the destination. For DAM in increment mode, there are no alignment restrictions imposed by EDMA3. For DAM in constant addressing mode, you must program the destination address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). The EDMA3TC will signal an error, if this rule is violated. See [Section 11.3.12.3](#) for additional details.

#### **11.3.3.2.4 Count for 1st Dimension (ACNT)**

ACNT represents the number of bytes within the 1st dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65 535. Therefore, the maximum number of bytes in an array is 65 535 bytes (64K – 1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to EDMA3TC. A transfer with ACNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in OPT.

See [Section 11.3.3.5](#) and [Section 11.3.5.3](#) for details on dummy/null completion conditions.

#### **11.3.3.2.5 Count for 2nd Dimension (BCNT)**
