BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT are between 1 and 65 535. Therefore, the maximum number of arrays in a frame is 65 535 (64K – 1 arrays). A transfer with BCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in OPT.

See [Section 11.3.3.5](#) and [Section 11.3.5.3](#) for details on dummy/null completion conditions.

#### **11.3.3.2.6 Count for 3rd Dimension (CCNT)**

CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT are between 1 and 65 535. Therefore, the maximum number of frames in a block is 65 535 (64K – 1 frames). A transfer with CCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in OPT.

A CCNT value of 0 is considered either a null or dummy transfer. See [Section 11.3.3.5](#) and [Section 11.3.5.3](#) for details on dummy/null completion conditions.

#### **11.3.3.2.7 BCNT Reload (BCNTRLD)**

BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-synchronized transfers. In this case, the EDMA3CC decrements the BCNT value by 1 on each TR submission. When BCNT reaches 0, the EDMA3CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value.

For AB-synchronized transfers, the EDMA3CC submits the BCNT in the TR and the EDMA3TC decrements BCNT appropriately. For AB-synchronized transfers, BCNTRLD is not used.

#### **11.3.3.2.8 Source B Index (SRCBIDX)**

SRCBIDX is a 16-bit signed value (2s complement) used for source address modification between each array in the 2nd dimension. Valid values for SRCBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-synchronized and AB-synchronized transfers. Some examples:

- SRCBIDX = 0000h (0): no address offset from the beginning of an array to the beginning of the next array. All arrays are fixed to the same beginning address.
- SRCBIDX = 0003h (+3): the address offset from the beginning of an array to the beginning of the next array in a frame is 3 bytes. For example, if the current array begins at address 1000h, the next array begins at 1003h.
- SRCBIDX = FFFFh (-1): the address offset from the beginning of an array to the beginning of the next array in a frame is –1 byte. For example, if the current array begins at address 5054h, the next array begins at 5053h.

#### **11.3.3.2.9 Destination B Index (DSTBIDX)**

DSTBIDX is a 16-bit signed value (2s complement) used for destination address modification between each array in the 2nd dimension. Valid values for DSTBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-synchronized and AB-synchronized transfers. See SRCBIDX for examples.

### 11.3.3.2.10 Source C Index (SRCCIDX)

SRCCIDX is a 16-bit signed value (2s complement) used for source address modification in the 3rd dimension. Valid values for SRCCIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-synchronized and AB-synchronized transfers. Note that when SRCCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 11-7), while the current array in an AB-synchronized transfer is the first array in the frame (Figure 11-8).

### 11.3.3.2.11 Destination C Index (DSTCIDX)

DSTCIDX is a 16-bit signed value (2s complement) used for destination address modification in the 3rd dimension. Valid values are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array TR in the next frame. It applies to both A-synchronized and AB-synchronized transfers. Note that when DSTCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 11-7), while the current array in a AB-synchronized transfer is the first array in the frame (Figure 11-8).

### 11.3.3.2.12 Link Address (LINK)

The EDMA3CC provides a mechanism, called linking, to reload the current PaRAM set upon its natural termination (that is, after the count fields are decremented to 0) with a new PaRAM set. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the EDMA3CC loads/reloads the next PaRAM set during linking.

You must program the link address to point to a valid aligned 32-byte PaRAM set. The 5 LSBs of the LINK field should be cleared to 0.

The EDMA3CC ignores the upper 2 bits of the LINK entry, allowing the programmer the flexibility of programming the link address as either an absolute/literal byte address or use the PaRAM-base-relative offset address. Therefore, if you make use of the literal address with a range from 4000h to 7FFFh, it will be treated as a PaRAM-base-relative value of 0000h to 3FFFh.

You should make sure to program the LINK field correctly, so that link update is requested from a PaRAM address that falls in the range of the available PaRAM addresses on the device.

A LINK value of FFFFh is referred to as a NULL link that should cause the EDMA3CC to perform an internal write of 0 to all entries of the current PaRAM set, except for the LINK field that is set to FFFFh. Also, see [Section 11.3.5](#) for details on terminating a transfer.

### 11.3.3.3 Null PaRAM Set

A null PaRAM set is defined as a PaRAM set where all count fields (ACNT, BCNT, and CCNT) are cleared to 0. If a PaRAM set associated with a channel is a NULL set, then when serviced by the EDMA3CC, the bit corresponding to the channel is set in the associated event missed register (EMR, EMRH, or QEMR). This bit remains set in the associated secondary event register (SER, SERH, or QSER). *This implies that any future events on the same channel are ignored by the EDMA3CC and you are required to clear the bit in SER, SERH, or QSER for the channel.* This is considered an error condition, since events are not expected on a channel that is configured as a null transfer. See [Section 11.4.1.6.8](#) and [Section 11.4.1.2.1](#) for more information on the SER and EMR registers, respectively.

### 11.3.3.4 Dummy PaRAM Set

A dummy PaRAM set is defined as a PaRAM set where at least one of the count fields (ACNT, BCNT, or CCNT) is cleared to 0 and at least one of the count fields is nonzero.

If a PaRAM set associated with a channel is a dummy set, then when serviced by the EDMA3CC, it will not set the bit corresponding to the channel (DMA/QDMA) in the event missed register (EMR, EMRH, or QEMR) and the secondary event register (SER, SERH, or QSER) bit gets cleared similar to a normal transfer. Future events on that channel are serviced. A dummy transfer is a legal transfer of 0 bytes. See [Section 11.4.1.6.8](#) and [Section 11.4.1.2.1](#) for more information on the SER and EMR registers, respectively.

### 11.3.3.5 Dummy Versus Null Transfer Comparison

There are some differences in the way the EDMA3CC logic treats a dummy versus a null transfer request. A null transfer request is an error condition, but a dummy transfer is a legal transfer of 0 bytes. A null transfer causes an error bit (*En*) in EMR to get set and the *En* bit in SER remains set, essentially preventing any further transfers on that channel without clearing the associated error registers.

[Table 11-8](#) summarizes the conditions and effects of null and dummy transfer requests.

**Table 11-8. Dummy and Null Transfer Request**

| Feature   | Null TR | Dummy TR |
|---|---------|----------|
| EMR/EMRH/QEMR is set                            | Yes     | No       |
| SER/SERH/QSER remains set                       | Yes     | No       |
| Link update (STATIC = 0 in OPT)                 | Yes     | Yes      |
| QER is set                                      | Yes     | Yes      |
| IPR/IPRH CER/CERH is set using early completion | Yes     | Yes      |

### 11.3.3.6 Parameter Set Updates

When a TR is submitted for a given DMA/QDMA channel and its corresponding PaRAM set, the EDMA3CC is responsible for updating the PaRAM set in anticipation of the next trigger event. For events that are not final, this includes address and count updates; for final events, this includes the link update.

The specific PaRAM set entries that are updated depend on the channel's synchronization type (A-synchronized or B-synchronized) and the current state of the PaRAM set. A B-update refers to the decrementing of BCNT in the case of A-synchronized transfers after the submission of successive TRs. A C-update refers to the decrementing of CCNT in the case of A-synchronized transfers after BCNT TRs for ACNT byte transfers have submitted. For AB-synchronized transfers, a C-update refers to the decrementing of CCNT after submission of every transfer request.

See [Table 11-9](#) for details and conditions on the parameter updates. A link update occurs when the PaRAM set is exhausted, as described in [Section 11.3.3.7](#).

After the TR is read from the PaRAM (and is in process of being submitted to EDMA3TC), the following fields are updated if needed:

- A-synchronized: BCNT, CCNT, SRC, DST.
- AB-synchronized: CCNT, SRC, DST.

The following fields are not updated (except for during linking, where all fields are overwritten by the link PaRAM set):

- A-synchronized: ACNT, BCNTRLD, SRCBIDX, DSTBIDX, SRCCIDX, DSTCIDX, OPT, LINK.
- AB-synchronized: ACNT, BCNT, BCNTRLD, SRCBIDX, DSTBIDX, SRCCIDX, DSTCIDX, OPT, LINK.

Note that PaRAM updates only pertain to the information that is needed to properly submit the next transfer request to the EDMA3TC. Updates that occur while data is moved within a transfer request are tracked within the transfer controller, and is detailed in [Section 11.3.12](#). For A-synchronized transfers, the EDMA3CC always submits a TRP for ACNT bytes (BCNT = 1 and CCNT = 1). For AB-synchronized transfers, the EDMA3CC always submits a TRP for ACNT bytes of BCNT arrays (CCNT = 1). The EDMA3TC is responsible for updating source and destination addresses within the array based on ACNT and FWID (in OPT). For AB-synchronized transfers, the EDMA3TC is also responsible to update source and destination addresses between arrays based on SRCBIDX and DSTBIDX.

[Table 11-9](#) shows the details of parameter updates that occur within EDMA3CC for A-synchronized and AB-synchronized transfers.

**Table 11-9. Parameter Updates in EDMA3CC (for Non-Null, Non-Dummy PaRAM Set)**

| Condition:         | A-Synchronized Transfer |                       |                        | AB-Synchronized Transfer |            |                |
|--------------------|-------------------------|-----------------------|------------------------|--------------------------|------------|----------------|
|                    | B-Update                | C-Update              | Link Update            | B-Update                 | C-Update   | Link Update    |
|                    | BCNT > 1                | BCNT == 1 && CCNT > 1 | BCNT == 1 && CCNT == 1 | N/A                      | CCNT > 1   | CCNT == 1      |
| SRC                | += SRCBIDX              | += SRCCIDX            | = Link.SRC             | in EDMA3TC               | += SRCCIDX | = Link.SRC     |
| DST                | += DSTBIDX              | += DSTCIDX            | = Link.DST             | in EDMA3TC               | += DSTCIDX | = Link.DST     |
| ACNT               | None                    | None                  | = Link.ACNT            | None                     | None       | = Link.ACNT    |
| BCNT               | -= 1                    | = BCNTRLD             | = Link.BCNT            | in EDMA3TC               | N/A        | = Link.BCNT    |
| CCNT               | None                    | -= 1                  | = Link.CCNT            | in EDMA3TC               | -=1        | = Link.CCNT    |
| SRCBIDX            | None                    | None                  | = Link.SRCBIDX         | in EDMA3TC               | None       | = Link.SRCBIDX |
| DSTBIDX            | None                    | None                  | = Link.DSTBIDX         | None                     | None       | = Link.DSTBIDX |
| SRCCIDX            | None                    | None                  | = Link.SRCCIDX         | in EDMA3TC               | None       | = Link.SRCCIDX |
| DSTCIDX            | None                    | None                  | = Link.DSTCIDX         | None                     | None       | = Link.DSTCIDX |
| LINK               | None                    | None                  | = Link.LINK            | None                     | None       | = Link.LINK    |
| BCNTRLD            | None                    | None                  | = Link.BCNTRLD         | None                     | None       | = Link.BCNTRLD |
| OPT <sup>(1)</sup> | None                    | None                  | = LINK.OPT             | None                     | None       | = LINK.OPT     |

<sup>(1)</sup> In all cases, no updates occur if OPT STATIC == 1 for the current PaRAM set.

---

**NOTE:** The EDMA3CC includes no special hardware to detect when an indexed address update calculation overflows/underflows. The address update will wrap across boundaries as programmed by the user. You should ensure that no transfer is allowed to cross internal port boundaries between peripherals. A single TR must target a single source/destination slave endpoint.

---

### 11.3.3.7 Linking Transfers

The EDMA3CC provides a mechanism known as linking, which allows the entire PaRAM set to be reloaded from a location within the PaRAM memory map (for both DMA and QDMA channels). Linking is especially useful for maintaining ping-pong buffers, circular buffering, and repetitive/continuous transfers with no CPU intervention. Upon completion of a transfer, the current transfer parameters are reloaded with the parameter set pointed to by the 16-bit link address field of the current parameter set. Linking only occurs when the STATIC bit in OPT is cleared.

---

**NOTE:** You should always link a transfer (EDMA3 or QDMA) to another useful transfer. If you must terminate a transfer, then you should link the transfer to a NULL parameter set. See [Section 11.3.3.3](#).

---

The link update occurs after the current PaRAM set event parameters have been exhausted. An event's parameters are exhausted when the EDMA3 channel controller has submitted all of the transfers that are associated with the PaRAM set.

A link update occurs for null and dummy transfers depending on the state of the STATIC bit in OPT and the LINK field. In both cases (null or dummy), if the value of LINK is FFFFh, then a null PaRAM set (with all 0s and LINK set to FFFFh) is written to the current PaRAM set. Similarly, if LINK is set to a value other than FFFFh, then the appropriate PaRAM location that LINK points to is copied to the current PaRAM set.

Once the channel completion conditions are met for an event, the transfer parameters that are located at the link address are loaded into the current DMA or QDMA channel's associated parameter set. This indicates that the EDMA3CC reads the entire set (eight words) from the PaRAM set specified by LINK and writes all eight words to the PaRAM set that is associated with the current channel. [Figure 11-11](#) shows an example of a linked transfer.

Any PaRAM set in the PaRAM can be used as a link/reload parameter set. The PaRAM sets associated with peripheral synchronization events (see [Section 11.3.6](#)) should only be used for linking if the corresponding events are disabled.

If a PaRAM set location is defined as a QDMA channel PaRAM set (by QCHMAPn), then copying the link PaRAM set into the current QDMA channel PaRAM set is recognized as a trigger event. It is latched in QER because a write to the trigger word was performed. You can use this feature to create a linked list of transfers using a single QDMA channel and multiple PaRAM sets. See [Section 11.3.4.2](#).

Linking to itself replicates the behavior of auto-initialization, thus facilitating the use of circular buffering and repetitive transfers. After an EDMA3 channel exhausts its current PaRAM set, it reloads all of the parameter set entries from another PaRAM set, which is initialized with values that are identical to the original PaRAM set. [Figure 11-11](#) shows an example of a linked to self transfer. Here, the PaRAM set 255 has the link field pointing to the address of parameter set 255 (linked to self).

---

**NOTE:** If the STATIC bit in OPT is set for a PaRAM set, then link updates are not performed.

---

### 11.3.3.8 Constant Addressing Mode Transfers/Alignment Issues

If either SAM or DAM is set (constant addressing mode), then the source or destination address must be aligned to a 256-bit aligned address, respectively, and the corresponding BIDX should be an even multiple of 32 bytes (256 bits). The EDMA3CC does not recognize errors here, but the EDMA3TC asserts an error if this is not true. See [Section 11.3.12.3](#).

---

**NOTE:** The constant addressing (CONST) mode has limited applicability. The EDMA3 should be configured for the constant addressing mode (SAM/DAM = 1) only if the transfer source or destination (on-chip memory, off-chip memory controllers, slave peripherals) support the constant addressing mode. See the device-specific data manual and/or peripheral user's guide to verify if the constant addressing mode is supported. If the constant addressing mode is not supported, the similar logical transfer can be achieved using the increment (INCR) mode (SAM/DAM =0) by appropriately programming the count and indices values.

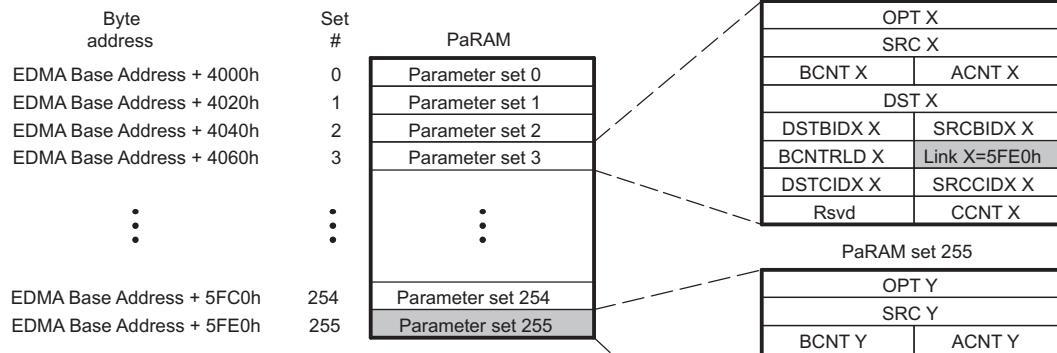

---

### 11.3.3.9 Element Size

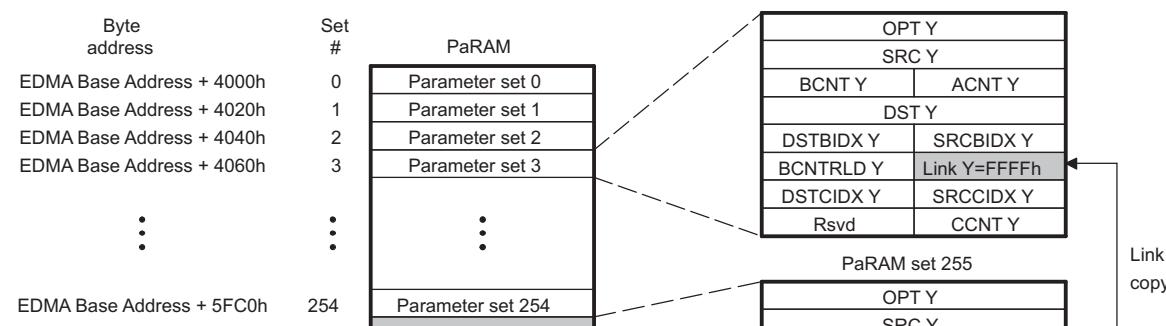

The EDMA3 controller does not use element-size and element-indexing. Instead, all transfers are defined in terms of all three dimensions: ACNT, BCNT, and CCNT. An element-indexed transfer is logically achieved by programming ACNT to the size of the element and BCNT to the number of elements that need to be transferred. For example, if you have 16-bit audio data and 256 audio samples that must be transferred to a serial port, you can only do this by programming the ACNT = 2 (2 bytes) and BCNT = 256.

**Figure 11-11. Linked Transfer**

#### 11.3.4 Initiating a DMA Transfer

There are multiple ways to initiate a programmed data transfer using the EDMA3 channel controller. Transfers on DMA channels are initiated by three sources.

They are listed as follows:

- **Event-triggered transfer request** (this is the more typical usage of EDMA3): A peripheral, system, or externally-generated event triggers a transfer request.
- **Manually-triggered transfer request**: The CPU manually triggers a transfer by writing a 1 to the

corresponding bit in the event set register (ESR/ESRH).

- **Chain-triggered transfer request:** A transfer is triggered on the completion of another transfer or sub-transfer.

Transfers on QDMA channels are initiated by two sources. They are as follows:

- **Auto-triggered transfer request:** Writing to the programmed trigger word triggers a transfer.
- **Link-triggered transfer requests:** Writing to the trigger word triggers the transfer when linking occurs.

#### 11.3.4.1 DMA Channel

##### 11.3.4.1.1 Event-Triggered Transfer Request

When an event is asserted from a peripheral or device pins, it gets latched in the corresponding bit of the event register (ER.En = 1). If the corresponding event in the event enable register (EER) is enabled (EER.En = 1), then the EDMA3CC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

If the PaRAM set is valid (not a NULL set), then a transfer request packet (TRP) is submitted to the EDMA3TC and the En bit in ER is cleared. At this point, a new event can be safely received by the EDMA3CC.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3](#)), then no transfer request (TR) is submitted and the corresponding En bit in ER is cleared and simultaneously the corresponding channel bit is set in the event miss register (EMR.En = 1) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include cleaning the event missed error before re-triggering the DMA channel.

When an event is received, the corresponding event bit in the event register is set (ER.En = 1), regardless of the state of EER.En. If the event is disabled when an external event is received (ER.En = 1 and EER.En = 0), the ER.En bit remains set. If the event is subsequently enabled (EER.En = 1), then the pending event is processed by the EDMA3CC and the TR is processed/submitted, after which the ER.En bit is cleared.

If an event is being processed (prioritized or is in the event queue) and another sync event is received for the same channel prior to the original being cleared (ER.En != 0), then the second event is registered as a missed event in the corresponding bit of the event missed register (EMR.En = 1).

See [Section 9.2.3, EDMA Event Multiplexing](#), for a description of how DMA events map to the EDMA event crossbar. See [Section 11.3.20, EDMA Events](#), for a table of direct and crossbar mapped EDMA events.

##### 11.3.4.1.2 Manually Triggered Transfer Request

The CPU or any EDMA programmer initiates a DMA transfer by writing to the event set register (ESR). Writing a 1 to an event bit in the ESR results in the event being prioritized/queued in the appropriate event queue, regardless of the state of the EER.En bit. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA3TC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3](#)), then no transfer request (TR) is submitted and the corresponding En bit in ER is cleared and simultaneously the corresponding channel bit is set in the event miss register (EMR.En = 1) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include clearing the event missed error before re-triggering the DMA channel.

If an event is being processed (prioritized or is in the event queue) and the same channel is manually set by a write to the corresponding channel bit of the event set register (ESR.En = 1) prior to the original being cleared (ESR.En = 0), then the second event is registered as a missed event in the corresponding bit of the event missed register (EMR.En = 1).

#### 11.3.4.1.3 Chain-Triggered Transfer Request

Chaining is a mechanism by which the completion of one transfer automatically sets the event for another channel. When a chained completion code is detected, the value of which is dictated by the transfer completion code (TCC[5:0] in OPT of the PaRAM set associated with the channel), it results in the corresponding bit in the chained event register (CER) to be set (CER.E[TCC] = 1).

Once a bit is set in CER, the EDMA3CC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA3TC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3](#)), then no transfer request (TR) is submitted and the corresponding En bit in CER is cleared and simultaneously the corresponding channel bit is set in the event miss register (EMR.En = 1) to indicate that the event was discarded due to a null TR being serviced. In this case, the error condition must be cleared by you before the DMA channel can be re-triggered. Good programming practices might include clearing the event missed error before re-triggering the DMA channel.

If a chaining event is being processed (prioritized or queued) and another chained event is received for the same channel prior to the original being cleared (CER.En != 0), then the second chained event is registered as a missed event in the corresponding channel bit of the event missed register (EMR.En = 1).

---

**NOTE:** Chained event registers, event registers, and event set registers operate independently. An event (En) can be triggered by any of the trigger sources (event-triggered, manually-triggered, or chain-triggered).

---

#### 11.3.4.2 QDMA Channels

##### 11.3.4.2.1 Auto-triggered and Link-Triggered Transfer Request

QDMA-based transfer requests are issued when a QDMA event gets latched in the QDMA event register (QER.En = 1). A bit corresponding to a QDMA channel is set in the QDMA event register (QER) when the following occurs:

- A CPU (or any EDMA3 programmer) write occurs to a PaRAM address that is defined as a QDMA channel trigger word (programmed in the QDMA channel mapping register (QCHMAP $n$ )) for the particular QDMA channel and the QDMA channel is enabled via the QDMA event enable register (QEER.En = 1).
- EDMA3CC performs a link update on a PaRAM set address that is configured as a QDMA channel (matches QCHMAP $n$  settings) and the corresponding channel is enabled via the QDMA event enable register (QEER.En = 1).

Once a bit is set in QER, the EDMA3CC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA3TC and the channel can be triggered again.

If a bit is already set in QER (QER.En = 1) and a second QDMA event for the same QDMA channel occurs prior to the original being cleared, the second QDMA event gets captured in the QDMA event miss register (QEMR.En = 1).

#### 11.3.4.3 Comparison Between DMA and QDMA Channels

The primary difference between DMA and QDMA channels is the event/channel synchronization. QDMA events are either auto-triggered or link triggered. auto-triggering allows QDMA channels to be triggered by CPU(s) with a minimum number of linear writes to PaRAM. Link triggering allows a linked list of transfers to be executed, using a single QDMA PaRAM set and multiple link PaRAM sets.

A QDMA transfer is triggered when a CPU (or other EDMA3 programmer) writes to the trigger word of the QDMA channel parameter set (auto-triggered) or when the EDMA3CC performs a link update on a PaRAM set that has been mapped to a QDMA channel (link triggered). Note that for CPU triggered (manually triggered) DMA channels, in addition to writing to the PaRAM set, it is required to write to the event set register (ESR) to kick-off the transfer.

QDMA channels are typically for cases where a single event will accomplish a complete transfer since the CPU (or EDMA3 programmer) must reprogram some portion of the QDMA PaRAM set in order to re-trigger the channel. In other words, QDMA transfers are programmed with BCNT = CCNT = 1 for A-synchronized transfers, and CCNT = 1 for AB-synchronized transfers.

Additionally, since linking is also supported (if STATIC = 0 in OPT) for QDMA transfers, it allows you to initiate a linked list of QDMAs, so when EDMA3CC copies over a link PaRAM set (including the write to the trigger word), the current PaRAM set mapped to the QDMA channel will automatically be recognized as a valid QDMA event and initiate another set of transfers as specified by the linked set.

### 11.3.5 Completion of a DMA Transfer

A parameter set for a given channel is complete when the required number of transfer requests is submitted (based on receiving the number of synchronization events). The expected number of TRs for a non-null/non-dummy transfer is shown in [Table 11-10](#) for both synchronization types along with state of the PaRAM set prior to the final TR being submitted. When the counts (BCNT and/or CCNT) are this value, the next TR results in a:

- Final chaining or interrupt codes to be sent by the transfer controllers (instead of intermediate).
- Link updates (linking to either null or another valid link set).

**Table 11-10. Expected Number of Transfers for Non-Null Transfer**

| Sync Mode       | Counts at time 0     | Total # Transfers                     | Counts prior to final TR |
|-----------------|----------------------|---------------------------------------|--------------------------|
| A-synchronized  | ACNT<br>BCNT<br>CCNT | (BCNT × CCNT ) TRs of ACNT bytes each | BCNT == 1 && CCNT == 1   |
| AB-synchronized | ACNT<br>BCNT<br>CCNT | CCNT TRs for ACNT × BCNT bytes each   | CCNT == 1                |

You must program the PaRAM OPT field with a specific transfer completion code (TCC) along with the other OPT fields (TCCHEN, TCINTEN, ITCCHEN, and ITCINTEN bits) to indicate whether the completion code is to be used for generating a chained event or/and for generating an interrupt upon completion of a transfer.

The specific TCC value (6-bit binary value) programmed dictates which of the 64-bits in the chain event register (CER[TCC]) and/or interrupt pending register (IPR[TCC]) is set.

You can also selectively program whether the transfer controller sends back completion codes on completion of the final transfer request (TR) of a parameter set (TCCHEN or TCINTEN), for all but the final transfer request (TR) of a parameter set (ITCCHEN or ITCINTEN), or for all TRs of a parameter set (both). See [Section 11.3.8](#) for details on chaining (intermediate/final chaining) and [Section 11.3.9](#) for details on intermediate/final interrupt completion.

A completion detection interface exists between the EDMA3 channel controller and transfer controller(s). This interface sends back information from the transfer controller to the channel controller to indicate that a specific transfer is completed. Completion of a transfer is used for generating chained events and/or generating interrupts to the CPU(s).

All DMA/QDMA PaRAM sets must also specify a link address value. For repetitive transfers such as ping-pong buffers, the link address value should point to another predefined PaRAM set. Alternatively, a non-repetitive transfer should set the link address value to the null link value. The null link value is defined as FFFFh. See [Section 11.3.3.7](#) for more details.

**NOTE:** Any incoming events that are mapped to a null PaRAM set results in an error condition. The error condition should be cleared before the corresponding channel is used again. See [Section 11.3.3.5](#).

There are three ways the EDMA3CC gets updated/informed about a transfer completion: normal completion, early completion, and dummy/null completion. This applies to both chained events and completion interrupt generation.

#### 11.3.5.1 Normal Completion

In normal completion mode (TCCMODE = 0 in OPT), the transfer or sub-transfer is considered to be complete when the EDMA3 channel controller receives the completion codes from the EDMA3 transfer controller. In this mode, the completion code to the channel controller is posted by the transfer controller after it receives a signal from the destination peripheral. Normal completion is typically used to generate an interrupt to inform the CPU that a set of data is ready for processing.

#### 11.3.5.2 Early Completion

In early completion mode (TCCMODE = 1 in OPT), the transfer is considered to be complete when the EDMA3 channel controller submits the transfer request (TR) to the EDMA3 transfer controller. In this mode, the channel controller generates the completion code internally. Early completion is typically useful for chaining, as it allows subsequent transfers to be chained-triggered while the previous transfer is still in progress within the transfer controller, maximizing the overall throughput of the set of the transfers.

#### 11.3.5.3 Dummy or Null Completion

This is a variation of early completion. Dummy or null completion is associated with a dummy set ([Section 11.3.3.4](#)) or null set ([Section 11.3.3.3](#)). In both cases, the EDMA3 channel controller does not submit the associated transfer request to the EDMA3 transfer controller(s). However, if the set (dummy/null) has the OPT field programmed to return completion code (intermediate/final interrupt/chaining completion), then it will set the appropriate bits in the interrupt pending registers (IPR/IPRH) or chained event register (CER/CERH). The internal early completion path is used by the channel controller to return the completion codes internally (that is, EDMA3CC generates the completion code).

#### 11.3.6 Event, Channel, and PaRAM Mapping

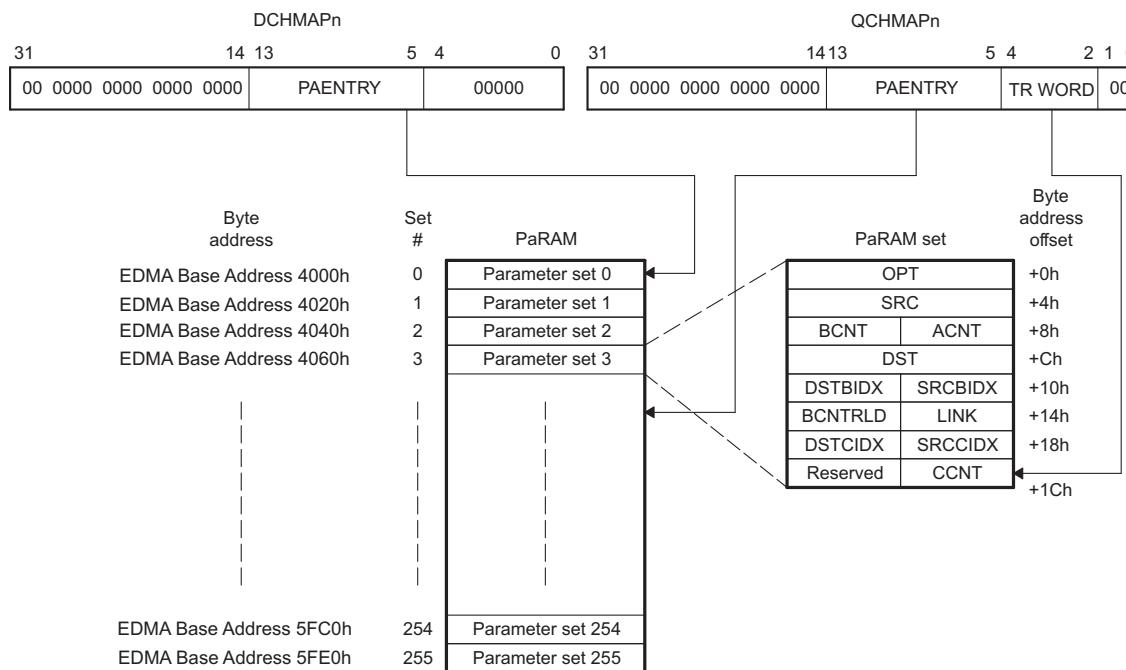

Several of the 64 DMA channels are tied to a specific hardware event, thus allowing events from device peripherals or external hardware to trigger transfers. A DMA channel typically requests a data transfer when it receives its event (apart from manually-triggered, chain-triggered, and other transfers). The amount of data transferred per synchronization event depends on the channel's configuration (ACNT, BCNT, CCNT, etc.) and the synchronization type (A-synchronized or AB-synchronized).

The association of an event to a channel is fixed, each DMA channel has one specific event associated with it. See [Section 9.2.3, EDMA Event Multiplexing](#), for a description of how DMA events map to the EDMA event crossbar. See [Section 11.3.20, EDMA Events](#), for a table of direct and crossbar mapped EDMA events.

In an application, if a channel does not use the associated synchronization event or if it does not have an associated synchronization event (unused), that channel can be used for manually-triggered or chained-triggered transfers, for linking/reloading, or as a QDMA channel.

##### 11.3.6.1 DMA Channel to PaRAM Mapping

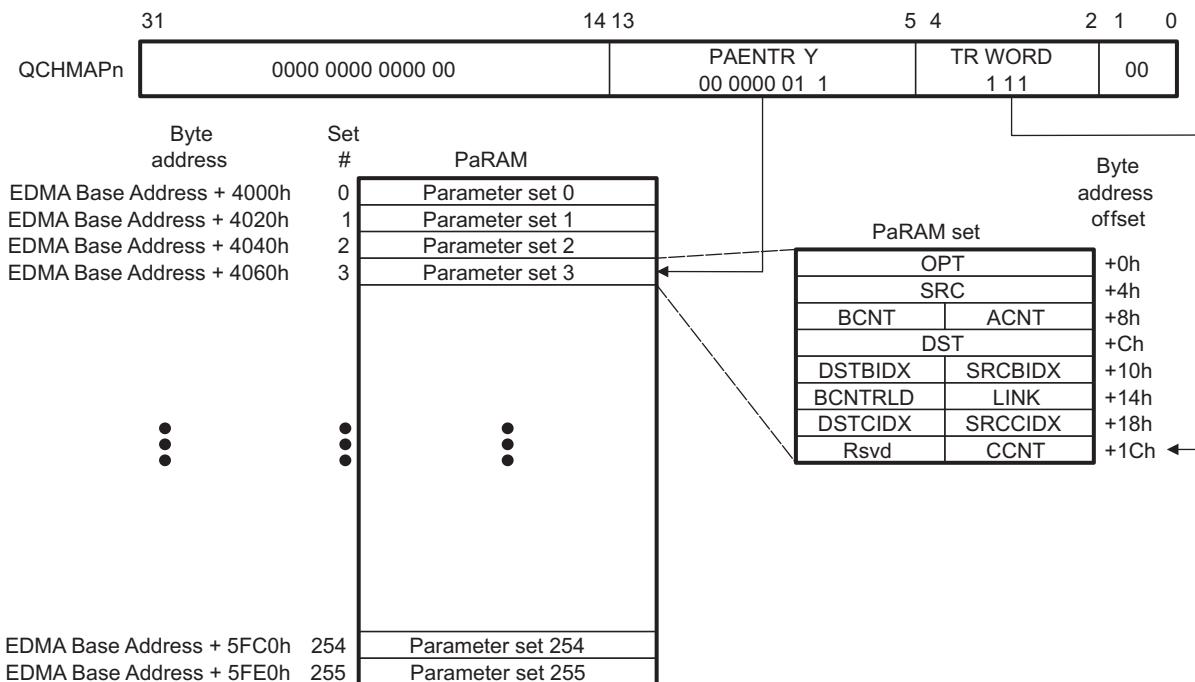

The mapping between the DMA channel numbers and the PaRAM sets is programmable (see [Table 11-5](#)). The DMA channel mapping registers (DCHMAPn) in the EDMA3CC provide programmability that allows the DMA channels to be mapped to any of the PaRAM sets in the PaRAM memory map. [Figure 11-13](#) illustrates the use of DCHMAP. There is one DCHMAP register per channel.

**Figure 11-13. DMA Channel and QDMA Channel to PaRAM Mapping**

### 11.3.6.2 QDMA Channel to PaRAM Mapping

The mapping between the QDMA channels and the PaRAM sets is programmable. The QDMA channel mapping register (QCHMAP) in the EDMA3CC allows you to map the QDMA channels to any of the PaRAM sets in the PaRAM memory map. [Figure 11-14](#) illustrates the use of QCHMAP.

Additionally, QCHMAP allows you to program the trigger word in the PaRAM set for the QDMA channel. A trigger word is one of the eight words in the PaRAM set. For a QDMA transfer to occur, a valid TR synchronization event for EDMA3CC is a write to the trigger word in the PaRAM set pointed to by QCHMAP for a particular QDMA channel. By default, QDMA channels are mapped to PaRAM set 0. You must appropriately re-map PaRAM set 0 before you use it.

**Figure 11-14. QDMA Channel to PaRAM Mapping**

### 11.3.7 EDMA3 Channel Controller Regions

The EDMA3 channel controller divides its address space into eight regions. Individual channel resources are assigned to a specific region, where each region is typically assigned to a specific EDMA programmer.

You can design the application software to use regions or to ignore them altogether. You can use active memory protection in conjunction with regions so that only a specific EDMA programmer (for example, privilege identification) or privilege level (for example, user vs. supervisor) is allowed access to a given region, and thus to a given DMA or QDMA channel. This allows robust system-level DMA code where each EDMA programmer only modifies the state of the assigned resources. Memory protection is described in [Section 11.3.10](#).

#### 11.3.7.1 Region Overview

The EDMA3 channel controller memory-mapped registers are divided in three main categories:

1. Global registers
2. Global region channel registers
3. Shadow region channel registers

The global registers are located at a single/fixed location in the EDMA3CC memory map. These registers control EDMA3 resource mapping and provide debug visibility and error tracking information.

The channel registers (including DMA, QDMA, and interrupt registers) are accessible via the global channel region address range, or in the shadow *n* channel region address range(s). For example, the event enable register (EER) is visible at the global address of EDMA Base Address + 1020h or region addresses of EDMA Base Address + 2020h for region 0, EDMA Base Address + 2220h for region 1, ..., EDMA Base Address + 2E20h for region 7.

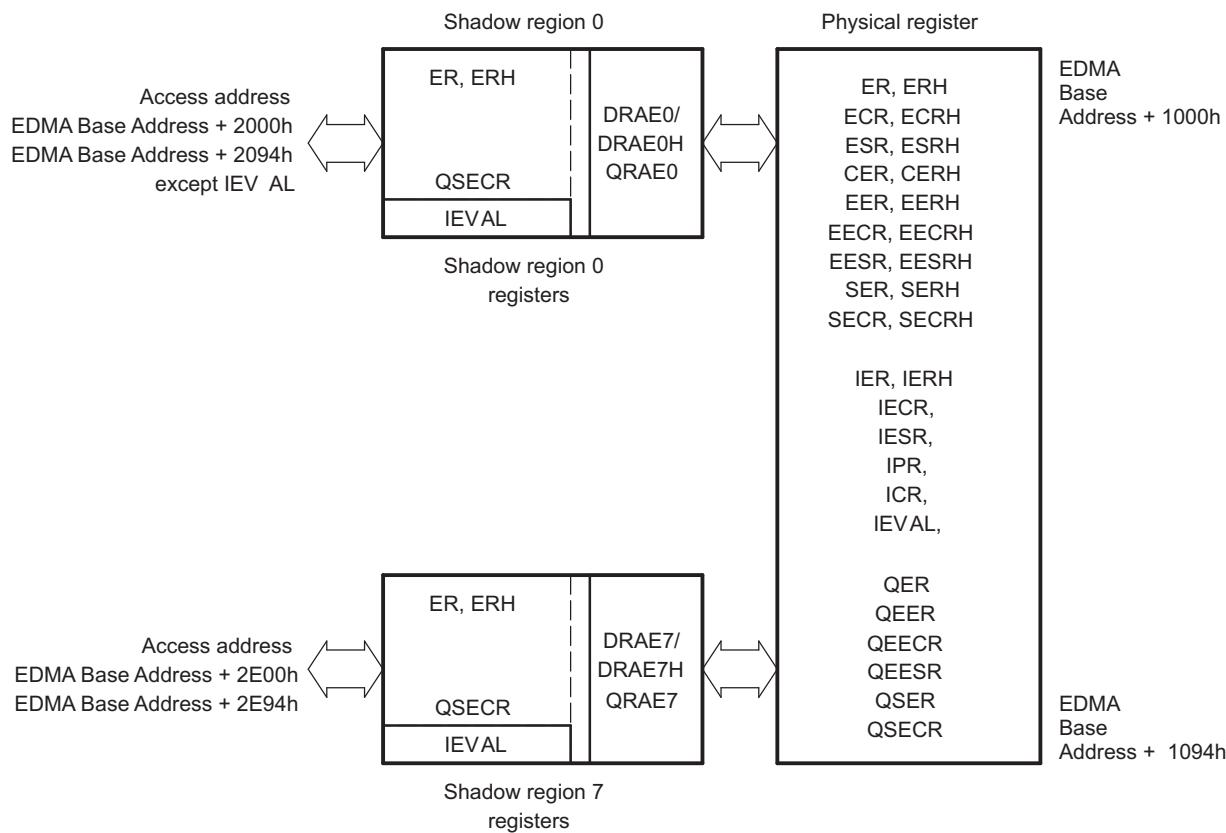

The DMA region access enable registers (DRAEm) and the QDMA region access enable registers (QRAEn) control the underlying control register bits that are accessible via the shadow region address space (except for IEVALn). [Table 11-11](#) lists the registers in the shadow region memory map. See the EDMA3CC memory map ([Table 11-25](#)) for the complete global and shadow region memory maps. [Figure 11-15](#) illustrates the conceptual view of the regions.

**Table 11-11. Shadow Region Registers**

| DRAEm | DRAEHm | QRAEn |
|-------|--------|-------|
| ER    | ERH    | QER   |
| ECR   | ECRH   | QEER  |
| ESR   | ESRH   | QEECR |
| CER   | CERH   | QEESR |
| EER   | EERH   |       |
| EECR  | EECRH  |       |
| EESR  | EESRH  |       |
| SER   | SERH   |       |
| SECR  | SECRH  |       |
| IER   | IERH   |       |
| IECR  | IECRH  |       |
| IESR  | IESRH  |       |
| IPR   | IPRH   |       |
| ICR   | ICRH   |       |

**Register not affected by DRAEDRAEH**

IEVAL

**Figure 11-15. Shadow Region Registers**

### 11.3.7.2 Channel Controller Regions

There are eight EDMA3 shadow regions (and associated memory maps). Associated with each shadow region are a set of registers defining which channels and interrupt completion codes belong to that region. These registers are user-programmed per region to assign ownership of the DMA/QDMA channels to a region.

- **DRAEm and DRAEHm:** One register pair exists for each of the shadow regions. The number of bits in each register pair matches the number of DMA channels (64 DMA channels). These registers need to be programmed to assign ownership of DMA channels and interrupt (or TCC codes) to the respective region. Accesses to DMA and interrupt registers via the shadow region address view are filtered through the DRAE/DRAEH pair. A value of 1 in the corresponding DRAE(H) bit implies that the corresponding DMA/interrupt channel is accessible; a value of 0 in the corresponding DRAE(H) bit forces writes to be discarded and returns a value of 0 for reads.
- **QRAEn:** One register exists for every region. The number of bits in each register matches the number of QDMA channels (4 QDMA channels). These registers must be programmed to assign ownership of QDMA channels to the respective region. To enable a channel in a shadow region using shadow region 0 QEER, the respective bit in QRAE must be set or writing into QEESR will not have the desired effect.
- **MPPAn and MPPAG:** One register exists for every region. This register defines the privilege level, requestor, and types of accesses allowed to a region's memory-mapped registers.

It is typical for an application to have a unique assignment of QDMA/DMA channels (and, therefore, a given bit position) to a given region.

The use of shadow regions allows for restricted access to EDMA3 resources (DMA channels, QDMA channels, TCC, interrupts) by tasks in a system by setting or clearing bits in the DRAE/ORAE registers. If exclusive access to any given channel / TCC code is required for a region, then only that region's DRAE/ORAE should have the associated bit set.

#### **Example 11-1. Resource Pool Division Across Two Regions**

This example illustrates a judicious resource pool division across two regions, assuming region 0 must be allocated 16 DMA channels (0-15) and 1 QDMA channel (0) and 32 TCC codes (0-15 and 48-63). Region 1 needs to be allocated 16 DMA channels (16-32) and the remaining 7 QDMA channels (1-7) and TCC codes (16-47). DRAE should be equal to the OR of the bits that are required for the DMA channels and the TCC codes:

```
Region 0: DRAEH, DRAE = 0xFFFF0000, 0x0000FFFF QRAE = 0x00000001
Region 1: DRAEH, DRAE = 0x0000FFFF, 0xFFFF0000 QRAE = 0x00000FE
```

#### **11.3.7.3 Region Interrupts**

In addition to the EDMA3CC global completion interrupt, there is an additional completion interrupt line that is associated with every shadow region. Along with the interrupt enable register (IER), DRAE acts as a secondary interrupt enable for the respective shadow region interrupts. See [Section 11.3.9](#) for more information.

#### **11.3.8 Chaining EDMA3 Channels**

The channel chaining capability for the EDMA3 allows the completion of an EDMA3 channel transfer to trigger another EDMA3 channel transfer. The purpose is to allow you the ability to chain several events through one event occurrence.

Chaining is different from linking ([Section 11.3.3.7](#)). The EDMA3 link feature reloads the current channel parameter set with the linked parameter set. The EDMA3 chaining feature does not modify or update any channel parameter set; it provides a synchronization event to the chained channel (see [Section 11.3.4.1.3](#) for chain-triggered transfer requests).

Chaining is achieved at either final transfer completion or intermediate transfer completion, or both, of the current channel. Consider a channel  $m$  (DMA/QDMA) required to chain to channel  $n$ . Channel number  $n$  (0-63) needs to be programmed into the TCC bit of channel  $m$  channel options parameter (OPT) set.

- If final transfer completion chaining (TCCHEN = 1 in OPT) is enabled, the chain-triggered event occurs after the submission of the last transfer request of channel  $m$  is either submitted or completed (depending on early or normal completion).
- If intermediate transfer completion chaining (ITCCHEN = 1 in OPT) is enabled, the chain-triggered

event occurs after every transfer request, except the last of channel  $m$  is either submitted or completed (depending on early or normal completion).

- If both final and intermediate transfer completion chaining (TCCHEN = 1 and ITCCHEN = 1 in OPT) are enabled, then the chain-trigger event occurs after every transfer request is submitted or completed (depending on early or normal completion).

**Table 11-12** illustrates the number of chain event triggers occurring in different synchronized scenarios. Consider channel 31 programmed with ACNT = 3, BCNT = 4, CCNT = 5, and TCC = 30.

**Table 11-12. Chain Event Triggers**

| Options                 | (Number of chained event triggers on channel 30) |                                  |
|-------------------------|--|----------------------------------|
|                         | A-Synchronized                                   | AB-Synchronized                  |
| TCCHEN = 1, ITCCHEN = 0 | 1 (Owing to the last TR)                         | 1 (Owing to the last TR)         |
| TCCHEN = 0, ITCCHEN = 1 | 19 (Owing to all but the last TR)                | 4 (Owing to all but the last TR) |
| TCCHEN = 1, ITCCHEN = 1 | 20 (Owing to a total of 20 TRs)                  | 5 (Owing to a total of 5 TRs)    |

### 11.3.9 EDMA3 Interrupts

The EDMA3 interrupts are divided into 2 categories: transfer completion interrupts and error interrupts.

There are nine region interrupts, eight shadow regions and one global region. The transfer completion interrupts are listed in **Table 11-13**. The transfer completion interrupts and the error interrupts from the transfer controllers are all routed to the ARM interrupt controllers.

**Table 11-13. EDMA3 Transfer Completion Interrupts**

| Name         | Description   |
|--------------|---|
| EDMA3CC_INT0 | EDMA3CC Transfer Completion Interrupt Shadow Region 0 |
| EDMA3CC_INT1 | EDMA3CC Transfer Completion Interrupt Shadow Region 1 |
| EDMA3CC_INT2 | EDMA3CC Transfer Completion Interrupt Shadow Region 2 |
| EDMA3CC_INT3 | EDMA3CC Transfer Completion Interrupt Shadow Region 3 |
| EDMA3CC_INT4 | EDMA3CC Transfer Completion Interrupt Shadow Region 4 |
| EDMA3CC_INT5 | EDMA3CC Transfer Completion Interrupt Shadow Region 5 |
| EDMA3CC_INT6 | EDMA3CC Transfer Completion Interrupt Shadow Region 6 |
| EDMA3CC_INT7 | EDMA3CC Transfer Completion Interrupt Shadow Region 7 |

**Table 11-14. EDMA3 Error Interrupts**

| Name            | Description                         |
|-----------------|-------------------------------------|
| EDMA3CC_ERRINT  | EDMA3CC Error Interrupt             |
| EDMA3CC_MPINT   | EDMA3CC Memory Protection Interrupt |
| EDMA3TC0_ERRINT | TC0 Error Interrupt                 |
| EDMA3TC1_ERRINT | TC1 Error Interrupt                 |
| EDMA3TC2_ERRINT | TC2 Error Interrupt                 |
| EDMA3TC3_ERRINT | TC3 Error Interrupt                 |

#### 11.3.9.1 Transfer Completion Interrupts

The EDMA3CC is responsible for generating transfer completion interrupts to the CPU(s) (and other EDMA3 masters). The EDMA3 generates a single completion interrupt per shadow region, as well as one for the global region on behalf of all 64 channels. The various control registers and bit fields facilitate EDMA3 interrupt generation.

The software architecture should either use the global interrupt or the shadow interrupts, but not both.

The transfer completion code (TCC) value is directly mapped to the bits of the interrupt pending register (IPR/IPRH). For example, if TCC = 10 0001b, IPRH[1] is set after transfer completion, and results in interrupt generation to the CPU(s) if the completion interrupt is enabled for the CPU. See [Section 11.3.9.1.1](#) for details on enabling EDMA3 transfer completion interrupts.

When a completion code is returned (as a result of early or normal completions), the corresponding bit in IPR/IPRH is set if transfer completion interrupt (final/intermediate) is enabled in the channel options parameter (OPT) for a PaRAM set associated with the transfer.

**Table 11-15. Transfer Complete Code (TCC) to EDMA3CC Interrupt Mapping**

| TCC Bits in OPT<br>(TCINTEN/ITCINTEN = 1) | IPR Bit Set | TCC Bits in OPT<br>(TCINTEN/ITCINTEN = 1) | IPRH Bit Set <sup>(1)</sup> |
|---|-------------|---|-----------------------------|
| 0   | IPR0        | 20h                                       | IPR32/IPRH0                 |
| 1   | IPR1        | 21h                                       | IPR33/IPRH1                 |
| 2h  | IPR2        | 22h                                       | IPR34/IPRH2                 |
| 3h  | IPR3        | 23h                                       | IPR35/IPRH3                 |
| 4h  | IPR4        | 24h                                       | IPR36/IPRH4                 |
| ...                                       | ...         | ...                                       | ...                         |
| 1Eh                                       | IPR30       | 3Eh                                       | IPR62/IPRH30                |
| 1Fh                                       | IPR31       | 3Fh                                       | IPR63/IPRH31                |

<sup>(1)</sup> Bit fields IPR[32-63] correspond to bits 0 to 31 in IPRH, respectively.

You can program the transfer completion code (TCC) to any value for a DMA/QDMA channel. A direct relation between the channel number and the transfer completion code value does not need to exist. This allows multiple channels having the same transfer completion code value to cause a CPU to execute the same interrupt service routine (ISR) for different channels.

If the channel is used in the context of a shadow region and you intend for the shadow region interrupt to be asserted, then ensure that the bit corresponding to the TCC code is enabled in IER/IERH and in the corresponding shadow region's DMA region access registers (DRAE/DRAEH).

You can enable Interrupt generation at either final transfer completion or intermediate transfer completion, or both. Consider channel *m* as an example.

- If the final transfer interrupt (TCCINT = 1 in OPT) is enabled, the interrupt occurs after the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).
- If the intermediate transfer interrupt (ITCCINT = 1 in OPT) is enabled, the interrupt occurs after every transfer request, except the last TR of channel *m* is either submitted or completed (depending on early or normal completion).
- If both final and intermediate transfer completion interrupts (TCCINT = 1, and ITCCINT = 1 in OPT) are enabled, then the interrupt occurs after every transfer request is submitted or completed (depending on early or normal completion).

[Table 11-16](#) shows the number of interrupts that occur in different synchronized scenarios. Consider channel 31, programmed with ACNT = 3, BCNT = 4, CCNT = 5, and TCC = 30.

**Table 11-16. Number of Interrupts**

| Options                   | A-Synchronized           | AB-Synchronized         |
|---------------------------|--------------------------|-------------------------|
| TCINTEN = 1, ITCINTEN = 0 | 1 (Last TR)              | 1 (Last TR)             |
| TCINTEN = 0, ITCINTEN = 1 | 19 (All but the last TR) | 4 (All but the last TR) |
| TCINTEN = 1, ITCINTEN = 1 | 20 (All TRs)             | 5 (All TRs)             |

### 11.3.9.1.1 Enabling Transfer Completion Interrupts

For the EDMA3 channel controller to assert a transfer completion to the external environment, the interrupts must be enabled in the EDMA3CC. This is in addition to setting up the TCINTEN and ITCINTEN bits in OPT of the associated PaRAM set.

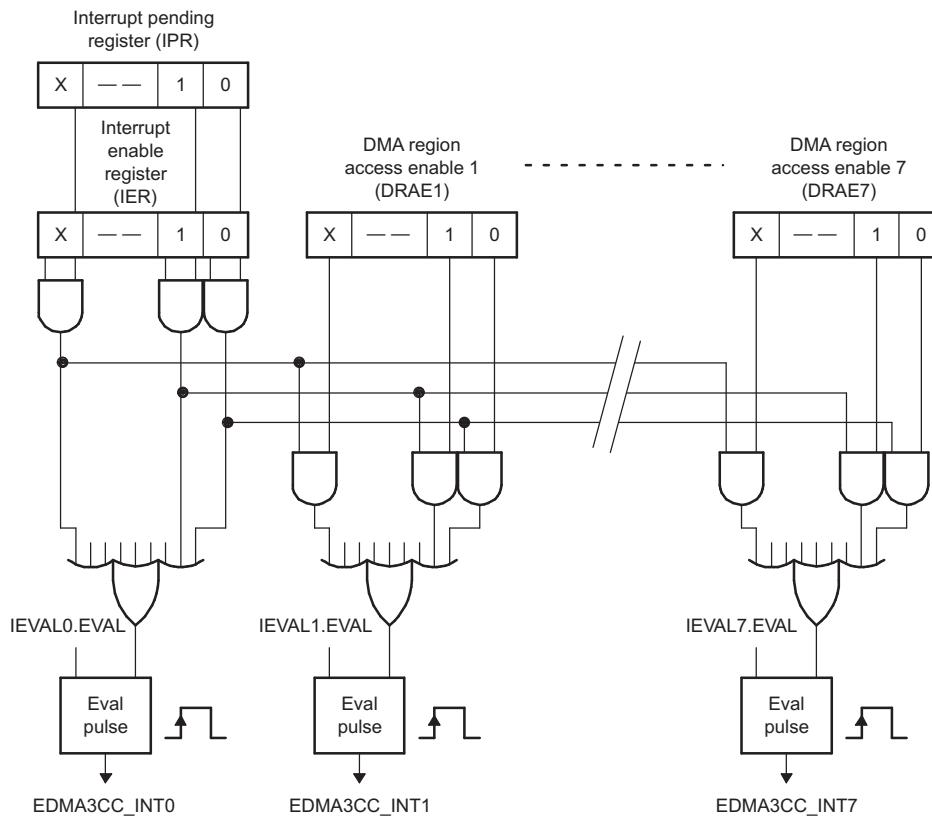

The EDMA3 channel controller has interrupt enable registers (IER/IERH) and each bit location in IER/IERH serves as a primary enable for the corresponding interrupt pending registers (IPR/IPRH).

All of the interrupt registers (IER, IESR, IEGR, and IPR) are either manipulated from the global DMA channel region, or by the DMA channel shadow regions. The shadow regions provide a view to the same set of physical registers that are in the global region.

The EDMA3 channel controller has a hierarchical completion interrupt scheme that uses a single set of interrupt pending registers (IPR/IPRH) and single set of interrupt enable registers (IER/IERH). The programmable DMA region access enable registers (DRAE/DRAEH) provides a second level of interrupt masking. The global region interrupt output is gated based on the enable mask that is provided by IER/IERH. see [Figure 11-16](#)

The region interrupt outputs are gated by IER and the specific DRAE/DRAEH associated with the region. See [Figure 11-16](#).

**Figure 11-16. Interrupt Diagram**

For the EDMA3CC to generate the transfer completion interrupts that are associated with each shadow region, the following conditions must be true:

- EDMA3CC\_INT0: (IPR.E0 & IER.E0 & DRAE0.E0) | (IPR.E1 & IER.E1 & DRAE0.E1) | ... | (IPR.E63 & IER.E63 & DRAE0.E63)
- EDMA3CC\_INT1: (IPR.E0 & IER.E0 & DRAE1.E0) | (IPR.E1 & IER.E1 & DRAE1.E1) | ... | (IPR.E63 & IER.E63 & DRAE1.E63)
- EDMA3CC\_INT2 : (IPR.E0 & IER.E0 & DRAE2.E0) | (IPR.E1 & IER.E1 & DRAE2.E1) | ... | (IPR.E63 & IER.E63 & DRAE2.E63)....

- Up to EDMA3CC\_INT7 : (IPR.E0 & IER.E0 & DRAE7.E0) | (IPR.E1 & IER.E1 & DRAE7.E1) | ...|(IPRH.E63 & IERH.E63 & DRAEH7.E63)

**NOTE:** The DRAE/DRAEH for all regions are expected to be set up at system initialization and to remain static for an extended period of time. The interrupt enable registers should be used for dynamic enable/disable of individual interrupts.

Because there is no relation between the TCC value and the DMA/QDMA channel, it is possible, for example, for DMA channel 0 to have the OPT.TCC = 63 in its associated PaRAM set. This would mean that if a transfer completion interrupt is enabled (OPT.TCINTEN or OPT.ITCINTEN is set), then based on the TCC value, IPRH.E63 is set up on completion. For proper channel operations and interrupt generation using the shadow region map, you must program the DRAE/DRAEH that is associated with the shadow region to have read/write access to both bit 0 (corresponding to channel 0) and bit 63 (corresponding to IPRH bit that is set upon completion).

#### 11.3.9.1.2 Clearing Transfer Completion Interrupts

Transfer completion interrupts that are latched to the interrupt pending registers (IPR/IPRH) are cleared by writing a 1 to the corresponding bit in the interrupt pending clear register (ICR/ICRH). For example, a write of 1 to ICR.E0 clears a pending interrupt in IPR.E0.

If an incoming transfer completion code (TCC) gets latched to a bit in IPR/IPRH, then additional bits that get set due to a subsequent transfer completion will not result in asserting the EDMA3CC completion interrupt. In order for the completion interrupt to be pulsed, the required transition is from a state where no enabled interrupts are set to a state where at least one enabled interrupt is set.

#### 11.3.9.2 EDMA3 Interrupt Servicing

Upon completion of a transfer (early or normal completion), the EDMA3 channel controller sets the appropriate bit in the interrupt pending registers (IPR/IPRH), as the transfer completion codes specify. If the completion interrupts are appropriately enabled, then the CPU enters the interrupt service routine (ISR) when the completion interrupt is asserted.

After servicing the interrupt, the ISR should clear the corresponding bit in IPR/IPRH, thereby enabling recognition of future interrupts. The EDMA3CC will only assert additional completion interrupts when all IPR/IPRH bits clear.

When one interrupt is serviced many other transfer completions may result in additional bits being set in IPR/IPRH, thereby resulting in additional interrupts. Each of the bits in IPR/IPRH may need different types of service; therefore, the ISR may check all pending interrupts and continue until all of the posted interrupts are serviced appropriately.

Examples of pseudo code for a CPU interrupt service routine for an EDMA3CC completion interrupt are shown in [Example 11-2](#) and [Example 11-3](#).

The ISR routine in [Example 11-2](#) is more exhaustive and incurs a higher latency.

#### Example 11-2. Interrupt Servicing

The pseudo code:

1. Reads the interrupt pending register (IPR/IPRH).
2. Performs the operations needed.
3. Writes to the interrupt pending clear register (ICR/ICRH) to clear the corresponding IPR/IPRH bit(s).
4. Reads IPR/IPRH again:
  - (a) If IPR/IPRH is not equal to 0, repeat from step 2 (implies occurrence of new event between step 2 to step 4).
  - (b) If IPR/IPRH is equal to 0, this should assure you that all of the enabled interrupts are inactive.

**Example 11-2. Interrupt Servicing (continued)**

**NOTE:** An event may occur during step 4 while the IPR/IPRH bits are read as 0 and the application is still in the interrupt service routine. If this happens, a new interrupt is recorded in the device interrupt controller and a new interrupt generates as soon as the application exits in the interrupt service routine.

Example 11-3 is less rigorous, with less burden on the software in polling for set interrupt bits, but can occasionally cause a race condition as mentioned above.

**Example 11-3. Interrupt Servicing**

If you want to leave any enabled and pending (possibly lower priority) interrupts; you must force the interrupt logic to reassert the interrupt pulse by setting the EVAL bit in the interrupt evaluation register (IEVAL).

The pseudo code is as follows:

1. Enters ISR.
2. Reads IPR/IPRH.
3. For the condition that is set in IPR/IPRH that you want to service, do the following:
  - (a) Service interrupt as the application requires.
  - (b) Clear the bit for serviced conditions (others may still be set, and other transfers may have resulted in returning the TCC to EDMA3CC after step 2).
4. Reads IPR/IPRH prior to exiting the ISR:
  - (a) If IPR/IPRH is equal to 0, then exit the ISR.
  - (b) If IPR/IPRH is not equal to 0, then set IEVAL so that upon exit of ISR, a new interrupt triggers if any enabled interrupts are still pending.

#### 11.3.9.3 Interrupt Evaluation Operations

The EDMA3CC has interrupt evaluate registers (IEVAL) that exist in the global region and in each shadow region. The registers in the shadow region are the only registers in the DMA channel shadow region memory map that are not affected by the settings for the DMA region access enable registers (DRAE/DRAEH). Writing a 1 to the EVAL bit in the registers that are associated with a particular shadow region results in pulsing the associated region interrupt (global or shadow), if any enabled interrupt (via IER/IERH) is still pending (IPR/IPRH). This register assures that the CPU does not miss the interrupts (or the EDMA3 master associated with the shadow region) if the software architecture chooses not to use all interrupts. See Example 11-3 for the use of IEVAL in the EDMA3 interrupt service routine (ISR).

Similarly an error evaluation register (EEVAL) exists in the global region. Writing a 1 to the EVAL bit in EEVAL causes the pulsing of the error interrupt if any pending errors are in EMR/EMRH, QEMR, or CCERR. See Section 11.3.9.4 for additional information regarding error interrupts.

**NOTE:** While using IEVAL for shadow region completion interrupts, you should make sure that the IEVAL operated upon is from that particular shadow region memory map.

#### 11.3.9.4 Error Interrupts

The EDMA3CC error registers provide the capability to differentiate error conditions (event missed, threshold exceed, etc.). Additionally, setting the error bits in these registers results in asserting the EDMA3CC error interrupt. If the EDMA3CC error interrupt is enabled in the device interrupt controller(s), then it allows the CPU(s) to handle the error conditions.

The EDMA3CC has a single error interrupt (EDMA3CC\_ERRINT) that is asserted for all EDMA3CC error conditions. There are four conditions that cause the error interrupt to pulse:

- DMA missed events: for all 64 DMA channels. DMA missed events are latched in the event missed registers (EMR/EMRH).
- QDMA missed events: for all 8 QDMA channels. QDMA missed events are latched in the QDMA event missed register (QEMR).
- Threshold exceed: for all event queues. These are latched in EDMA3CC error register (CCERR).
- TCC error: for outstanding transfer requests that are expected to return completion code (TCCHEN or TCINTEN bit in OPT is set to 1) exceeding the maximum limit of 63. This is also latched in the EDMA3CC error register (CCERR).

[Figure 11-17](#) illustrates the EDMA3CC error interrupt generation operation.

If any of the bits are set in the error registers due to any error condition, the EDMA3CC\_ERRINT is always asserted, as there are no enables for masking these error events. Similar to transfer completion interrupts (EDMA3CC\_INT), the error interrupt also only pulses when the error interrupt condition transitions from no errors being set to at least one error being set. If additional error events are latched prior to the original error bits clearing, the EDMA3CC does not generate additional interrupt pulses.

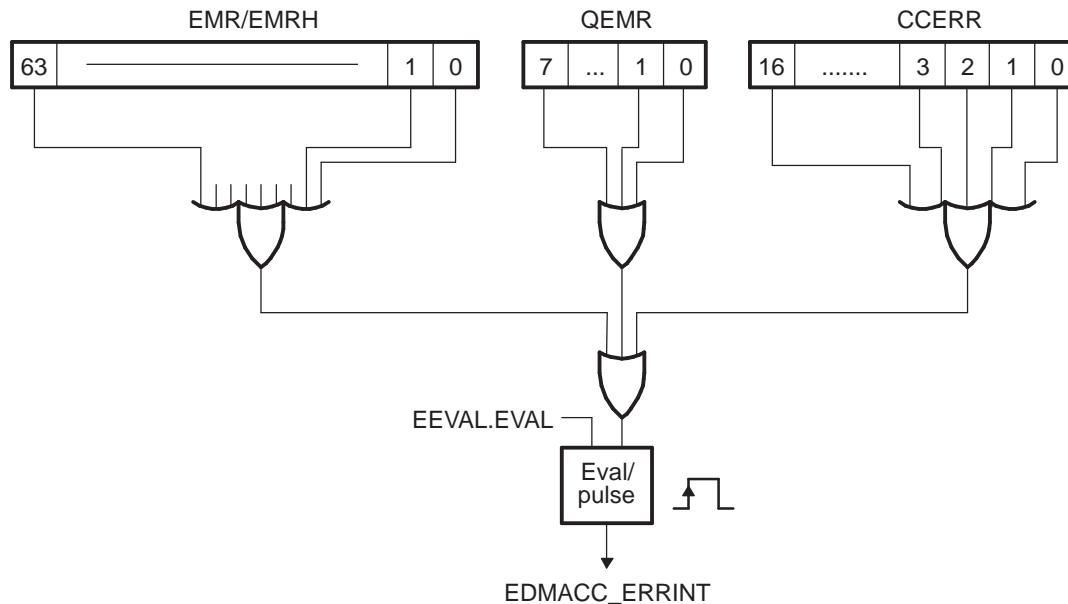

To reduce the burden on the software, there is an error evaluate register (EEVAL) that allows re-evaluation of pending set error events/bits, similar to the interrupt evaluate register (IEVAL). You can use this so that the CPU(s) does not miss any error events.

---

**NOTE:** It is good practice to enable the error interrupt in the device interrupt controller and to associate an interrupt service routine with it to address the various error conditions appropriately. Doing so puts less burden on the software (polling for error status); additionally, it provides a good debug mechanism for unexpected error conditions.

---

**Figure 11-17. Error Interrupt Operation**

### 11.3.10 Memory Protection

The EDMA3 channel controller supports two kinds of memory protection: active and proxy.

#### 11.3.10.1 Active Memory Protection

Active memory protection is a feature that allows or prevents read and write accesses (by any EDMA3 programmer) to the EDMA3CC registers (based on permission characteristics that you program). Active memory protection is achieved by a set of memory protection permissions attribute (MPPA) registers.

The EDMA3CC register map is divided into three categories:

- a global region.
- a global channel region.
- eight shadow regions.

Each shadow region consists of the respective shadow region registers and the associated PaRAM. For more detailed information regarding the contents of a shadow region, refer to section [Table 11-11](#).

Each of the eight shadow regions has an associated MPPA register (MPPAn) that defines the specific requestor(s) and types of requests that are allowed to the regions resources.

The global channel region is also protected with a memory-mapped register (MPPAG). The MPPAG applies to the global region and to the global channel region, except the other MPPA registers themselves. For more detailed information on the list of the registers in each region, refer to the register memory-map in section [Table 11-18](#).

See [Section 11.4.1.5.4](#) for the bit field descriptions of MPPAn. The MPPAn have a certain set of access rules.

[Table 11-17](#) shows the accesses that are allowed or not allowed to the MPPAG and MPPAn. The active memory protection uses the PRIV and PRIVID attributes of the EDMA programmer. The PRIV is the privilege level (i.e., user vs. supervisor). The PRIVID refers to a privilege ID with a number that is associated with an EDMA3 programmer. See the device-specific data manual for the PRIVIDs that are associated with potential EDMA3 programmers.

**Table 11-17. Allowed Accesses**

| Access | Supervisor | User |
|--------|------------|------|
| Read   | Yes        | Yes  |
| Write  | Yes        | No   |

[Table 11-18](#) describes the MPPA register mapping for the shadow regions (which includes shadow region registers and PaRAM addresses).

The region-based MPPA registers are used to protect accesses to the DMA shadow regions and the associated region PaRAM. Because there are eight regions, there are eight MPPA region registers (MPPA[0-7]).

**Table 11-18. MPPA Registers to Region Assignment**

| Register | Registers Protect | Address Range | PaRAM Protect <sup>(1)</sup> | Address Range |
|----------|-------------------|---------------|------------------------------|---------------|
| MPPAG    | Global Range      | 0000h-1FFCh   | N/A                          | N/A           |
| MPPA0    | DMA Shadow 0      | 2000h-21FCh   | 1st octant                   | 4000h-47FCh   |
| MPPA1    | DMA Shadow 1      | 2200h-23FCh   | 2nd octant                   | 4800h-4FFCh   |
| MPPA2    | DMA Shadow 2      | 2400h-25FCh   | 3rd octant                   | 5000h-57FCh   |
| MPPA3    | DMA Shadow 3      | 2600h-27FCh   | 4th octant                   | 5800h-5FFCh   |
| MPPA4    | DMA Shadow 4      | 2800h-29FCh   | 5th octant                   | 6000h-67FCh   |
| MPPA5    | DMA Shadow 5      | 2A00h-2BFCh   | 6th octant                   | 6800h-6FFCh   |
| MPPA6    | DMA Shadow 6      | 2C00h-2DFCh   | 7th octant                   | 7000h-77FCh   |
| MPPA7    | DMA Shadow 7      | 2E00h-2FFCh   | 8th octant                   | 7800h-7FFCh   |

<sup>(1)</sup> The PARAM region is divided into 8 regions referred to as an octant.

### Example Access denied.

Write access to shadow region 7's event enable set register (EESR):

1. The original value of the event enable register (EER) at address offset 0x1020 is 0x0.
2. The MPPA[7] is set to prevent user level accesses (UW = 0, UR = 0), but it allows supervisor level accesses (SW = 1, SR = 1) with a privilege ID of 0. (AID0 = 1).
3. An EDMA3 programmer with a privilege ID of 0 attempts to perform a user-level write of a value of 0xFF00FF00 to shadow region 7's event enable set register (EESR) at address offset 0x2E30. Note that the EER is a read-only register and the only way that you can write to it is by writing to the EESR. Also remember that there is only one physical register for EER, EESR, etc. and that the shadow regions only provide to the same physical set.
4. Since the MPPA[7] has UW = 0, though the privilege ID of the write access is set to 0, the access is not allowed and the EER is not written to.

**Table 11-19. Example Access Denied**

| Register                   | Value            | Description   |
|----------------------------|------------------|---|
| EER<br>(offset 0x1020)     | 0x0000 0000      | Value in EER to begin with.   |
| EESR<br>(offset 0x2E30)    | 0xFF00 FF00<br>↓ | Value attempted to be written to shadow region 7's EESR.<br>This is done by an EDMA3 programmer with a privilege level of User and Privilege ID of 0. |
| MPPA[7]<br>(offset 0x082C) | 0x0000 04B0      | Memory Protection Filter AID0 = 1, UW = 0, UR = 0, SW = 1, SR = 1.  |
| EER<br>(offset 0x1020)     | X                | Access Denied   |
|                            | 0x0000 0000      | Final value of EER  |

### Example Access Allowed

Write access to shadow region 7's event enable set register (EESR):

1. The original value of the event enable register (EER) at address offset 0x1020 is 0x0.
2. The MPPA[7] is set to allow user-level accesses (UW = 1, UR = 1) and supervisor-level accesses (SW = 1, SR = 1) with a privilege ID of 0. (AID0 = 1).
3. An EDMA3 programmer with a privilege ID of 0, attempts to perform a user-level write of a value of 0xABCD0123 to shadow region 7's event enable set register (EESR) at address offset 0x2E30. Note that the EER is a read-only register and the only way that you can write to it is by writing to the EESR. Also remember that there is only one physical register for EER, EESR, etc. and that the shadow regions only provide to the same physical set.
4. Since the MPPA[7] has UW = 1 and AID0 = 1, the user-level write access is allowed.
5. Remember that accesses to shadow region registers are masked by their respective DRAE register. In this example, the DRAE[7] is set of 0x9FF00FC2.
6. The value finally written to EER is 0x8BC00102.

**Table 11-20. Example Access Allowed**

| Register                   | Value       | Description  |
|----------------------------|-------------|--|
| EER<br>(offset 0x1020)     | 0x0000 0000 | Value in EER to begin with.  |
| EESR<br>(offset 0x2E30)    | 0xFF00 FF00 | Value attempted to be written to shadow region 7's EESR. This is done by an EDMA3 programmer with a privilege level of User and Privilege ID of 0. |
| MPPA[7]<br>(offset 0x082C) | 0x0000 04B3 | Memory Protection Filter AID = 1, UW = 1, UR = 1, SW = 1, SR = 1.  |
|                            | ↓           | Access allowed.  |
| DRAE[7]<br>(offset 0x0378) | 0x9FF0 0FC2 | DMA Region Access Enable Filter  |
| EESR<br>(offset 0x2E30)    | 0x8BC0 0102 | Value written to shadow region 7's EESR. This is done by an EDMA3 programmer with a privilege level of User and a Privilege ID of 0.               |
| EER<br>(offset 0x1020)     | 0xBC0 0102  | Final value of EER.  |

### 11.3.10.2 Proxy Memory Protection

Proxy memory protection allows an EDMA3 transfer programmed by a given EDMA3 programmer to have its permissions travel with the transfer through the EDMA3TC. The permissions travel along with the read transactions to the source and the write transactions to the destination endpoints. The PRIV bit and PRIVID bit in the channel options parameter (OPT) is set with the EDMA3 programmer's PRIV value and PRIVID values, respectively, when any part of the PaRAM set is written.

The PRIV is the privilege level (i.e., user vs. supervisor). The PRIVID refers to a privilege ID with a number that is associated with an EDMA3 programmer.

See the data manual for the PRIVIDs that are associated with potential EDMA3 programmers.

These options are part of the TR that are submitted to the transfer controller. The transfer controller uses the above values on their respective read and write command bus so that the target endpoints can perform memory protection checks based on these values.

Consider a parameter set that is programmed by a CPU in user privilege level for a simple transfer with the source buffer on an L2 page and the destination buffer on an L1D page. The PRIV is 0 for user-level and the CPU has a PRIVID of 0.

The PaRAM set is shown in [Figure 11-18](#).

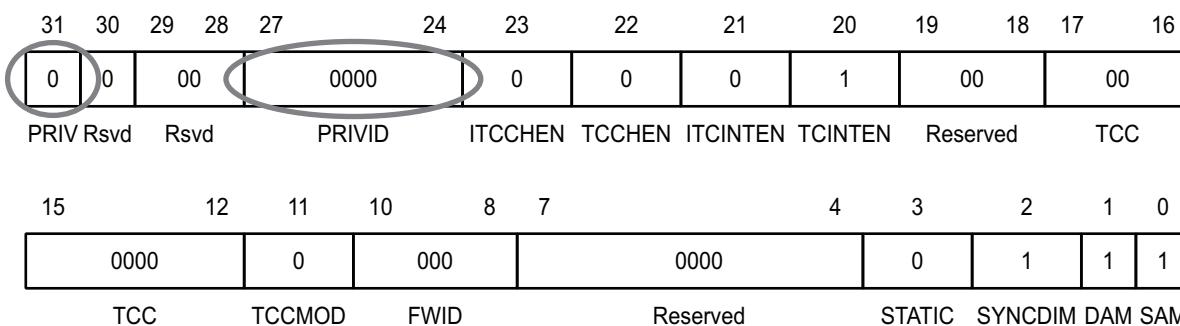

**Figure 11-18. PaRAM Set Content for Proxy Memory Protection Example**

(a) EDMA3 Parameters

| Parameter Contents |       | Parameter                         |                                |
|--------------------|-------|-----------------------------------|--------------------------------|
| 0010 0007h         |       | Channel Options Parameter (OPT)   |                                |
| 009F 0000h         |       | Channel Source Address (SRC)      |                                |
| 0001h              | 0004h | Count for 2nd Dimension (BCNT)    | Count for 1st Dimension (ACNT) |
| 00F0 7800h         |       | Channel Destination Address (DST) |                                |
| 0001h              | 0001h | Destination BCNT Index (DSTBIDX)  | Source BCNT Index (SRCBIDX)    |
| 0000h              | FFFFh | BCNT Reload (BCNTRLD)             | Link Address (LINK)            |
| 0001h              | 1000h | Destination CCNT Index (DSTCIDX)  | Source CCNT Index (SRCCIDX)    |
| 0000h              | 0001h | Reserved                          | Count for 3rd Dimension (CCNT) |

**Figure 11-19. Channel Options Parameter (OPT) Example**

(b) Channel Options Parameter (OPT) Content

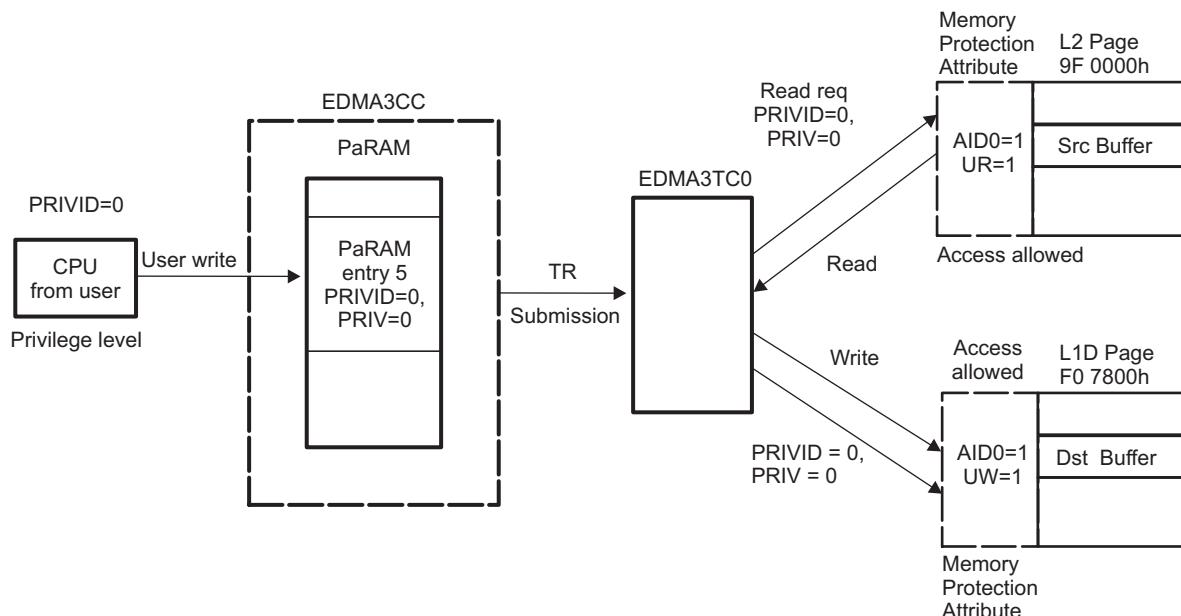

The PRIV and PRIVID information travels along with the read and write requests that are issued to the source and destination memories.

For example, if the access attributes that are associated with the L2 page with the source buffer only allow supervisor read, write accesses (SR,SW), the user-level read request above is refused. Similarly, if the access attributes that are associated with the L1D page with the destination buffer only allow supervisor read and write accesses (SR, SW), the user-level write request above is refused. For the transfer to succeed, the source and destination pages should have user-read and user-write permissions, respectively, along with allowing accesses from a PRIVID 0.

Because the programmer's privilege level and privilege identification travel with the read and write requests, EDMA3 acts as a proxy.

[Figure 11-20](#) illustrates the propagation of PRIV and PRIVID at the boundaries of all the interacting entities (CPU, EDMA3CC, EDMA3TC, and slave memories).

Figure 11-20. Proxy Memory Protection Example

### 11.3.11 Event Queue(s)

Event queues are a part of the EDMA3 channel controller. Event queues form the interface between the event detection logic in the EDMA3CC and the transfer request (TR) submission logic of the EDMA3CC. Each queue is 16 entries deep; thus, each event queue can queue a maximum of 16 events. If there are more than 16 events, then the events that cannot find a place in the event queue remain set in the associated event register and the CPU does not stall.

There are four event queues for the device: Queue0, Queue1, Queue2, and Queue3. Events in Queue0 result in submission of its associated transfer requests (TRs) to TC0. Similarly, transfer requests that are associated with events in Queue3 are submitted to TC3.

An event that wins prioritization against other DMA and/or QDMA pending events is placed at the tail of the appropriate event queue. Each event queue is serviced in FIFO order. Once the event reaches the head of its queue and the corresponding transfer controller is ready to receive another TR, the event is de-queued and the PaRAM set corresponding to the de-queued event is processed and submitted as a transfer request packet (TRP) to the associated EDMA3 transfer controller.

Queue0 has highest priority and Queue3 has the lowest priority, if Queue0 and Queue1 both have at least one event entry and if both TC0 and TC1 can accept transfer requests, then the event in Queue0 is de-queued first and its associated PaRAM set is processed and submitted as a transfer request (TR) to TC0.

See [Section 11.3.11.4](#) for system-level performance considerations. All of the event entries in all of the event queues are software readable (not writeable) by accessing the event entry registers (Q0E0, Q0E1,...Q1E15, etc.). Each event entry register characterizes the queued event in terms of the type of event (manual, event, chained or auto-triggered) and the event number. See [Section 11.4.1.4.1](#) for a description of the bit fields in the queue event entry registers.

#### 11.3.11.1 DMA/QDMA Channel to Event Queue Mapping

Each of the 64 DMA channels and eight QDMA channels are programmed independently to map to a specific queue, using the DMA queue number register (DMAQNUM) and the QDMA queue number register (QDMANUM). The mapping of DMA/QDMA channels is critical to achieving the desired performance level for the EDMA and most importantly, in meeting real-time deadlines. See [Section 11.3.11.4](#).

---

**NOTE:** If an event is ready to be queued and both the event queue and the EDMA3 transfer controller that is associated to the event queue are empty, then the event bypasses the event queue, and moves the PaRAM processing logic, and eventually to the transfer request submission logic for submission to the EDMA3TC. In this case, the event is not logged in the event queue status registers.

---

#### 11.3.11.2 Queue RAM Debug Visibility

There are four event queues and each queue has 16 entries. These 16 entries are managed in a circular FIFO manner. There is a queue status register (QSTAT) associated with each queue. These along with all of the 16 entries per queue can be read via registers QSTAT $n$  and QxEy, respectively.

These registers provide user visibility and may be helpful while debugging real-time issues (typically post-mortem), involving multiple events and event sources. The event queue entry register (QxEy) uniquely identifies the specific event type (event-triggered, manually-triggered, chain-triggered, and QDMA events) along with the event number (for all DMA/QDMA event channels) that are in the queue or have been de-queued (passed through the queue).

Each of the 16 entries in the event queue are read using the EDMA3CC memory-mapped register. By reading the event queue, you see the history of the last 16 TRs that have been processed by the EDMA3 on a given queue. This provides user/software visibility and is helpful for debugging real-time issues (typically post-mortem), involving multiple events and event sources.

The queue status register (QSTAT $n$ ) includes fields for the start pointer (STRTPTR) which provides the offset to the head entry of an event. It also includes a field called NUMVAL that provides the total number of valid entries residing in the event queue at a given instance of time. The STRTPTR may be used to index appropriately into the 16 event entries. NUMVAL number of entries starting from STRTPTR are indicative of events still queued in the respective queue. The remaining entry may be read to determine what's already de-queued and submitted to the associated transfer controller.

#### 11.3.11.3 Queue Resource Tracking

The EDMA3CC event queue includes watermarking/threshold logic that allows you to keep track of maximum usage of all event queues. This is useful for debugging real-time deadline violations that may result from head-of-line blocking on a given EDMA3 event queue.

You can program the maximum number of events that can queue up in an event queue by programming the threshold value (between 0 to 15) in the queue watermark threshold A register (QWMTHRA). The maximum queue usage is recorded actively in the watermark (WM) field of the queue status register (QSTAT $n$ ) that keeps getting updated based on a comparison of number of valid entries, which is also visible in the NUMVAL bit in QSTAT $n$  and the maximum number of entries (WM bit in QSTAT $n$ ).

If the queue usage is exceeded, this status is visible in the EDMA3CC registers: the QTHRXC $n$  bit in the channel controller error register (CCERR) and the THRXC $n$  bit in QSTAT $n$ , where  $n$  stands for the event queue number. Any bits that are set in CCERR also generate an EDMA3CC error interrupt.

#### 11.3.11.4 Performance Considerations

The main system bus infrastructure (L3) arbitrates bus requests from all of the masters (TCs, CPU(S), and other bus masters) to the shared slave resources (peripherals and memories).

The priorities of transfer requests (read and write commands) from the EDMA3 transfer controllers with respect to other masters within the system crossbar are programmed using the queue priority register (QUEPRI). QUEPRI programs the priority of the event queues (or indirectly, TC0-TC3, because QueueN transfer requests are submitted to TCN).

Therefore, the priority of unloading queues has a secondary affect compared to the priority of the transfers as they are executed by the EDMA3TC (dictated by the priority set using QUEPRI).

### 11.3.12 EDMA3 Transfer Controller (EDMA3TC)

The EDMA3 channel controller is the user-interface of the EDMA3 and the EDMA3 transfer controller (EDMA3TC) is the data movement engine of the EDMA3. The EDMA3CC submits transfer requests (TR) to the EDMA3TC and the EDMA3TC performs the data transfers dictated by the TR; thus, the EDMA3TC is a slave to the EDMA3CC.

#### 11.3.12.1 Architecture Details

##### 11.3.12.1.1 Command Fragmentation

The TC read and write controllers in conjunction with the source and destination register sets are responsible for issuing optimally-sized reads and writes to the slave endpoints. An optimally-sized command is defined by the transfer controller default burst size (DBS), which is defined in [Section 11.3.12.5](#).

The EDMA3TC attempts to issue the largest possible command size as limited by the DBS value or the ACNT/BCNT value of the TR. EDMA3TC obeys the following rules:

- The read/write controllers always issue commands less than or equal to the DBS value.
- The first command of a 1D transfer command always aligns the address of subsequent commands to the DBS value.

[Table 11-21](#) lists the TR segmentation rules that are followed by the EDMA3TC. In summary, if the ACNT value is larger than the DBS value, then the EDMA3TC breaks the ACNT array into DBS-sized commands to the source/destination addresses. Each BCNT number of arrays are then serviced in succession.

For BCNT arrays of ACNT bytes (that is, a 2D transfer), if the ACNT value is less than or equal to the DBS value, then the TR may be optimized into a 1D-transfer in order to maximize efficiency. The optimization takes place if the EDMA3TC recognizes that the 2D-transfer is organized as a single dimension (ACNT == BIDX) and the ACNT value is a power of 2.

[Table 11-21](#) lists conditions in which the optimizations are performed.

**Table 11-21. Read/Write Command Optimization Rules**

| ACNT ≤ DBS | ACNT is power of 2 | BIDX = ACNT | BCNT ≤ 1023 | SAM/DAM = Increment | Description   |
|------------|--------------------|-------------|-------------|---------------------|---------------|
| Yes        | Yes                | Yes         | Yes         | Yes                 | Optimized     |
| No         | x                  | x           | x           | x                   | Not Optimized |
| x          | No                 | x           | x           | x                   | Not Optimized |
| x          | x                  | No          | x           | x                   | Not Optimized |
| x          | x                  | x           | No          | x                   | Not Optimized |
| x          | x                  | x           | x           | No                  | Not Optimized |

##### 11.3.12.1.2 TR Pipelining

TR pipelining refers to the ability of the source active set to proceed ahead of the destination active set. Essentially, the reads for a given TR may already be in progress while the writes of a previous TR may not have completed.

The number of outstanding TRs is limited by the number of destination FIFO register entries.

TR pipelining is useful for maintaining throughput on back-to-back small TRs. It minimizes the startup overhead because reads start in the background of a previous TR writes.

#### **Example 11-4. Command Fragmentation (DBS = 64)**

The pseudo code:

- ACNT = 8, BCNT = 8, SRCBIDX = 8, DSTBIDX = 10, SRCADDR = 64, DSTADDR = 191

Read Controller: This is optimized from a 2D-transfer to a 1D-transfer such that the read side is equivalent to ACNT = 64, BCNT = 1.

Cmd0 = 64 byte

Write Controller: Because DSTBIDX != ACNT, it is not optimized.

Cmd0 = 8 byte, Cmd1 = 8 byte, Cmd2 = 8 byte, Cmd3 = 8 byte, Cmd4 = 8 byte, Cmd5 = 8 byte, Cmd6 = 8 byte, Cmd7 = 8 byte.

- ACNT=128, BCNT = 1, SRCADDR = 63, DSTADDR = 513

Read Controller: Read address is not aligned.

Cmd0 = 1 byte, (now the SRCADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 63 bytes

Write Controller: The write address is also not aligned.

Cmd0 = 63 bytes, (now the DSTADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 1 byte

#### **11.3.12.1.3 Performance Tuning**

By default, reads are as issued as fast as possible. In some cases, the reads issued by the EDMA3TC could fill the available command buffering for a slave, delaying other (potentially higher priority) masters from successfully submitting commands to that slave. The rate at which read commands are issued by the EDMA3TC is controlled by the RDRATE register. The RDRATE register defines the number of cycles that the EDMA3TC read controller waits before issuing subsequent commands for a given TR, thus minimizing the chance of the EDMA3TC consuming all available slave resources. The RDRATE value should be set to a relatively small value if the transfer controller is targeted for high priority transfers and to a higher value if the transfer controller is targeted for low priority transfers.

In contrast, the Write Interface does not have any performance tuning knobs because writes always have an interval between commands as write commands are submitted along with the associated write data.

#### **11.3.12.2 Memory Protection**

The transfer controller plays an important role in handling proxy memory protection. There are two access properties associated with a transfer: for instance, the privilege id (system-wide identification assigned to a master) of the master initiating the transfer, and the privilege level (user versus supervisor) used to program the transfer. This information is maintained in the PaRAM set when it is programmed in the channel controller. When a TR is submitted to the transfer controller, this information is made available to the EDMA3TC and used by the EDMA3TC while issuing read and write commands. The read or write commands have the same privilege identification, and privilege level as that programmed in the EDMA3 transfer in the channel controller.

#### **11.3.12.3 Error Generation**

Errors are generated if enabled under three conditions:

- EDMA3TC detection of an error signaled by the source or destination address.
- Attempt to read or write to an invalid address in the configuration memory map.
- Detection of a constant addressing mode TR violating the constant addressing mode transfer rules (the source/destination addresses and source/destination indexes must be aligned to 32 bytes).

Either or all error types may be disabled. If an error bit is set and enabled, the error interrupt for the concerned transfer controller is pulsed.

#### 11.3.12.4 Debug Features

The DMA program register set, DMA source active register set, and the destination FIFO register set are used to derive a brief history of TRs serviced through the transfer controller.

Additionally, the EDMA3TC status register (TCSTAT) has dedicated bit fields to indicate the ongoing activity within different parts of the transfer controller:

- The SRCACTV bit indicates whether the source active set is active.
- The DSTACTV bit indicates the number of TRs resident in the destination register active set at a given instance.
- The PROGBUSY bit indicates whether a valid TR is present in the DMA program set.

If the TRs are in progression, caution must be used and you must realize that there is a chance that the values read from the EDMA3TC status registers will be inconsistent since the EDMA3TC may change the values of these registers due to ongoing activities.

It is recommended that you ensure no additional submission of TRs to the EDMA3TC in order to facilitate ease of debug.

##### 11.3.12.4.1 Destination FIFO Register Pointer

The destination FIFO register pointer is implemented as a circular buffer with the start pointer being DFSTRTPTTR and a buffer depth of usually 2 or 4. The EDMA3TC maintains two important status details in TCSTAT that may be used during advanced debugging, if necessary. The DFSTRTPTTR is a start pointer, that is, the index to the head of the destination FIFO register. The DSTACTV is a counter for the number of valid (occupied) entries. These registers may be used to get a brief history of transfers.

Examples of some register field values and their interpretation:

- DFSTRTPTTR = 0 and DSTACTV = 0 implies that no TRs are stored in the destination FIFO register.
- DFSTRTPTTR = 1 and DSTACTV = 2h implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 1 and the second pending TR is read from the destination FIFO register entry 2.
- DFSTRTPTTR = 3h and DSTACTV = 2h implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 3 and the second pending TR is read from the destination FIFO register entry 0.

#### 11.3.12.5 EDMA3TC Configuration

[Table 11-22](#) provides the configuration of the individual EDMA3 transfer controllers present on the device. The DBS for each transfer controller is configurable using the TPTC\_CFG register in the chip configuration module.

**Table 11-22. EDMA3 Transfer Controller Configurations**

| Name        | TC0          | TC1          | TC2          | TC3          |
|-------------|--------------|--------------|--------------|--------------|
| FIFOSIZE    | 512 bytes    | 512 bytes    | 512 bytes    | 512 bytes    |
| BUSWIDTH    | 128 bits     | 128 bits     | 128 bits     | 128 bits     |
| DSTREGDEPTH | 4 entries    | 4 entries    | 4 entries    | 4 entries    |
| DBS         | Configurable | Configurable | Configurable | Configurable |

### 11.3.13 Event Dataflow

This section summarizes the data flow of a single event, from the time the event is latched to the channel controller to the time the transfer completion code is returned. The following steps list the sequence of EDMA3CC activity:

1. Event is asserted from an external source (peripheral or external interrupt). This also is similar for a manually-triggered, chained-triggered, or QDMA-triggered event. The event is latched into the ER.En/ERH.En (or CER.En/CERH.En, ESR.En /ESRH.En, QER.En) bit.
2. Once an event is prioritized and queued into the appropriate event queue, the SER.En/SERH.En (or QSER.En) bit is set to inform the event prioritization/processing logic to disregard this event since it is already in the queue. Alternatively, if the transfer controller and the event queue are empty, then the event bypasses the queue.
3. The EDMA3CC processing and the submission logic evaluates the appropriate PaRAM set and determines whether it is a non-null and non-dummy transfer request (TR).
4. The EDMA3CC clears the ER.En/ERH.En (or CER.En/CERH.En, ESR.En/ESRH.En, QER.En) bit and the SER.En/SERH.En bit as soon as it determines the TR is non-null. In the case of a null set, the SER.En/SERH.En bit remains set. It submits the non-null/non-dummy TR to the associated transfer controller. If the TR was programmed for early completion, the EDMA3CC immediately sets the interrupt pending register (IPR.I[TCC]/IPRH.I[TCC]-32).
5. If the TR was programmed for normal completion, the EDMA3CC sets the interrupt pending register (IPR.I[TCC]/IPRH.I[TCC]) when the EDMA3TC informs the EDMA3CC about completion of the transfer (returns transfer completion codes).
6. The EDMA3CC programs the associated EDMA3TCn's Program Register Set with the TR.
7. The TR is then passed to the Source Active set and the DST FIFO Register Set, if both the register sets are available.
8. The Read Controller processes the TR by issuing read commands to the source slave endpoint. The Read Data lands in the Data FIFO of the EDMA3TCn.
9. As soon as sufficient data is available, the Write Controller begins processing the TR by issuing write commands to the destination slave endpoint.
10. This continues until the TR completes and the EDMA3TCn then signals completion status to the EDMA3CC.

### 11.3.14 EDMA3 Prioritization

The EDMA3 controller has many implementation rules to deal with concurrent events/channels, transfers, etc. The following subsections detail various arbitration details whenever there might be occurrence of concurrent activity. [Figure 11-21](#) shows the different places EDMA3 priorities come into play.

#### 11.3.14.1 Channel Priority

The DMA event registers (ER and ERH) capture up to 64 events; likewise, the QDMA event register (QER) captures QDMA events for all QDMA channels; therefore, it is possible for events to occur simultaneously on the DMA/QDMA event inputs. For events arriving simultaneously, the event associated with the lowest channel number is prioritized for submission to the event queues (for DMA events, channel 0 has the highest priority and channel 63 has the lowest priority; similarly, for QDMA events, channel 0 has the highest priority and channel 7 has the lowest priority). This mechanism only sorts simultaneous events for submission to the event queues.

If a DMA and QDMA event occurs simultaneously, the DMA event always has prioritization against the QDMA event for submission to the event queues.

#### 11.3.14.2 Trigger Source Priority

If a DMA channel is associated with more than one trigger source (event trigger, manual trigger, and chain trigger), and if multiple events are set simultaneously for the same channel ( $ER.E_n = 1$ ,  $ESR.E_n = 1$ ,  $CER.E_n = 1$ ), then the EDMA3CC always services these events in the following priority order: event trigger (via ER) is higher priority than chain trigger (via CER) and chain trigger is higher priority than manual trigger (via ESR).

This implies that if for channel 0, both  $ER.E_0 = 1$  and  $CER.E_0 = 1$  at the same time, then the  $ER.E_0$  event is always queued before the  $CER.E_0$  event.

#### 11.3.14.3 Dequeue Priority

The priority of the associated transfer request (TR) is further mitigated by which event queue is being used for event submission (dictated by DMAQNUM and QDMAQNUM). For submission of a TR to the transfer request, events need to be de-queued from the event queues. Queue 0 has the highest dequeue priority and queue 3 the lowest.

#### 11.3.14.4 System (Transfer Controller) Priority

`INIT_PRIORITY_0` and `INIT_PRIORITY_1` registers in the chip configuration module are used to configure the EDMA TC's priority through the system bus infrastructure. Additionally, the priority settings for DDR memory accesses are defined in the dynamic memory manager (DMM).

---

**NOTE:** The default priority for all TCs is the same, 0 or highest priority relative to other masters. It is recommended that this priority be changed based on system level considerations, such as real-time deadlines for all masters including the priority of the transfer controllers with respect to each other.

---

### 11.3.15 EDMA3 Operating Frequency (Clock Control)

The EDMA3 channel controller and transfer controller are clocked from `PLL_L3 SYSCLK4`. The EDMA3 system runs at the L3 clock frequency.

### 11.3.16 Reset Considerations

A hardware reset resets the EDMA3 (EDMA3CC and EDMA3TC) and the EDMA3 configuration registers. The PaRAM memory contents are undefined after device reset and you should not rely on parameters to be reset to a known state. The PaRAM entry must be initialized to a desired value before it is used.

### 11.3.17 Power Management

The EDMA3 (EDMA3CC and EDMA3TC) can be placed in reduced-power modes to conserve power during periods of low activity. The power management of the peripheral is controlled by the power reset clock management (PRCM). The PRCM acts as a master controller for power management for all peripherals on the device.

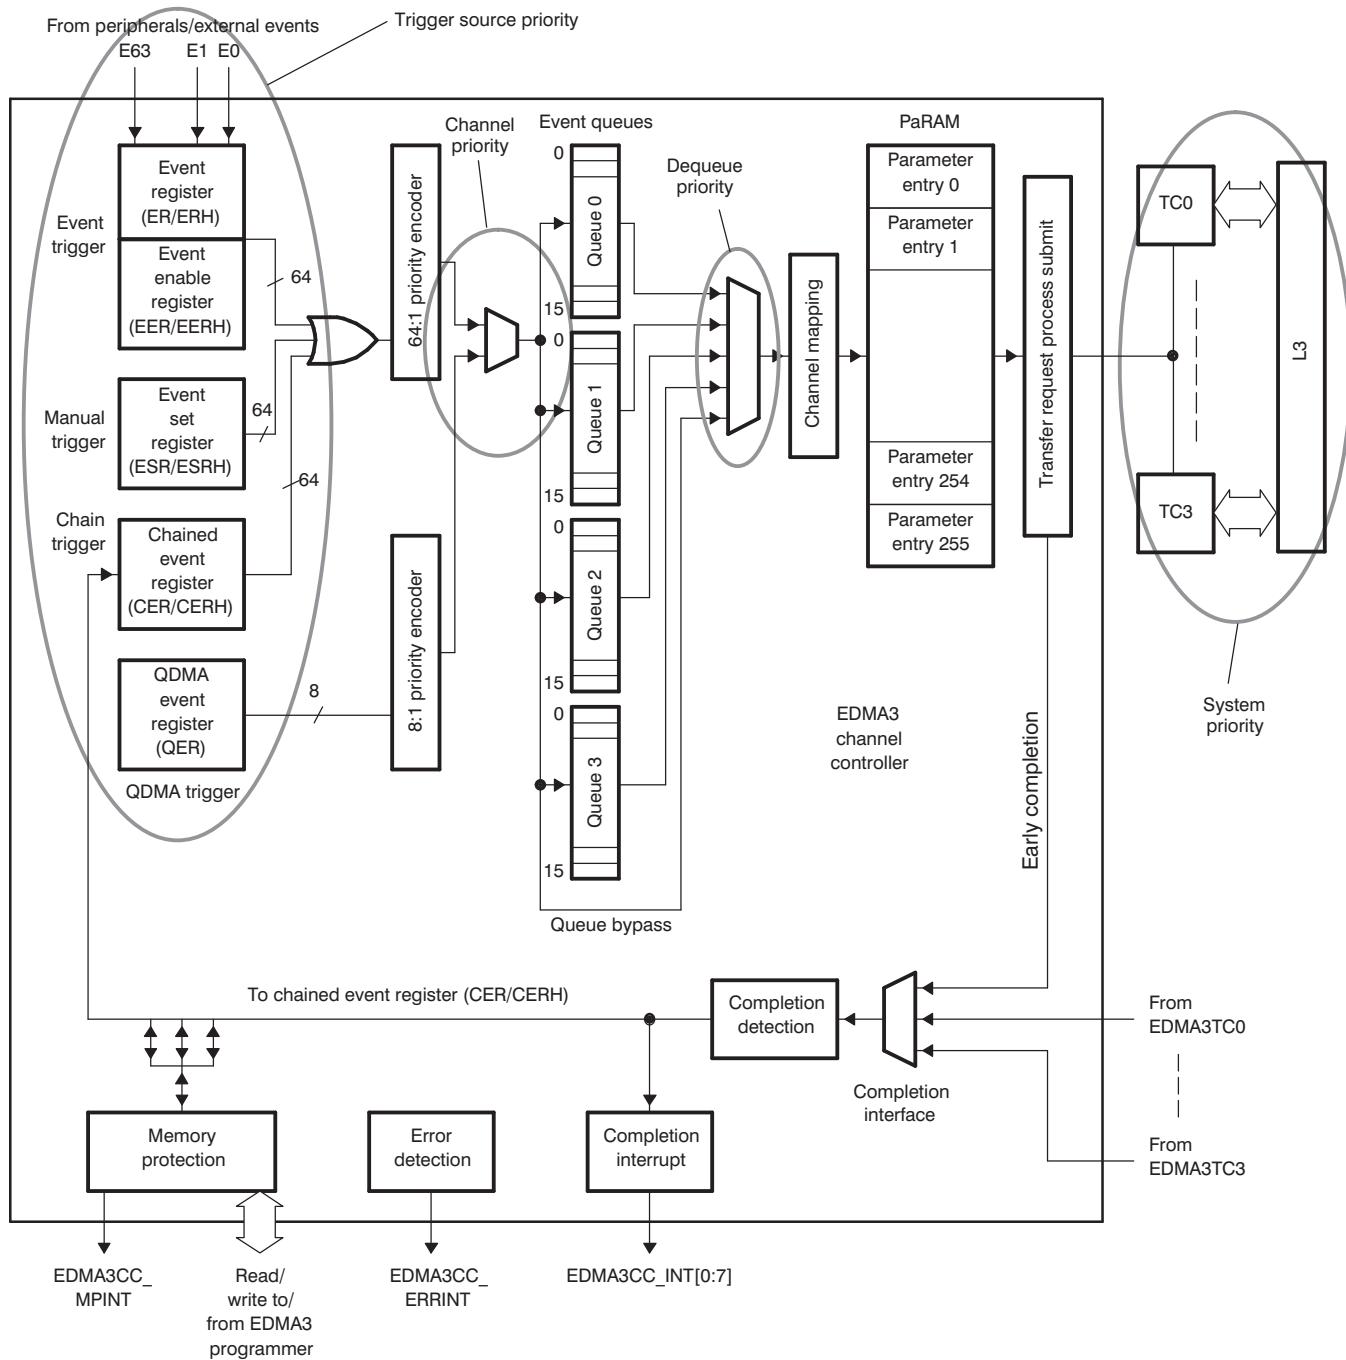

The EDMA3 controller can be idled on receiving a clock stop request from the PRCM. The requests to EDMA3CC and EDMA3TC are separate. In general, it should be verified that there are no pending activities in the EDMA3 controller.

### 11.3.18 Emulation Considerations

During debug when using the emulator, the CPU(s) may be halted on an execute packet boundary for single-stepping, benchmarking, profiling, or other debug purposes. During an emulation halt, the EDMA3 channel controller and transfer controller operations continue. Events continue to be latched and processed and transfer requests continue to be submitted and serviced.

Since EDMA3 is involved in servicing multiple master and slave peripherals, it is not feasible to have an independent behavior of the EDMA3 for emulation halts. EDMA3 functionality would be coupled with the peripherals it is servicing, which might have different behavior during emulation halts. For example, if a McASP is halted during an emulation access (FREE = 0 and SOFT = 0 or 1 in McASP registers), the McASP stops generating the McASP receive or transmit events (REVT or XEVT) to the EDMA. From the point of view of the McASP, the EDMA3 is suspended, but other peripherals (for example, a timer) still assert events and will be serviced by the EDMA.

**Figure 11-21. EDMA3 Prioritization**

### 11.3.19 EDMA Transfer Examples

The EDMA3 channel controller performs a variety of transfers depending on the parameter configuration. The following sections provide a description and PaRAM configuration for some typical use case scenarios.

#### 11.3.19.1 Block Move Example

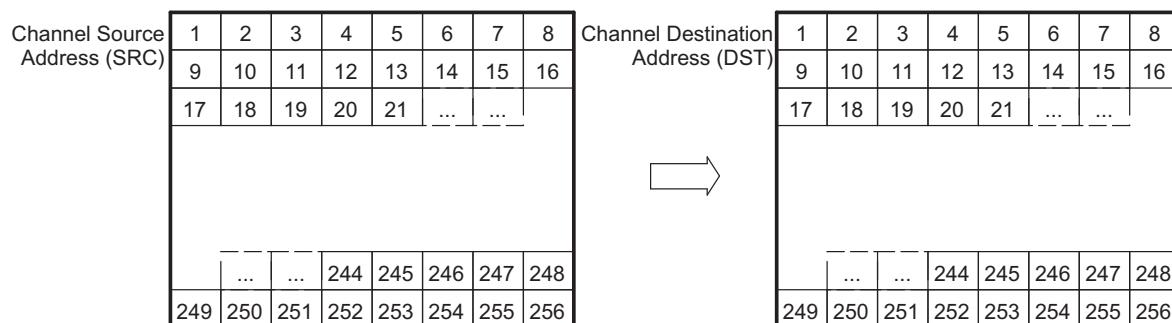

The most basic transfer performed by the EDMA3 is a block move. During device operation it is often necessary to transfer a block of data from one location to another, usually between on-chip and off-chip memory.

In this example, a section of data is to be copied from external memory to internal L2 SRAM as shown in [Figure 11-22](#). [Figure 11-23](#) shows the parameters for this transfer.

The source address for the transfer is set to the start of the data block in external memory, and the destination address is set to the start of the data block in L2. If the data block is less than 64K bytes, the PaRAM configuration shown in [Figure 11-23](#) holds true with the synchronization type set to A-synchronized and indexes cleared to 0. If the amount of data is greater than 64K bytes, BCNT and the B-indexes need to be set appropriately with the synchronization type set to AB-synchronized. The STATIC bit in OPT is set to prevent linking.

This transfer example may also be set up using QDMA. For successive transfer submissions, of a similar nature, the number of cycles used to submit the transfer are fewer depending on the number of changing transfer parameters. You may program the QDMA trigger word to be the highest numbered offset in the PaRAM set that undergoes change.

**Figure 11-22. Block Move Example**

**Figure 11-23. Block Move Example PaRAM Configuration**

(a) EDMA Parameters

| Parameter Contents                |       | Parameter                         |  |
|-----------------------------------|-------|-----------------------------------|--|
| 0010 0008h                        |       | Channel Options Parameter (OPT)   |  |
| Channel Source Address (SRC)      |       | Channel Source Address (SRC)      |  |
| 0001h                             | 0100h | Count for 2nd Dimension (BCNT)    |  |
| Channel Destination Address (DST) |       | Count for 1st Dimension (ACNT)    |  |
| 0000h                             | 0000h | Channel Destination Address (DST) |  |
| 0000h                             | FFFFh | Destination BCNT Index (DSTBIDX)  |  |
| 0000h                             | 0000h | Source BCNT Index (SRCBIDX)       |  |
| 0000h                             | 0001h | BCNT Reload (BCNTRLD)             |  |
| Destination CCNT Index (DSTCIDX)  |       | Link Address (LINK)               |  |
| Reserved                          |       | Source CCNT Index (SRCCIDX)       |  |
|                                   |       | Count for 3rd Dimension (CCNT)    |  |

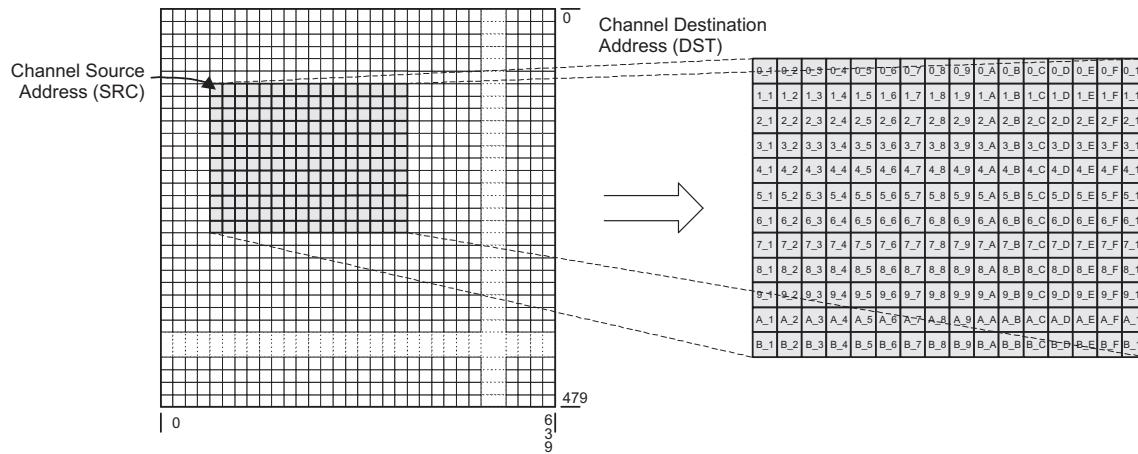

## (b) Channel Options Parameter (OPT) Content

|      |          |        |        |         |          |          |         |        |          |     |     |    |
|------|----------|--------|--------|---------|----------|----------|---------|--------|----------|-----|-----|----|

| 0000 |          | 0      | 000    |         | 0000     |          |         | 1      | 0        | 0   | 0   | 0  |
| TCC  |          | TCCMOD | FWID   |         | Reserved |          |         | STATIC | SYNCDIM  | DAM | SAM |    |

**11.3.19.2 Subframe Extraction Example**

The EDMA3 can efficiently extract a small frame of data from a larger frame of data. By performing a 2D-to-1D transfer, the EDMA3 retrieves a portion of data for the CPU to process. In this example, a 640 × 480-pixel frame of video data is stored in external memory. Each pixel is represented by a 16-bit halfword. The CPU extracts a 16 × 12-pixel subframe of the image for processing. To facilitate more efficient processing time by the CPU, the EDMA3 places the subframe in internal L2 SRAM. [Figure 11-24](#) shows the transfer of a subframe from external memory to L2. [Figure 11-25](#) shows the parameters for this transfer.

The same PaRAM entry options are used for QDMA channels, as well as DMA channels. The STATIC bit in OPT is set to prevent linking. For successive transfers, only changed parameters need to be programmed before triggering the channel.

**Figure 11-24. Subframe Extraction Example****Figure 11-25. Subframe Extraction Example PaRAM Configuration**

## (a) EDMA Parameters

| Parameter Contents                |       | Parameter                         |                                |
|-----------------------------------|-------|-----------------------------------|--------------------------------|

**11.3.19.3 Data Sorting Example**

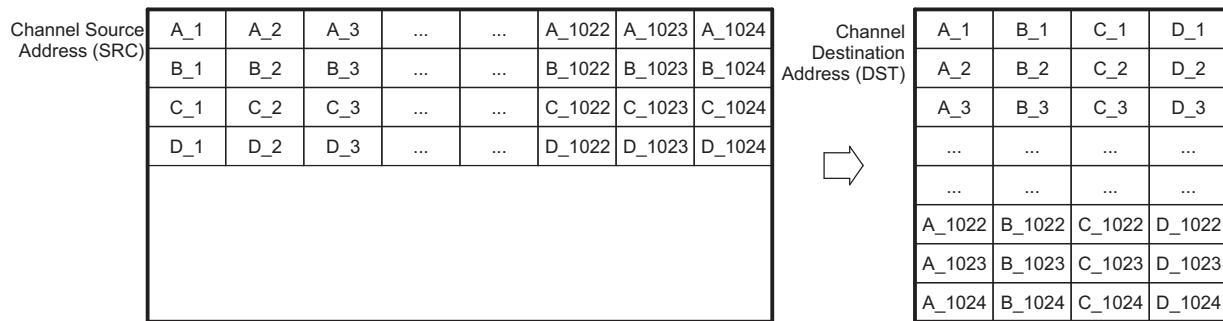

Many applications require the use of multiple data arrays; it is often desirable to have the arrays arranged such that the first elements of each array are adjacent, the second elements are adjacent, and so on. Often this is not how the data is presented to the device. Either data is transferred via a peripheral with the data arrays arriving one after the other or the arrays are located in memory with each array occupying a portion of contiguous memory spaces. For these instances, the EDMA3 can reorganize the data into the desired format. [Figure 11-26](#) shows the data sorting.

To determine the parameter set values, the following need to be considered:

- ACNT - Program this to be the size in bytes of an element.
- BCNT - Program this to be the number of elements in a frame.
- CCNT - Program this to be the number of frames.
- SRCBIDX - Program this to be the size of the element or ACNT.
- DSTBIDX - CCNT × ACNT
- SRCCDX - ACNT × BCNT
- DSTCIDX - ACNT

The synchronization type needs to be AB-synchronized and the STATIC bit is 0 to allow updates to the parameter set. It is advised to use normal EDMA3 channels for sorting.

It is not possible to sort this with a single trigger event. Instead, the channel can be programmed to be chained to itself. After BCNT elements get sorted, intermediate chaining could be used to trigger the channel again causing the transfer of the next BCNT elements and so on. [Figure 11-27](#) shows the parameter set programming for this transfer, assuming channel 0 and an element size of 4 bytes.

#### 11.3.19.4 Peripheral Servicing Example

The EDMA3 channel controller also services peripherals in the background of CPU operation, without requiring any CPU intervention. Through proper initialization of the EDMA3 channels, they can be configured to continuously service on-chip and off-chip peripherals throughout the device operation. Each event available to the EDMA3 has its own dedicated channel, and all channels operate simultaneously. The only requirements are to use the proper channel for a particular transfer and to enable the channel event in the event enable register (EER). When programming an EDMA3 channel to service a peripheral, it is necessary to know how data is to be presented to the processor. Data is always provided with some kind of synchronization event as either one element per event (non-bursting) or multiple elements per event (bursting).

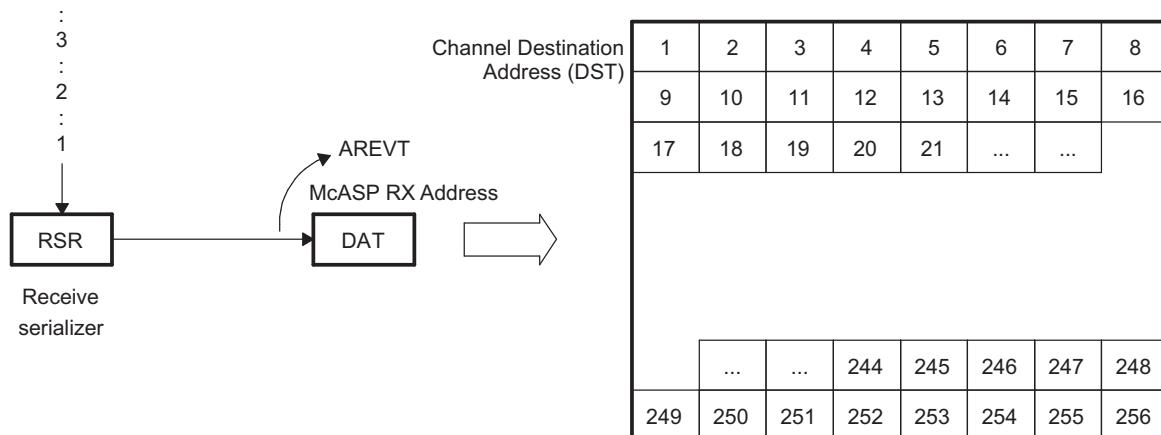

##### 11.3.19.4.1 Non-bursting Peripherals

Non-bursting peripherals include the on-chip multichannel audio serial port (McASP) and many external devices, such as codecs. Regardless of the peripheral, the EDMA3 channel configuration is the same.

The McASP transmit and receive data streams are treated independently by the EDMA3. The transmit and receive data streams can have completely different counts, data sizes, and formats. [Figure 11-28](#) shows servicing incoming McASP data.

To transfer the incoming data stream to its proper location in DDR memory, the EDMA3 channel must be set up for a 1D-to-1D transfer with A-synchronization. Because an event (AREVT) is generated for every word as it arrives, it is necessary to have the EDMA3 issue the transfer request for each element individually. [Figure 11-29](#) shows the parameters for this transfer. The source address of the EDMA3 channel is set to the data port address(DAT) for McASP, and the destination address is set to the start of the data block in DDR. Because the address of serializer buffer is fixed, the source B index is cleared to 0 (no modification) and the destination B index is set to 01b (increment).

Based on the premise that serial data is typically a high priority, the EDMA3 channel should be programmed to be on queue 0.

### 11.3.19.4.2 Bursting Peripherals

Higher bandwidth applications require that multiple data elements be presented to the processor core for every synchronization event. This frame of data can either be from multiple sources that are working simultaneously or from a single high-throughput peripheral that streams data to/from the processor.

In this example, a port is receiving a video frame from a camera and presenting it to the processor one array at a time. The video image is  $640 \times 480$  pixels, with each pixel represented by a 16-bit element. The image is to be stored in external memory. [Figure 11-30](#) shows this example.

To transfer data from an external peripheral to an external buffer one array at a time based on  $EVT_n$ , channel  $n$  must be configured. Due to the nature of the data (a video frame made up of arrays of pixels) the destination is essentially a 2D entity. [Figure 11-31](#) shows the parameters to service the incoming data with a 1D-to-2D transfer using AB-synchronization. The source address is set to the location of the video framer peripheral, and the destination address is set to the start of the data buffer. Because the input address is static, the SRCBIDX is 0 (no modification to the source address). The destination is made up of arrays of contiguous, linear elements; therefore, the DSTBIDX is set to pixel size, 2 bytes. ANCT is equal to the pixel size, 2 bytes. BCNT is set to the number of pixels in an array, 640. CCNT is equal to the total number of arrays in the block, 480. SRCCIDX is 0 because the source address undergoes no increment. The DSTCIDX is equal to the difference between the starting addresses of each array. Because a pixel is 16 bits (2 bytes), DSTCIDX is equal to  $640 \times 2$ .

### 11.3.19.4.3 Continuous Operation

Configuring an EDMA3 channel to receive a single frame of data is useful, and is applicable to some systems. A majority of the time, however, data is going to be continuously transmitted and received throughout the entire operation of the processor. In this case, it is necessary to implement some form of linking such that the EDMA3 channels continuously reload the necessary parameter sets. In this example, McASP is configured to transmit and receive data on a T1 array. To simplify the example, only two channels are active for both transmit and receive data streams. Each channel receives packets of 128 elements. The packets are transferred from the serial port to internal memory and from internal memory to the serial port, as shown [Figure 11-32](#).

The McASP generates AREVT for every element received and generates AXEVT for every element transmitted. To service the data streams, the DMA channels associated with the McASP must be setup for 1D-to-1D transfers with A-synchronization.

[Figure 11-33](#) shows the parameter entries for the channel for these transfers. To service the McASP continuously, the channels must be linked to a duplicate PaRAM set in the PaRAM. After all frames have been transferred, the EDMA3 channels reload and continue. [Figure 11-34](#) shows the reload parameters for the channel.

#### 11.3.19.4.3.1 Receive Channel

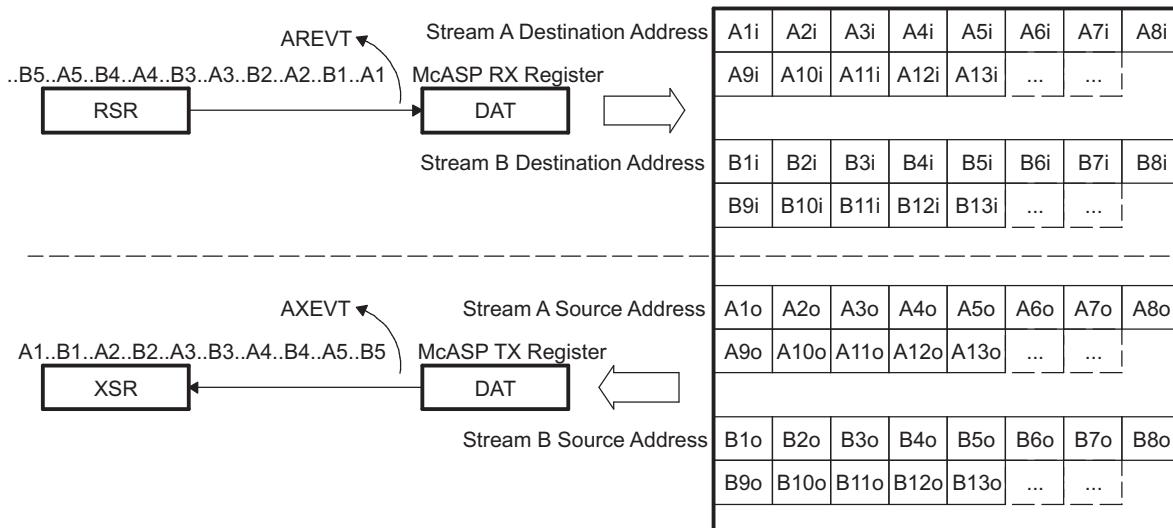

EDMA3 channel 15 services the incoming data stream of McASP. The source address is set to that of the receive serializer buffer, and the destination address is set to the first element of the data block. Because there are two data channels being serviced, A and B, they are to be located separately within the L2 SRAM.

To facilitate continuous operation, a copy of the PaRAM set for the channel is placed in PaRAM set 64. The LINK option is set and the link address is provided in the PaRAM set. Upon exhausting the channel 15 parameter set, the parameters located at the link address are loaded into the channel 15 parameter set and operation continues. This function continues throughout device operation until halted by the CPU.

#### 11.3.19.4.3.2 Transmit Channel

EDMA3 channel 12 services the outgoing data stream of McASP. In this case the destination address needs no update, hence, the parameter set changes accordingly. Linking is also used to allow continuous operation by the EDMA3 channel, with duplicate PaRAM set entries at PaRAM set 65.

#### 11.3.19.4.4 Ping-Pong Buffering

Although the previous configuration allows the EDMA3 to service a peripheral continuously, it presents a number of restrictions to the CPU. Because the input and output buffers are continuously being filled/emptied, the CPU must match the pace of the EDMA3 very closely to process the data. The EDMA3 receive data must always be placed in memory before the CPU accesses it, and the CPU must provide the output data before the EDMA3 transfers it. Though not impossible, this is an unnecessary challenge. It is particularly difficult in a 2-level cache scheme.

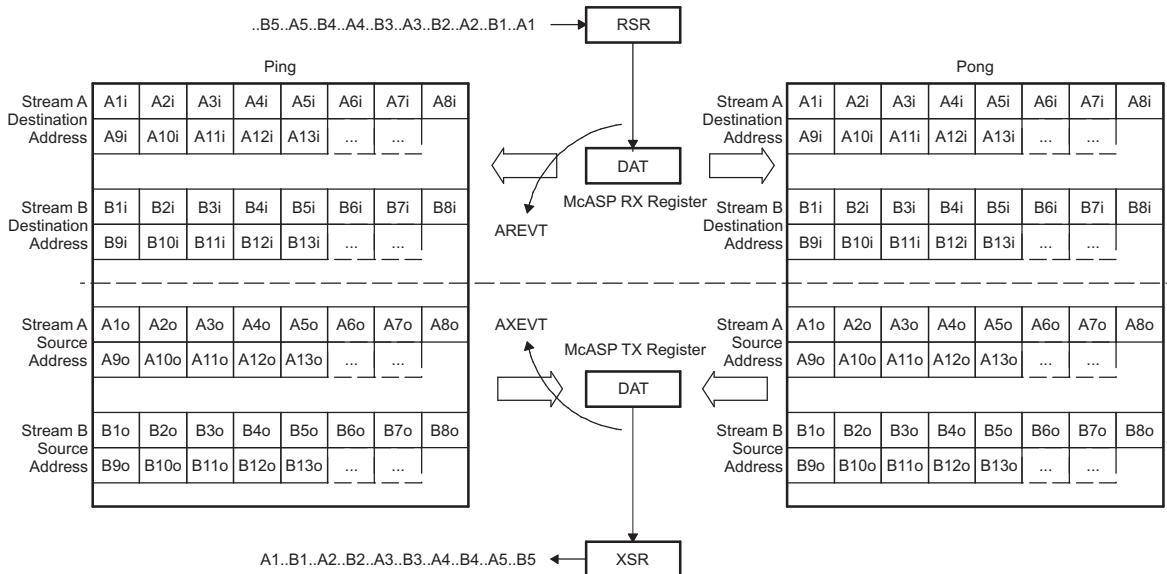

Ping-pong buffering is a simple technique that allows the CPU activity to be distanced from the EDMA3 activity. This means that there are multiple (usually two) sets of data buffers for all incoming and outgoing data streams. While the EDMA3 transfers the data into and out of the ping buffers, the CPU manipulates the data in the pong buffers. When both CPU and EDMA3 activity completes, they switch. The EDMA3 then writes over the old input data and transfers the new output data. [Figure 11-35](#) shows the ping-pong scheme for this example.

To change the continuous operation example, such that a ping-pong buffering scheme is used, the EDMA3 channels need only a moderate change. Instead of one parameter set, there are two; one for transferring data to/from the ping buffers and one for transferring data to/from the pong buffers. As soon as one transfer completes, the channel loads the PaRAM set for the other and the data transfers continue. [Figure 11-36](#) shows the EDMA3 channel configuration required.

Each channel has two parameter sets, ping and pong. The EDMA3 channel is initially loaded with the ping parameters ([Figure 11-36](#)). The link address for the ping set is set to the PaRAM offset of the pong parameter set ([Figure 11-37](#)). The link address for the pong set is set to the PaRAM offset of the ping parameter set ([Figure 11-38](#)). The channel options, count values, and index values are all identical between the ping and pong parameters for each channel. The only differences are the link address provided and the address of the data buffer.

#### 11.3.19.4.4.1 Synchronization with the CPU

To utilize the ping-pong buffering technique, the system must signal the CPU when to begin to access the new data set. After the CPU finishes processing an input buffer (ping), it waits for the EDMA3 to complete before switching to the alternate (pong) buffer. In this example, both channels provide their channel numbers as their report word and set the TCINTEN bit to generate an interrupt after completion. When channel 15 fills an input buffer, the E15 bit in the interrupt pending register (IPR) is set; when channel 12 empties an output buffer, the E12 bit in IPR is set. The CPU must manually clear these bits. With the channel parameters set, the CPU polls IPR to determine when to switch. The EDMA3 and CPU could alternatively be configured such that the channel completion interrupts the CPU. By doing this, the CPU could service a background task while waiting for the EDMA3 to complete.

#### 11.3.19.4.5 Transfer Chaining Examples

The following examples explain the intermediate transfer complete chaining function.

##### 11.3.19.4.5.1 Servicing Input/Output FIFOs with a Single Event

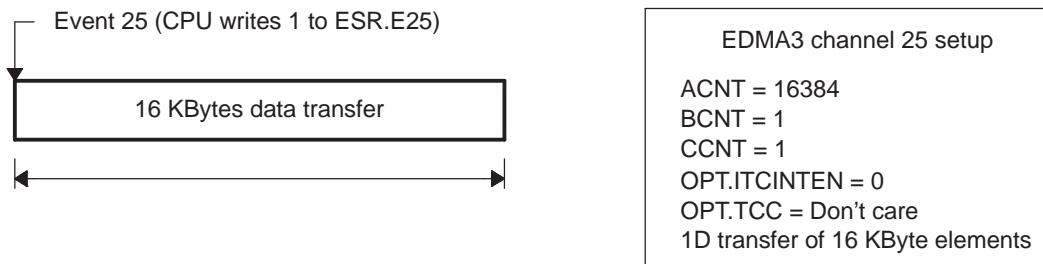

Many systems require the use of a pair of external FIFOs that must be serviced at the same rate. One FIFO buffers data input, and the other buffers data output. The EDMA3 channels that service these FIFOs can be set up for AB-synchronized transfers. While each FIFO is serviced with a different set of parameters, both can be signaled from a single event. For example, an external interrupt pin can be tied to the status flags of one of the FIFOs. When this event arrives, the EDMA3 needs to perform servicing for both the input and output streams. Without the intermediate transfer complete chaining feature this would require two events, and thus two external interrupt pins. The intermediate transfer complete chaining feature allows the use of a single external event (for example, a GPIO event). [Figure 11-39](#) shows the EDMA3 setup and illustration for this example.

A GPIO event (in this case, GPINT0) triggers an array transfer. Upon completion of each intermediate array transfer of channel 48, intermediate transfer complete chaining sets the E8 bit (specified by TCC of 8) in the chained event register (CER) and provides a synchronization event to channel 8. Upon completion of the last array transfer of channel 48, transfer complete chaining—not intermediate transfer complete chaining—sets the E8 bit in CER (specified by TCCMODE:TCC) and provides a synchronization event to channel 8. The completion of channel 8 sets the I8 bit (specified by TCCMODE:TCC) in the interrupt pending register (IPR), which can generate an interrupt to the CPU, if the I8 bit in the interrupt enable register (IER) is set.

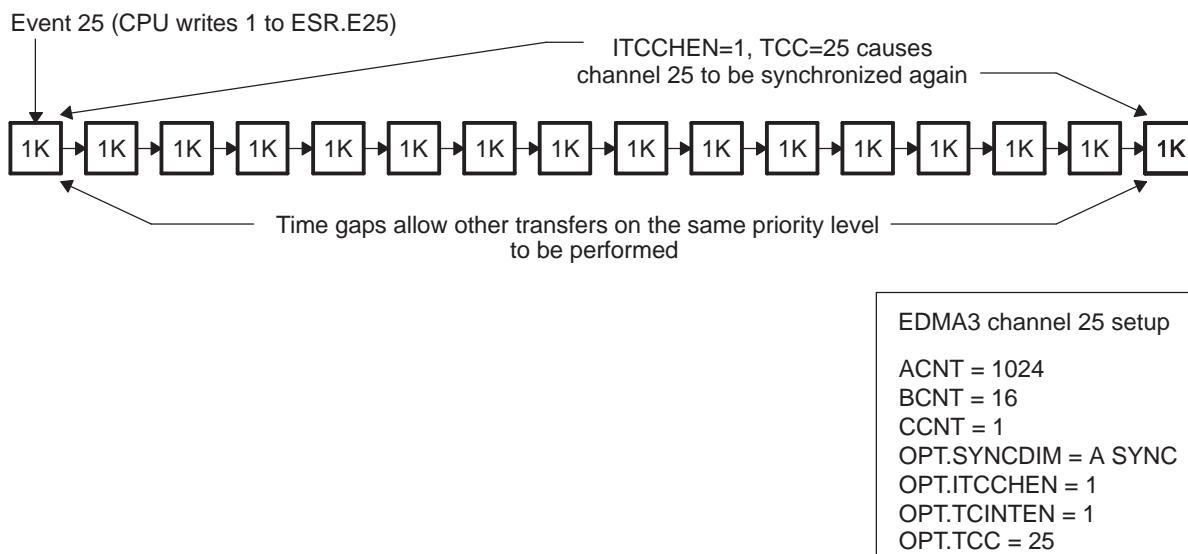

**Figure 11-39. Intermediate Transfer Completion Chaining Example**

#### 11.3.19.4.5.2 Breaking Up Large Transfers with Intermediate Chaining

Another feature of intermediate transfer chaining (ITCCHEN) is for breaking up large transfers. A large transfer may lock out other transfers of the same priority level for the duration of the transfer. For example, a large transfer on queue 0 from the internal memory to the external memory using the EMIF may starve other EDMA3 transfers on the same queue. In addition, this large high-priority transfer may prevent the EMIF for a long duration to service other lower priority transfers. When a large transfer is considered to be high priority, it should be split into multiple smaller transfers. [Figure 11-40](#) shows the EDMA3 setup and illustration of an example single large block transfer.

**Figure 11-40. Single Large Block Transfer Example**

The intermediate transfer chaining enable (ITCCHEN) provides a method to break up a large transfer into smaller transfers. For example, to move a single large block of memory (16K bytes), the EDMA3 performs an A-synchronized transfer. The element count is set to a reasonable value, where reasonable derives from the amount of time it would take to move this smaller amount of data. Assume 1 Kbyte is a reasonable small transfer in this example. The EDMA3 is set up to transfer 16 arrays of 1 Kbyte elements, for a total of 16K byte elements. The TCC field in the channel options parameter (OPT) is set to the same value as the channel number and ITCCHEN are set. In this example, EDMA3 channel 25 is used and TCC is also set to 25. The TCINTEN may also be set to trigger interrupt 25 when the last 1 Kbyte array is transferred. The CPU starts the EDMA3 transfer by writing to the appropriate bit of the event set register (ESR.E25). The EDMA3 transfers the first 1 Kbyte array. Upon completion of the first array, intermediate transfer complete code chaining generates a synchronization event to channel 25, a value specified by the TCC field. This intermediate transfer completion chaining event causes EDMA3 channel 25 to transfer the next 1 Kbyte array. This process continues until the transfer parameters are exhausted, at which point the EDMA3 has completed the 16K byte transfer. This method breaks up a large transfer into smaller packets, thus providing natural time slices in the transfer such that other events may be processed. [Figure 11-41](#) shows the EDMA3 setup and illustration of the broken up smaller packet transfers.

**Figure 11-41. Smaller Packet Data Transfers Example**

## 11.4 EDMA3 Registers

### 11.4.1 EDMA3 Channel Controller Registers

Table 11-25 lists the memory-mapped registers for the EDMA3 channel controller (EDMACC). All other register offset addresses not listed in Table 11-25 should be considered as reserved locations and the register contents should not be modified.

**Table 11-25. EDMACC Registers**

| Offset      | Acronym    | Register Description                                | Section                            |
|-------------|------------|---|------------------------------------|

### 11.4.1.1 Global Registers

#### 11.4.1.1.1 Peripheral Identification Register (PID)

The peripheral identification register (PID) uniquely identifies the EDMA3CC and the specific revision of the EDMA3CC.

The PID is shown in [Figure 11-42](#) and described in [Table 11-26](#).

**Figure 11-42. Peripheral ID Register (PID)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-26. Peripheral ID Register (PID) Field Descriptions**

| Bit  | Field | Value        | Description   |
|------|-------|--------------|---|
| 31-0 | PID   | 0xFFFF FFFFh | Peripheral identifier uniquely identifies the EDMA3CC and the specific revision of the EDMA3CC. |

#### 11.4.1.1.2 EDMA3CC Configuration Register (CCCFG)

The EDMA3CC configuration register (CCCFG) provides the features/resources for the EDMA3CC in a particular device.

The CCCFG is shown in [Figure 11-43](#) and described in [Table 11-27](#).

**Figure 11-43. EDMA3CC Configuration Register (CCCFG)**

#### 11.4.1.1.3 EDMA3CC System Configuration Register (SYSCONFIG)

The EDMA3CC system configuration register is used for clock management configuration. The register is shown in [Figure 11-44](#) and described in [Table 11-28](#).

**Figure 11-44. EDMA3CC System Configuration Register (SYSCONFIG)**

|    |          |     |   |             |          |         |           |       |
|----|----------|-----|---|-------------|----------|---------|-----------|-------|
| 31 |          |     |   |             |          |         |           | 16    |
|    | Reserved |     |   |             |          |         |           |       |
|    | R-0      |     |   |             |          |         |           |       |
| 15 | Reserved | 6   | 5 | 4           | 3        | 2       | 1         | 0     |
|    |          |     |   | STANDBYMODE | IDLEMODE | FREEEMU | SOFTRESET |       |
|    |          | R-0 |   | R/W-2       | R/W-2    | R/W-0   |           | R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

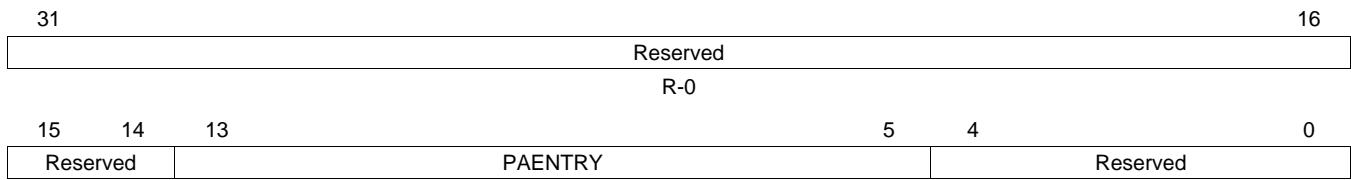

**Table 11-28. EDMA3CC System Configuration Register (SYSCONFIG) Field Descriptions**

| Bit  | Field       | Value | Description   |
|------|-------------|-------|---|
| 31-6 | Reserved    | 0     | Read returns 0.   |
| 5-4  | STANDBYMODE |       | Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state.<br>0x0 = Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only.<br>0x1 = No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only.<br>0x2 = Smart-standby mode: local initiator standby status depends on local conditions, i.e., the module's functional requirement from the initiator. IP module should not generate (initiator-related) wakeup events.<br>0x3 = Smart-Standby wakeup-capable mode: local initiator standby status depends on local conditions, i.e., the module's functional requirement from the initiator. IP module may generate (master-related) wakeup events when in standby state. Mode is only relevant if the appropriate IP module "mwakeup" output is implemented. |
| 3-2  | IDLEMODE    |       | Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.<br>0x0 = Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only.<br>0x1 = No-idle mode: local target never enters idle state. Backup mode, for debug only.<br>0x2 = Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events.<br>0x3 = Reserved.   |
| 1    | FREEEMU     |       | Sensitivity to emulation (debug) suspend input signal.<br>0 = IP module is sensitive to emulation suspend.<br>1 = IP module is not sensitive to emulation suspend.  |
| 0    | SOFTRESET   | 0     | Software reset (optional)   |

#### 11.4.1.1.4 DMA Channel Map *n* Registers (DCHMAP*n*)

The DMA channel map *n* register (DCHMAP*n*) is shown in [Figure 11-45](#) and described in [Table 11-29](#).

**Figure 11-45. DMA Channel Map *n* Registers (DCHMAP*n*)**

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

**Table 11-29. DMA Channel Map *n* Registers (DCHMAP*n*) Field Descriptions**

| Bit   | Field    | Value  | Description   |
|-------|----------|--------|---|
| 31-14 | Reserved | 0      | Reserved  |
| 13-5  | PAENTRY  | 0-1FFh | Points to the PaRAM set number for DMA channel <i>n</i> . |
| 4-0   | Reserved | 0      | Reserved  |

#### **11.4.1.1.5 QDMA Channel Map n Registers (QCHMAPn)**

Each QDMA channel in EDMA3CC can be associated with any PaRAM set available on the device. Furthermore, the specific trigger word (0-7) of the PaRAM set can be programmed. The PaRAM set association and trigger word for every QDMA channel register is configurable using the QDMA channel map  $n$  register (QCHMAP $n$ ).

The QCHMAP $n$  is shown in Figure 11-46 and described in Table 11-30.

**NOTE:** At reset the QDMA channel map registers for all QDMA channels point to PaRAM set 0. If an application makes use of both a DMA channel that points to PaRAM set 0 and any QDMA channels, ensure that  $\text{QCHMAP}_n$  is programmed appropriately to point to a different PaRAM entry.

**Figure 11-46. QDMA Channel Map  $n$  Registers (QCHMAP $n$ )**

|          |          |    |  |        |   |   |          |   |     |
|----------|----------|----|--|--------|---|---|----------|---|-----|
| 31       | Reserved |    |  |        |   |   |          |   | 16  |
|          | R-0      |    |  |        |   |   |          |   |     |

| R-0      | R/W-0    |    |  | R/W-0  |   |   | R-0      |   |     |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-30. QDMA Channel Map  $n$  Registers (QCHMAP $n$ ) Field Descriptions**

| <b>Bit</b> | <b>Field</b> | <b>Value</b>                 | <b>Description</b>  |
|------------|--------------|------------------------------|---|
| 31-14      | Reserved     | 0                            | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 13-5       | PAENTRY      | 0-1FFh<br>0-FFh<br>100h-1FFh | PAENTRY points to the PaRAM set number for QDMA channel <i>n</i> .<br>Parameter entry 0 through 255.<br>Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 4-2        | TRWORD       | 0-7h                         | Points to the specific trigger word of the PaRAM set defined by PAENTRY. A write to the trigger word results in a QDMA event being recognized.  |
| 1-0        | Reserved     | 0                            | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |

#### 11.4.1.1.6 DMA Channel Queue *n* Number Registers (DMAQNUM*n*)

The DMA channel queue number register (DMAQNUM*n*) allows programmability of each of the 64 DMA channels in the EDMA3CC to submit its associated synchronization event to any event queue in the EDMA3CC. At reset, all channels point to event queue 0.

The DMAQNUM*n* is shown in [Figure 11-47](#) and described in [Table 11-31](#). [Table 11-32](#) shows the channels and their corresponding bits in DMAQNUM*n*.

---

**NOTE:** Because the event queues in EDMA3CC have a fixed association to the transfer controllers, that is, Q0 TRs are submitted to TC0, Q1 TRs are submitted to TC1, etc., by programming DMAQNUM*n* for a particular DMA channel *n* also dictates which transfer controller is utilized for the data movement (or which EDMA3TC receives the TR request).

---

**Figure 11-47. DMA Channel Queue *n* Number Registers (DMAQNUM*n*)**

#### 11.4.1.1.7 QDMA Channel Queue Number Register (QDMAQNUM)

The QDMA channel queue number register (QDMAQNUM) is used to program all the QDMA channels in the EDMA3CC to submit the associated QDMA event to any of the event queues in the EDMA3CC.

The QDMAQNUM is shown in [Figure 11-48](#) and described in [Table 11-33](#).

**Figure 11-48. QDMA Channel Queue Number Register (QDMAQNUM)**

| 31   | 30    | 28   | 27 | 26    | 24   | 23 | 22    | 20   | 19 | 18    | 16 |

|-------|----------|-------|---|
| 31-15 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 14-0  | $E_n$    | 0-7h  | QDMA queue number. Contains the event queue number to be used for the corresponding QDMA channel.<br><br>0 Event $n$ is queued on Q0.<br>1h Event $n$ is queued on Q1.<br>2h Event $n$ is queued on Q2.<br>3h Event $n$ is queued on Q3.<br><br>4h-7h Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |

#### 11.4.1.1.8 Queue Priority Register (QUEPRI)

The queue priority register (QUEPRI) allows you to change the priority of the individual queues and the priority of the transfer request (TR) associated with the events queued in the queue. Because the queue to EDMA3TC mapping is fixed, programming QUEPRI essentially governs the priority of the associated transfer controller(s) read/write commands with respect to the other bus masters in the device. You can modify the EDMA3TC priority to obtain the desired system performance.

The QUEPRI is shown in [Figure 11-49](#) and described in [Table 11-34](#).

**Figure 11-49. Queue Priority Register (QUEPRI)**

| 31   | Reserved |      |       |      |       |      |       |   |   |   | 16 |       |
|------|----------|------|-------|------|-------|------|-------|---|---|---|----|-------|
|      |          |      |       |      |       |      |       |   |   |   |    | R-0   |
| 15   | 14       | 12   | 11    | 10   | 8     | 7    | 6     | 4 | 3 | 2 | 0  |       |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-34. Queue Priority Register (QUEPRI) Field Descriptions**

| Bit   | Field    | Value | Description  |
|-------|----------|-------|--|
| 31-15 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 14-12 | PRIQ3    | 0-7h  | Priority level for queue 3. Dictates the priority level used by TC3 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority. |
| 11    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 10-8  | PRIQ2    | 0-7h  | Priority level for queue 2. Dictates the priority level used by TC2 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority. |
| 7     | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 6-4   | PRIQ1    | 0-7h  | Priority level for queue 1. Dictates the priority level used by TC1 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority. |
| 3     | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 2-0   | PRIQ0    | 0-7h  | Priority level for queue 0. Dictates the priority level used by TC0 relative to other masters in the device. A value of 0 means highest priority and a value of 7 means lowest priority. |

### 11.4.1.2 Error Registers

The EDMA3CC contains a set of registers that provide information on missed DMA and/or QDMA events, and instances when event queue thresholds are exceeded. If any of the bits in these registers is set, it results in the EDMA3CC generating an error interrupt.

#### 11.4.1.2.1 Event Missed Registers (EMR/EMRH)

For a particular DMA channel, if a second event is received prior to the first event getting cleared/serviced, the bit corresponding to that channel is set/asserted in the event missed registers (EMR/EMRH). All trigger types are treated individually, that is, manual triggered (ESR/ESRH), chain triggered (CER/CERH), and event triggered (ER/ERH) are all treated separately. The EMR/EMRH bits for a channel are also set if an event on that channel encounters a NULL entry (or a NULL TR is serviced). If any EMR/EMRH bit is set (and all errors, including bits in other error registers (QEMR, CCERR) were previously cleared), the EDMA3CC generates an error interrupt. For details on EDMA3CC error interrupt generation, see *Error Interrupts*.

The EMR is shown in [Figure 11-50](#) and described in [Table 11-35](#). The EMRH is shown in [Figure 11-51](#) and described in [Table 11-36](#).

**Figure 11-50. Event Missed Register (EMR)**

| Bit  | Field | Value | Description  |
|------|-------|-------|--|
| 31-0 | En    | 0     | Channel 32-63 event missed. En is cleared by writing a 1 to the corresponding bit in the event missed clear register high (EMCRH). |
|      |       | 1     | No missed event.   |
|      |       |       | Missed event occurred.   |

#### 11.4.1.2.2 Event Missed Clear Registers (EMCR/EMCRH)

Once a missed event is posted in the event missed registers (EMR/EMRH), the bit remains set and you need to clear the set bit(s). This is done by way of CPU writes to the event missed clear registers (EMCR/EMCRH). Writing a 1 to any of the bits clears the corresponding missed event (bit) in EMR/EMRH; writing a 0 has no effect.

The EMCR is shown in [Figure 11-52](#) and described in [Table 11-37](#). The EMCRH is shown in [Figure 11-53](#) and described in [Table 11-38](#).

|      |       | 1     | No effect.   |
|      |       |       | Corresponding missed event bit in the event missed register high (EMRH) is cleared (En = 0).                                 |

#### 11.4.1.2.3 QDMA Event Missed Register (QEMR)

For a particular QDMA channel, if two QDMA events are detected without the first event getting cleared/serviced, the bit corresponding to that channel is set/asserted in the QDMA event missed register (QEMR). The QEMR bits for a channel are also set if a QDMA event on the channel encounters a NULL entry (or a NULL TR is serviced). If any QEMR bit is set (and all errors, including bits in other error registers (EMR/EMRH, CCERR) were previously cleared), the EDMA3CC generates an error interrupt. For details on EDMA3CC error interrupt generation, see *Error Interrupts*.

The QEMR is shown in [Figure 11-54](#) and described in [Table 11-39](#).

**Figure 11-54. QDMA Event Missed Register (QEMR)**

|    |          |  |     |     |     |     |     |     |     |     |

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-0  | En       | 0     | Channel 0-7 QDMA event missed. En is cleared by writing a 1 to the corresponding bit in the QDMA event missed clear register (QEMCR).   |
|      |          | 1     | No missed event.<br>Missed event occurred.  |

#### 11.4.1.2.4 QDMA Event Missed Clear Register (QEMCR)

Once a missed event is posted in the QDMA event missed registers (QEMR), the bit remains set and you need to clear the set bit(s). This is done by way of CPU writes to the QDMA event missed clear registers (QEMCR). Writing a 1 to any of the bits clears the corresponding missed event (bit) in QEMR; writing a 0 has no effect.

The QEMCR is shown in [Figure 11-55](#) and described in [Table 11-40](#).

**Figure 11-55. QDMA Event Missed Clear Register (QEMCR)**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-0  | En       | 0     | QDMA event missed clear. All error bits must be cleared before additional error interrupts will be asserted by the EDMA3CC.             |
|      |          | 1     | No effect.  |
|      |          | 1     | Corresponding missed event bit in the QDMA event missed register (QEMR) is cleared (En = 0).  |

#### 11.4.1.2.5 EDMA3CC Error Register (CCERR)

The EDMA3CC error register (CCERR) indicates whether or not at any instant of time the number of events queued up in any of the event queues exceeds or equals the threshold/watermark value that is set in the queue watermark threshold register (QWMTHRA). Additionally, CCERR also indicates if when the number of outstanding TRs that have been programmed to return transfer completion code (TRs which have the TCINTEN or TCCHEN bit in OPT set) to the EDMA3CC has exceeded the maximum allowed value of 63. If any bit in CCERR is set (and all errors, including bits in other error registers (EMR/EMRH, QEMR) were previously cleared), the EDMA3CC generates an error interrupt. For details on EDMA3CC error interrupt generation, see *Error Interrupts*. Once the error bits are set in CCERR, they can only be cleared by writing to the corresponding bits in the EDMA3CC error clear register (CCERRCLR).

The CCERR is shown in [Figure 11-56](#) and described in [Table 11-41](#).

**Figure 11-56. EDMA3CC Error Register (CCERR)**

|          |          |          |          |          |   |    |    |

| Bit   | Field     | Value | Description  |
|-------|-----------|-------|--|
| 31-17 | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.          |
| 16    | TCCERR    | 0     | Transfer completion code error. TCCERR is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR).        |
|       |           | 1     | Total number of allowed TCCs outstanding has not been reached.   |
|       |           | 1     | Total number of allowed TCCs has been reached.   |
| 15-4  | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.          |
| 3     | QTHRXC3D3 | 0     | Queue threshold error for queue 3. QTHRXC3D3 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR).  |
|       |           | 0     | Watermark/threshold has not been exceeded.   |
|       |           | 1     | Watermark/threshold has been exceeded.   |
| 2     | QTHRXC2D2 | 0     | Queue threshold error for queue 2. QTHRXC2D2 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR).  |
|       |           | 0     | Watermark/threshold has not been exceeded.   |
|       |           | 1     | Watermark/threshold has been exceeded.   |
| 1     | QTHRXC1D1 | 0     | Queue threshold error for queue 1 . QTHRXC1D1 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR). |
|       |           | 0     | Watermark/threshold has not been exceeded.   |
|       |           | 1     | Watermark/threshold has been exceeded.   |
| 0     | QTHRXC0D0 | 0     | Queue threshold error for queue 0. QTHRXC0D0 is cleared by writing a 1 to the corresponding bit in the EDMA3CC error clear register (CCERRCLR).  |
|       |           | 0     | Watermark/threshold has not been exceeded.   |
|       |           | 1     | Watermark/threshold has been exceeded.   |

#### 11.4.1.2.6 EDMA3CC Error Clear Register (CCERRCLR)

The EDMA3CC error clear register (CCERRCLR) is used to clear any error bits that are set in the EDMA3CC error register (CCERR). In addition, CCERRCLR also clears the values of some bit fields in the queue status registers (QSTAT $n$ ) associated with a particular event queue. Writing a 1 to any of the bits clears the corresponding bit in CCERR; writing a 0 has no effect.

The CCERRCLR is shown in [Figure 11-57](#) and described in [Table 11-42](#).

**Figure 11-57. EDMA3CC Error Clear Register (CCERRCLR)**

|          |          |     |     |     |     |     |

| Bit   | Field    | Value | Description   |
|-------|----------|-------|---|
| 31-17 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 16    | TCCERR   | 0     | Transfer completion code error clear.<br>No effect.   |
|       |          | 1     | Clears the TCCERR bit in the EDMA3CC error register (CCERR).  |

**Table 11-42. EDMA3CC Error Clear Register (CCERRCLR) Field Descriptions (continued)**

| Bit  | Field     | Value | Description   |
|------|-----------|-------|---|
| 15-4 | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 3    | QTHRXC3D3 | 0     | Queue threshold error clear for queue 3.<br>No effect.  |
|      |           | 1     | Clears the QTHRXC3D3 bit in the EDMA3CC error register (CCERR) and the WM and THRXC3D bits in the queue status register 3 (QSTAT3).     |
| 2    | QTHRXC2D2 | 0     | Queue threshold error clear for queue 2.<br>No effect.  |
|      |           | 1     | Clears the QTHRXC2D2 bit in the EDMA3CC error register (CCERR) and the WM and THRXC2D bits in the queue status register 2 (QSTAT2).     |
| 1    | QTHRXC1D1 | 0     | Queue threshold error clear for queue 1.<br>No effect.  |
|      |           | 1     | Clears the QTHRXC1D1 bit in the EDMA3CC error register (CCERR) and the WM and THRXC1D bits in the queue status register 1 (QSTAT1).     |
| 0    | QTHRXC0D0 | 0     | Queue threshold error clear for queue 0.<br>No effect.  |
|      |           | 1     | Clears the QTHRXC0D0 bit in the EDMA3CC error register (CCERR) and the WM and THRXC0D bits in the queue status register 0 (QSTAT0).     |

#### 11.4.1.2.7 Error Evaluation Register (EEVAL)

The EDMA3CC error interrupt is asserted whenever an error bit is set in any of the error registers (EMR/EMRH, QEMR, and CCERR). For subsequent error bits that get set, the EDMA3CC error interrupt is reass器ted only when transitioning from an “all the error bits cleared” to “at least one error bit is set”. Alternatively, a CPU write of 1 to the EVAL bit in the error evaluation register (EEVAL) results in reasserting the EDMA3CC error interrupt, if there are any outstanding error bits set due to subsequent error conditions. Writes of 0 have no effect.

The EEVAL is shown in [Figure 11-58](#) and described in [Table 11-43](#).

**Figure 11-58. Error Evaluation Register (EEVAL)**

|     |          |  |  |                              |

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-2 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 1    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 0    | EVAL     | 0     | Error interrupt evaluate.<br>No effect.   |
|      |          | 1     | EDMA3CC error interrupt will be pulsed if any errors have not been cleared in any of the error registers (EMR/EMRH, QEMR, or CCERR).    |

### 11.4.1.3 Region Access Enable Registers

The region access enable register group consists of the DMA access enable registers (DRAEm and DRAEHm) and the QDMA access enable registers (QRAEm). Where  $m$  is the number of shadow regions in the EDMA3CC memory map for a device. You can configure these registers to assign ownership of DMA/QDMA channels to a particular shadow region.

#### 11.4.1.3.1 DMA Region Access Enable for Region $m$ (DRAEm)

The DMA region access enable register for shadow region  $m$  (DRAEm/DRAEHm) is programmed to allow or disallow read/write accesses on a bit-by-bit bases for all DMA registers in the shadow region  $m$  view of the DMA channel registers. See the EDMA3CC register memory map ([Table 11-25](#)) for a list of all the DMA channel and interrupt registers mapped in the shadow region view. Additionally, the DRAEm/DRAEHm configuration determines completion of which DMA channels will result in assertion of the shadow region  $m$  DMA completion interrupt (see *EDMA3 Interrupts*).

The DRAEm is shown in [Figure 11-59](#) and described in [Table 11-44](#). The DRAEHm is shown in [Figure 11-60](#) and described in [Table 11-44](#).

Field Descriptions**

| Bit  | Field | Value | Description  |
|------|-------|-------|--|
| 31-0 | En    | 0     | DMA region access enable for bit $n$ /channel $n$ in region $m$ .<br>Accesses via region $m$ address space to bit $n$ in any DMA channel register are not allowed. Reads return 0 on bit $n$ and writes do not modify the state of bit $n$ . Enabled interrupt bits for bit $n$ do not contribute to the generation of a transfer completion interrupt for shadow region $m$ . |
|      |       | 1     | Accesses via region $m$ address space to bit $n$ in any DMA channel register are allowed. Reads return the value from bit $n$ and writes modify the state of bit $n$ . Enabled interrupt bits for bit $n$ contribute to the generation of a transfer completion interrupt for shadow region $m$ .  |

#### 11.4.1.3.2 QDMA Region Access Enable Registers (QRAEm)

The QDMA region access enable register for shadow region  $m$  (QRAEm) is programmed to allow or disallow read/write accesses on a bit-by-bit bases for all QDMA registers in the shadow region  $m$  view of the QDMA registers. This includes all 4-bit QDMA registers.

The QRAEm is shown in [Figure 11-61](#) and described in [Table 11-45](#).

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 7-0  | En       | 0     | QDMA region access enable for bit $n$ /QDMA channel $n$ in region $m$ .<br>Accesses via region $m$ address space to bit $n$ in any QDMA channel register are not allowed. Reads return 0 on bit $n$ and writes do not modify the state of bit $n$ . |
|      |          | 1     | Accesses via region $m$ address space to bit $n$ in any QDMA channel register are allowed. Reads return the value from bit $n$ and writes modify the state of bit $n$ .   |

#### 11.4.1.4 Status/Debug Visibility Registers

The following set of registers provide visibility into the event queues and a TR life cycle. These are useful for system debug as they provide in-depth visibility for the events queued up in the event queue and also provide information on what parts of the EDMA3CC logic are active once the event has been received by the EDMA3CC.

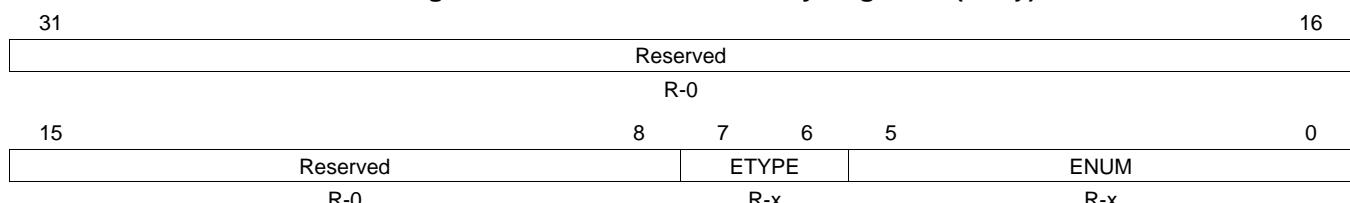

##### 11.4.1.4.1 Event Queue Entry Registers (QxEy)

The event queue entry registers (QxEy) exist for all 16 queue entries (the maximum allowed queue entries) for all event queues in the EDMA3CC.

There are Q0E0 to Q0E15, Q1E0 to Q1E15, Q2E0 to Q2E15, and Q3E0 to Q3E15. Each register details the event number (ENUM) and the event type (ETYPE). For example, if the value in Q1E4 is read as 000 004Fh, this means the 4th entry in queue 1 is a manually-triggered event on DMA channel 15.

The QxEy is shown in [Figure 11-62](#) and described in [Table 11-46](#).

**Figure 11-62. Event Queue Entry Registers (QxEy)**

LEGEND: R = Read only; -n = value after reset; -x = value is indeterminate after reset

**Table 11-46. Event Queue Entry Registers (QxEy) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-6  | ETYPE    | 0-3h  | Event entry y in queue x. Specifies the specific event type for the given entry in the event queue.                                     |
|      |          | 0     | Event triggered via ER.   |
|      |          | 1h    | Manual triggered via ESR.   |
|      |          | 2h    | Chain triggered via CER.  |
|      |          | 3h    | Auto-triggered via QER.   |
| 5-0  | ENUM     | 0-3Fh | Event entry y in queue x. Event number:   |
|      |          | 0-3h  | QDMA channel number (0 to 3).   |
|      |          | 0-3Fh | DMA channel/event number (0 to 63).   |

#### 11.4.1.4.2 Queue Status Registers (QSTAT $n$ )

The queue status registers (QSTAT $n$ ) is shown in [Figure 11-63](#) and described in [Table 11-47](#).

**Figure 11-63. Queue Status Register  $n$  (QSTAT $n$ )**

| 31       | 25 | 24     | 23       | 21       | 20  | 16      |

| Reserved |    | NUMVAL |          | Reserved |     | STRTPTR |
| R-0      |    | R-0    |          | R-0      |     | R-0     |

LEGEND: R = Read only; -n = value after reset

**Table 11-47. Queue Status Register  $n$  (QSTAT $n$ ) Field Descriptions**

| Bit   | Field    | Value   | Description  |
|-------|----------|---------|--|
| 31-25 | Reserved | 0       | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 24    | THRXCD   | 0       | Threshold exceeded. THRXC $D$ is cleared by writing a 1 to the corresponding QTHRXC $Dn$ bit in the EDMA3CC error clear register (CCERRCLR).   |
|       |          | 1       | Threshold specified by the Q $n$ bit in the queue watermark threshold A register (QWMTHRA) has not been exceeded.  |
|       |          | 1       | Threshold specified by the Q $n$ bit in the queue watermark threshold A register (QWMTHRA) has been exceeded.  |
| 23-21 | Reserved | 0       | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 20-16 | WM       | 0-10h   | Watermark for maximum queue usage. Watermark tracks the most entries that have been in queue $n$ since reset or since the last time that the watermark (WM) bit was cleared. WM is cleared by writing a 1 to the corresponding QTHRXC $Dn$ bit in the EDMA3CC error clear register (CCERRCLR). |
|       |          | 0-10h   | Legal values are 0 (empty) to 10h (full).  |
|       |          | 11h-1Fh | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 15-13 | Reserved | 0       | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 12-8  | NUMVAL   | 0-10h   | Number of valid entries in queue $n$ . The total number of entries residing in the queue manager FIFO at a given instant. Always enabled.  |
|       |          | 0-10h   | Legal values are 0 (empty) to 10h (full).  |
|       |          | 11h-1Fh | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 7-4   | Reserved | 0       | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 3-0   | STRTPTR  | 0-Fh    | Start pointer. The offset to the head entry of queue $n$ , in units of entries. Always enabled. Legal values are 0 (0th entry) to Fh (15th entry).   |

#### 11.4.1.4.3 Queue Watermark Threshold A Register (QWMTHRA)

The queue watermark threshold A register (QWMTHRA) is shown in [Figure 11-64](#) and described in [Table 11-48](#).

**Figure 11-64. Queue Watermark Threshold A Register (QWMTHRA)**

| 31       | 29 | 28      | 24 | 23       | 21 | 20      | 16 |

The QTHRXC2D bit in the EDMA3CC error register (CCERR) and the THRXC2D bit in the queue status register 2 (QSTAT2) are set when the number of events in queue 2 at an instant in time (visible via the NUMVAL bit in QSTAT2) equals or exceeds the value specified by Q2.<br><br>The default is 16 (maximum allowed).<br><br>Disables the threshold errors.<br><br>Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 15-13 | Reserved | 0                                | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 12-8  | Q1       | 0-10h<br>11h<br>12h-1Fh          | Queue threshold for queue 1 value. The QTHRXC1D bit in the EDMA3CC error register (CCERR) and the THRXC1D bit in the queue status register 1 (QSTAT1) are set when the number of events in queue 1 at an instant in time (visible via the NUMVAL bit in QSTAT1) equals or exceeds the value specified by Q1.<br><br>The default is 16 (maximum allowed).<br><br>Disables the threshold errors.<br><br>Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-5   | Reserved | 0                                | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 4-0   | Q0       | 0-10h<br>11h<br>12h-1Fh          | Queue threshold for queue 0 value. The QTHRXC0D bit in the EDMA3CC error register (CCERR) and the THRXC0D bit in the queue status register 0 (QSTAT0) are set when the number of events in queue 0 at an instant in time (visible via the NUMVAL bit in QSTAT0) equals or exceeds the value specified by Q0.<br><br>The default is 16 (maximum allowed).<br><br>Disables the threshold errors.<br><br>Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |

#### 11.4.1.4.4 EDMA3CC Status Register (CCSTAT)

The EDMA3CC status register (CCSTAT) has a number of status bits that reflect which parts of the EDMA3CC logic is active at any given instant of time. The CCSTAT is shown in [Figure 11-65](#) and described in [Table 11-49](#).

**Figure 11-65. EDMA3CC Status Register (CCSTAT)**

|          |          |          |      |          |          |          |          |  |    |

| R-0      |          |          | R-0  | R-0      | R-0      | R-0      | R-0      |  |    |

LEGEND: R = Read only; -n = value after reset

**Table 11-49. EDMA3CC Status Register (CCSTAT) Field Descriptions**

| Bit   | Field    | Value  | Description  |
|-------|----------|--------|--|
| 31-20 | Reserved | 0      | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 19    | QUEACTV3 | 0      | Queue 3 active.<br>No events are queued in queue 3.  |
|       |          | 1      | At least one TR is queued in queue 3.  |
| 18    | QUEACTV2 | 0      | Queue 2 active.<br>No events are queued in queue 2.  |
|       |          | 1      | At least one TR is queued in queue 2.  |
| 17    | QUEACTV1 | 0      | Queue 1 active.<br>No events are queued in queue 1.  |
|       |          | 1      | At least one TR is queued in queue 1.  |
| 16    | QUEACTV0 | 0      | Queue 0 active.<br>No events are queued in queue 0.  |
|       |          | 1      | At least one TR is queued in queue 0.  |
| 15-14 | Reserved | 0      | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 13-8  | COMPACTV | 0-3Fh  | Completion request active. The COMPACTV field reflects the count for the number of completion requests submitted to the transfer controllers. This count increments every time a TR is submitted and is programmed to report completion (the TCINTEN or TCCCHEN bits in OPT in the parameter entry associated with the TR are set). The counter decrements for every valid TCC received back from the transfer controllers. If at any time the count reaches a value of 63, the EDMA3CC will not service any new TRs until the count is less than 63 (or return a transfer completion code from a transfer controller, which would decrement the count). |
|       |          | 0      | No completion requests outstanding.  |
|       |          | 1h-3Fh | Total of 1 completion request to 63 completion requests are outstanding.   |
| 7-5   | Reserved | 0      | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |

**Table 11-49. EDMA3CC Status Register (CCSTAT) Field Descriptions (continued)**

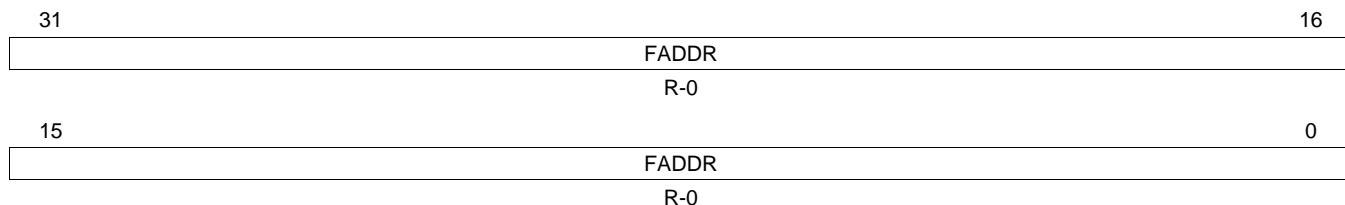

| Bit | Field    | Value | Description   |
|-----|----------|-------|---|
| 4   | ACTV     | 0     | Channel controller active. Channel controller active is a logical-OR of each of the *ACTV bits. The ACTV bit remains high through the life of a TR. |
|     |          |       | Channel is idle..   |
|     |          | 1     | Channel is busy.  |
| 3   | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.             |
|     |          |       | Transfer request active.  |
|     |          | 1     | Transfer request processing/submission logic is inactive.   |
| 2   | TRACTV   | 0     | Transfer request processing/submission logic is active.   |
|     |          |       | QEVTACTV  |
|     |          | 1     | QDMA event active.<br>No enabled QDMA events are active within the EDMA3CC.<br>At least one enabled QDMA event (QER) is active within the EDMA3CC.  |
| 1   | EVTACTV  | 0     | DMA event active.<br>No enabled DMA events are active within the EDMA3CC.   |
|     |          |       | At least one enabled DMA event (ER and EER, ESR, CER) is active within the EDMA3CC.   |
|     |          | 1     |   |

### 11.4.1.5 Memory Protection Address Space

#### 11.4.1.5.1 *Memory Protection Fault Address Register (MPFAR)*

The memory protection fault address register (MPFAR) is shown in [Figure 11-66](#) and described in [Table 11-50](#). A CPU write of 1 to the MPFCLR bit in the memory protection fault command register (MPFCR) causes any error conditions stored in MPFAR to be cleared.

**Figure 11-66. Memory Protection Fault Address Register (MPFAR)**

LEGEND: R = Read only; -n = value after reset

**Table 11-50. Memory Protection Fault Address Register (MPFAR) Field Descriptions**

| Bit  | Field | Value        | Description   |
|------|-------|--------------|---|
| 31-0 | FADDR | 0xFFFF FFFFh | Fault address. This 32-bit read-only status register contains the fault address when a memory protection violation is detected. This register can only be cleared via the memory protection fault command register (MPFCR). |

#### 11.4.1.5.2 Memory Protection Fault Status Register (MPFSR)

The memory protection fault status register (MPFSR) is shown in [Figure 11-67](#) and described in [Table 11-51](#). A CPU write of 1 to the MPFCLR bit in the memory protection fault command register (MPFCR) causes any error conditions stored in MPFSR to be cleared.

**Figure 11-67. Memory Protection Fault Status Register (MPFSR)**

### 11.4.1.6 DMA Channel Registers

The following sets of registers pertain to the 64 DMA channels. The 64 DMA channels consist of a set of registers (with exception of DMAQNUM $n$ ) that each have 64 bits and the bit position of each register matches the DMA channel number. Each register is named with the format *reg\_name* that corresponds to DMA channels 0 through 31 and *reg\_name\_High* that corresponds to DMA channels 32 through 64.

For example, the event register (ER) corresponds to DMA channel 0 through 31 and the event register high register (ERH) corresponds to DMA channel 32 through 63. The register is typically called the event register.

The DMA channel registers are accessible via read/writes to the global address range. They are also accessible via read/writes to the shadow address range. The read/write ability to the registers in the shadow region are controlled by the DMA region access registers (DRAEm/DRAEHm). The registers are described in [Section 11.4.1.3.1](#) and the details for shadow region/global region usage is explained in *EDMA3 Channel Controller Regions*.

#### 11.4.1.6.1 Event Registers (ER, ERH)

All external events are captured in the event register (ER/ERH). The events are latched even when the events are not enabled. If the event bit corresponding to the latched event is enabled (EER.En/EERH.En = 1), then the event is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. The event register bits are automatically cleared (ER.En/ERH.En = 0) once the corresponding events are prioritized and serviced. If ER.En/ERH.En are already set and another event is received on the same channel/event, then the corresponding event is latched in the event miss register (EMR.En/EMRH.En), provided that the event was enabled (EER.En/EERH.En = 1).

Event  $n$  can be cleared by the CPU writing a 1 to corresponding event bit in the event clear register (ECR/ECRH). The setting of an event is a higher priority relative to clear operations (via hardware or software). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then EMR/EMRH would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

The *Debug List* table provides the type of synchronization events and the EDMA3CC channels associated to each of these external events.

The ER is shown in [Figure 11-70](#) and described in [Table 11-54](#). The ERH is shown in [Figure 11-71](#) and described in [Table 11-55](#).

|      |       | 1     | EDMA3CC event is asserted. Corresponding DMA event is prioritized versus other pending DMA/QDMA events for submission to the EDMA3TC.   |

#### 11.4.1.6.2 Event Clear Registers (ECR, ECRH)

Once an event has been posted in the event registers (ER/ERH), the event is cleared in two ways. If the event is enabled in the event enable register (EER/EERH) and the EDMA3CC submits a transfer request for the event to the EDMA3TC, it clears the corresponding event bit in the event register. If the event is disabled in the event enable register (EER/EERH), the CPU can clear the event by way of the event clear registers (ECR/ECRH).

Writing a 1 to any of the bits clears the corresponding event; writing a 0 has no effect. Once an event bit is set in the event register, it remains set until EDMA3CC submits a transfer request for that event or the CPU clears the event by setting the corresponding bit in ECR/ECRH.

The ECR is shown in [Figure 11-72](#) and described in [Table 11-56](#). The ECRH is shown in [Figure 11-73](#) and described in [Table 11-57](#).

| Bit  | Field | Value | Description  |
|------|-------|-------|--|
| 31-0 | En    | 0     | Event clear for event 32-63. Any of the event bits in ECRH are set to clear the event (En) in the event register high (ERH). A write of 0 has no effect. |
|      |       | 1     | No effect.   |
|      |       |       | EDMA3CC event is cleared in the event register high (ERH).   |

### 11.4.1.6.3 Event Set Registers (ESR, ESRH)

The event set registers (ESR/ESRH) allow the CPU (EDMA3 programmers) to manually set events to initiate DMA transfer requests. CPU writes of 1 to any event set register (En) bits set the corresponding bits in the registers. The set event is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. Writing a 0 has no effect.

The event set registers operate independent of the event registers (ER/ERH), and a write of 1 is always considered a valid event regardless of whether the event is enabled (the corresponding event bits are set or cleared in EER.En/EERH.En).

Once the event is set in the event set registers, it cannot be cleared by CPU writes, in other words, the event clear registers (ECR/ECRH) have no effect on the state of ESR/ESRH. The bits will only be cleared once the transfer request corresponding to the event has been submitted to the transfer controller. The setting of an event is a higher priority relative to clear operations (via hardware). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then EMR/EMRH would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

Manually-triggered transfers via writes to ESR/ESRH allow the CPU to submit DMA requests in the system, these are relevant for memory-to-memory transfer scenarios. If the ESR.En/ESRH.En bit is already set and another CPU write of 1 is attempted to the same bit, then the corresponding event is latched in the event missed registers (EMR.En/EMRH.En = 1).

The ESR is shown in [Figure 11-74](#) and described in [Table 11-58](#). The ESRH is shown in [Figure 11-75](#) and described in [Table 11-59](#).

#### 11.4.1.6.4 Chained Event Registers (CER, CERH)

When the OPTIONS parameter for a PaRAM entry is programmed to returned a chained completion code (ITCCHEN = 1 and/or TCCHEN = 1), then the value dictated by the TCC[5:0] (also programmed in OPT) forces the corresponding event bit to be set in the chained event registers (CER/CERH). The set chained event is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. This results in a chained-triggered transfer.

The chained event registers do not have any enables. The generation of a chained event is essentially enabled by the PaRAM entry that has been configured for intermediate and/or final chaining on transfer completion. The En bit is set (regardless of the state of EER.En/EERH.En) when a chained completion code is returned from one of the transfer controllers or is generated by the EDMA3CC via the early completion path. The bits in the chained event register are cleared when the corresponding events are prioritized and serviced.

If the En bit is already set and another chaining completion code is return for the same event, then the corresponding event is latched in the event missed registers (EMR.En/EMRH.En = 1). The setting of an event is a higher priority relative to clear operations (via hardware). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then EMR/EMRH would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

The CER is shown in [Figure 11-76](#) and described in [Table 11-60](#). The CERH is shown in [Figure 11-77](#) and described in [Table 11-61](#).

#### 11.4.1.6.5 Event Enable Registers (EER, EERH)

The EDMA3CC provides the option of selectively enabling/disabling each event in the event registers (ER/ERH) by using the event enable registers (EER/EERH). If an event bit in EER/EERH is set (using the event enable set registers, EESR/EESRH), it will enable that corresponding event. Alternatively, if an event bit in EER/EERH is cleared (using the event enable clear registers, EECR/EECRH), it will disable the corresponding event.

The event registers latch all events that are captured by EDMA3CC, even if the events are disabled (although EDMA3CC does not process it). Enabling an event with a pending event already set in the event registers enables the EDMA3CC to process the already set event like any other new event. The EER/EERH settings do not have any effect on chained events (CER.En/CERH.En = 1) and manually set events (ESR.En/ESRH.En = 1).

The EER is shown in [Figure 11-78](#) and described in [Table 11-62](#). The EERH is shown in [Figure 11-79](#) and described in [Table 11-63](#).

#### 11.4.1.6.6 Event Enable Clear Register (EECR, EECRH)

The event enable registers (EER/EERH) cannot be modified by directly writing to them. The intent is to ease the software burden for the case where multiple tasks are attempting to simultaneously modify these registers. The event enable clear registers (EECR/EECRH) are used to disable events. Writes of 1 to the bits in EECR/EECRH clear the corresponding event bits in EER/EERH; writes of 0 have no effect.

The EECR is shown in [Figure 11-80](#) and described in [Table 11-64](#). The EECRH is shown in [Figure 11-81](#) and described in [Table 11-65](#).

**Figure 11-80. Event Enable Clear Register (EECR)**

#### 11.4.1.6.7 Event Enable Set Registers (EESR, EESRH)

The event enable registers (EER/EERH) cannot be modified by directly writing to them. The intent is to ease the software burden for the case where multiple tasks are attempting to simultaneously modify these registers. The event enable set registers (EESR/EESRH) are used to enable events. Writes of 1 to the bits in EESR/EESRH set the corresponding event bits in EER/EERH; writes of 0 have no effect.

The EESR is shown in [Figure 11-82](#) and described in [Table 11-66](#). The EESRH is shown in [Figure 11-83](#) and described in [Table 11-67](#).

#### 11.4.1.6.8 Secondary Event Registers (SER, SERH)

The secondary event registers (SER/SERH) provide information on the state of a DMA channel or event (0 through 63). If the EDMA3CC receives a TR synchronization due to a manual-trigger, event-trigger, or chained-trigger source (ESR.En/ESRH.En = 1, ER.En/ERH.En = 1, or CER.En/CERH.En = 1), which results in the setting of a corresponding event bit in SER/SERH (SER.En/SERH.En = 1), it implies that the corresponding DMA event is in the queue.

Once a bit corresponding to an event is set in SER/SERH, the EDMA3CC does not prioritize additional events on the same DMA channel. Depending on the condition that lead to the setting of the SER bits, either the EDMA3CC hardware or the software (using SECR/SECRH) needs to clear the SER/SERH bits for the EDMA3CC to evaluate subsequent events (subsequent transfers) on the same channel. For additional conditions that can cause the secondary event registers to be set, see *EDMA Overview*.

The SER is shown in [Figure 11-84](#) and described in [Table 11-68](#). The SERH is shown in [Figure 11-85](#) and described in [Table 11-69](#).

|      |       | 1     | Event is not currently stored in the event queue.  |
|      |       |       | Event is currently stored in the event queue. Event submission/prioritization logic will not prioritize additional events.                               |

#### 11.4.1.6.9 Secondary Event Clear Registers (SECR, SECRH)

The secondary event clear registers (SECR/SECRH) clear the status of the secondary event registers (SER/SERH). CPU writes of 1 clear the corresponding set bits in SER/SERH. Writes of 0 have no effect.

The SECR is shown in [Figure 11-86](#) and described in [Table 11-70](#). The SECRH is shown in [Figure 11-87](#) and described in [Table 11-71](#).

**Figure 11-86. Secondary Event Clear Register (SECR)**

### 11.4.1.7 Interrupt Registers

All DMA/QDMA channels can be set to assert an EDMA3CC completion interrupt to the CPU on transfer completion, by appropriately configuring the PaRAM entry associated with the channels. The following set of registers is used for the transfer completion interrupt reporting/generating by the EDMA3CC. For more details on EDMA3CC completion interrupt generation, see *EDMA3 Interrupts*.

#### 11.4.1.7.1 Interrupt Enable Registers (IER, IERH)

Interrupt enable registers (IER/IERH) are used to enable/disable the transfer completion interrupt generation by the EDMA3CC for all DMA/QDMA channels. The IER/IERH cannot be written to directly. To set any interrupt bit in IER/IERH, a 1 must be written to the corresponding interrupt bit in the interrupt enable set registers (IESR/IESRH). Similarly, to clear any interrupt bit in IER/IERH, a 1 must be written to the corresponding interrupt bit in the interrupt enable clear registers (IECR/IECRH).

The IER is shown in [Figure 11-88](#) and described in [Table 11-72](#). The IERH is shown in [Figure 11-89](#) and described in [Table 11-73](#).

#### 11.4.1.7.2 Interrupt Enable Clear Register (IECR, IECRH)

The interrupt enable clear registers (IECR/IECRH) are used to clear interrupts. Writes of 1 to the bits in IECR/IECRH clear the corresponding interrupt bits in the interrupt enable registers (IER/IERH); writes of 0 have no effect.

The IEGR is shown in [Figure 11-90](#) and described in [Table 11-74](#). The IECRH is shown in [Figure 11-91](#) and described in [Table 11-75](#).

#### 11.4.1.7.3 Interrupt Enable Set Registers (IESR, IESRH)

The interrupt enable set registers (IESR/IESRH) are used to enable interrupts. Writes of 1 to the bits in IESR/IESRH set the corresponding interrupt bits in the interrupt enable registers (IER/IERH); writes of 0 have no effect.

The IESR is shown in [Figure 11-92](#) and described in [Table 11-76](#). The IESRH is shown in [Figure 11-93](#) and described in [Table 11-77](#).

|      |       | 1     | Corresponding bit in the interrupt enable register high (IERH) is set (In = 1). |

#### 11.4.1.7.4 Interrupt Pending Register (IPR, IPRH)

If the TCINTEN and/or ITCINTEN bit in the channel option parameter (OPT) is set in the PaRAM entry associated with the channel (DMA or QDMA), then the EDMA3TC (for normal completion) or the EDMA3CC (for early completion) returns a completion code on transfer or intermediate transfer completion. The value of the returned completion code is equal to the TCC bit in OPT for the PaRAM entry associated with the channel.

When an interrupt transfer completion code with  $TCC = n$  is detected by the EDMA3CC, then the corresponding bit is set in the interrupt pending register (IPR.In, if  $n = 0$  to 31; IPRH.In, if  $n = 32$  to 63). Note that once a bit is set in the interrupt pending registers, it remains set; it is your responsibility to clear these bits. The bits set in IPR/IPRH are cleared by writing a 1 to the corresponding bits in the interrupt clear registers (ICR/ICRH).

The IPR is shown in [Figure 11-94](#) and described in [Table 11-78](#). The IPRH is shown in [Figure 11-95](#) and described in [Table 11-79](#).

|      |       | 1     | Interrupt transfer completion code is not detected or was cleared.                       |
|      |       |       | Interrupt transfer completion code is detected ( $In = 1$ , $n = \text{EDMA3TC}[5:0]$ ). |

#### 11.4.1.7.5 Interrupt Clear Registers (ICR, ICRH)

The bits in the interrupt pending registers (IPR/IPRH) are cleared by writing a 1 to the corresponding bits in the interrupt clear registers (ICR/ICRH). Writes of 0 have no effect. All set bits in IPR/IPRH must be cleared to allow EDMA3CC to assert additional transfer completion interrupts.

The ICR is shown in [Figure 11-96](#) and described in [Table 11-80](#). The ICRH is shown in [Figure 11-97](#) and described in [Table 11-81](#).

**Figure 11-96. Interrupt Clear Register (ICR)**

|      |       | 1     | Corresponding bit in the interrupt pending register high (IPRH) is cleared (In = 0). |

#### 11.4.1.7.6 Interrupt Evaluate Register (IEVAL)

The interrupt evaluate register (IEVAL) is the only register that physically exists in both the global region and the shadow regions. In other words, the read/write accessibility for the shadow region IEVAL is not affected by the DMA/QDMA region access registers (DRAEm/DRAEHm, QRAEn/QRAEHn). IEVAL is needed for robust ISR operations to ensure that interrupts are not missed by the CPU.

The IEVAL is shown in [Figure 11-98](#) and described in [Table 11-82](#).

**Figure 11-98. Interrupt Evaluate Register (IEVAL)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-82. Interrupt Evaluate Register (IEVAL) Field Descriptions**

| Bit  | Field    | Value | Description  |
|------|----------|-------|--|
| 31-2 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 1    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 0    | EVAL     | 0     | Interrupt evaluate.<br>No effect.  |
|      |          | 1     | Causes EDMA3CC completion interrupt to be pulsed, if any enabled (IERn/IERHn = 1) interrupts are still pending (IPRn/IPRHn = 1).<br><br>The EDMA3CC completion interrupt that is pulsed depends on which IEVAL is being exercised. For example, writing to the EVAL bit in IEVAL pulses the global completion interrupt, but writing to the EVAL bit in IEVAL0 pulses the region 0 completion interrupt. |

### 11.4.1.8 QDMA Registers

The following sets of registers control the QDMA channels in the EDMA3CC. The QDMA channels (with the exception of the QDMA queue number register) consist of a set of registers, each of which have a bit location. Each bit position corresponds to a QDMA channel number. The QDMA channel registers are accessible via read/writes to the global address range. They are also accessible via read/writes to the shadow address range. The read/write accessibility in the shadow region address region is controlled by the QDMA region access registers (QRAEn/QRAEHn). *EDMA3 Channel Controller Regions* details shadow region/global region usage.

#### 11.4.1.8.1 QDMA Event Register (QER)

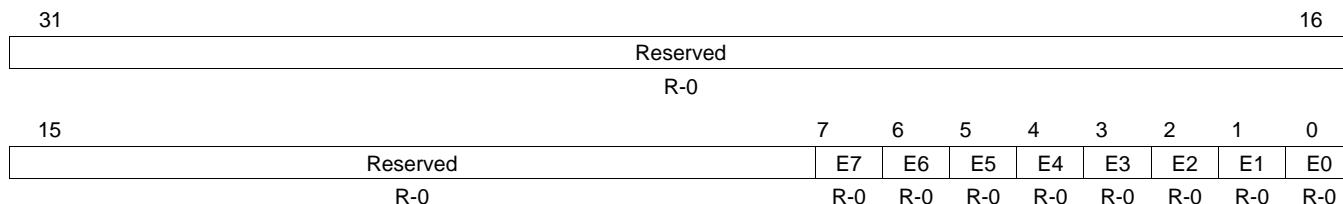

The QDMA event register (QER) channel  $n$  bit is set ( $En = 1$ ) when the CPU or any EDMA3 programmer (including EDMA3) performs a write to the trigger word (using the QDMA channel mapping register (QCHMAP $n$ )) in the PaRAM entry associated with QDMA channel  $n$  (which is also programmed using QCHMAP $n$ ). The  $En$  bit is also set when the EDMA3CC performs a link update on a PaRAM address that matches the QCHMAP $n$  settings. The QDMA event is latched only if the QDMA event enable register (QEER) channel  $n$  bit is also enabled (QEER. $En = 1$ ). Once a bit is set in QER, then the corresponding QDMA event (auto-trigger) is evaluated by the EDMA3CC logic for an associated transfer request submission to the transfer controllers. For additional conditions that can lead to the setting of QER bits, see *EDMA Overview*.

The setting of an event is a higher priority relative to clear operations (via hardware). If set and clear conditions occur concurrently, the set condition wins. If the event was previously set, then the QDMA event missed register (QEMR) would be set because an event is lost. If the event was previously clear, then the event remains set and is prioritized for submission to the event queues.

The set bits in QER are only cleared when the transfer request associated with the corresponding channels has been processed by the EDMA3CC and submitted to the transfer controller. If the  $En$  bit is already set and a QDMA event for the same QDMA channel occurs prior to the original being cleared, then the second missed event is latched in QEMR ( $En = 1$ ).

The QER is shown in [Figure 11-99](#) and described in [Table 11-83](#).

**Figure 11-99. QDMA Event Register (QER)**

LEGEND: R = Read only; -n = value after reset

**Table 11-83. QDMA Event Register (QER) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-0  | En       | 0     | QDMA event for channels 0-7.<br>No effect.  |
|      |          | 1     | Corresponding QDMA event is prioritized versus other pending DMA/QDMA events for submission to the EDMA3TC.                             |

#### 11.4.1.8.2 QDMA Event Enable Register (QEER)

The EDMA3CC provides the option of selectively enabling/disabling each channel in the QDMA event register (QER) by using the QDMA event enable register (QEER). If any of the event bits in QEER is set (using the QDMA event enable set register, QEESR), it will enable that corresponding event. Alternatively, if any event bit in QEER is cleared (using the QDMA event enable clear register, QEECR), it will disable the corresponding QDMA channel. The QDMA event register will not latch any event for a QDMA channel, if it is not enabled via QEER.

The QEER is shown in [Figure 11-100](#) and described in [Table 11-84](#).

**Figure 11-100. QDMA Event Enable Register (QEER)**

|     |          |  |     |     |     |     |     |     |     |     |
|-----|----------|--|-----|-----|-----|-----|-----|-----|-----|-----|

|     |          |  | R-0 |

LEGEND: R = Read only; -n = value after reset

**Table 11-84. QDMA Event Enable Register (QEER) Field Descriptions**

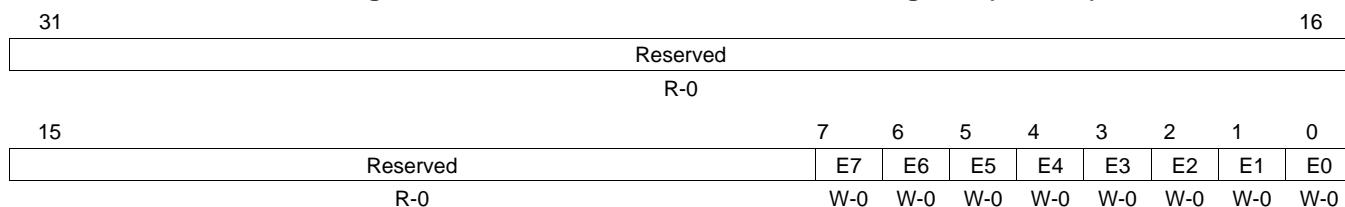

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.                             |
| 7-0  | En       | 0     | QDMA event enable for channels 0-7.<br>QDMA channel <i>n</i> is not enabled. QDMA event will not be recognized and will not latch in the QDMA event register (QER). |
|      |          | 1     | QDMA channel <i>n</i> is enabled. QDMA events will be recognized and will get latched in the QDMA event register (QER).   |

#### 11.4.1.8.3 QDMA Event Enable Clear Register (QEECR)

The QDMA event enable register (QEER) cannot be modified by directly writing to the register, to ease the software burden when multiple tasks are attempting to simultaneously modify these registers. The QDMA event enable clear register (QEECR) is used to disable events. Writes of 1 to the bits in QEECR clear the corresponding QDMA channel bits in QEER; writes of 0 have no effect.

The QEECR is shown in [Figure 11-101](#) and described in [Table 11-85](#).

**Figure 11-101. QDMA Event Enable Clear Register (QEECR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-85. QDMA Event Enable Clear Register (QEECR) Field Descriptions**

| Bit  | Field    | Value  | Description  |
|------|----------|--------|--|
| 31-8 | Reserved | 0      | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.                            |
| 7-0  | En       | 0<br>1 | QDMA event enable clear for channels 0-7.<br>No effect.<br>QDMA event is disabled. Corresponding bit in the QDMA event enable register (QEER) is cleared (En = 0). |

#### 11.4.1.8.4 QDMA Event Enable Set Register (QEESR)

The QDMA event enable register (QEER) cannot be modified by directly writing to the register, to ease the software burden when multiple tasks are attempting to simultaneously modify these registers. The QDMA event enable set register (QEESR) is used to enable events. Writes of 1 to the bits in QEESR set the corresponding QDMA channel bits in QEER; writes of 0 have no effect.

The QEESR is shown in [Figure 11-102](#) and described in [Table 11-86](#).

**Figure 11-102. QDMA Event Enable Set Register (QEESR)**

|    |          |     |     |     |     |     |     |     |     |
|----|----------|-----|-----|-----|-----|-----|-----|-----|-----|
| 31 |          |     |     |     |     |     |     |     | 16  |

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-0  | En       | 0     | QDMA event enable set for channels 0-7.   |
|      |          | 1     | No effect.<br>QDMA event is enabled. Corresponding bit in the QDMA event enable register (QEER) is set (En = 1).                        |

#### 11.4.1.8.5 QDMA Secondary Event Register (QSER)

The QDMA secondary event register (QSER) provides information on the state of a QDMA event. If at any time a bit corresponding to a QDMA channel is set in QSER, that implies that the corresponding QDMA event is in the queue. Once a bit corresponding to a QDMA channel is set in QSER, the EDMA3CC does not prioritize additional events on the same QDMA channel. Depending on the condition that lead to the setting of the QSER bits, either the EDMA3CC hardware or the software (using QSECR) needs to clear the QSER bits for the EDMA3CC to evaluate subsequent QDMA events on the channel. Based on whether the associated TR request is valid, or it is a null or dummy TR, the implications on the state of QSER and the required user actions to submit another QDMA transfer might be different. For additional conditions that can cause the secondary event registers (QSER\SER) to be set, see *EDMA Overview*.

The QSER is shown in [Figure 11-103](#) and described in [Table 11-87](#).

**Figure 11-103. QDMA Secondary Event Register (QSER)**

LEGEND: R = Read only; -n = value after reset

**Table 11-87. QDMA Secondary Event Register (QSER) Field Descriptions**

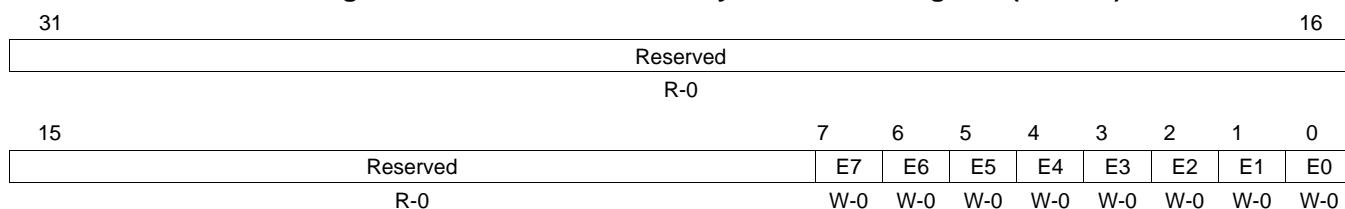

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-8 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7-0  | En       | 0     | QDMA secondary event register for channels 0-7.<br>QDMA event is not currently stored in the event queue.                               |
|      |          | 1     | QDMA event is currently stored in the event queue. EDMA3CC will not prioritize additional events.                                       |

#### 11.4.1.8.6 QDMA Secondary Event Clear Register (QSECR)

The QDMA secondary event clear register (QSECR) clears the status of the QDMA secondary event register (QSER) and the QDMA event register (QER). CPU writes of 1 clear the corresponding set bits in QSER and QER. Writes of 0 have no effect. Note that this differs from the secondary event clear register (SECR) operation, which only clears the secondary event register (SER) bits and does not affect the event registers.

The QSECR is shown in [Figure 11-104](#) and described in [Table 11-88](#).

**Figure 11-104. QDMA Secondary Event Clear Register (QSECR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-88. QDMA Secondary Event Clear Register (QSECR) Field Descriptions**

| Bit  | Field    | Value  | Description   |
|------|----------|--------|---|
| 31-8 | Reserved | 0      | Reserved  |
| 7-0  | En       | 0<br>1 | QDMA secondary event clear register for channels 0-7.<br>No effect.<br>Corresponding bit in the QDMA secondary event register (QSER) and the QDMA event register (QER) is cleared (En = 0). |

### 11.4.2 EDMA3 Transfer Controller Registers

Table 11-89 lists the memory-mapped registers for the EDMA3 transfer controller (EDMA3TC).

**Table 11-89. EDMA3TC Registers**

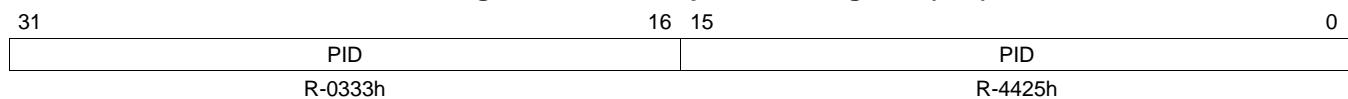

| Offset | Acronym   | Register Description  | Section                             |

#### 11.4.2.1 Peripheral Identification Register (PID)

The peripheral identification register (PID) is a constant register that uniquely identifies the EDMA3TC and specific revision of the EDMA3TC. The PID is shown in [Figure 11-105](#) and described in [Table 11-90](#).

**Figure 11-105. Peripheral ID Register (PID)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

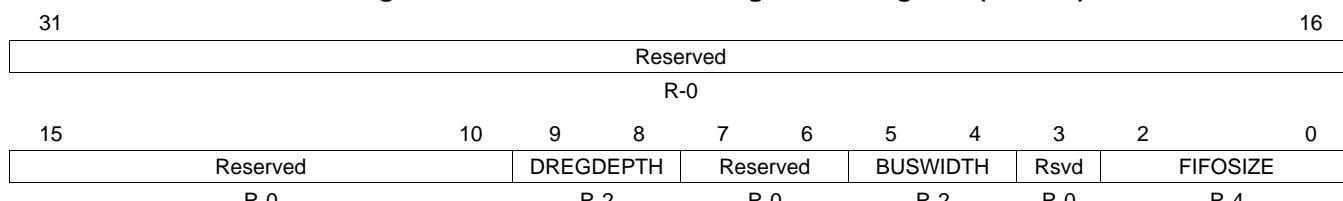

**Table 11-90. Peripheral ID Register (PID) Field Descriptions**

| Bit  | Field | Value        | Description            |
|------|-------|--------------|------------------------|
| 31-0 | PID   | 0xFFFF FFFFh | Peripheral identifier. |

#### 11.4.2.2 EDMA3TC Configuration Register (TCCFG)

The EDMA3TC configuration register (TCCFG) is shown in [Figure 11-106](#) and described in [Table 11-91](#).

**Figure 11-106. EDMA3TC Configuration Register (TCCFG)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset; -x = value is indeterminate after reset

**Table 11-91. EDMA3TC Configuration Register (TCCFG) Field Descriptions**

| Bit   | Field     | Value | Description                                       |
|-------|-----------|-------|---|
| 31-10 | Reserved  | 0     | Reserved.   |
| 9-8   | DREGDEPTH | 0-3h  | Destination register FIFO depth parameterization. |
|       |           | 0     | Reserved.   |
|       |           | 1h    | Reserved.   |
|       |           | 2h    | 4 entry (for TC0, TC1, TC2, and TC3)              |
|       |           | 3h    | Reserved.   |
| 7-6   | Reserved  | 0     | Reserved.   |
| 5-4   | BUSWIDTH  | 0-3h  | Bus width parameterization.                       |
|       |           | 0-1h  | Reserved.   |
|       |           | 2h    | 128-bit   |
|       |           | 3h    | Reserved.   |
| 3     | Reserved  | 0     | Reserved.   |
| 2-0   | FIFOSIZE  | 0-7h  | FIFO size   |
|       |           | 0-1h  | Reserved.   |
|       |           | 2h    | Reserved.   |
|       |           | 3h    | Reserved.   |
|       |           | 4h    | 512 byte FIFO                                     |
|       |           | 5h    | Reserved.   |
|       |           | 6h-7h | Reserved.   |

### 11.4.2.3 EDMA3TC Channel Status Register (TCSTAT)

The EDMA3TC channel status register (TCSTAT) is shown in [Figure 11-107](#) and described in [Table 11-92](#).

**Figure 11-107. EDMA3TC Channel Status Register (TCSTAT)**

|          |          |           |    |          |        |          |          |  |    |
|----------|----------|-----------|----|----------|--------|----------|----------|--|----|
| 31       | Reserved |           |    |          |        |          |          |  | 16 |
| R-0      |          |           |    |          |        |          |          |  |    |
| 15       | 14       | 13        | 12 | 11       | 9      | 8        |          |  |    |
| Reserved |          | DFSTRTPTR |    | Reserved |        | Reserved |          |  |    |
| R-0      |          | R-0       |    | R-0      |        | R-1      |          |  |    |
| 7        | 6        | 4         | 3  | 2        | 1      | 0        |          |  |    |
| Reserved |          | DSTACTV   |    | Reserved | WSACTV | SRCACTV  | PROGBUSY |  |    |
| R-0      |          | R-0       |    | R-0      | R-0    | R-0      | R-0      |  |    |

LEGEND: R = Read only; -n = value after reset

**Table 11-92. EDMA3TC Channel Status Register (TCSTAT) Field Descriptions**

| Bit   | Field     | Value | Description   |
|-------|-----------|-------|---|
| 31-14 | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 13-12 | DFSTRTPTR | 0-3h  | Destination FIFO start pointer. Represents the offset to the head entry of the destination register FIFO, in units of entries.  |
| 11-9  | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 8     | Reserved  | 1     | Reserved. Always read as 1.   |
| 7     | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 6-4   | DSTACTV   | 0-7h  | Destination active state. Specifies the number of transfer requests (TRs) that are resident in the destination register FIFO at a given instant. This bit field can be primarily used for advanced debugging. Legal values are constrained by the destination register FIFO depth parameterization (DSTREGDEPTH) parameter.<br><br>0 Destination FIFO is empty.<br>1h Destination FIFO contains 1 TR.<br>2h Destination FIFO contains 2 TRs.<br>3h Destination FIFO contains 3 TRs.<br>4h Destination FIFO contains 4 TRs. (Full if DSTREGDEPTH==4).<br><br>If the destination register FIFO is empty, then any TR written to Prog Set immediately transitions to the destination register FIFO. If the destination register FIFO is not empty and not full, then any TR written to Prog Set immediately transitions to the destination register FIFO set if the source active state (SRCACTV) bit is set to idle.<br><br>If the destination register FIFO is full, then TRs cannot transition to the destination register FIFO. The destination register FIFO becomes not full when the TR at the head of the destination register FIFO is completed.<br><br>5h-7h Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 3     | Reserved  | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 2     | WSACTV    | 0     | Write status active   |
|       |           | 1     | Write status is not pending. Write status has been received for all previously issued write commands.   |
| 1     | SRCACTV   | 0     | Source active state   |
|       |           | 1     | Source controller is idle. Source active register set contains a previously processed transfer request.   |
|       |           |       | Source controller is busy servicing a transfer request.   |

**Table 11-92. EDMA3TC Channel Status Register (TCSTAT) Field Descriptions (continued)**

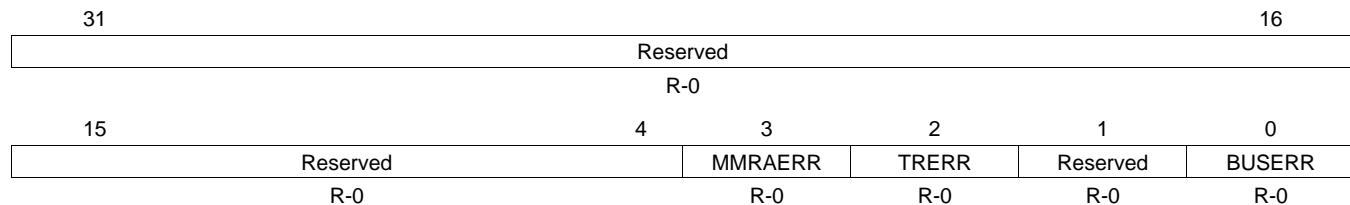

| Bit | Field    | Value | Description  |
|-----|----------|-------|--|
| 0   | PROGBUSY | 0     | Program register set busy<br>Program set idle and is available for programming by the EDMA3CC. |

### 11.4.2.4 Error Registers

#### 11.4.2.4.1 Error Register (ERRSTAT)

The error status register (ERRSTAT) is shown in [Figure 11-108](#) and described in [Table 11-93](#).

**Figure 11-108. Error Register (ERRSTAT)**

LEGEND: R = Read only; -n = value after reset

**Table 11-93. Error Register (ERRSTAT) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-4 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 3    | MMRAERR  | 0     | MMR address error.<br>Condition is not detected.  |
|      |          | 1     | User attempted to read or write to an invalid address in configuration memory map.  |
| 2    | TRERR    | 0     | Transfer request (TR) error event.<br>Condition is not detected.  |
|      |          | 1     | TR detected that violates constant addressing mode transfer (SAM or DAM is set) alignment rules or has ACNT or BCNT == 0.               |
| 1    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 0    | BUSERR   | 0     | Bus error event.<br>Condition is not detected.  |
|      |          | 1     | EDMA3TC has detected an error at source or destination address. Error information can be read from the error details register (ERRDET). |

#### 11.4.2.4.2 Error Enable Register (ERREN)

The error enable register (ERREN) is shown in [Figure 11-109](#) and described in [Table 11-94](#).

When any of the enable bits are set, a bit set in the corresponding ERRSTAT causes an assertion of the EDMA3TC interrupt.

**Figure 11-109. Error Enable Register (ERREN)**

|    |          |   |         |       |          |        |
|----|----------|---|---------|-------|----------|--------|
| 31 |          |   |         |       |          | 16     |
|    | Reserved |   |         |       |          |        |
|    | R-0      |   |         |       |          |        |
| 15 |          | 4 | 3       | 2     | 1        | 0      |
|    | Reserved |   | MMRAERR | TRERR | Reserved | BUSERR |
|    | R-0      |   | R/W-0   | R/W-0 | R/W-0    | R/W-0  |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

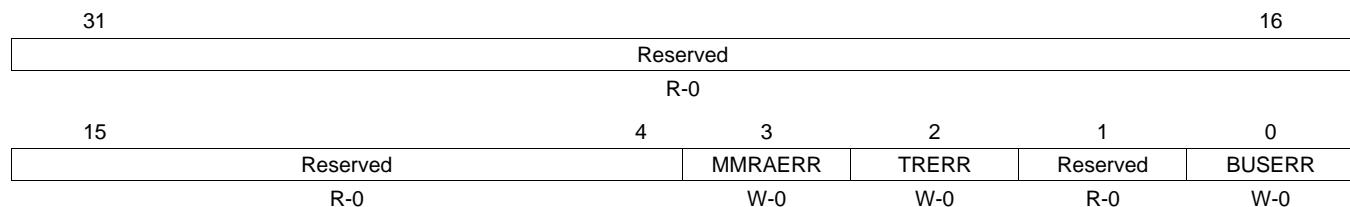

**Table 11-94. Error Enable Register (ERREN) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-4 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 3    | MMRAERR  | 0     | Interrupt enable for MMR address error (MMRAERR).   |
|      |          | 1     | MMRAERR is disabled.  |
| 2    | TRERR    | 0     | Interrupt enable for transfer request error (TRERR).  |
|      |          | 1     | TRERR is disabled.  |
| 1    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
|      |          | 1     | TRERR is enabled and contributes to the state of EDMA3TC error interrupt generation.  |
| 0    | BUSERR   | 0     | Interrupt enable for bus error (BUSERR).  |
|      |          | 1     | BUSERR is disabled.   |
|      |          |       | BUSERR is enabled and contributes to the state of EDMA3TC error interrupt generation.   |

#### 11.4.2.4.3 Error Clear Register (ERRCLR)

The error clear register (ERRCLR) is shown in [Figure 11-110](#) and described in [Table 11-95](#).

**Figure 11-110. Error Clear Register (ERRCLR)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-95. Error Clear Register (ERRCLR) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-4 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 3    | MMRAERR  | 0     | Interrupt enable clear for the MMRAERR bit in the error status register (ERRSTAT).  |
|      |          | 1     | No effect.<br>Clears the MMRAERR bit in ERRSTAT but does not clear the error details register (ERRDET).                                 |
| 2    | TRERR    | 0     | Interrupt enable clear for the TRERR bit in the error status register (ERRSTAT).  |
|      |          | 1     | No effect.<br>Clears the TRERR bit in ERRSTAT but does not clear the error details register (ERRDET).                                   |
| 1    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 0    | BUSERR   | 0     | Interrupt clear for the BUSERR bit in the error status register (ERRSTAT).  |
|      |          | 1     | No effect.<br>Clears the BUSERR bit in ERRSTAT and clears the error details register (ERRDET).  |

#### 11.4.2.4.4 Error Details Register (ERRDET)

The error details register (ERRDET) is shown in [Figure 11-111](#) and described in [Table 11-96](#).

**Figure 11-111. Error Details Register (ERRDET)**

| 31       | Reserved |    |     |   |   |     |   |   | 18       | 17     | 16      |
|----------|----------|----|-----|---|---|-----|---|---|----------|--------|---------|
|          |          |    |     |   |   |     |   |   |          | TCCHEN | TCINTEN |
|          | R-0      |    |     |   |   |     |   |   | R-0      | R-0    |         |
| 15       | 14       | 13 |     | 8 | 7 |     | 4 | 3 |          | 0      |         |
| Reserved | TCC      |    |     |   |   |     |   |   | Reserved | STAT   |         |
|          | R-0      |    | R-0 |   |   | R-0 |   |   | R-0      |        |         |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

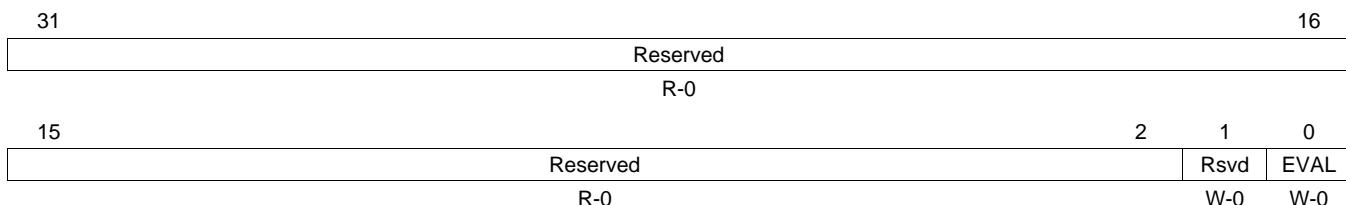

**Table 11-96. Error Details Register (ERRDET) Field Descriptions**

| Bit    | Field    | Value | Description  |
|--------|----------|-------|--|
| 31-8   | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 17     | TCCHEN   | 0-1   | Transfer completion chaining enable. Contains the TCCHEN value in the channel options parameter (OPT) programmed by the channel controller for the read or write transaction that resulted in an error.  |
| 16     | TCINTEN  | 0-1   | Transfer completion interrupt enable. Contains the TCINTEN value in the channel options parameter (OPT) programmed by the channel controller for the read or write transaction that resulted in an error.  |
| 15-14  | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 13 - 8 | TCC      | 0-3Fh | Transfer complete code. Contains the TCC value in the channel options parameter (OPT) programmed by the channel controller for the read or write transaction that resulted in an error.  |
| 7-4    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 3-0    | STAT     | 0-Fh  | Transaction status. Stores the nonzero status/error code that was detected on the read status or write status bus. If read status and write status are returned on the same cycle, then the EDMA3TC chooses nonzero version. If both are nonzero, then the write status is treated as higher priority. |
|        |          | 0     | No error.  |
|        |          | 1h-7h | Read error.  |
|        |          | 8h-Fh | Write error.   |

#### 11.4.2.4.5 Error Interrupt Command Register (ERRCMD)

The error command register (ERRCMD) is shown in [Figure 11-112](#) and described in [Table 11-97](#).

**Figure 11-112. Error Interrupt Command Register (ERRCMD)**

LEGEND: R = Read only; W = Write only; -n = value after reset

**Table 11-97. Error Interrupt Command Register (ERRCMD) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-2 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 1    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 0    | EVAL     | 0     | Error evaluate<br>No effect   |
|      |          | 1     | EDMA3TC error line is pulsed if any of the error status register (ERRSTAT) bits are set.  |

#### 11.4.2.5 Read Rate Register (RDRATE)

The EDMA3 transfer controller issues read commands at a rate controlled by the read rate register (RDRATE). The RDRATE defines the number of idle cycles that the read controller must wait before issuing subsequent commands. This applies both to commands within a transfer request packet (TRP) and for commands that are issued for different transfer requests (TRs). For instance, if RDRATE is set to 4 cycles between reads, there are 3 inactive cycles between reads.

RDRATE allows flexibility in transfer controller access requests to an endpoint. For an application, RDRATE can be manipulated to slow down the access rate, so that the endpoint may service requests from other masters during the inactive EDMA3TC cycles.

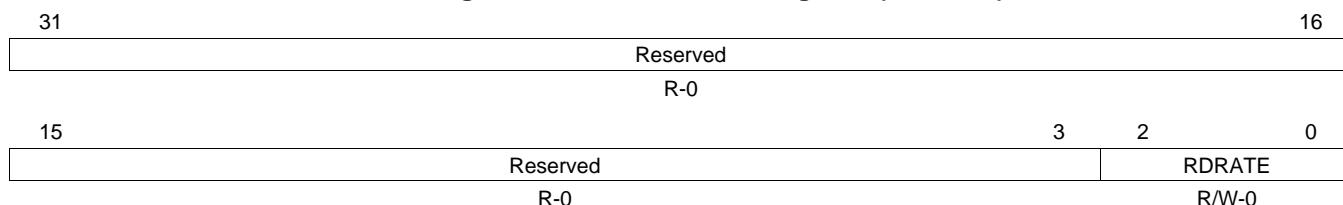

The RDRATE is shown in [Figure 11-113](#) and described in [Table 11-98](#).

---

**NOTE:** It is expected that the RDRATE value for a transfer controller is static, as it is decided based on the application requirement. It is not recommended to change this setting on the fly.

---

**Figure 11-113. Read Rate Register (RDRATE)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-98. Read Rate Register (RDRATE) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-3 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 2-0  | RDRATE   | 0-7h  | Read rate. Controls the number of cycles between read commands. This is a global setting that applies to all TRs for this EDMA3TC.<br>0      Reads issued as fast as possible.<br>1h     4 cycles between reads.<br>2h     8 cycles between reads.<br>3h     16 cycles between reads.<br>4h     32 cycles between reads.<br>5h-7h   Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |

### 11.4.2.6 EDMA3TC Channel Registers

The EDMA3TC channel registers are split into three parts: the programming registers, the source active registers, and the destination FIFO register. This section describes the registers and their functions. The program register set is programmed by the channel controller, and is for internal use. The other two sets are read-only and provided to facilitate advanced debug capabilities. The number of destination FIFO register sets depends on the destination FIFO depth.

TC0 has a FIFO depth of 2, so there are two sets of destination FIFO registers associated with TC0. TC1, TC2, and TC3 have a destination FIFO depth of 4, so there are four sets of destination FIFO registers for each of these transfer controllers.

#### 11.4.2.6.1 Source Active Options Register (SAOPT)

The source active options register (SAOPT) is shown in [Figure 11-114](#) and described in [Table 11-99](#).

**Figure 11-114. Source Active Options Register (SAOPT)**

| 31 |          |      |       |      |   |       |  |  | 23       | 22     | 21    | 20      | 19       | 18 | 17    | 16 |
|----|----------|------|-------|------|---|-------|--|--|----------|--------|-------|---------|----------|----|-------|----|
|    | Reserved |      |       |      |   |       |  |  |          | TCCHEN | Rsvd  | TCINTEN | Reserved |    | TCC   |    |
|    | R-0      |      |       |      |   |       |  |  |          | R/W-0  | R-0   | R/W-0   | R-0      |    | R/W-0 |    |
| 15 | 12       | 11   | 10    | 8    | 7 | 6     |  |  | 4        | 3      | 2     | 1       | 0        |    |       |    |
|    | TCC      | Rsvd | FWID  | Rsvd |   | PRI   |  |  | Reserved | DAM    | SAM   |         |          |    |       |    |
|    | R/W-0    | R-0  | R/W-0 | R-0  |   | R/W-0 |  |  | R-0      | R/W-0  | R/W-0 |         |          |    |       |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-99. Source Active Options Register (SAOPT) Field Descriptions**

| Bit   | Field    | Value | Description   |
|-------|----------|-------|---|
| 31-23 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 22    | TCCHEN   | 0     | Transfer complete chaining enable   |
|       |          | 1     | Transfer complete chaining is disabled.   |
| 21    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 20    | TCINTEN  | 0     | Transfer complete interrupt enable.   |
|       |          | 1     | Transfer complete interrupt is disabled.  |
| 19-18 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 17-12 | TCC      | 0-3Fh | Transfer complete code. This 6-bit code is used to set the relevant bit in CER or IPR of the EDMA3PCC module.                           |
| 11    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 10-8  | FWID     | 0-7h  | FIFO width. Applies if either SAM or DAM is set to constant addressing mode.  |
|       |          | 0     | FIFO width is 8-bit.  |
|       |          | 1h    | FIFO width is 16-bit.   |
|       |          | 2h    | FIFO width is 32-bit.   |
|       |          | 3h    | FIFO width is 64-bit.   |
|       |          | 4h    | FIFO width is 128-bit.  |
|       |          | 5h    | FIFO width is 256-bit.  |
|       |          | 6h-7h | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7     | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |

**Table 11-99. Source Active Options Register (SAOPT) Field Descriptions (continued)**

| <b>Bit</b> | <b>Field</b> | <b>Value</b>             | <b>Description</b>   |
|------------|--------------|--------------------------|--|
| 6-4        | PRI          | 0-7h<br>0<br>1h-6h<br>7h | Transfer priority. Reflects the values programmed in the QUEPRI register in the EDMACC.<br>Priority 0 - Highest priority<br>Priority 1 to priority 6<br>Priority 7 - Lowest priority   |
| 3-2        | Reserved     | 0                        | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.  |
| 1          | DAM          | 0<br>1                   | Destination address mode within an array<br>Increment (INCR) mode. Destination addressing within an array increments.<br>Constant addressing (CONST) mode. Destination addressing within an array wraps around upon reaching FIFO width. |
| 0          | SAM          | 0<br>1                   | Source address mode within an array<br>Increment (INCR) mode. Source addressing within an array increments.<br>Constant addressing (CONST) mode. Source addressing within an array wraps around upon reaching FIFO width.                |

#### 11.4.2.6.2 Source Active Source Address Register (SASRC)

The source active source address register (SASRC) is shown in [Figure 11-115](#) and described in [Table 11-100](#).

**Figure 11-115. Source Active Source Address Register (SASRC)**

|    |       |     |
|----|-------|-----|
| 31 | SADDR | 0   |
|    |       | R-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-100. Source Active Source Address Register (SASRC) Field Descriptions**

| Bit  | Field | Value        | Description   |
|------|-------|--------------|---|
| 31-0 | SADDR | 0xFFFF FFFFh | Source address for program register set. EDMA3TC updates value according to source addressing mode (SAM bit in the source active options register, SAOPT) . |

#### 11.4.2.6.3 Source Active Count Register (SACNT)

The source active count register (SACNT) is shown in [Figure 11-116](#) and described in [Table 11-101](#).

**Figure 11-116. Source Active Count Register (SACNT)**

|    |      |     |
|----|------|-----|
| 31 | BCNT | 16  |
|    |      | R-0 |
| 15 | ACNT | 0   |
|    |      | R-0 |

LEGEND: R = Read only; -n = value after reset

**Table 11-101. Source Active Count Register (SACNT) Field Descriptions**

| Bit   | Field | Value   | Description  |
|-------|-------|---------|--|
| 31-16 | BCNT  | 0xFFFFh | B dimension count. Number of arrays to be transferred, where each array is ACNT in length. It is decremented after each read command appropriately. Represents the amount of data remaining to be read. It should be 0 when transfer request (TR) is complete. |
| 15-0  | ACNT  | 0xFFFFh | A dimension count. Number of bytes to be transferred in first dimension. It is decremented after each read command appropriately. Represents the amount of data remaining to be read. It should be 0 when transfer request (TR) is complete.                   |

#### 11.4.2.6.4 Source Active Destination Address Register (SADST)

The source active destination address register (SADST) is shown in [Figure 11-117](#) and described in [Table 11-102](#).

**Figure 11-117. Source Active Destination Address Register (SADST)**

|    |          |    |
|----|----------|----|
| 31 | Reserved | 16 |
|    | R-0      |    |
| 15 | Reserved | 0  |
|    | R-0      |    |

LEGEND: R = Read only; -n = value after reset

**Table 11-102. Source Active Destination Address Register (SADST) Field Descriptions**

| Bit  | Field     | Value | Description                  |
|------|-----------|-------|------------------------------|
| 31-0 | Reserve d | 0     | Reserved. Always reads as 0. |

#### 11.4.2.6.5 Source Active Source B-Dimension Index Register (SABIDX)

The source active set B-dimension index register (SABIDX) is shown in [Figure 11-118](#) and described in [Table 11-103](#).

**Figure 11-118. Source Active Source B-Dimension Index Register (SABIDX)**

|    |       |    |
|----|-------|----|
| 31 | DBIDX | 16 |
|    | R-0   |    |
| 15 | SBIDX | 0  |
|    | R-0   |    |

LEGEND: R = Read only; -n = value after reset

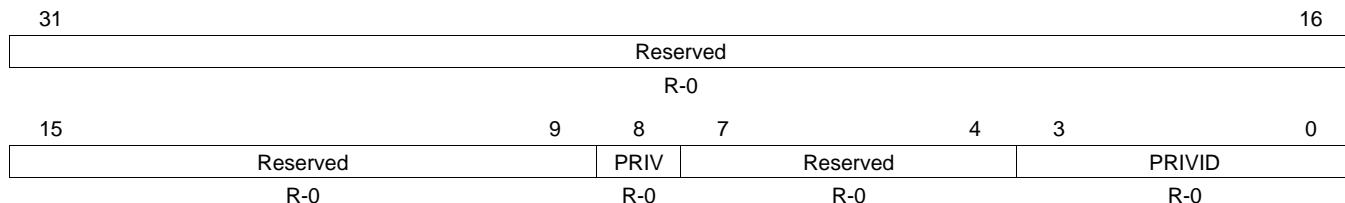

**Table 11-103. Source Active Source B-Dimension Index Register (SABIDX) Field Descriptions**

| Bit   | Field | Value   | Description  |
|-------|-------|---------|--|
| 31-16 | DBIDX | 0       | B-Index offset between destination arrays. Represents the offset in bytes between the starting address of each destination. Always reads as 0. |
| 15-0  | SBIDX | 0xFFFFh | B-Index offset between source arrays. Represents the offset in bytes between the starting address of each source array.                        |

#### 11.4.2.6.6 Source Active Memory Protection Proxy Register (SAMPPRXY)

The source active memory protection proxy register (SAMPPRXY) is shown in [Figure 11-119](#) and described in [Table 11-104](#).

**Figure 11-119. Source Active Memory Protection Proxy Register (SAMPPRXY)**

LEGEND: R = Read only; -n = value after reset

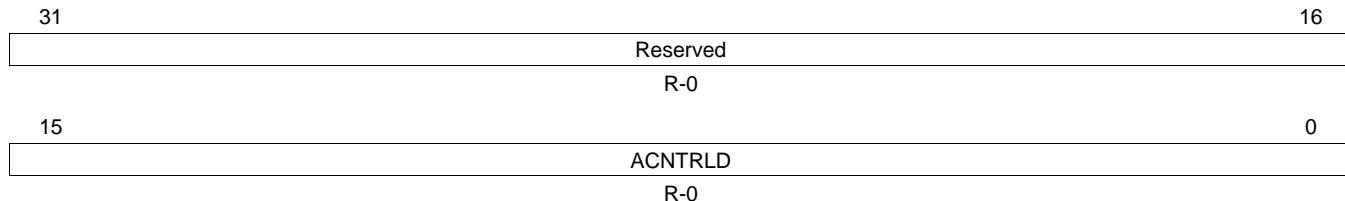

**Table 11-104. Source Active Memory Protection Proxy Register (SAMPPRXY) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-9 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 8    | PRIV     |       | Privilege level. The privilege level used by the host to set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.<br>The privilege ID is used while issuing read and write command to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIV of the host that set up the DMA transaction.<br>0 User-level privilege.<br>1 Supervisor-level privilege. |
| 7-4  | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 3-0  | PRIVID   | 0-Fh  | Privilege ID. This contains the privilege ID of the host that set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.<br>This PRIVID value is used while issuing read and write commands to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIVID of the host that set up the DMA transaction.  |

#### 11.4.2.6.7 Source Active Count Reload Register (SACNTRLD)

The source active count reload register (SACNTRLD) is shown in [Figure 11-120](#) and described in [Table 11-105](#).

**Figure 11-120. Source Active Count Reload Register (SACNTRLD)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

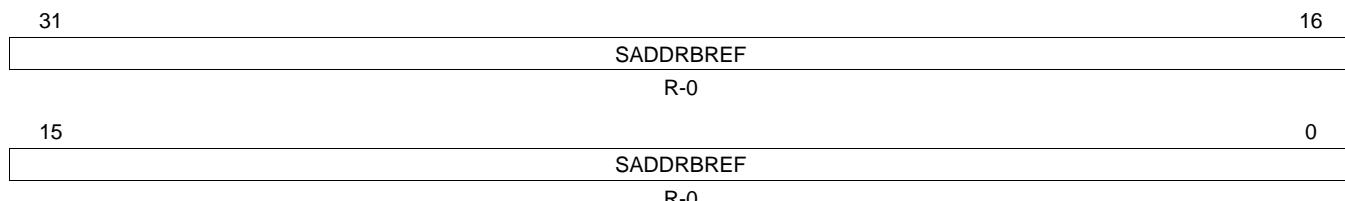

**Table 11-105. Source Active Count Reload Register (SACNTRLD) Field Descriptions**

| Bit   | Field    | Value   | Description   |
|-------|----------|---------|---|
| 31-16 | Reserved | 0       | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.               |
| 15-0  | ACNTRLD  | 0xFFFFh | A-count reload value. Represents the originally programmed value of ACNT. The reload value is used to reinitialize ACNT after each array is serviced. |

#### 11.4.2.6.8 Source Active Source Address B-Reference Register (SASRCBREF)

The source active source address B-reference register (SASRCBREF) is shown in [Figure 11-121](#) and described in [Table 11-106](#).

**Figure 11-121. Source Active Source Address B-Reference Register (SASRCBREF)**

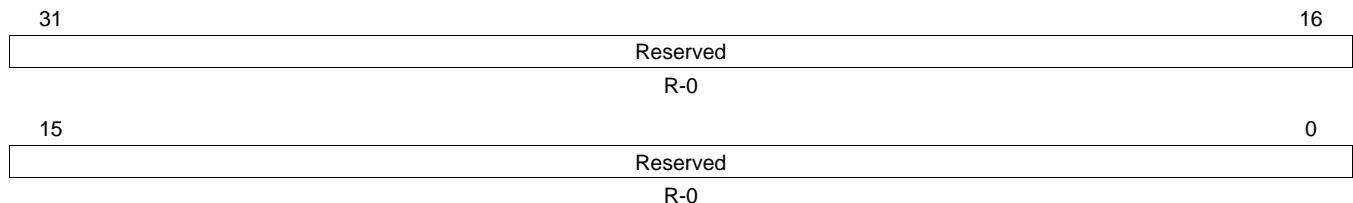

LEGEND: R = Read only; -n = value after reset

**Table 11-106. Source Active Source Address B-Reference Register (SASRCBREF) Field Descriptions**

| Bit  | Field     | Value        | Description   |
|------|-----------|--------------|---|
| 31-0 | SADDRBREF | 0xFFFF FFFFh | Source address B-reference. Represents the starting address for the array currently being read. |

**11.4.2.6.9 Source Active Destination Address B-Reference Register (SADSTBREF)**

The source active destination address B-reference register (SADSTBREF) is shown in [Figure 11-122](#) and described in [Table 11-107](#).

**Figure 11-122. Source Active Destination Address B-Reference Register (SADSTBREF)**

LEGEND: R = Read only; -n = value after reset

**Table 11-107. Source Active Destination Address B-Reference Register (SADSTBREF) Field Descriptions**

| Bit  | Field    | Value | Description                  |
|------|----------|-------|------------------------------|
| 31-0 | Reserved | 0     | Reserved. Always reads as 0. |

#### 11.4.2.6.10 Destination FIFO Options Register (DFOPT $n$ )

The destination FIFO options register (DFOPT $n$ ) is shown in [Figure 11-123](#) and described in [Table 11-108](#).

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

**Figure 11-123. Destination FIFO Options Register (DFOPT $n$ )**

| 31 | Reserved |      |       |      | 23     | 22   | 21      | 20       | 19    | 18    | 17 | 16 |
|----|----------|------|-------|------|--------|------|---------|----------|-------|-------|----|----|
|    |          |      |       |      | TCCHEN | Rsvd | TCINTEN | Reserved |       | TCC   |    |    |
|    | R-0      |      |       |      | R/W-0  | R-0  | R/W-0   | R-0      | R/W-0 |       |    |    |
| 15 | 12       | 11   | 10    | 8    | 7      | 6    |         | 4        | 3     | 2     | 1  | 0  |
|    | TCC      | Rsvd | FWID  | Rsvd | PRI    |      |         | Reserved | DAM   | SAM   |    |    |
|    | R/W-0    | R-0  | R/W-0 | R-0  | R/W-0  |      |         | R-0      | R/W-0 | R/W-0 |    |    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11-108. Destination FIFO Options Register (DFOPT $n$ ) Field Descriptions**

| Bit   | Field    | Value | Description   |
|-------|----------|-------|---|
| 31-23 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 22    | TCCHEN   | 0     | Transfer complete chaining enable   |
|       |          | 1     | Transfer complete chaining is disabled  |
|       |          | 1     | Transfer complete chaining is enabled   |
| 21    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 20    | TCINTEN  | 0     | Transfer complete interrupt enable.   |
|       |          | 1     | Transfer complete interrupt is disabled.  |
|       |          | 1     | Transfer complete interrupt is enabled.   |
| 19-18 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 17-12 | TCC      | 0-3Fh | Transfer complete code. This 6-bit code is used to set the relevant bit in CER or IPR of the EDMA3PCC module.                           |
| 11    | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 10-8  | FWID     | 0-7h  | FIFO width. Applies if either SAM or DAM is set to constant addressing mode.  |
|       |          | 0     | FIFO width is 8-bit.  |
|       |          | 1h    | FIFO width is 16-bit.   |
|       |          | 2h    | FIFO width is 32-bit.   |
|       |          | 3h    | FIFO width is 64-bit.   |
|       |          | 4h    | FIFO width is 128-bit.  |
|       |          | 5h    | FIFO width is 256-bit.  |
|       |          | 6h-7h | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 7     | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |
| 6-4   | PRI      | 0-7h  | Transfer priority   |
|       |          | 0     | Priority 0 - Highest priority   |
|       |          | 1h-6h | Priority 1 to priority 6  |
|       |          | 7h    | Priority 7 - Lowest priority  |
| 3-2   | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior. |

**Table 11-108. Destination FIFO Options Register (DFOPT $n$ ) Field Descriptions (continued)**

| Bit | Field | Value | Description   |
|-----|-------|-------|---|
| 1   | DAM   | 0     | Destination address mode within an array<br>Increment (INCR) mode. Destination addressing within an array increments. |
|     |       | 1     | Constant addressing (CONST) mode. Destination addressing within an array wraps around upon reaching FIFO width.       |
| 0   | SAM   | 0     | Source address mode within an array<br>Increment (INCR) mode. Source addressing within an array increments.           |
|     |       | 1     | Constant addressing (CONST) mode. Source addressing within an array wraps around upon reaching FIFO width.            |

#### 11.4.2.6.11 Destination FIFO Source Address Register (DFSRC $n$ )

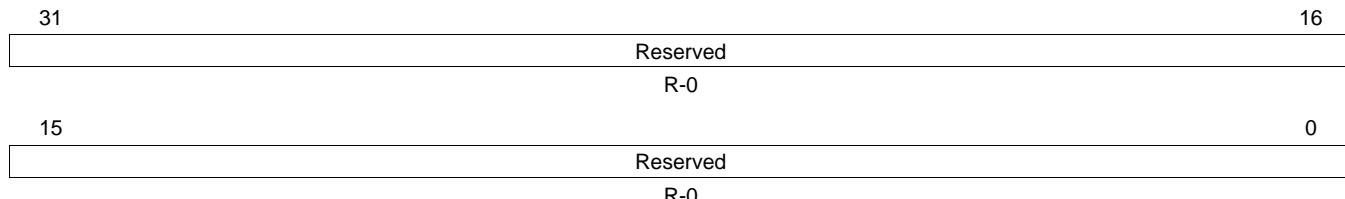

The destination FIFO source address register (DFSRC $n$ ) is shown in [Figure 11-124](#) and described in [Table 11-109](#).

---

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

---

**Figure 11-124. Destination FIFO Source Address Register (DFSRC $n$ )**

LEGEND: R = Read only; - $n$  = value after reset

**Table 11-109. Destination FIFO Source Address Register (DFSRC $n$ ) Field Descriptions**

| Bit  | Field    | Value | Description                 |
|------|----------|-------|-----------------------------|
| 31-0 | Reserved | 0     | Reserved. Always read as 0. |

#### 11.4.2.6.12 Destination FIFO Count Register (DFCNT $n$ )

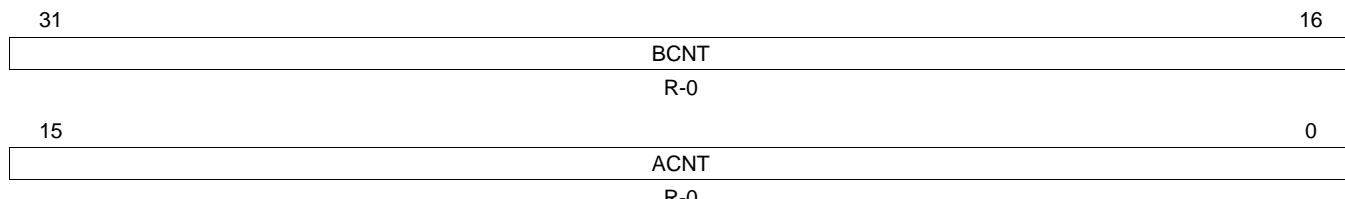

The destination FIFO count register (DFCNT $n$ ) is shown in [Figure 11-125](#) and described in [Table 11-110](#).

---

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

---

**Figure 11-125. Destination FIFO Count Register (DFCNT $n$ )**

LEGEND: R = Read only; - $n$  = value after reset

**Table 11-110. Destination FIFO Count Register (DFCNT $n$ ) Field Descriptions**

| Bit   | Field | Value   | Description   |
|-------|-------|---------|---|
| 31-16 | BCNT  | 0-FFFFh | B-dimension count. Number of arrays to be transferred, where each array is ACNT in length. Count/count remaining for destination register set. Represents the amount of data remaining to be written. |
| 15-0  | ACNT  | 0-FFFFh | A-dimension count. Number of bytes to be transferred in first dimension count/count remaining for destination register set. Represents the amount of data remaining to be written.                    |

#### 11.4.2.6.13 Destination FIFO Destination Address Register (DFDST $n$ )

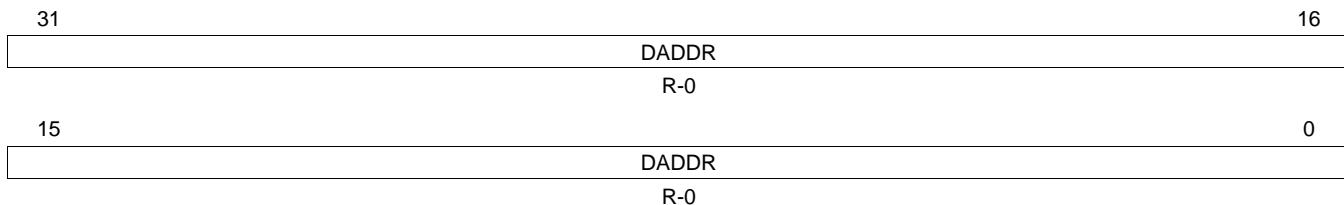

The destination FIFO destination address register (DFDST $n$ ) is shown in [Figure 11-126](#) and described in [Table 11-111](#).

---

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

---

**Figure 11-126. Destination FIFO Destination Address Register (DFDST $n$ )**

LEGEND: R = Read only; - $n$  = value after reset

**Table 11-111. Destination FIFO Destination Address Register (DFDST $n$ ) Field Descriptions**

| Bit  | Field | Value | Description  |
|------|-------|-------|--|
| 31-0 | DADDR | 0     | Destination address for the destination FIFO register set. When a transfer request (TR) is complete, the final value should be the address of the last write command issued. |

#### 11.4.2.6.14 Destination FIFO B-Index Register (DFBIDX $n$ )

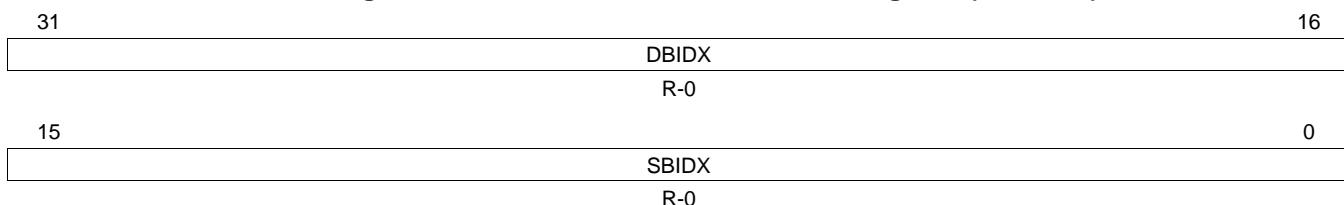

The destination FIFO B-index register (DFBIDX $n$ ) is shown in [Figure 11-127](#) and described in [Table 11-112](#).

---

**NOTE:** The value for  $n$  varies from 0 to DSTREGDEPTH for the given EDMA3TC.

---

**Figure 11-127. Destination FIFO B-Index Register (DFBIDX $n$ )**

LEGEND: R = Read only; - $n$  = value after reset

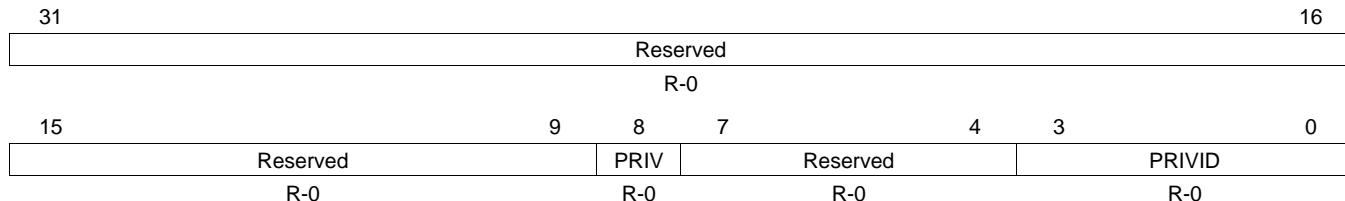

**Table 11-112. Destination FIFO B-Index Register (DFBIDX $n$ ) Field Descriptions**

| Bit   | Field | Value   | Description   |
|-------|-------|---------|---|
| 31-16 | DBIDX | 0-FFFFh | B-Index offset between destination arrays. Represents the offset in bytes between the starting address of each destination. |
| 15-0  | SBIDX | 0       | Always read as 0.   |

#### **11.4.2.6.15 Destination FIFO Memory Protection Proxy Register (DFMPPRXY $n$ )**

The destination FIFO memory protection proxy register (DFMPPRXY $n$ ) is shown in [Figure 11-128](#) and described in [Table 11-104](#).

**Figure 11-128. Destination FIFO Memory Protection Proxy Register (DFMPPRXY $n$ )**

LEGEND: R = Read only; -n = value after reset

**Table 11-113. Destination FIFO Memory Protection Proxy Register (DFMPPRXY $n$ ) Field Descriptions**

| Bit  | Field    | Value | Description   |
|------|----------|-------|---|
| 31-9 | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 8    | PRIV     |       | Privilege level. This contains the Privilege level used by the EDMA3 programmer to set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.<br>The privilege ID is used while issuing read and write command to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIV of the host that set up the DMA transaction.<br>0 User-level privilege<br>1 Supervisor-level privilege |
| 7-4  | Reserved | 0     | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.   |
| 3-0  | PRIVID   | 0-Fh  | Privilege ID. This contains the Privilege ID of the EDMA3 programmer that set up the parameter entry in the channel controller. This field is set up when the associated TR is submitted to the EDMA3TC.<br>This PRIVID value is used while issuing read and write commands to the target endpoints so that the target endpoints can perform memory protection checks based on the PRIVID of the host that set up the DMA transaction.  |

#### 11.4.2.6.16 Destination FIFO Count Reload Register (DFCNTRLD $n$ )

The destination FIFO count reload register (DFCNTRLD $n$ ) is shown in [Figure 11-129](#) and described in [Table 11-114](#).

**Figure 11-129. Destination FIFO Count Reload Register (DFCNTRLD $n$ )**

|    |          |    |
|----|----------|----|
| 31 | Reserved | 16 |
|    | R-0      |    |
| 15 | ACNTRLD  | 0  |
|    | R-0      |    |

LEGEND: R = Read only; -n = value after reset

**Table 11-114. Destination FIFO Count Reload Register (DFCNTRLD $n$ ) Field Descriptions**

| Bit   | Field    | Value   | Description   |
|-------|----------|---------|---|
| 31-16 | Reserved | 0       | Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts to do so may result in undefined behavior.               |
| 15-0  | ACNTRLD  | 0xFFFFh | A-count reload value. Represents the originally programmed value of ACNT. The reload value is used to reinitialize ACNT after each array is serviced. |

#### 11.4.2.6.17 Destination FIFO Source Address B-Reference Register (DFSRCBREF $n$ )

The destination FIFO source address B-reference register (DFSRCBREF $n$ ) is shown in [Figure 11-130](#) and described in [Table 11-115](#).

**Figure 11-130. Destination FIFO Source Address B-Reference Register (DFSRCBREF $n$ )**

|    |          |    |
|----|----------|----|
| 31 | Reserved | 16 |
|    | R-0      |    |
| 15 | Reserved | 0  |
|    | R-0      |    |

LEGEND: R = Read only; -n = value after reset

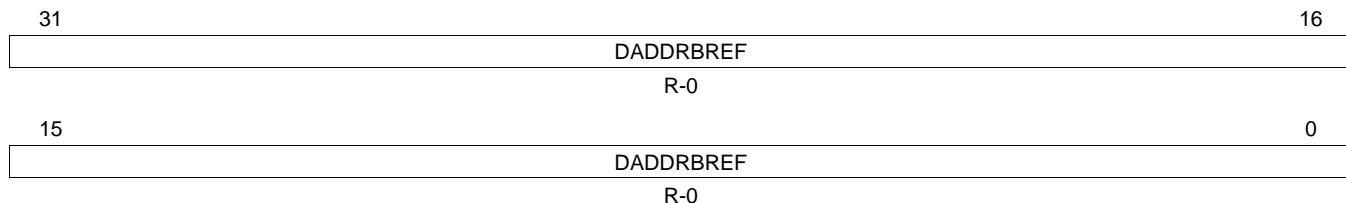

**Table 11-115. Destination FIFO Source Address B-Reference Register (DFSRCBREF $n$ ) Field Descriptions**

| Bit  | Field    | Value | Description                 |
|------|----------|-------|-----------------------------|
| 31-0 | Reserved | 0     | Reserved. Always read as 0. |

#### 11.4.2.6.18 Destination FIFO Destination Address B-Reference (DFDSTBREF $n$ )

The destination FIFO destination address B-reference register (DFDSTBREF $n$ ) is shown in [Figure 11-131](#) and described in [Table 11-116](#).

**Figure 11-131. Destination FIFO Destination Address B-Reference Register (DFDSTBREF $n$ )**

LEGEND: R = Read only; -n = value after reset

**Table 11-116. Destination FIFO Destination Address B-Reference Register (DFDSTBREF $n$ ) Field Descriptions**

| Bit  | Field     | Value        | Description   |
|------|-----------|--------------|---|
| 31-0 | DADDRBREF | 0xFFFF FFFFh | Destination address reference for the destination FIFO register set. Represents the starting address for the array currently being written. |

## 11.5 Appendix A

### 11.5.1 Debug Checklist

This section lists some tips to keep in mind while debugging applications using the EDMA3.

The following table provides some common issues and their probable causes and resolutions.

**Table 11-117. Debug List**

| Issue  | Description/Solution   |
|--|--|
| The transfer associated with the channel does not happen. The channel does not get serviced.         | <p>The EDMA3CC may not service a transfer request, even though the associated ParAM set is programmed appropriately. Check for the following:</p> <ol style="list-style-type: none"> <li>1) Verify that events are enabled, i.e., if an external/peripheral event is latched in Event Registers (ER/ERH), make sure that the event is enabled in the Event Enable Registers (EER/EERH). Similarly, for QDMA channels, make sure that QDMA events are appropriately enabled in the QDMA Event Enable Register (QEER).</li> <li>2) Verify that the DMA or QDMA Secondary Event Register (SER/SERH/QSERH) bits corresponding to the particular event or channel are not set.</li> </ol>   |
| The Secondary Event Registers bits are set, not allowing additional transfers to occur on a channel. | <p>It is possible that a trigger event was received when the parameter set associated with the channel/event was a NULL set for a previous transfer on the channel. This is typical in two cases:</p> <ol style="list-style-type: none"> <li>1) QDMA channels: Typically if the parameter set is non-static and expected to be terminated by a NULL set (i.e., OPT STATIC = 0, LINK = 0xFFFF), the parameter set is updated with a NULL set after submission of the last TR. Because QDMA channels are auto-triggered, this update caused the generation of an event. An event generated for a NULL set causes an error condition and results in setting the bits corresponding to the QDMA channel in the QEMR and QSER. This will disable further prioritization of the channel.</li> <li>2) DMA channels used in a continuous mode: The peripheral may be set up to continuously generate infinite events (for instance, in case of McASP, every time the data shifts out from the DXR register, it generates an XEV). The parameter set may be programmed to expect only a finite number of events and to be terminated by a NULL link. After the expected number of events, the parameter set is reloaded with a NULL parameter set. Because the peripheral will generate additional events, an error condition is set in the SER.Ex and EMR.Ex set, preventing further event prioritization. You must ensure that the number of events received is limited to the expected number of events for which the parameter set is programmed, or you must ensure that bits corresponding to particular channel or event are not set in the Secondary event registers (SER/SERH/QSER) and Event Missed Registers (EMR/EMRH/QEMR) before trying to perform subsequent transfers for the event/channel.</li> </ol> |

**Table 11-117. Debug List (continued)**

| Issue   | Description/Solution  |
|---|---|
| Completion interrupts are not asserted, or no further interrupts are received after the first completion interrupt. | <p>You must ensure the following:</p> <ol style="list-style-type: none"> <li>1) The interrupt generation is enabled in the OPT of the associated PaRAM set (TCINTEN = 1 and/or ITCINTEN = 1).</li> <li>2) The interrupts are enabled in the EDMA3 Channel Controller, via the Interrupt Enable Registers (IER/IERH).</li> <li>3) The corresponding interrupts are enabled in the device interrupt controller.</li> <li>4) The set interrupts are cleared in the interrupt pending registers (IPR/IPRH) before exiting the transfer completion interrupt service routine (ISR). See <a href="#">Section 11.3.9.1.2</a> for details on writing EDMA3 ISRs.</li> <li>5) If working with shadow region interrupts, make sure that the DMA Region Access registers (DRAE/DRAEH) are set up properly, because the DRAE/DRAEH registers act as secondary enables for shadow region completion interrupts, along with the IER/IERH registers.</li> </ol> <p>If working with shadow region interrupts, make sure that the bits corresponding to the transfer completion code (TCC) value are also enabled in the DRAE/DRAEH registers. For instance, if the PaRAM set associated with Channel 0 returns a completion code of 63 (OPT.TCC=63), ensure that DRAEH.E63 is also set for a shadow region completion interrupt because the interrupt pending register bit set will be IPRH.I63 (not IPR.I0).</p> |

### 11.5.2 Miscellaneous Programming/Debug Tips

1. For several registers, the setting and clearing of bits needs to be done via separate dedicated registers. For example, the Event Register (ER/ERH) can only be cleared by writing a 1 to the corresponding bits in the Event Clear Registers (ECR/ECRH). Similarly, the Event Enable Register (EER/EERH) bits can only be set with writes of 1 to the Event Enable Set Registers (EESR/EESRH) and cleared with writes of 1 to the corresponding bits in the Event Enable Clear Register (EECR/EECRH).
2. Writes to the shadow region memory maps are governed by region access registers (DRAE/DRAEH/QRAE). If the appropriate channels are not enabled in these registers, read/write access to the shadow region memory map is not enabled.
3. When working with shadow region completion interrupts, ensure that the DMA Region Access Registers (DRAE/DRAEH) for every region are set in a mutually exclusive way (unless it is a requirement for an application). If there is an overlap in the allocated channels and transfer completion codes (setting of Interrupt Pending Register bits) in the region resource allocation, it results in multiple shadow region completion interrupts. For example, if DRAE0.E0 and DRAE1.E0 are both set, then on completion of a transfer that returns a TCC=0, they will generate both shadow region 0 and 1 completion interrupts.
4. While programming a non-dummy parameter set, ensure the CCNT is not left to zero.
5. Enable the EDMA3CC error interrupt in the device controller and attach an interrupt service routine (ISR) to ensure that error conditions are not missed in an application and are appropriately addressed with the ISR.
6. Depending on the application, you may want to break large transfers into smaller transfers and use self-chaining to prevent starvation of other events in an event queue.
7. In applications where a large transfer is broken into sets of small transfers using chaining or other methods, you might choose to use the early chaining option to reduce the time between the sets of transfers and increase the throughput. However, keep in mind that with early completion, all data might have not been received at the end point when completion is reported because the EDMA3CC internally signals completion when the TR is submitted to the EDMA3TC, potentially before any data has been transferred.
8. The event queue entries can be observed to determine the last few events if there is a system failure (provided the entries were not bypassed).

### 11.5.3 Setting Up a Transfer

The following list provides a quick guide for the typical steps involved in setting up a transfer.

Step 1. Initiating a DMA/QDMA channel

- (a) Determine the type of channel (QDMA or DMA) to be used.
- (b) Channel mapping
  - (i) If using a QDMA channel, program the QCHMAP with the parameter set number to which the channel maps and the trigger word.
  - (ii) If using a DMA channel, program the DCHMAP with the parameter set number to which the channel maps.
- (c) If the channel is being used in the context of a shadow region, ensure the DRAE/DRAEH for the region is properly set up to allow read write accesses to bits in the event registers and interrupt registers in the Shadow region memory map. The subsequent steps in this process should be done using the respective shadow region registers. (Shadow region descriptions and usage are provided in [Section 11.3.7.1](#).)
- (d) Determine the type of triggering used.
  - (i) If external events are used for triggering (DMA channels), enable the respective event in EER/EERH by writing into EESR/EESRH.
  - (ii) If QDMA Channel is used, enable the channel in QEER by writing into QEESR.
- (e) Queue setup
  - (i) If a QDMA channel is used, set up the QDMAQNUM to map the channel to the respective event queue.
  - (ii) If a DMA channel is used, set up the DMAQNUM to map the event to the respective event queue.

Step 2. Parameter set setup

- (a) Program the PaRAM set number associated with the channel. Note that if it is a QDMA channel, the PaRAM entry that is configured as trigger word is written to last. Alternatively, enable the QDMA channel (step 1-b-ii above) just before the write to the trigger word.  
See [Section 11.3.19](#) for parameter set field setups for different types of transfers. See the sections on chaining ([Section 11.3.8](#)) and interrupt completion ([Section 11.3.9](#)) on how to set up final/intermediate completion chaining and/or interrupts.

Step 3. Interrupt setup

- (a) Enable the interrupt in the IER/IERH by writing into IESR/IESRH.
- (b) Ensure that the EDMA3CC completion interrupt (either the global or the shadow region interrupt) is enabled properly in the device interrupt controller.
- (c) Ensure the EDMA3CC completion interrupt (this refers to either the Global interrupt or the shadow region interrupt) is enabled properly in the Device Interrupt controller.
- (d) Set up the interrupt controller properly to receive the expected EDMA3 interrupt.

**Step 4. Initiate transfer**

- (a) This step is highly dependent on the event trigger source:
- (i) If the source is an external event coming from a peripheral, the peripheral will be enabled to start generating relevant EDMA3 events that can be latched to the ER transfer.
  - (ii) For QDMA events, writes to the trigger word (step 2-a above) will initiate the transfer.
  - (iii) Manually triggered transfers will be initiated by writes to the Event Set Registers (ESR/ESRH).
  - (iv) Chained-trigger events initiate when a previous transfer returns a transfer completion code equal to the chained channel number.

**Step 5. Wait for completion**

- (a) If the interrupts are enabled as mentioned in step 3 above, then the EDMA3CC will generate a completion interrupt to the CPU whenever transfer completion results in setting the corresponding bits in the interrupt pending register (IPR\IPRH). The set bits must be cleared in the IPR\IPRH by writing to corresponding bit in ICR\ICRH.
- (b) If polling for completion (interrupts not enabled in the device controller), then the application code can wait on the expected bits to be set in the IPR\IPRH. Again, the set bits in the IPR\IPRH must be manually cleared via ICR\ICRH before the next set of transfers is performed for the same transfer completion code values.

## **Touchscreen Controller**

This chapter describes the touchscreen controller of the device.

## 12.1 Introduction

The touchscreen controller and analog-to-digital converter subsystem (TSC\_ADC\_SS) is an 8-channel general-purpose analog-to-digital converter (ADC) with optional support for interleaving touchscreen (TS) conversions for a 4-wire, 5-wire, or 8-wire resistive panel. The TSC\_ADC\_SS can be configured for use in one of the following applications:

- 8 general-purpose ADC channels
- 4-wire TSC with 4 general-purpose ADC channels
- 5-wire TSC with 3 general-purpose ADC channels
- 8-wire TSC

### 12.1.1 TSC\_ADC Features

The main features of the TSC\_ADC\_SS include:

- Support for 4-wire, 5-wire, and 8-wire resistive TS panels
- Support for interleaving TS capture and general-purpose ADC modes
- Programmable FSM sequencer that supports 16 steps:
  - Software register bit for start of conversion
  - Optional start of conversion HW synchronized to Pen touch or external HW event (but not both)
  - Single conversion (one-shot)
  - Continuous conversions
  - Sequence through all input channels based on a mask
  - Programmable OpenDelay before sampling each channel
  - Programmable sampling delay for each channel
  - Programmable averaging of input samples - 16/8/4/2/1
  - Differential or singled ended mode setting for each channel
  - Store data in either of two FIFO groups
  - Option to encode channel number with data
  - Support for servicing FIFOs via DMA or CPU
  - Programmable DMA Request event (for each FIFO)
  - Dynamically enable or disable channel inputs during operation
  - Stop bit to end conversion
- Support for the following interrupts and status, with masking:
  - Interrupt for HW pen (touch) event
  - Interrupt for HW Pen Up event
  - Interrupt after a sequence of conversions (all non-masked channels)
  - Interrupt for FIFO threshold levels
  - Interrupt if sampled data is out of a programmable range
  - Interrupt for FIFO overflow and underflow conditions
  - Status bit to indicate if ADC is busy converting

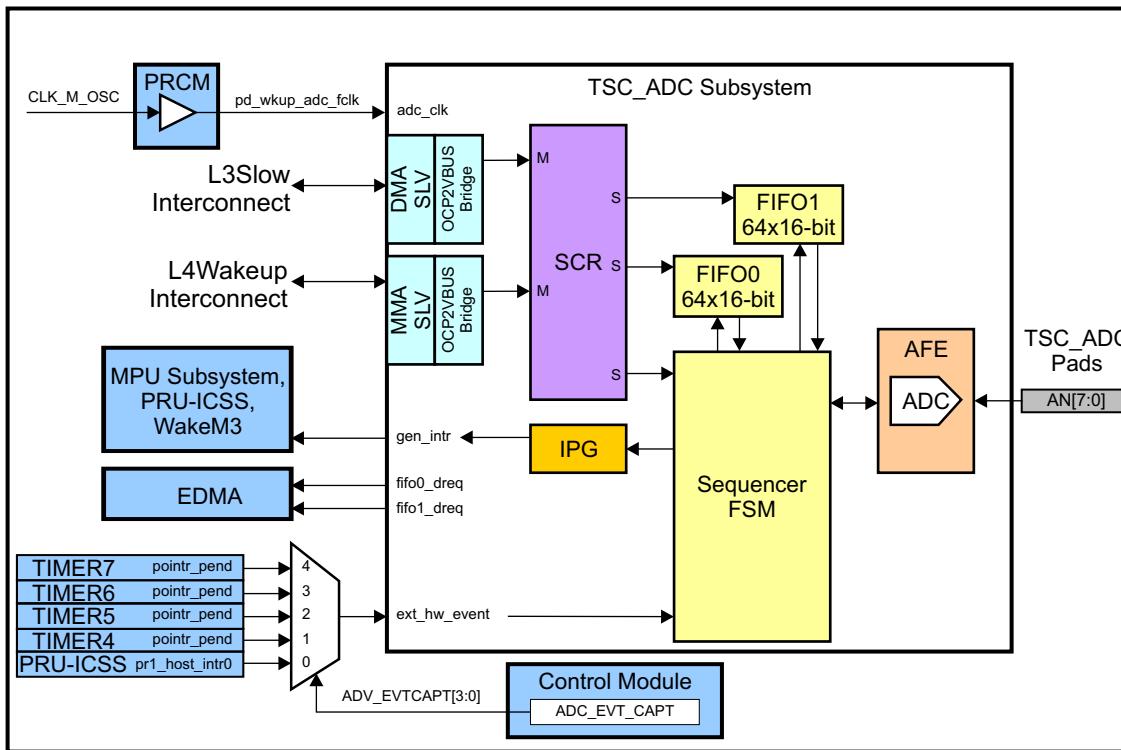

### 12.1.2 Unsupported TSC\_ADC\_SS Features

This device supports all TSC\_ADC\_SS features.

## 12.2 Integration

Figure 12-1 shows the integration of the TSC\_ADC module in the device.

**Figure 12-1. TSC\_ADC Integration**

pr1\_host\_intr[0:7] corresponds to Host-2 to Host-9 of the PRU-ICSS interrupt controller.

### 12.2.1 TSC\_ADC Connectivity Attributes

The general connectivity attributes for the TSC\_ADC module are summarized in [Table 12-1](#).

**Table 12-1. TSC\_ADC Connectivity Attributes**

| Attributes          | Type  |
|---------------------|---|
| Power domain        | Wakeup Domain   |
| Clock domain        | PD_WKUP_L4_WKUP_GCLK (OCP)<br>PD_WKUP_ADC_FCLK (Func)                               |
| Reset signals       | WKUP_DOM_RST_N  |
| Idle/Wakeup signals | Smart idle<br>Wakeup  |
| Interrupt request   | 1 interrupt to MPU Subsystem (ADC_TSC_GENINT), PRU-ICSS (gen_intr_pend), and WakeM3 |
| DMA request         | 2 Events (tsc_adc_FIFO0, tsc_adc_FIFO1)   |
| Physical address    | L3 Slow slave port (DMA)<br>L4 Wkup slave port (MMR)                                |

### 12.2.2 TSC\_ADC Clock and Reset Management

The TSC\_ADC has two clock domains. The ADC uses the adc\_clk. The bus interfaces, FIFOs, sequencer, and all other logic use the ocp\_clk.

**Table 12-2. TSC\_ADC Clock Signals**

| Clock Signal                      | Max Freq        | Reference / Source | Comments                          |
|-----------------------------------|-----------------|--------------------|-----------------------------------|
| ocp_clk<br>OCP / Functional clock | 100 MHz         | CORE_CLKOUTM4 / 2  | pd_pkup_l4_pkup_gclk<br>From PRCM |
| adc_clk<br>ADC clock              | 24 MHz<br>(typ) | CLK_M_OSC          | pd_pkup_adc_fclk<br>From PRCM     |

### 12.2.3 TSC\_ADC Pin List

The TSC\_ADC external interface signals are shown in [Table 12-3](#).

**Table 12-3. TSC\_ADC Pin List**

| Pin     | Type  | Description                              |
|---------|-------|--|
| AN[7:0] | I     | Analog Input                             |
| VREFN   | Power | Analog Reference Input Negative Terminal |
| VREFP   | Power | Analog Reference Input Positive Terminal |

## 12.3 Functional Description

Before enabling the TSC\_ADC\_SS module, the user must first program the Step Configuration registers in order to configure a channel input to be sampled. There are 16 programmable Step Configuration registers which are used by the sequencer to control which switches to turn on or off (inputs to the AFE), which channel to sample, , and which mode to use (HW triggered or SW enabled, one-shot or continuous, averaging, where to save the FIFO data, etc).

### 12.3.1 HW Synchronized or SW Channels

The user can control the start behavior of each channel input by deciding if a channel should be sampled immediately (SW enabled) after it is enabled, or if the channel should wait for a HW event to occur first ( a HW event must either be mapped to the touch screen PEN event or mapped to theHW event input signal, but not both) . Each channel input can be configured independently via the Step Configuration register.

### 12.3.2 Open Delay and Sample Delay

The user can program the delay between driving the inputs to the AFE and the time to send the start of conversion signal. This delay can be used to allow the voltages to stabilize on the touch screen panel before sampling. This delay is called “open delay” and can also be programmed to zero. The user also has control of the sampling time (width of the start of conversion signal) to the AFE which is called the “sample delay”. Each channel input is configured independently via the Step Delay register.

### 12.3.3 Averaging of Samples (1, 2, 4, 8, and 16)

Each channel input has the capability to average the sampled data. The valid averaging options are 1 (no average), 2, 4, 8, and 16. If averaging is turned on, then the channel is immediately sampled again (up to 16 times) and final averaged sample data is stored in the FIFO. Each channel input can be independently configured via the Step Configuration registers.

### 12.3.4 One-Shot (Single) or Continuous Mode

When the sequencer finishes cycling through all the enabled steps , the user can decide if the sequencer should stop (one-shot), or loop back and schedule a the step again (continuous).

If one-shot mode is selected, the sequencer will take care of disabling the step enable bit after the conversion. If continuous mode is selected, it is the software's responsibility to turn off the step enable bit.

### 12.3.5 Interrupts

The following interrupts are supported via enable bits and maskable.

The HW Pen (Touch) interrupt is generated when the user presses the touch screen. This can only occur if the AFE is configured properly (i.e., one of the Pen Ctrl bits must be enabled, and also the correct setting for a path to ground in the StepConfig Registers). Although the HW Pen interrupt can be disabled by the SW, the event will still trigger the sequencer to start if the step is configured as a HW synchronized event. The HW Pen interrupt is an synchronous event and can be used even if the TSC\_ADC\_SS clocks are disabled. The HW Pen interrupt can be used to as a wakeup source.

An END\_OF\_SEQUENCE interrupt is generated after the sequencer finishes servicing the last enabled step.

A PEN\_UP interrupt is generated only if the HW steps are used and the Charge step must be enabled. If a pen\_down event caused the HW steps to be scheduled, and after the sequencer finishes servicing the charge step, if the HW Pen (touch) is not active then PEN UP is generated.

Each FIFO has support for generating interrupts when the FIFO word count has reached a programmable threshold level. The user can program these registers to the desired word count at which the CPU should be interrupted. Whenever the threshold counter value is reached, it sets the FIFO THRESHOLD interrupt flag, and the CPU is interrupted if the FIFO THRESHOLD interrupt enable bit is set. The CPU clears the interrupt flag, after emptying the FIFO, by writing a '1' to the FIFO TRESHOLD interrupt status bit. To determine how many samples are currently in the FIFO at a given moment, the FIFO\_WORD\_COUNT register can be read by the CPU.

The FIFO can also generate FIFO\_OVERRUN and FIFO\_UNDERFLOW interrupts. The user can mask these events by programming the enable bits. To clear a FIFO underflow or FIFO overrun interrupt, the user should write a '1' so the status bit. The TSC\_ADC\_SS does not recover from these conditions automatically. Therefore, the software will need to disable and then again enable the TSC\_ADC\_SS. Before user can turn the module back on, he must first check if the ADC FSM is in IDLE state by reading from the ADC\_STATUS\_REG register.

### 12.3.6 DMA Requests

Each FIFO group can be serviced by either a DMA or by the CPU. To generate DMA requests, the user must first enable the TSC\_ADC\_SS\_DMAENABLE\_SET Register. Also, the user can program the desired number of words to generate a DMA request using the TSC\_ADC\_SS\_DMAREQ register. When the FIFO level reaches or exceeds that value, a DMA request is generated.

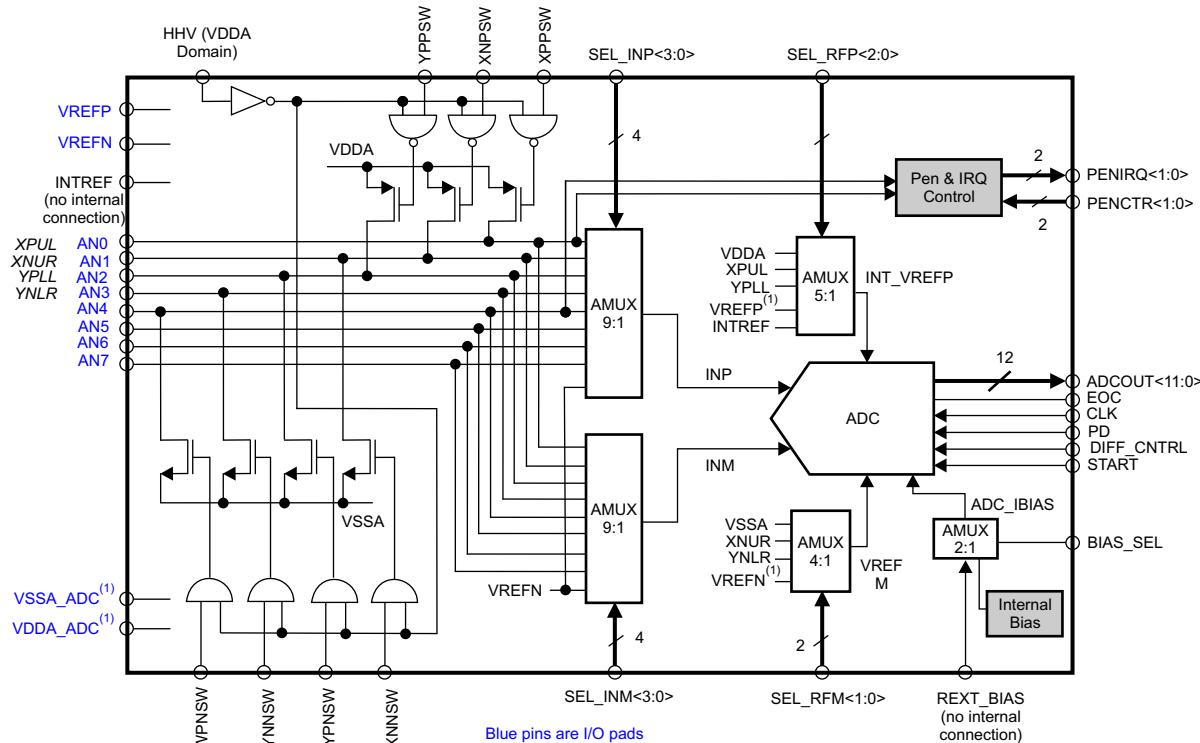

The DMA slave port allows for burst reads in order to effectively move the FIFO data. Internally, the OCP DMA address (MSB) is decoded for either FIFO 0 or FIFO 1. The lower bits of the DMA addresses are ignored since the FIFO pointers are incremented internally. Refer to **section 5 (DMA)** for more information.

### 12.3.7 Analog Front End (AFE) Functional Block Diagram

The AFE features are listed below, and some are controlled by the TSC\_ADC\_SS:

- 12-bit ADC
- Sampling rate can be as fast as every 15 ADC clock cycles
- Support for internal ADC clock divider logic
- Support for configuring the delay between samples also the sampling time

**Figure 12-2. Functional Block Diagram**

(1) In AM335x ARM Cortex-A8 Microprocessors (MPUs) (literature number [SPRS717](#)):

- VDDA\_ADC and VSSA\_ADC are referred to as "Internal References"
- VREFP and VREFN are referred to as "External References"

## 12.4 Operational Modes

The sequencer is completely controlled by software and behaves accordingly to how the **Step Registers** are programmed. A **step** is the general term for sampling a channel input. It is defined by the programmer who decides which input values to send to the AFE (via the StepConfig register), and also how (via StepConfig register) and when (via StepDelay register) to sample a channel input.

A step consists of these three registers:

- StepEnable: Enables or disables the step
- StepConfig: Controls the input values to the ADC (the reference voltages, the pull up/down transistor biasing, which input channel to sample, differential control, HW synchronized or SW enabled, averaging, and which FIFO group to save the data)
- StepDelay: Controls the OpenDelay (the time between driving the AFE inputs until sending the SOC signal to the AFE), and also controls the SampleDelay (the time for the ADC to sample the input signal)

The sequencer supports a total of 16 programmable steps, a touchscreen Charge step, and an Idle step. Each step consists of the three registers above (StepEnable, StepConfig, and StepDelay), except the Idle step does not have a StepEnable bit (it must always be on), and it also does not have a StepDelay register. Also, during the Idle and touchscreen Charge steps, the ADC does not actually sample a channel.

Assuming all the steps are configured as general purpose mode (no touchscreen), then the steps would be configured as SW enabled. When the TSC\_ADC\_SS is first enabled, the sequencer will always start in the Idle step and then wait for a StepEnable[n] bit to turn on. After a step is enabled, the sequencer will start with the lowest step (1) and continue until step (16). If a step is not enabled, then sequencer will skip to the next step. If all steps are disabled, then the sequencer will remain in the IDLE state and continue to apply the Idle StepConfig settings.

Assuming a touchscreen-only mode (no general-purpose channels) the steps could be configured as HW synchronized triggered (mapped to the PEN event).. The sequencer would wait in the IDLE state until a HW pen down event occurred and then begin the HW step conversions. The touchscreen Charge step occurs after the last HW step before going back to the Idle state (the TS Charge step is needed to charge touch screen capacitance which allows the controller to detect subsequent Pen touch events).

Assuming a mixed mode application (touchscreen and general purpose channels), the user can configure the steps as either HW triggered (mapped to Pen event) or SW enabled. If the sequencer is in the IDLE state and a HW pen event occurs, then the HW steps (from lowest to highest) are always scheduled first, followed by the TS Charge step. If there is no HW event, then the SW enabled steps are scheduled instead

If a HW event occurs while the sequencer is in the middle of scheduling the SW steps, the user can program the scheduler to allow preemption. If the HW preempt control bit is enabled, the sequencer will allow the current SW step to finish and then schedule the HW steps. After the last HW step and TS Charge step are completed, the sequencer will continue from the next SW step (before the preemption occurred). If the HW preemption is disabled, then the touch event will be ignored until the last software step is completed; if the touch event is removed before the last software step is finished, then the touch event will be missed.

Even if a touch screen is not present, the user can still configure the steps to be HW synchronize by mapping to the HW event input signal. This HW event input signal could be driven at the SOC level from a timer interrupt or some other IP and can be used to start a channel conversion.

When mapping is set for the input HW event signal, then the TSC\_ADC\_SS will wait for a rising edge transition (from low to high) before starting. The input HW event signal is captured on the internal L4 OCP clock domain. The HW event input signal should be held for at least 2 TSC\_ADC\_SS OCP clocks (L4 frequency).

An END\_OF\_SEQUENCE interrupt and the PEN\_UP interrupt are generated after the last active step is completed before going back to the IDLE state. The END\_OF\_SEQUENCE interrupt does not mean data is in the FIFO (should use the FIFO interrupts and word count reg)

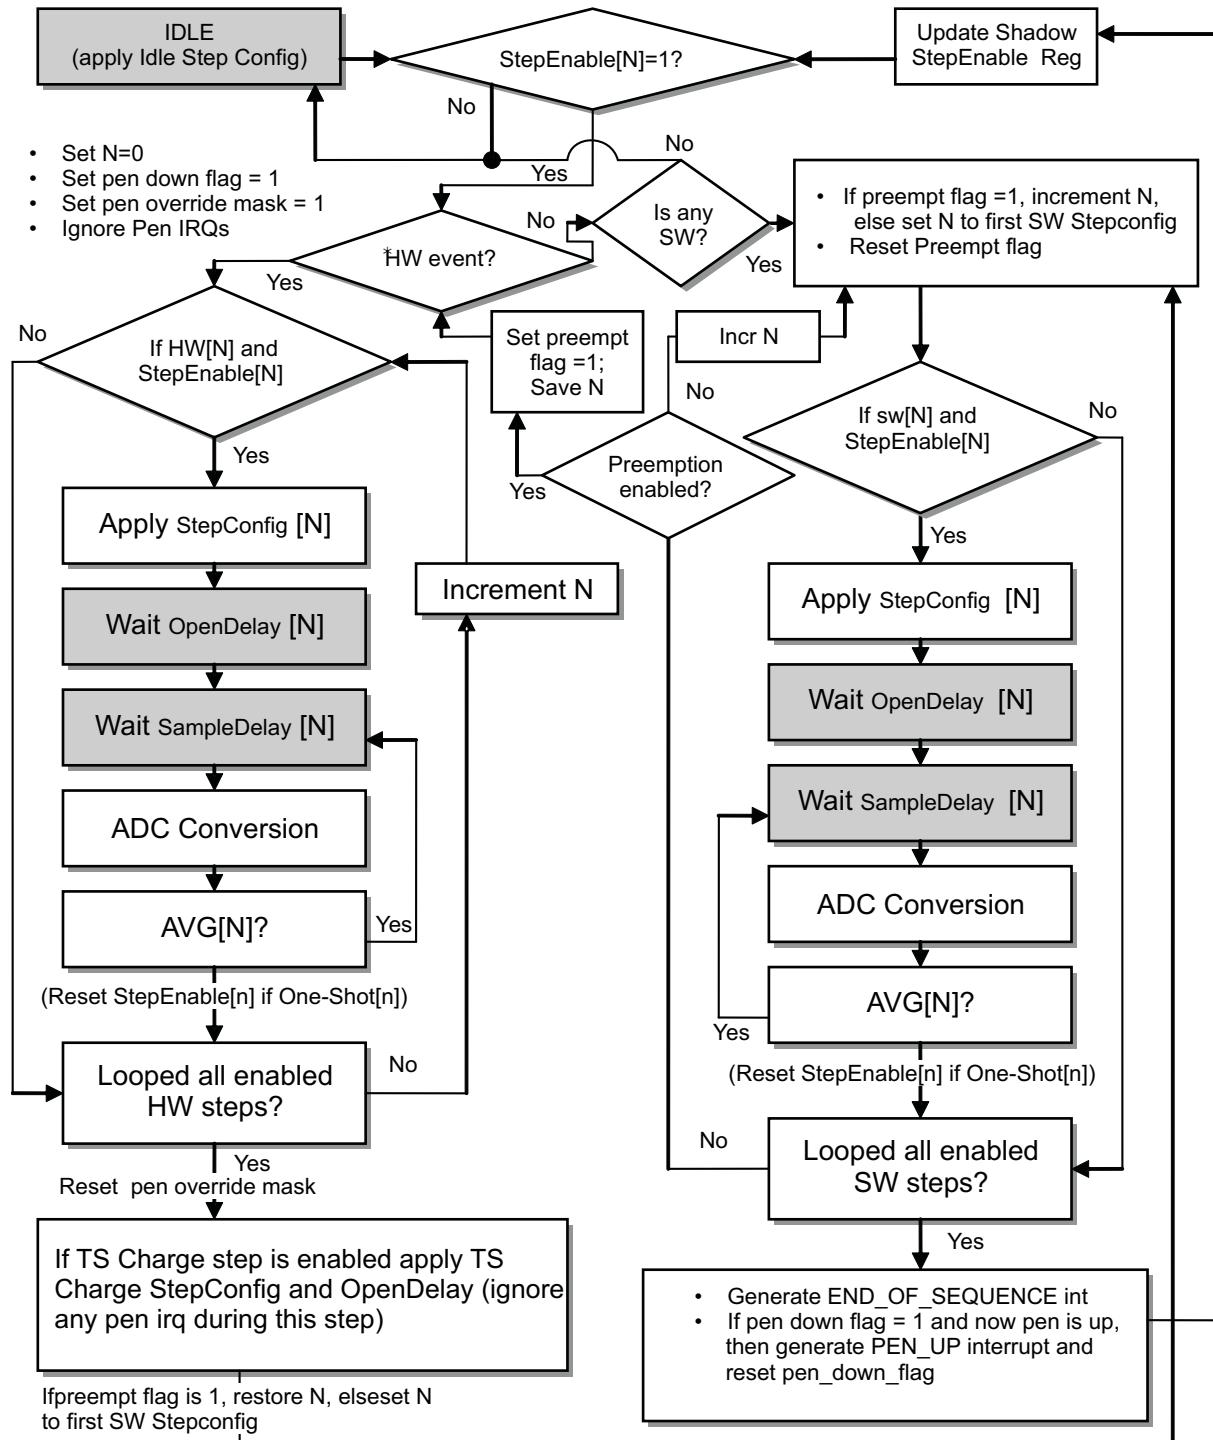

### 12.4.1 PenCtrl and PenIRQ

The Pen IRQ can only occur if the correct Pen Ctrl bits are high (AFE Pen Ctrl bits 6:5 in the TSC\_ADC control register) and if the correct ground transistor biasing is set in the StepConfig [N] Register. Refer to the application notes for the correct settings.

If a step is configured as HW synchronized, the sequencer will override the PenCtrl bits set by the software (bits 6 and 5) once it transitions from the IdleStep. The sequencer will automatically mask the PenCtrl bits (override them and turn them off) so that the ADC can get an accurate measurement from the x and y channels. After the last HW synchronized step, the sequence will go to the TS Charge step and the pen\_overide mask is removed and the values set by the SW (bits 6:5) will have control. The pen\_irq will be temporarily ignored during the TS Charge step (HW will mask any potential glitches that may occur)

If the sequencer is not using the HW synchronized approach, (all the steps are configured as software enabled), then it is the software programmer's responsibility to correctly turn on and off the pen ctrl bits to the AFE in order get the correct measures from the touch screen. It is the responsibility of the software to enable the charge step and ignore any potential glitches by using pen\_irq register.

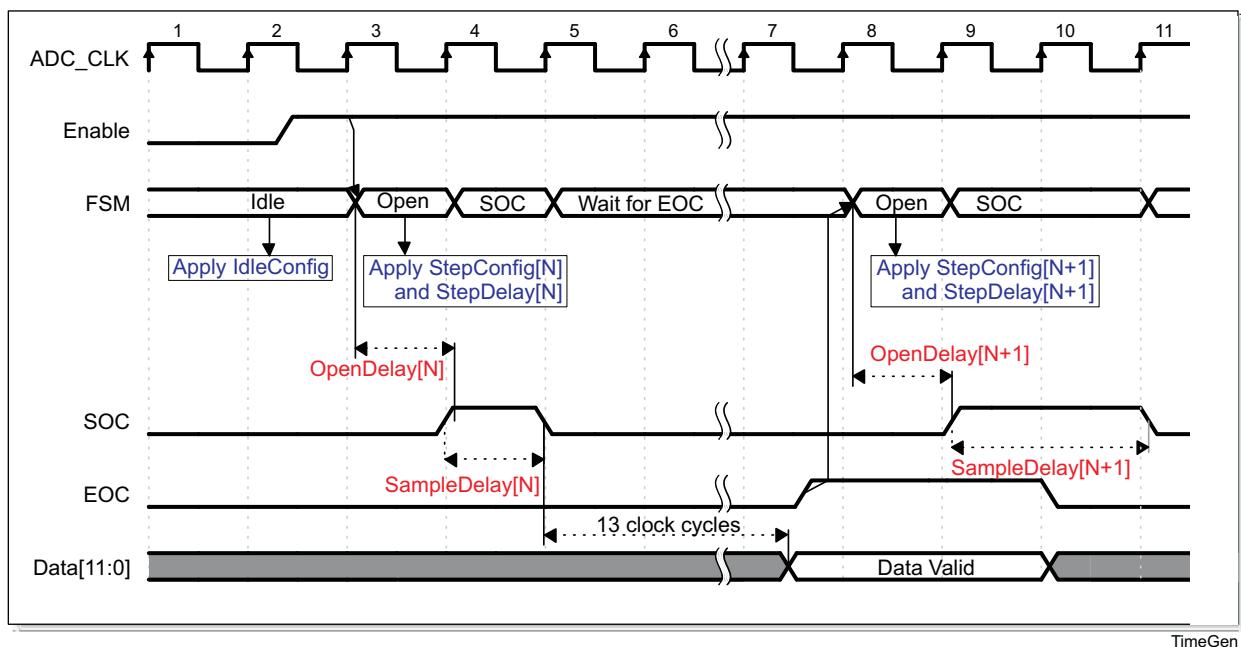

It is also possible to detect the HW Pen event even if all the StepEnable[n] bits are off. By setting the PenCtrl bit to 1, and configuring the IdleStep Configuration register to correctly bias the transistor to grnd, the HW\_PEN event will be generated. The flowchart for the sequencer is shown in [Figure 12-3](#) and an example timing diagram in [Figure 12-4](#).

**Figure 12-3. Sequencer FSM**

\* HW event can either be Pen touch, or input HW event, but not both

The previous diagram does not actually represent clock cycles but instead illustrates how the scheduler will work. However, each shaded box above does represent a FSM state and will use a clock cycle. Using the minimum delay values, the ADC can sample at 15 ADC clocks per sample. Below is an example timing diagram illustrating the states of the sequencer and also the showing when the StepConfig and the StepDelay registers values are applied. The below example assumes the steps are software controlled, and averaging is turned off.

Figure 12-4. Example Timing Diagram for Sequencer

The Idle StepConfig is always enabled and applied when the FSM is in the IDLE state (i.e., either waiting for a HW event or waiting for a step to be enabled). The Idle StepConfig can not be disabled.

Once the TSC\_ADC\_SS is enabled and assuming at least one StepEnable[N] is active, the FSM will transition from the Idle state and apply the first active StepConfig[N] and StepDelay[N] register settings. It is possible for the OpenDelay[N] value to be 0, and therefore the FSM will immediately skip to the SampleDelay[N] state (which is minimum 1 clock cycle). The ADC will begin the sampling on the falling edge of the SOC signal. After the ADC is finished converting the channel data (13 cycles later), the EOC signal is sent and the FSM will then apply the next active step [N+1].

This process is repeated and continued (from step 1 to step 16) until the last active step is completed.

## 12.5 Touchscreen Controller Registers

### 12.5.1 TSC\_ADC\_SS Registers

**Table 12-4** lists the memory-mapped registers for the TSC\_ADC\_SS. All register offset addresses not listed in **Table 12-4** should be considered as reserved locations and the register contents should not be modified.

**Table 12-4. TSC\_ADC\_SS REGISTERS**

| Offset | Acronym              | Register Name | Section                           |

### 12.5.1.1 REVISION Register (offset = 0h) [reset = 47300001h]

REVISION is shown in [Figure 12-5](#) and described in [Table 12-5](#).

#### Revision Register

**Figure 12-5. REVISION Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-5. REVISION Register Field Descriptions**

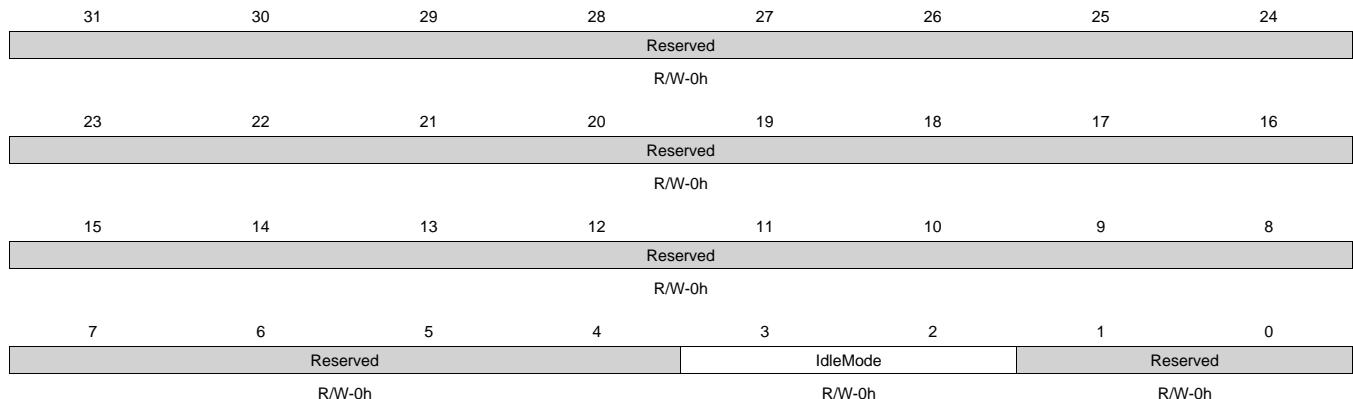

| Bit   | Field    | Type | Reset | Description                                      |
|-------|----------|------|-------|--|
| 31-30 | SCHEME   | R    | 1h    | HL 0.8 scheme                                    |
| 29-28 | Reserved | R    | 0h    | Always read as 0.<br>Writes have no affect.      |
| 27-16 | FUNC     | R    | 730h  | Functional Number                                |
| 15-11 | R RTL    | R    | 0h    | RTL revision.<br>Will vary depending on release. |
| 10-8  | X_MAJOR  | R    | 0h    | Major revision.                                  |
| 7-6   | CUSTOM   | R    | 0h    | Custom revision.                                 |
| 5-0   | Y_MINOR  | R    | 1h    | Minor revision                                   |

### 12.5.1.2 SYSCONFIG Register (offset = 10h) [reset = 0h]

SYSCONFIG is shown in [Figure 12-6](#) and described in [Table 12-6](#).

#### SysConfig Register

**Figure 12-6. SYSCONFIG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-6. SYSCONFIG Register Field Descriptions**

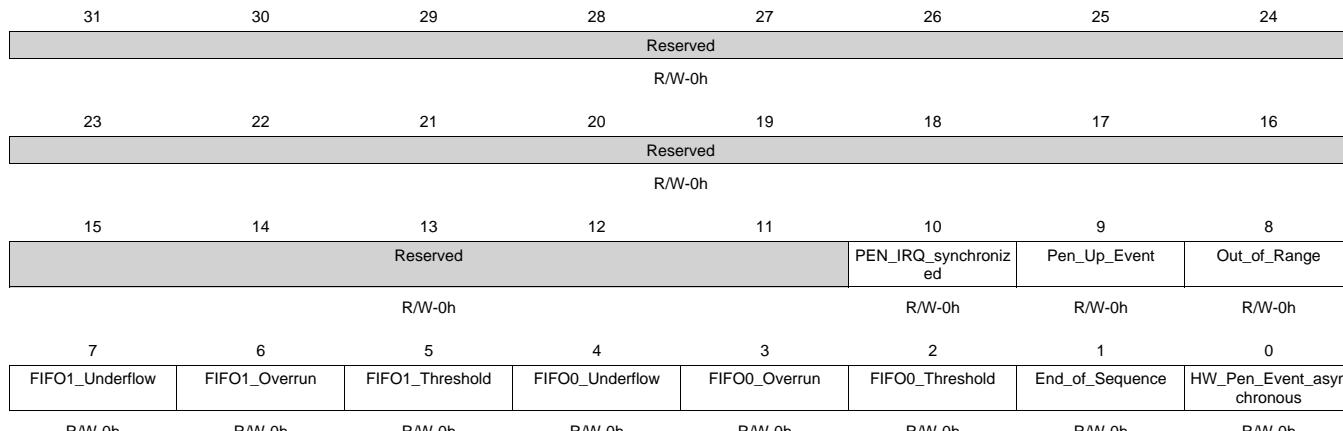

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-4 | Reserved | R/W  | 0h    |  |
| 3-2  | IdleMode | R/W  | 0h    | 00 = Force Idle (always acknowledges).<br>01 = No Idle Mode (never acknowledges).<br>10 = Smart-Idle Mode.<br>11 = Smart Idle with Wakeup. |
| 1-0  | Reserved | R/W  | 0h    |  |

### 12.5.1.3 IRQSTATUS\_RAW Register (offset = 24h) [reset = 0h]

IRQSTATUS\_RAW is shown in [Figure 12-7](#) and described in [Table 12-7](#).

IRQ status (unmasked)

**Figure 12-7. IRQSTATUS\_RAW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-7. IRQSTATUS\_RAW Register Field Descriptions**

| Bit   | Field                | Type | Reset | Description   |
|-------|----------------------|------|-------|---|
| 31-11 | Reserved             | R/W  | 0h    |   |
| 10    | PEN_IRQ_synchronized | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 9     | Pen_Up_Event         | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 8     | Out_of_Range         | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 7     | FIFO1_Underflow      | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 6     | FIFO1_OVERRUN        | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 5     | FIFO1_Threshold      | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 4     | FIFO0_Underflow      | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 3     | FIFO0_OVERRUN        | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |

**Table 12-7. IRQSTATUS\_RAW Register Field Descriptions (continued)**

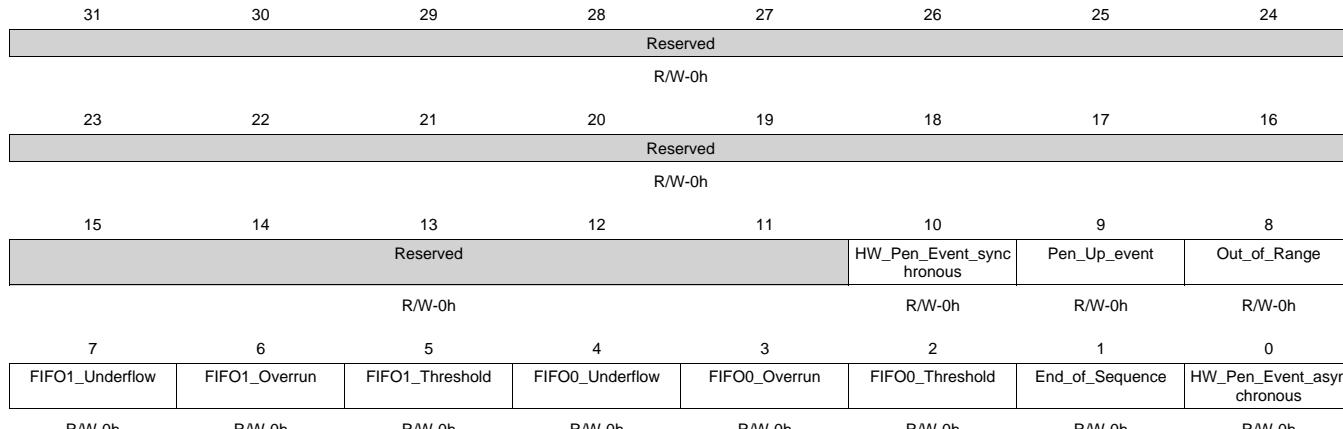

| Bit | Field                     | Type | Reset | Description   |
|-----|---------------------------|------|-------|---|
| 2   | FIFO0_Threshold           | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 1   | End_of_Sequence           | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |
| 0   | HW_Pen_Event_asynchronous | R/W  | 0h    | Write 0 = No action.<br>Write 1 = Set event (debug).<br>Read 0 = No event pending.<br>Read 1 = Event pending. |

#### 12.5.1.4 IRQSTATUS Register (offset = 28h) [reset = 0h]

IRQSTATUS is shown in [Figure 12-8](#) and described in [Table 12-8](#).

IRQ status (masked)

**Figure 12-8. IRQSTATUS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-8. IRQSTATUS Register Field Descriptions**

| Bit   | Field                        | Type | Reset | Description   |
|-------|------------------------------|------|-------|---|
| 31-11 | Reserved                     | R/W  | 0h    |   |
| 10    | HW_Pen_Event_sync<br>hronous | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 9     | Pen_Up_event                 | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 8     | Out_of_Range                 | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 7     | FIFO1_Underflow              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 6     | FIFO1_OVERRUN                | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 5     | FIFO1_Threshold              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 4     | FIFO0_Underflow              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 3     | FIFO0_OVERRUN                | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |

**Table 12-8. IRQSTATUS Register Field Descriptions (continued)**

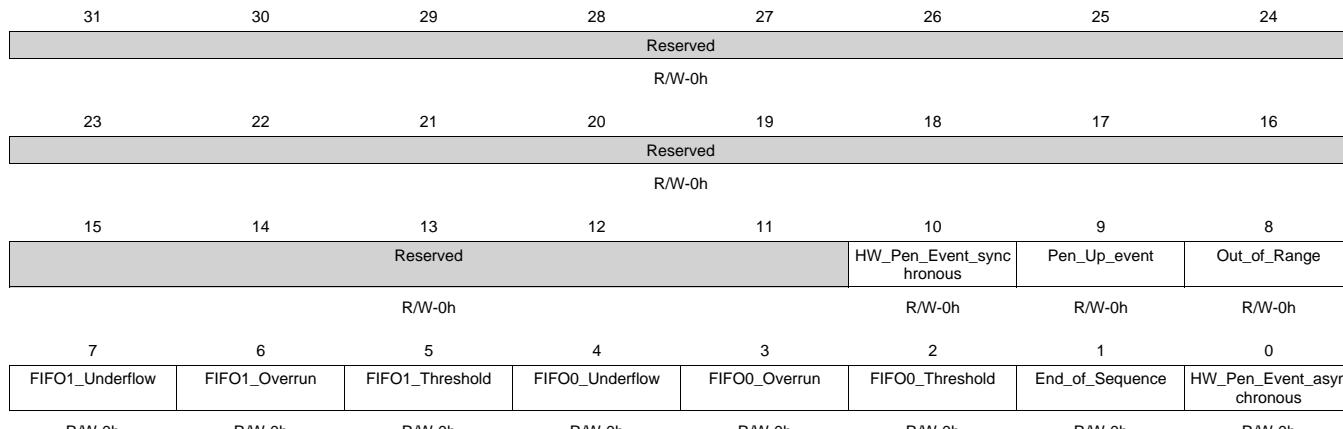

| Bit | Field                     | Type | Reset | Description   |
|-----|---------------------------|------|-------|---|
| 2   | FIFO0_Threshold           | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 1   | End_of_Sequence           | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |
| 0   | HW_Pen_Event_asynchronous | R/W  | 0h    | Write 0 = No action.<br>Read 0 = No (enabled) event pending.<br>Read 1 = Event pending.<br>Write 1 = Clear (raw) event. |

### 12.5.1.5 IRQENABLE\_SET Register (offset = 2Ch) [reset = 0h]

IRQENABLE\_SET is shown in [Figure 12-9](#) and described in [Table 12-9](#).

IRQ enable set bits

**Figure 12-9. IRQENABLE\_SET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-9. IRQENABLE\_SET Register Field Descriptions**

| Bit   | Field                        | Type | Reset | Description   |
|-------|------------------------------|------|-------|---|
| 31-11 | Reserved                     | R/W  | 0h    |   |
| 10    | HW_Pen_Event_sync<br>hronous | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 9     | Pen_Up_event                 | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 8     | Out_of_Range                 | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 7     | FIFO1_Underflow              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 6     | FIFO1_OVERRUN                | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 5     | FIFO1_Threshold              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 4     | FIFO0_Underflow              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 3     | FIFO0_OVERRUN                | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |

**Table 12-9. IRQENABLE\_SET Register Field Descriptions (continued)**

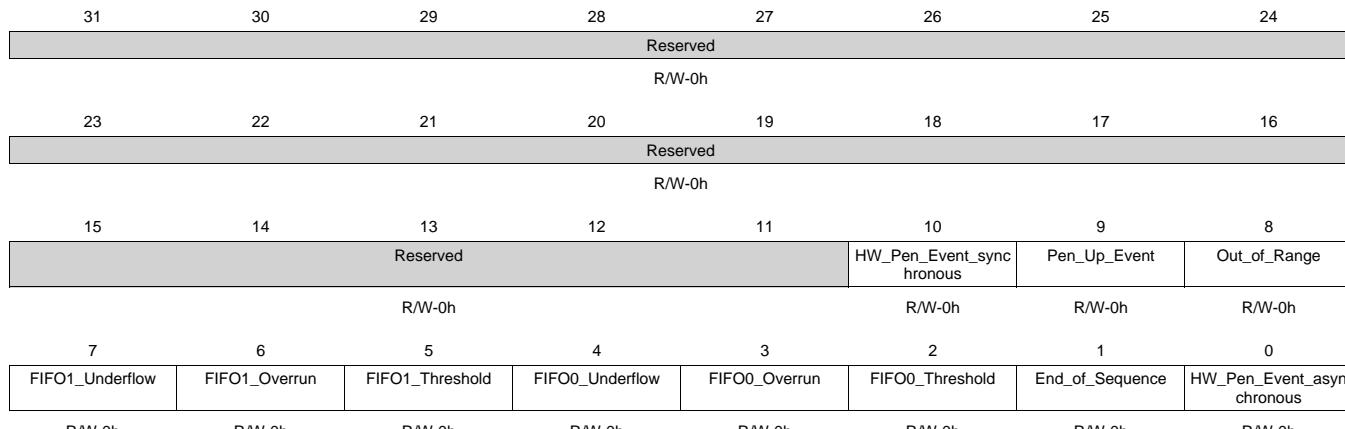

| Bit | Field                     | Type | Reset | Description   |
|-----|---------------------------|------|-------|---|
| 2   | FIFO0_Threshold           | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 1   | End_of_Sequence           | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |
| 0   | HW_Pen_Event_asynchronous | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Enable interrupt. |

### 12.5.1.6 IRQENABLE\_CLR Register (offset = 30h) [reset = 0h]

IRQENABLE\_CLR is shown in [Figure 12-10](#) and described in [Table 12-10](#).

IRQ enable clear bits

**Figure 12-10. IRQENABLE\_CLR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-10. IRQENABLE\_CLR Register Field Descriptions**

| Bit   | Field                        | Type | Reset | Description  |
|-------|------------------------------|------|-------|--|
| 31-11 | Reserved                     | R/W  | 0h    |  |
| 10    | HW_Pen_Event_sync<br>hronous | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 9     | Pen_Up_Event                 | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 8     | Out_of_Range                 | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 7     | FIFO1_Underflow              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 6     | FIFO1_OVERRUN                | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 5     | FIFO1_Threshold              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 4     | FIFO0_Underflow              | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 3     | FIFO0_OVERRUN                | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |

**Table 12-10. IRQENABLE\_CLR Register Field Descriptions (continued)**

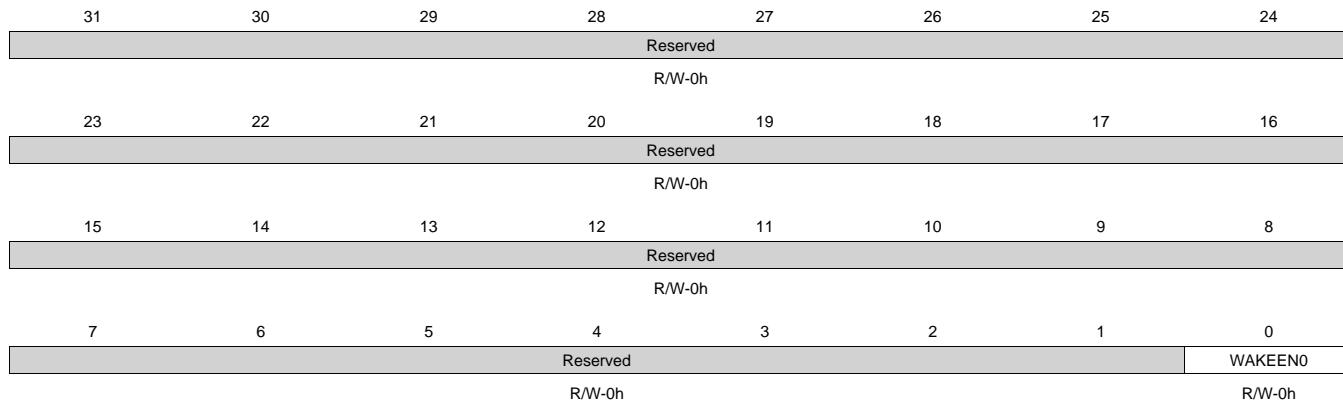

| Bit | Field                     | Type | Reset | Description  |
|-----|---------------------------|------|-------|--|
| 2   | FIFO0_Threshold           | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 1   | End_of_Sequence           | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |
| 0   | HW_Pen_Event_asynchronous | R/W  | 0h    | Write 0 = No action.<br>Read 0 = Interrupt disabled (masked).<br>Read 1 = Interrupt enabled.<br>Write 1 = Disable interrupt. |

### 12.5.1.7 IRQWAKEUP Register (offset = 34h) [reset = 0h]

IRQWAKEUP is shown in [Figure 12-11](#) and described in [Table 12-11](#).

IRQ wakeup enable

**Figure 12-11. IRQWAKEUP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-11. IRQWAKEUP Register Field Descriptions**

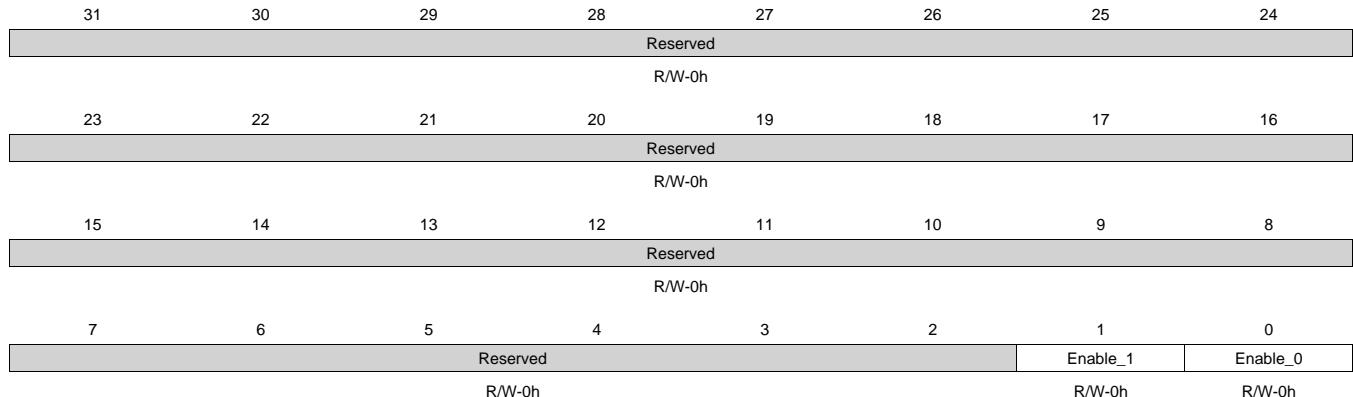

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-1 | Reserved | R/W  | 0h    |  |
| 0    | WAKEEN0  | R/W  | 0h    | Wakeup generation for HW Pen event.<br>0 = Wakeup disabled.<br>1 = Wakeup enabled. |

### 12.5.1.8 DMAENABLE\_SET Register (offset = 38h) [reset = 0h]

DMAENABLE\_SET is shown in [Figure 12-12](#) and described in [Table 12-12](#).

Per-Line DMA set

**Figure 12-12. DMAENABLE\_SET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-12. DMAENABLE\_SET Register Field Descriptions**

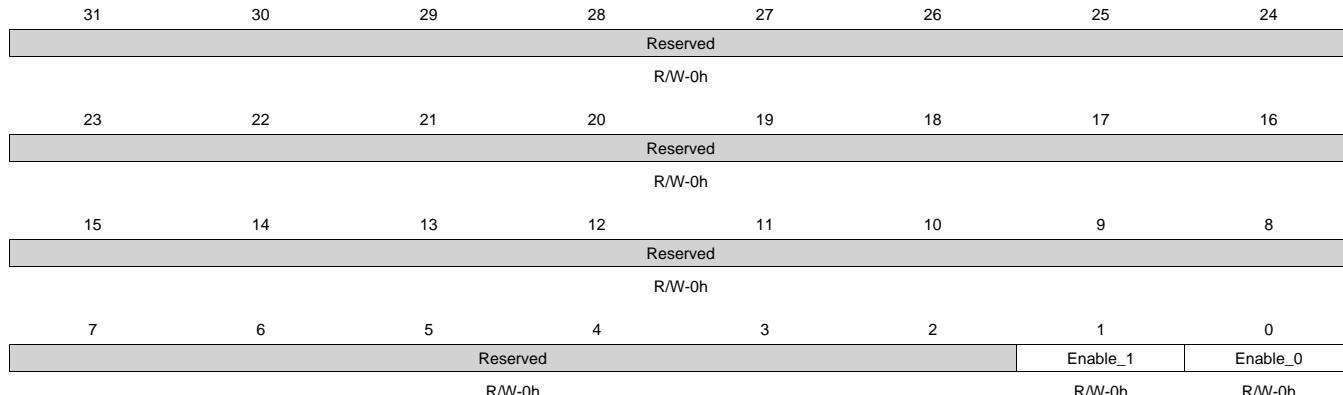

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-2 | Reserved | R/W  | 0h    |   |
| 1    | Enable_1 | R/W  | 0h    | Enable DMA request FIFO 1.<br>Write 0 = No action.<br>Read 0 = DMA line disabled.<br>Read 1 = DMA line enabled.<br>Write 1 = Enable DMA line. |
| 0    | Enable_0 | R/W  | 0h    | Enable DMA request FIFO 0.<br>Write 0 = No action.<br>Read 0 = DMA line disabled.<br>Read 1 = DMA line enabled.<br>Write 1 = Enable DMA line. |

### 12.5.1.9 DMAENABLE\_CLR Register (offset = 3Ch) [reset = 0h]

DMAENABLE\_CLR is shown in [Figure 12-13](#) and described in [Table 12-13](#).

Per-Line DMA clr

**Figure 12-13. DMAENABLE\_CLR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-13. DMAENABLE\_CLR Register Field Descriptions**

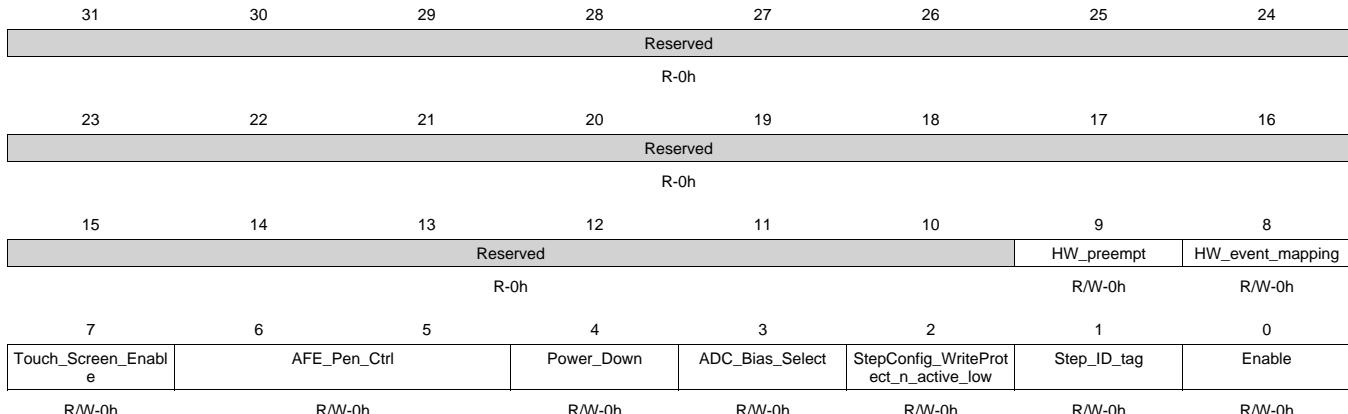

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-2 | Reserved | R/W  | 0h    |   |
| 1    | Enable_1 | R/W  | 0h    | Disable DMA request FIFO 1.<br>Write 0 = No action.<br>Read 0 = DMA line disabled.<br>Read 1 = DMA line enabled.<br>Write 1 = Disable DMA line. |
| 0    | Enable_0 | R/W  | 0h    | Disable DMA request FIFO 0.<br>Write 0 = No action.<br>Read 0 = DMA line disabled.<br>Read 1 = DMA line enabled.<br>Write 1 = Disable DMA line. |

### 12.5.1.10 CTRL Register (offset = 40h) [reset = 0h]

CTRL is shown in [Figure 12-14](#) and described in [Table 12-14](#).

@TSC\_ADC\_SS Control Register

**Figure 12-14. CTRL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-14. CTRL Register Field Descriptions**

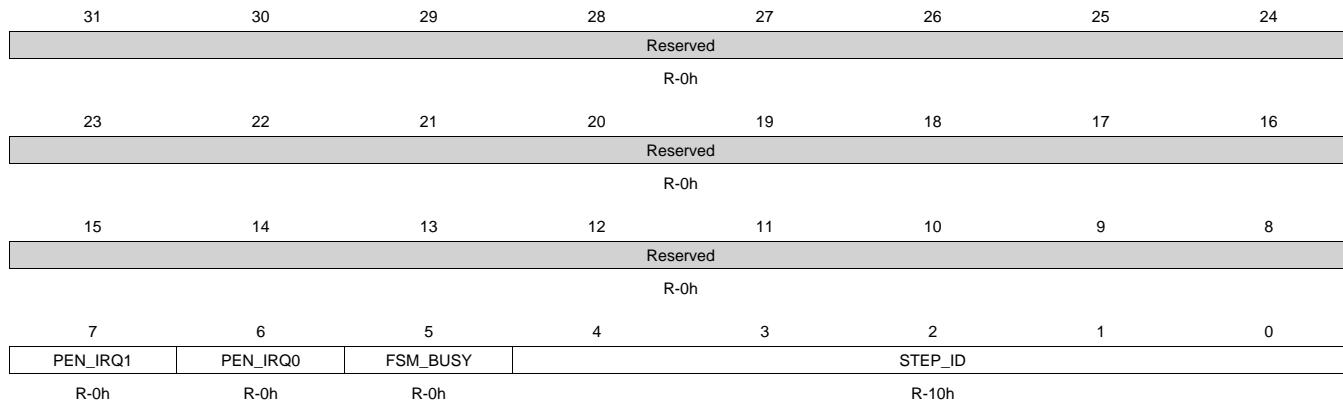

| Bit   | Field                                | Type | Reset | Description   |
|-------|--------------------------------------|------|-------|---|
| 31-10 | Reserved                             | R    | 0h    |   |
| 9     | HW_preempt                           | R/W  | 0h    | 0 = SW steps are not pre-empted by HW events.<br>1 = SW steps are pre-empted by HW events   |
| 8     | HW_event_mapping                     | R/W  | 0h    | 0 = Map HW event to Pen touch irq (from AFE).<br>1 = Map HW event to HW event input.  |
| 7     | Touch_Screen_Enable                  | R/W  | 0h    | 0 = Touchscreen transistors disabled.<br>1 = Touchscreen transistors enabled  |
| 6-5   | AFE_Pen_Ctrl                         | R/W  | 0h    | These two bits are sent directly to the AFE Pen Ctrl inputs.<br>Bit 6 controls the Wiper touch (5 wire modes)Bit 5 controls the X+ touch (4 wire modes)User also needs to make sure the ground path is connected properly for pen interrupt to occur (using the StepConfig registers)Refer to section 4 interrupts for more information |
| 4     | Power_Down                           | R/W  | 0h    | ADC Power Down control.<br>0 = AFE is powered up (default).<br>1 = Write 1 to power down AFE (the tsc_adc_ss enable (bit 0) should also be set to off)  |
| 3     | ADC_Bias_Select                      | R/W  | 0h    | Select Bias to AFE.<br>0 = Internal.<br>1 = Reserved.   |
| 2     | StepConfig_WriteProtect_n_active_low | R/W  | 0h    | 0 = Step configuration registers are protected (not writable).<br>1 = Step configuration registers are not protected (writable).  |
| 1     | Step_ID_tag                          | R/W  | 0h    | Writing 1 to this bit will store the Step ID number with the captured ADC data in the FIFO.<br>0 = Write zeroes.<br>1 = Store the channel ID tag.   |
| 0     | Enable                               | R/W  | 0h    | TSC_ADC_SS module enable bit.<br>After programming all the steps and configuration registers, write a 1to this bit to turn on TSC_ADC_SS.<br>Writing a 0 will disable the module (after the current conversion).  |

### 12.5.1.11 ADCSTAT Register (offset = 44h) [reset = 10h]

ADCSTAT is shown in [Figure 12-15](#) and described in [Table 12-15](#).

General Status bits @TSC\_ADC\_SS\_Sequencer\_Status Register

**Figure 12-15. ADCSTAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-15. ADCSTAT Register Field Descriptions**

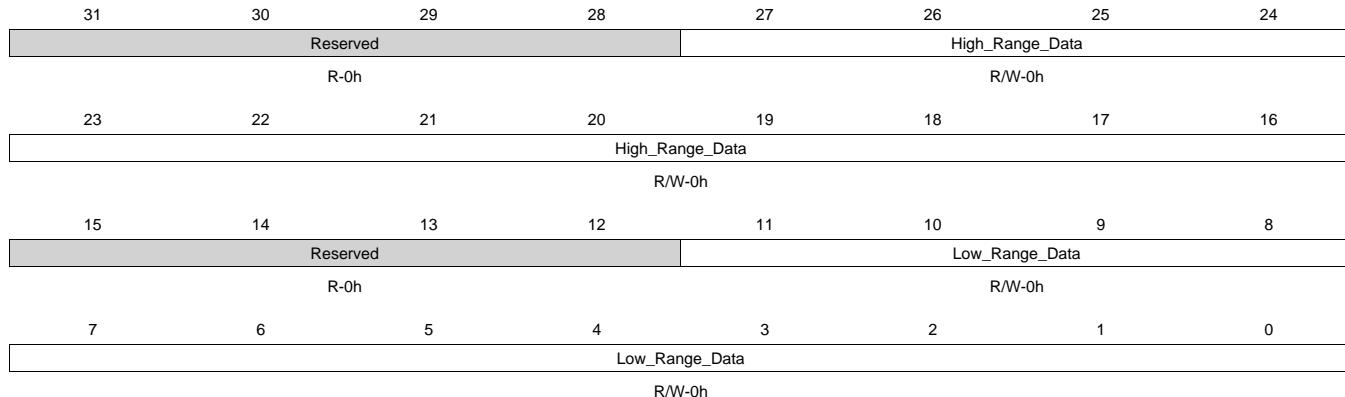

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-8 | Reserved | R    | 0h    | -   |
| 7    | PEN_IRQ1 | R    | 0h    | PEN_IRQ[1] status   |
| 6    | PEN_IRQ0 | R    | 0h    | PEN_IRQ[0] status   |
| 5    | FSM_BUSY | R    | 0h    | Status of OCP FSM and ADC FSM.<br>0 = Idle.<br>1 = Busy.  |
| 4-0  | STEP_ID  | R    | 10h   | Encoded values::<br>10000 = Idle.<br>10001 = Charge.<br>00000 = Step 1.<br>00001 = Step 2.<br>00010 = Step 3.<br>00011 = Step 4.<br>00100 = Step 5.<br>00101 = Step 6.<br>00110 = Step 7.<br>00111 = Step 8.<br>01000 = Step 9.<br>01001 = Step 10.<br>01010 = Step 11.<br>01011 = Step 12.<br>01100 = Step 13.<br>01101 = Step 14.<br>01110 = Step 15.<br>01111 = Step 16. |

### 12.5.1.12 ADCRANGE Register (offset = 48h) [reset = 0h]

ADCRANGE is shown in [Figure 12-16](#) and described in [Table 12-16](#).

High and Low Range Threshold@TSC\_ADC\_SS\_Range\_Check Register

**Figure 12-16. ADCRANGE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-16. ADCRANGE Register Field Descriptions**

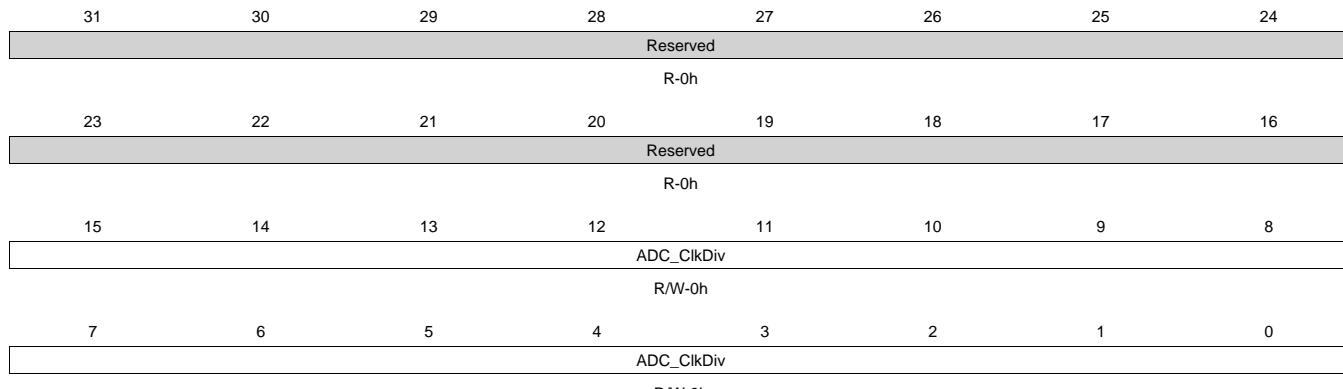

| Bit   | Field           | Type | Reset | Description   |
|-------|-----------------|------|-------|---|
| 31-28 | Reserved        | R    | 0h    |   |
| 27-16 | High_Range_Data | R/W  | 0h    | Sampled ADC data is compared to this value.<br>If the sampled data is greater than the value, then an interrupt is generated. |
| 15-12 | Reserved        | R    | 0h    | Reserved.   |
| 11-0  | Low_Range_Data  | R/W  | 0h    | Sampled ADC data is compared to this value.<br>If the sampled data is less than the value, then an interrupt is generated.    |

### 12.5.1.13 ADC\_CLKDIV Register (offset = 4Ch) [reset = 0h]

ADC\_CLKDIV is shown in [Figure 12-17](#) and described in [Table 12-17](#).

ADC clock divider register@TSC\_ADC\_SS\_Clock\_Divider Register

**Figure 12-17. ADC\_CLKDIV Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-17. ADC\_CLKDIV Register Field Descriptions**

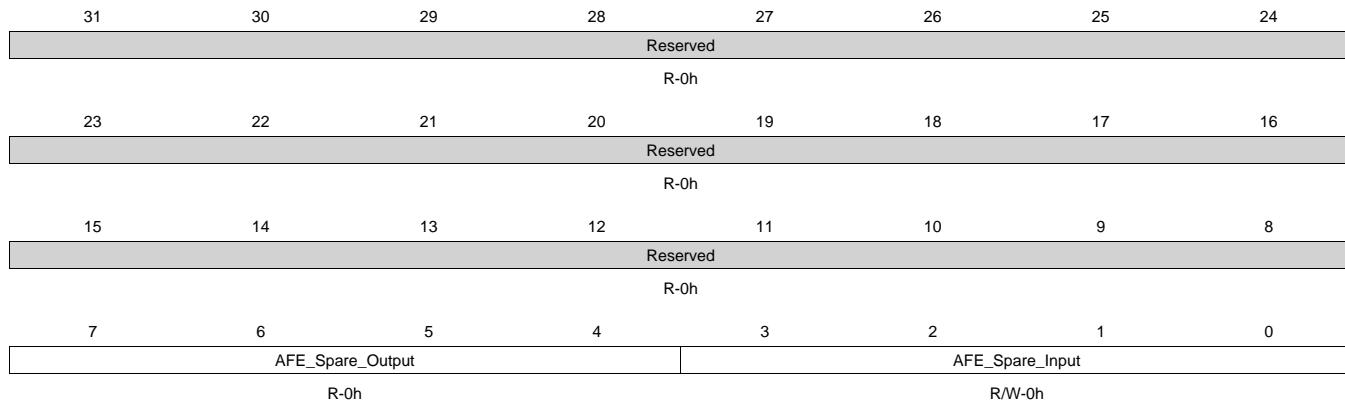

| Bit   | Field      | Type | Reset | Description  |
|-------|------------|------|-------|--|
| 31-16 | Reserved   | R    | 0h    |  |
| 15-0  | ADC_ClkDiv | R/W  | 0h    | The input ADC clock will be divided by this value and sent to the AFE.<br>Program to the value minus 1 |

### 12.5.1.14 ADC\_MISC Register (offset = 50h) [reset = 0h]

ADC\_MISC is shown in [Figure 12-18](#) and described in [Table 12-18](#).

AFE misc debug@TSC\_ADC\_SS\_MISC Register

**Figure 12-18. ADC\_MISC Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 12-18. ADC\_MISC Register Field Descriptions**

| Bit  | Field            | Type | Reset | Description  |
|------|------------------|------|-------|--|
| 31-8 | Reserved         | R    | 0h    | RESERVED.  |
| 7-4  | AFE_Spare_Output | R    | 0h    | Connected to AFE Spare Output pins.<br>Reserved in normal operation. |
| 3-0  | AFE_Spare_Input  | R/W  | 0h    | Connected to AFE Spare Input pins.<br>Reserved in normal operation.  |

### 12.5.1.15 STEPENABLE Register (offset = 54h) [reset = 0h]

STEPENABLE is shown in [Figure 12-19](#) and described in [Table 12-19](#).

Step Enable

**Figure 12-19. STEPENABLE Register**

## LCD Controller

This chapter describes the LCD controller of the device.

| Topic                             | Page |
|-----------------------------------|------|
| 13.1 Introduction .....           | 1090 |
| 13.2 Integration .....            | 1092 |
| 13.3 Functional Description ..... | 1094 |
| 13.4 Programming Model .....      | 1114 |
| 13.5 LCD Registers .....          | 1120 |

## 13.1 Introduction

### 13.1.1 Purpose of the Peripheral

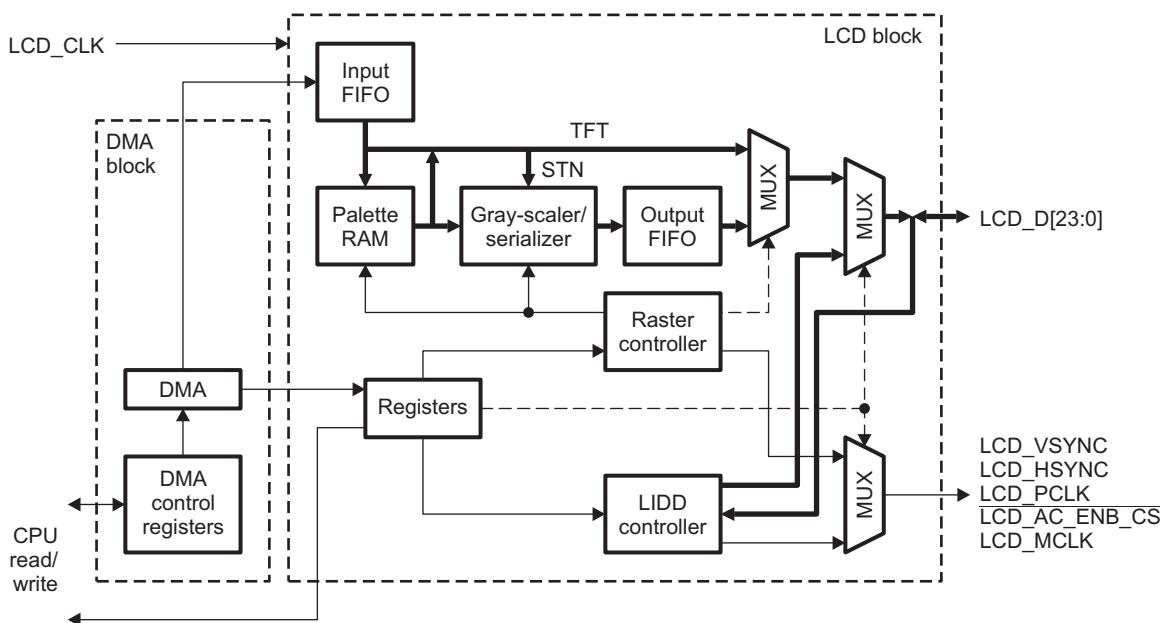

The LCD controller consists of two independent controllers, the Raster Controller and the LCD Interface Display Driver (LIDD) controller. Each controller operates independently from the other and only one of them is active at any given time.

- The Raster Controller handles the synchronous LCD interface. It provides timing and data for constant graphics refresh to a passive display. It supports a wide variety of monochrome and full-color display types and sizes by use of programmable timing controls, a built-in palette, and a gray-scale/serializer. Graphics data is processed and stored in frame buffers. A frame buffer is a contiguous memory block in the system. A built-in DMA engine supplies the graphics data to the Raster engine which, in turn, outputs to the external LCD device.
- The LIDD Controller supports the asynchronous LCD interface. It provides full-timing programmability of control signals (CS, WE, OE, ALE) and output data.

**Figure 13-1** shows the LCD controller details. The raster and LIDD Controllers are responsible for generating the correct external timing. The DMA engine provides a constant flow of data from the frame buffer(s) to the external LCD panel via the Raster and LIDD Controllers. In addition, CPU access is provided to read and write registers.

The solid, thick lines in **Figure 13-1** indicate the data path. The Raster Controller's data path is fairly complicated, for a thorough description of the Raster Controller data path, see [Section 13.3.5](#).

**Figure 13-1. LCD Controller**

### 13.1.2 Features

General features of the LCD Controller include:

- Supports up to 24-bit data output; 8 bits-per-pixel (RGB).
- Supports up to WXGA (1366x768) resolution.
- Integrated DMA engine to pull data from the external frame buffer without burdening the processor via interrupts or a firmware timer.
- 512 word deep internal FIFO with programmable threshold values.
- Character Based Panels
  - Supports 2 Character Panels (CS0 and CS1) with independent and programmable bus timing parameters when in asynchronous Hitachi, Motorola and Intel modes
  - Supports 1 Character Panel (CS0) with programmable bus timing parameters when in synchronous Motorola and Intel modes
  - Can be used as a generic 16 bit address/data interleaved MPU bus master with no external stall
- Passive Matrix LCD Panels
  - Panel types including STN, DSTN, and C-DSTN
  - AC Bias Control
- Active Matrix LCD Panels
  - Panel types including TN TFT
- OLED Panels
  - Passive Matrix (PM OLED) with frame buffer and controller IC inside the Panel
  - Active Matrix (AM OLED)

## 13.2 Integration

The device includes an LCD Controller that reads display data from external memory and drives several different types of LCD displays. The LCD Controller integration is shown in [Figure 13-2](#).

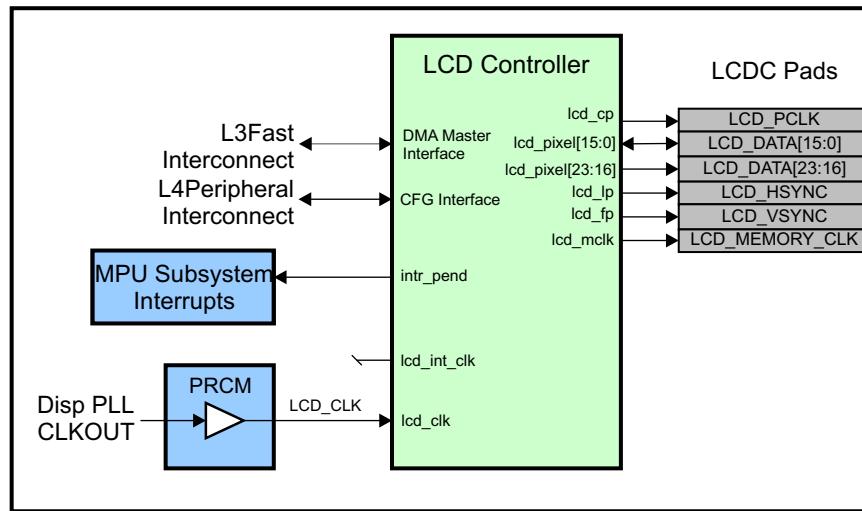

Figure 13-2. LCD Controller Integration

### 13.2.1 LCD Controller Connectivity Attributes

The general connectivity attributes for the LCDC subsystems are shown in [Table 13-1](#).

Table 13-1. LCD Controller Connectivity Attributes

| Attributes          | Type  |
|---------------------|---|
| Power Domain        | Peripheral Domain   |
| Clock Domain        | PD_PER_LCD_L3_GCLK (OCP Master Clock)<br>PD_PER_LCD_L3_GCLK (OCP Slave Clock)<br>PD_PER_LCD_GCLK (Functional Clock) |
| Reset Signals       | PER_DOM_RST_N   |
| Idle/Wakeup Signals | Standby Smart Idle  |
| Interrupt Requests  | 1 Interrupt to MPU Subsystem (LCDCINT)  |
| DMA Requests        | None  |
| Physical Address    | L4 Peripheral Slave Port  |

### 13.2.2 LCD Controller Clock and Reset Management

The LCDC module uses the following functional and OCP interface clocks. The L4 Slave interface runs at half the frequency of the L3 Master interface but uses the same clock. The clock is divided within the LCDC through the I4\_clkdiv input using the pd\_per\_lcd\_I4s\_gclk\_iens signal from the PRCM. The functional clock comes from the Display PLL. When the Display PLL is in bypass mode, its output is sourced by either CORE\_CLKOUTM6 or PER\_CLKOUTM2.

**Table 13-2. LCD Controller Clock Signals**

| Clock Signal                     | Max Freq | Reference / Source                     | Comments                        |
|----------------------------------|----------|--|---------------------------------|
| I3_clk<br>Master Interface Clock | 200 MHz  | CORE_CLKOUTM4                          | pd_per_lcd_I3_gclk<br>From PRCM |
| I4_clk<br>Slave Interface Clock  | 100 MHz  | CORE_CLKOUTM4<br>(divided within LCDC) | pd_per_lcd_I3_gclk<br>From PRCM |
| Lcd_clk<br>Functional Clock      | 200 MHz  | Display PLL CLKOUT                     | pd_per_lcd_gclk<br>From PRCM    |

### 13.2.3 LCD Controller Pin List

The LCD Controller external interface signals are shown in [Table 13-3](#).

**Table 13-3. LCD Controller Pin List**

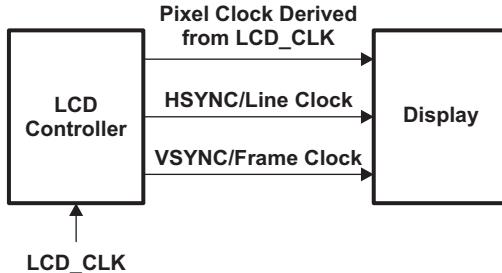

| Pin               | Type | Description  |
|-------------------|------|--|
| lcd_cp            | O    | Pixel Clock in Raster mode Read Strobe or Read/Write Strobe in LIDD mode   |
| lcd_pixel_i[15:0] | I    | LCD Data Bus input (for LIDD mode only)  |
| lcd_pixel_o[23:0] | O    | LCD Data Bus output  |
| lcd_lp            | O    | Line Clock or HSYNC in Raster mode; Write Strobe or Direction bit in LIDD mode                                     |
| lcd_fp            | O    | Frame Clock or VSYNC in Raster mode; Address Latch Enable in LIDD mode   |
| lcd_ac            | O    | AC bias or Latch Enable in Raster mode; Primary Chip Select/Primary Enable in LIDD MPU/Hitachi mode                |
| lcd_mclk          | O    | N/A in Raster mode; Memory Clock/Secondary chip Select/Secondary Enable in LIDD Synchronous/Async MPU/Hitachi mode |

## 13.3 Functional Description

### 13.3.1 Clocking

This section details the various clocks and signals. [Figure 13-3](#) shows input and output LCD controller clocks.

**Figure 13-3. Input and Output Clocks**

#### 13.3.1.1 Pixel Clock (LCD\_PCLK)

The pixel clock (LCD\_PCLK) frequency is derived from LCD\_CLK, the reference clock to this LCD module (see [Figure 13-3](#)). The pixel clock is used by the LCD display to clock the pixel data into the line shift register.

$$\text{LCD\_PCLK} = \frac{\text{LCD\_CLK}}{\text{CLKDIV}}$$

where CLKDIV is a field in the LCD\_CTRL register and should not be 0 or 1.

- **Passive (STN) mode.** LCD\_PCLK only transitions when valid data is available for output. It does not transition when the horizontal clock (HSYNC) is asserted or during wait state insertion.
- **Active (TFT) mode.** LCD\_PCLK continuously toggles as long as the Raster Controller is enabled.

### 13.3.1.2 Horizontal Clock (LCD\_HSYNC)

LCD\_HSYNC toggles after all pixels in a horizontal line have been transmitted to the LCD and a programmable number of pixel clock wait states has elapsed both at the beginning and end of each line.

The RASTER\_TIMING\_0 register fully defines the behavior of this signal.

LCD\_HSYNC can be programmed to be synchronized with the rising or falling edge of LCD\_PCLK. The configuration field is bits 24 and 25 in the RASTER\_TIMING\_2 register.

**Active (TFT) mode:** The horizontal clock or the line clock is also used by TFT displays as the horizontal synchronization signal (LCD\_HSYNC).

The timings of the horizontal clock (line clock) pins are programmable to support:

- Delay insertion both at the beginning and end of each line.
- Line clock polarity.
- Line clock pulse width, driven on rising or falling edge of pixel clock.

### 13.3.1.3 Vertical Clock (LCD\_VSYNC)

LCD\_VSYNC toggles after all lines in a frame have been transmitted to the LCD and a programmable number of line clock cycles has elapsed both at the beginning and end of each frame.

The RASTER\_TIMING\_1 register fully defines the behavior of this signal.

LCD\_VSYNC can be programmed to be synchronized with the rising or falling edge of LCD\_PCLK. The configuration field is bits 24 and 25 in the RASTER\_TIMING\_2 register.

- **Passive (STN) mode.** The vertical, or frame, clock toggles during the first line of the screen.
- **Active (TFT) mode.** The vertical, or frame, clock is also used by TFT displays as the vertical synchronization signal (LCD\_VSYNC).

The timings of the vertical clock pins are programmable to support:

- Delay insertion both at the beginning and end of each frame
- Frame clock polarity

### 13.3.1.4 LCD\_AC\_BIAS\_EN

- **Passive (STN) mode.** To prevent a dc charge within the screen pixels, the power and ground supplies of the display are periodically switched. The Raster Controller signals the LCD to switch the polarity by toggling this pin (LCD\_AC\_BIAS\_EN).
- **Active (TFT) mode.** This signal acts as an output enable (OE) signal. It is used to signal the external LCD that the data is valid on the data bus (LCD\_DATA).

### 13.3.2 LCD External I/O Signals

Table 13-4 shows the details of the LCD controller external signals.

**Table 13-4. LCD External I/O Signals**

| Signal         | Type        | Description   |
|----------------|-------------|---|
| LCD_VSYNC      | OUT         | Raster controller: Frame clock the LCD uses to signal the start of a new frame of pixels.<br>Also used by TFT displays as the vertical synchronization signal.<br><br>LIDD character: Register select (RS) or address latch enable (ALE)<br><br>LIDD graphics: Address bit 0 (A0) or command/data select (C/D)  |
| LCD_HSYNC      | OUT         | Raster controller: Line clock the LCD uses to signal the end of a line of pixels that transfers line data from the shift register to the screen and to increment the line pointer(s). Also used by TFT displays as the horizontal synchronization signal.<br><br>LIDD character: not used.<br><br>LIDD graphics: <ul style="list-style-type: none"><li>• 6800 mode = read or write enable</li><li>• 8080 mode = not write strobe</li></ul>  |
| LCD_PCLK       | OUT         | Raster controller: Pixel clock the LCD uses to clock the pixel data into the line shift register.<br>In passive mode, the pixel clock transitions only when valid data is available on the data lines. In active mode, the pixel clock transitions continuously, and the ac-bias pin is used as an output enable to signal when data is available on the LCD pin.<br><br>LIDD character: not used.<br><br>LIDD graphics: <ul style="list-style-type: none"><li>• 6800 mode = enable strobe</li><li>• 8080 mode = not read strobe</li></ul>  |
| LCD_AC_BIAS_EN | OUT         | Raster controller: ac-bias used to signal the LCD to switch the polarity of the power supplies to the row and column axis of the screen to counteract DC offset. Used in TFT mode as the output enable to signal when data is latched from the data pins using the pixel clock.<br><br>LIDD character: Primary enable strobe<br><br>LIDD graphics: Chip select 0 (CS0)  |
| LCD_MCLK       | OUT         | Raster controller: not used.<br><br>LIDD character: Secondary enable strobe<br><br>LIDD graphics: Chip select 1 (CS1)   |
| LCD_D[23:0]    | Raster: OUT | LCD data bus, providing a 4-, 8-, 16- or 24-bit data path.<br><br>Raster controller: For monochrome displays, each signal represents a pixel; for passive color displays, groupings of three signals represent one pixel (red, green, and blue). LCD_DATA[3:0] is used for monochrome displays of 2, 4, and 8 BPP; LCD_DATA[7:0] is used for color STN displays and LCD_DATA[15:0] or LCD_DATA[23:0] is used for active (TFT) mode.<br><br>LIDD: OUT/IN LIDD character: LCD_DATA[15:0] Read and write the command and data registers.<br>LIDD graphics: LCD_DATA[15:0] Read and write the command and data registers. |

### 13.3.3 DMA Engine

The DMA engine provides the capability to output graphics data to constantly refresh LCDs, without burdening the CPU, via interrupts or a firmware timer. It operates on one or two frame buffers, which are set up during initialization. Using two frame buffers (ping-pong buffers) enables the simultaneous operation of outputting the current video frame to the external display and updating the next video frame. The ping-pong buffering approach is preferred in most applications.

When the Raster Controller is used, the DMA engine reads data from a frame buffer and writes it to the input FIFO (as shown in [Figure 13-1](#)). The Raster Controller requests data from the FIFO for frame refresh; as a result, the DMA's job is to ensure that the FIFO is always kept full.

When the LIDD Controller is used, the DMA engine accesses the LIDD Controller's address and/or data registers.

To program the DMA engine, configure the following registers, as shown in [Table 13-5](#).

**Table 13-5. Register Configuration for DMA Engine Programming**

| Register           | Configuration   |
|--------------------|---|
| LCDDMA_CTRL        | Configure DMA data format   |
| LCDDMA_FB0_BASE    | Configure frame buffer 0  |
| LCDDMA_FB0_CEILING |   |
| LCDDMA_FB1_BASE    | Configure frame buffer 1. (If only one frame buffer is used, these two registers will not be used.) |
| LCDDMA_FB1_CEILING |   |

In addition, the LIDD\_CTRL register (for LIDD Controller) or the RASTER\_CTRL register (for Raster Controller) should also be configured appropriately, along with all the timing registers.

To enable DMA transfers, the LIDD\_DMA\_EN bit (in the LIDD\_CTRL register) or the LCDEN bit (in the RASTER\_CTRL register) should be written with 1.

#### 13.3.3.1 Interrupts

Interrupts in this LCD module are related to DMA engine operation. Three registers are used to control and monitor the interrupts:

- The LIDD\_CTRL and RASTER\_CTRL registers enable or disable each individual interrupt sources.
- The IRQSTATUS\_RAW register collects all the interrupt status information.

##### 13.3.3.1.1 LIDD Mode

When operating in LIDD mode, the DMA engine generates one interrupt signal every time the specified frame buffer has been transferred completely.

- The DONE\_INT\_EN bit in the LIDD\_CTRL register specifies if the interrupt signal is delivered to the system interrupt controller, which in turn may or may not generate an interrupt to CPU.
- The EOF1, EOF0, and DONE bits in the IRQSTATUS\_RAW register reflect the interrupt signal, regardless of being delivered to the system interrupt controller or not.

##### 13.3.3.1.2 Raster Mode

When operating in Raster mode, the DMA engine can generate the interrupts in the following scenarios:

1. **Output FIFO under-run.** This occurs when the DMA engine cannot keep up with the data rate consumed by the LCD (which is determined by the LCD\_PCLK.) This is likely due to a system memory throughput issue or an incorrect LCD\_PCLK setting. The FUF bit in IRQSTATUS\_RAW is set when this error occurs. This bit is cleared by disabling the Raster Controller (i.e., clearing the LCDEN bit in RASTER\_CTRL).

2. **Frame synchronization lost.** This error happens when the DMA engine attempts to read what it believes to be the first word of the video buffer but it cannot be recognized as such. This could be caused by an invalid frame buffer address or an invalid BPP value (for more details, see [Section 13.3.5.2](#)). The SYNC bit in the IRQSTATUS\_RAW register is set when such an error is detected. This field is cleared by disabling the Raster Controller (clearing the LCDEN bit in the RASTER\_CTRL register).
3. **Palette loaded.** This interrupt can be generated when the palette is loaded into the memory by the DMA engine. At the same time, the PL bit in the IRQSTATUS\_RAW register is set. In data-only (PLM = 2h) and palette-plus-data (PLM = 00) modes, writing 0 to this bit clears the interrupt. In the palette-only (PLM = 1) mode, this bit is cleared by disabling the Raster Controller (clearing the LCDEN bit in the RASTER\_CTRL register).
4. **AC bias transition.** If the ACB\_I bit in the RASTER\_TIMING\_2 register is programmed with a non-zero value, an internal counter will be loaded with this value and starts to decrement each time LCD\_AC\_BIAS\_EN (AC-bias signal) switches its state. When the counter reaches zero, the ACB bit in the IRQSTATUS\_RAW register is set, which will deliver an interrupt signal to the system interrupt controller (if the interrupt is enabled.) The counter reloads the value in field ACB\_I, but does not start to decrement until the ABC bit is cleared by writing 0 to this bit.
5. **Frame transfer completed.** When one frame of data is transferred completely, the DONE bit in the IRQSTATUS\_RAW register is set. This bit is cleared by disabling the Raster Controller (i.e., clearing the LCDEN bit in the RASTER\_CTRL register). Note that the EOF0 and EOF1 bits in the IRQSTATUS\_RAW register will be set accordingly.

Note that the interrupt enable bits are in the RASTER\_CTRL register. The corresponding enable bit must be set in order to generate an interrupt to the CPU. However, the IRQSTATUS\_RAW register reflects the interrupt signal regardless of the interrupt enable bits settings.

#### 13.3.3.1.3 Interrupt Handling

See [Chapter 6, Interrupts](#), for information about LCD interrupt number to CPU. The interrupt service routine needs to determine the interrupt source by examining the IRQSTATUS\_RAW register and clearing the interrupt properly.

#### 13.3.4 LIDD Controller

The LIDD Controller is designed to support LCD panels with a memory-mapped interface. The types of displays range from low-end character monochrome LCD panels to high-end TFT smart LCD panels.

LIDD mode (and the use of this logic) is enabled by clearing the MODESEL bit in the LCD control register (LCD\_CTRL).

LIDD Controller operation is summarized as follows:

- During initialization, the LCD LIDD CS0/CS1 configuration registers (LIDD\_CS0\_CONF and LIDD\_CS1\_CONF) are configured to match the requirements of the LCD panel being used.
- During normal operation, the CPU writes display data to the LCD data registers (LIDD\_CS0\_DATA and LIDD\_CS1\_DATA). The LIDD interface converts the CPU write into the proper signal transition sequence for the display, as programmed earlier. Note that the first CPU write should send the beginning address of the update to the LCD panel and the subsequent writes update data at display locations starting from the first address and continuing sequentially. Note that DMA may be used instead of CPU.
- The LIDD Controller is also capable of reading back status or data from the LCD panel, if the latter has this capability. This is set up and activated in a similar manner to the write function described above.

---

**NOTE:** If an LCD panel is not used, this interface can be used to control any MCU-like peripheral.

---

See your device-specific data manual to check the LIDD features supported by the LCD controller.

[Table 13-6](#) describes how the signals are used to interface external LCD modules, which are configured by the LIDD\_CTRL register.

**Table 13-6. LIDD I/O Name Map**

| Display Type                    | Interface Type | Data Bits | LIDD_CTRL [2:0] | I/O Name   | Display I/O Name                                      | Comment  |
|---------------------------------|----------------|-----------|-----------------|--|---|--|
| Character Display               | HD44780 Type   | 4         | 100             | LCD_DATA[7:4]<br><br>LCD_AC_BIAS_EN<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_MCLK              | DATA[7:4]<br><br>E (or E0)<br>R/W<br>RS<br>E1         | Data Bus (length defined by Instruction)<br><br>Enable Strobe (first display)<br>Read/Write<br>Register Select (Data/not Instruction)<br>Enable Strobe (second display optional) |
| Character Display               | HD44780 Type   | 8         | 100             | LCD_DATA[7:0]<br><br>LCD_AC_BIAS_EN<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_MCLK              | DATA[7:0]<br><br>E (or E0)<br>R/W<br>RS<br>E1         | Data Bus (length defined by Instruction)<br><br>Enable Strobe (first display)<br>Read/Write<br>Register Select (Data/not Instruction)<br>Enable Strobe (second display optional) |
| Micro Interface Graphic Display | 6800 Family    | Up to 16  | 001             | LCD_DATA[15:0]<br><br>LCD_PCLK<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_AC_BIAS_EN<br>LCD_MCLK | DATA[7:0]<br><br>E<br>R/W<br>A0<br>CS (or CS0)<br>CS1 | Data Bus (16 bits always available)<br><br>Enable Clock<br>Read/Write<br>Address/Data Select<br>Chip Select (first display)<br>Chip Select (second display optional)             |
|                                 |                |           | 000             | LCD_MCLK   | None  | Synchronous Clock (optional)   |
| Micro Interface Graphic Display | 8080 Family    | Up to 16  | 011             | LCD_DATA[15:0]<br><br>LCD_PCLK<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_AC_BIAS_EN<br>LCD_MCLK | DATA[7:0]<br><br>RD<br>WR<br>A0<br>CS (or CS0)<br>CS1 | Data Bus (16 bits always available)<br><br>Read Strobe<br>Write Strobe<br>Address/Data Select<br>Chip Select (first display)<br>Chip Select (second display optional)            |
|                                 |                |           | 010             | LCD_MCLK   | None  | Synchronous Clock (optional)   |

The timing parameters are defined by the LIDD\_CS0\_CONF and LIDD\_CS1\_CONF registers, which are described in [Section 13.5.4](#) and [Section 13.5.7](#).

The timing configuration is based on an internal reference clock, MCLK. The MCLK is generated out of LCD\_CLK, which is determined by the CLKDIV bit in the LCD\_CTRL register.

$$\text{MCLK} = \text{LCD\_CLK} \text{ when } \text{CLKDIV} = 0.$$

$$\text{MCLK} = \frac{\text{LCD\_CLK}}{\text{CLKDIV}} \text{ when } \text{CLKDIV} \neq 0.$$

See your device-specific data manual for the timing configurations supported by the LCD controller.

### 13.3.5 Raster Controller

Raster mode (and the use of this logic) is enabled by setting the MODESEL bit in the LCD control register (LCD\_CTRL). [Table 13-7](#) shows the active external signals when this mode is active.

**Table 13-7. Operation Modes Supported by Raster Controller**

| Interface                | Data Bus Width | Register Bits<br>RASTER_CTRL[9, 7, 1] | Signal Name  | Description  |
|--------------------------|----------------|---------------------------------------|--|--|
| Passive (STN) Mono 4-bit | 4              | 001                                   | LCD_DATA[3:0]<br>LCD_PCLK<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_AC_BIAS_EN<br>LCD_MCLK  | Data bus<br>Pixel clock<br>Horizontal clock(Line Clock)<br>Vertical clock (Frame Clock)<br>AC Bias<br>Not used       |
| Passive (STN) Mono 8-bit | 8              | 101                                   | LCD_DATA[7:0]<br>LCD_PCLK<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_AC_BIAS_EN<br>LCD_MCLK  | Data bus<br>Pixel clock<br>Horizontal clock(Line Clock)<br>Vertical clock (Frame Clock)<br>AC Bias<br>Not used       |
| Passive (STN) Color      | 8              | 100                                   | LCD_DATA[7:0]<br>LCD_PCLK<br>LCD_HSYNC<br>LCD_VSYNC<br>LCD_AC_BIAS_EN<br>LCD_MCLK  | Data bus<br>Pixel clock<br>Horizontal clock(Line Clock)<br>Vertical clock (Frame Clock)<br>AC Bias<br>Not used       |

### 13.3.5.1 Logical Data Path

The block diagram of the Raster Controller is shown in [Figure 13-1](#). [Figure 13-4](#) illustrates its logical data path for various operation modes (passive (STN) versus active (TFT), various BPP size).

[Figure 13-4](#) shows that:

- The gray-scaler/serializer and output FIFO blocks are bypassed in active (TFT) modes.
- The palette is bypassed in both 12- and 16-BPP modes.

**Figure 13-4. Logical Data Path for Raster Controller**

In summary:

- The display image is stored in frame buffers.
- The built-in DMA engine constantly transfers the data stored in the frame buffers to the Input FIFO.
- The Raster Controller relays data to the external pins according to the specified format.

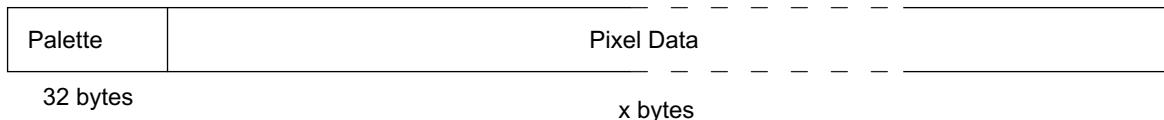

The remainder of this section describes the functioning blocks in [Figure 13-4](#), including frame buffers, palette, and gray-scaler(serializer). Their operation and programming techniques are covered in detail. The output format is also described in [Section 13.3.5.5](#).

### 13.3.5.2 Frame Buffer

A frame buffer is a contiguous memory block, storing enough data to fill a full LCD screen. For this device, external memory needs to be used for the frame buffer. For specific details on which external memory interface (EMIF) controller can be accessed by the LCD controller, see your device-specific data manual. The data in the frame buffer consists of pixel values as well as a look-up palette. [Figure 13-5](#) shows the frame buffer structure.

**Figure 13-5. Frame Buffer Structure**

#### 1, 2, 4, 12, 16, 24 BPP Modes

#### 8 BPP Mode

#### NOTE:

- 8-BPP mode uses the first 512 bytes in the frame buffer as the palette while the other modes use 32 bytes.
- 12-, 16-, and 24-BPP modes do not need a palette; i.e., the pixel data is the desired RGB value. However, the first 32 bytes are still considered a palette. The first entry should be 4000h (bit 14 is 1) while the remaining entries must be filled with 0. (For details, see [Table 13-8](#).)
- Each entry in a palette occupies 2 bytes. As a result, 8-BPP mode palette has 256 color entries while the other palettes have up to 16 color entries.
- 4-BPP mode uses up all the 16 entries in a palette.
- 1-BPP mode uses the first 2 entries in a palette while 2-BPP mode uses the first 4 entries. The remaining entries are not used and must be filled with 0.
- In 12- and 16-BPP modes, pixel data is RGB data. For all the other modes, pixel data is actually an index of the palette entry.

**Table 13-8. Bits-Per-Pixel Encoding for Palette Entry 0 Buffer**

| Bit   | Name | Value | Description  | (1) | (2) | (3) |
|-------|------|-------|--|-----|-----|-----|
| 14-12 | BPP  |       | Bits-per-pixel.  |     |     |     |
|       |      | 000   | 1 BPP  |     |     |     |
|       |      | 001   | 2 BPP  |     |     |     |
|       |      | 010   | 4 BPP  |     |     |     |
|       |      | 011   | 8 BPP  |     |     |     |
|       |      | 1xx   | 12 BPP in passive mode (TFT_STN = 0 and STN_565 = 0 in RASTER_CTRL)<br>16 BPP in passive mode (TFT_STN = 0 and STN_565 = 1 in RASTER_CTRL)<br>16 BPP in active mode (LCDTFT = 1 and TFT24 = 0 in RASTER_CTRL)<br>24 BPP in active mode (LCDTFT = 1 and TFT24 = 1 in RASTER_CTRL) |     |     |     |

(1) Eight 1-bit pixels, four 2-bit pixels, and two 4-bit pixels are packed into each byte, and 12-bit pixels are right justified on (16-bit) word boundaries (in the same format as palette entry).

(2) For STN565, see the 16 BPP STN mode bit ([Section 13.5.10](#)).

(3) For Raw Data (12/16/24 bpp) framebuffers, no Palette lookup is employed therefore PALMODE = 0x10 in RASTER\_CTRL.

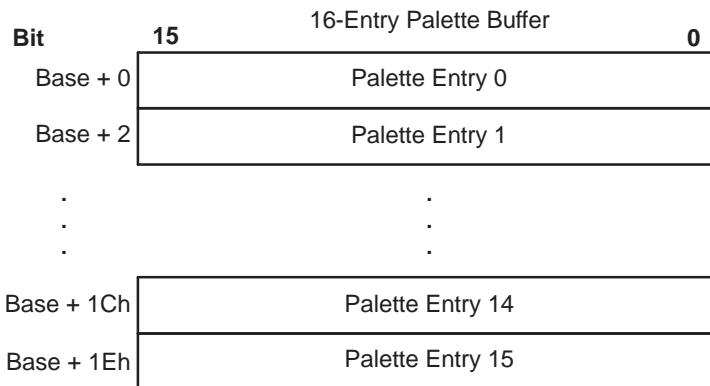

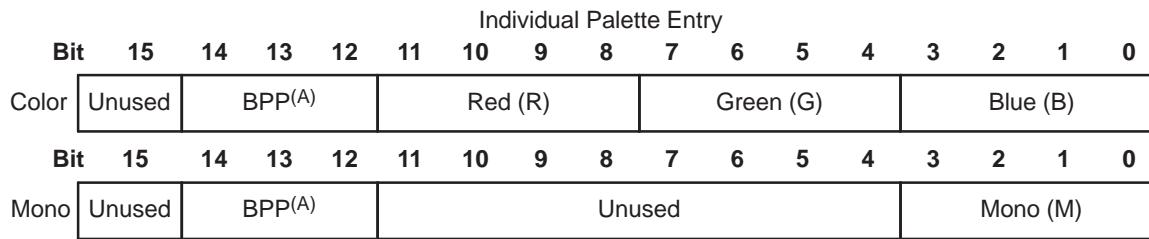

The equations shown in [Table 13-9](#) are used to calculate the total frame buffer size (in bytes) based on varying pixel size encoding and screen sizes.

[Figure 13-6](#) and [Figure 13-7](#) show more detail of the palette entry organization.

**Table 13-9. Frame Buffer Size According to BPP**

| BPP   | Frame Buffer Size                                    |
|-------|--|
| 1     | $32 + (\text{Lines} \times \text{Columns})/8$        |
| 2     | $32 + (\text{Lines} \times \text{Columns})/4$        |
| 4     | $32 + (\text{Lines} \times \text{Columns})/2$        |
| 8     | $512 + (\text{Lines} \times \text{Columns})$         |
| 12/16 | $32 + 2 \times (\text{Lines} \times \text{Columns})$ |

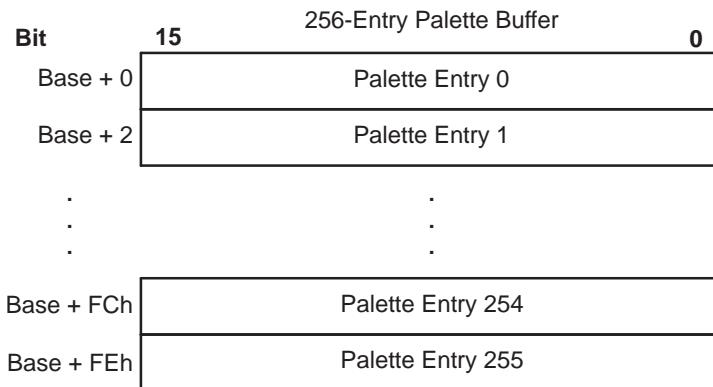

**Figure 13-6. 16-Entry Palette/Buffer Format (1, 2, 4, 12, 16 BPP)**

A. Bits-per-pixels (BPP) is only contained within the first palette entry (palette entry 0).

**Figure 13-7. 256-Entry Palette/Buffer Format (8 BPP)**

| Bit   | 15                       | 14                 | 13      | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3         | 2 | 1 | 0 |
|-------|--------------------------|--------------------|---------|----|----|----|---|---|---|---|---|---|-----------|---|---|---|
|       | Individual Palette Entry |                    |         |    |    |    |   |   |   |   |   |   |           |   |   |   |
| Color | Unused                   | BPP <sup>(A)</sup> | Red (R) |    |    |    |   |   |   |   |   |   | Green (G) |   |   |   |
| Mono  | Unused                   | BPP <sup>(A)</sup> | Unused  |    |    |    |   |   |   |   |   |   | Blue (B)  |   |   |   |

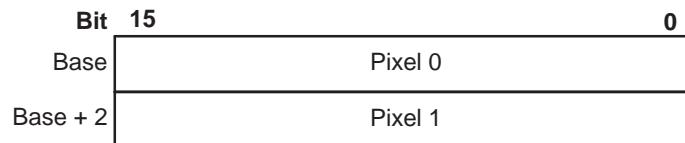

A. Bits-per-pixels (BPP) is only contained within the first palette entry (palette entry 0).

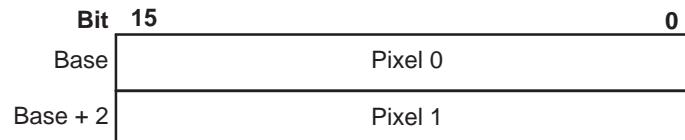

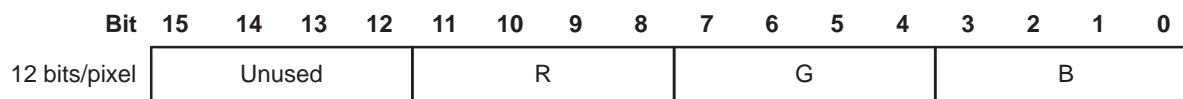

Bits 12, 13, and 14 of the first palette entry select the number of bits-per-pixel to be used in the following frame and thus the number of palette RAM entries. The palette entry is used by the Raster Controller to correctly unpack pixel data.

Figure 13-8 through Figure 13-13 show the memory organization within the frame buffer for each pixel encoding size.

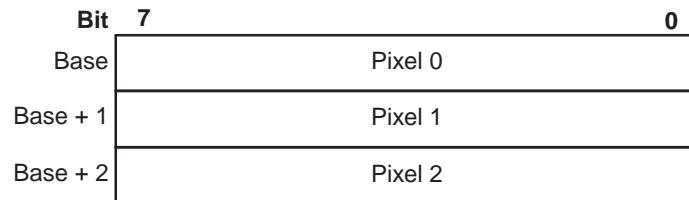

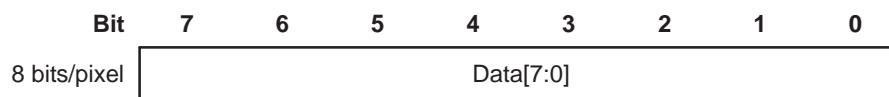

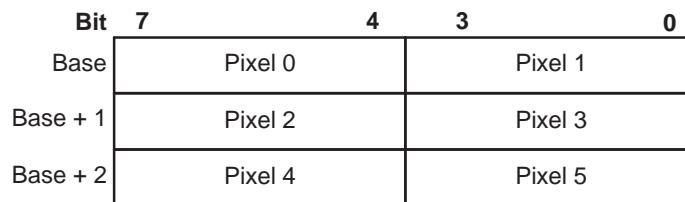

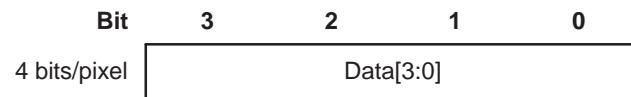

**Figure 13-8. 16-BPP Data Memory Organization (TFT Mode Only)—LittleEndian**

| Bit           | 15    | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 16 bits/pixel | R G B |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

**Figure 13-9. 12-BPP Data Memory Organization—Little Endian**

Unused [15-12] bits are filled with zeroes in TFT mode.

**Figure 13-10. 8-BPP Data Memory Organization**

| Base + 1 | P8 | P9 | P10 | P11 | P12 | P13 | P14 | P15 |

### 13.3.5.3 Palette

As explained in the previous section, the pixel data is an index of palette entry (when palette is used). The number of colors supported is given by  $2^{\text{number of BPP}}$ . However, due to a limitation of the gray-scaler/serializer block, fewer grayscales or colors may be supported.

The PLM field (in RASTER\_CTRL) affects the palette loading:

- If PLM is 00b (palette-plus-data mode) or 01b (palette-only mode), the palette is loaded by the DMA engine at the very beginning, which is followed by the loading of pixel data.
- If PLM is 10b (data-only mode), the palette is not loaded. Instead, the DMA engine loads the pixel data immediately.

### 13.3.5.4 Gray-Scaler/Serializer

#### 13.3.5.4.1 Passive (STN) Mode

Once a palette entry is selected from the look-up palette by the pixel data, its content is sent to the gray-scaler/serializer. If it is monochrome data, it is encoded as 4 bits. If it is color data, it is encoded as 4 bits (Red), 4 bits (Green), and 4 bits (Blue).

These 4-bit values are used to select one of the 16 intensity levels, as shown in [Table 13-10](#). A patented algorithm is used during this processing to provide an optimized intensity value that matches the eye's visual perception of color/gray gradations.

#### 13.3.5.4.2 Active (TFT) Mode

The gray-scaler(serializer is bypassed.

**Table 13-10. Color/Grayscale Intensities and Modulation Rates**

| Dither Value<br>(4-Bit Value from Palette) | Intensity<br>(0% is White) | Modulation Rate<br>(Ratio of ON to ON+OFF Pixels) |
|--|----------------------------|---|
| 0000                                       | 0.0%                       | 0   |

### 13.3.5.4.3 Summary of Color Depth

**Table 13-11. Number of Colors/Shades of Gray Available on Screen**

| Number of BPP | Passive Mode (LCDTFT = 0)  |  | Active Mode (LCDTFT = 1)                                  |
|---------------|--|--|---|
|               | Monochrome (LCDBW = 1)   | Color (LCDBW = 0)  | Color Only (LCDBW = 0)                                    |
| 1             | 2 palette entries to select within 15 grayscales   | 2 palette entries to select within 3375 possible colors  | 2 palette entries to select within 4096 possible colors   |
| 2             | 4 palette entries to select within 15 grayscales   | 4 palette entries to select within 3375 possible colors  | 4 palette entries to select within 4096 possible colors   |
| 4             | 16 palette entries to select within 15 grayscales  | 16 palette entries to select within 3375 possible colors | 16 palette entries to select within 4096 possible colors  |
| 8             | Not relevant since it would consist in 256 palette entries to select within 15 grayscales, but exists anyway | 256 palette entries to select 3375 possible colors       | 256 palette entries to select within 4096 possible colors |
| 12            | x  | 3375 possible colors                                     | 4096 possible colors                                      |
| 16            | x  | 3375 possible colors (STN_565 = 1)                       | Up to 65536 possible colors                               |
| 24            | X  | X  | Up to 16.7 million colors                                 |

### 13.3.5.5 Output Format

#### 13.3.5.5.1 Passive (STN) Mode

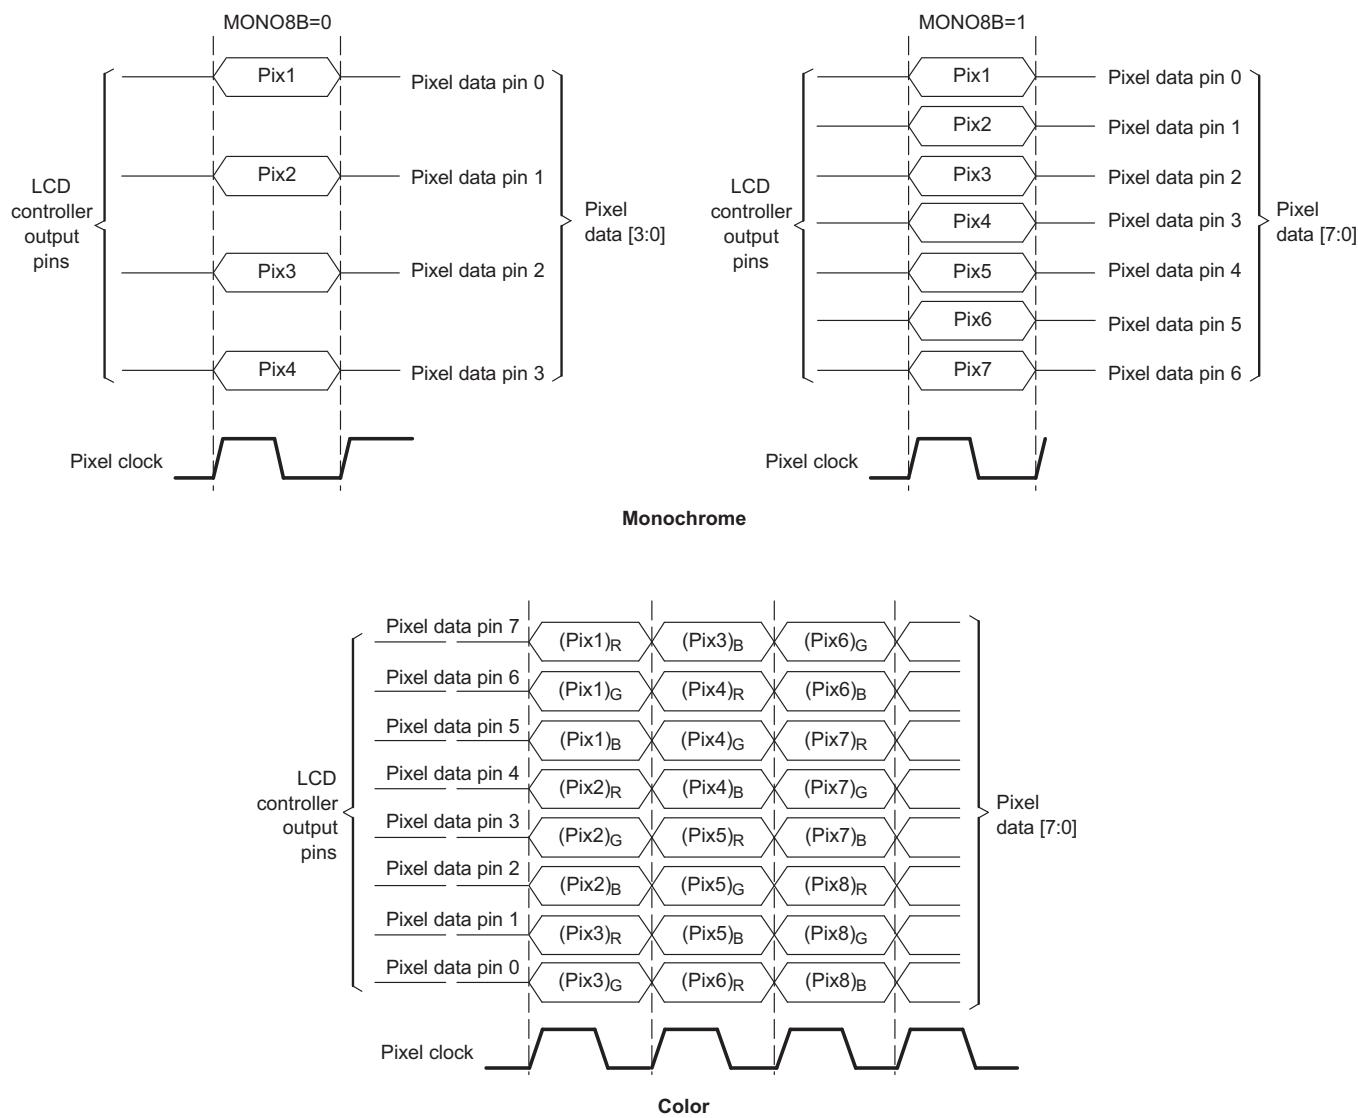

As shown in [Figure 13-4](#), the pixel data stored in frame buffers go through palette (if applicable) and gray-scaler/serializer before reaching the Output FIFO. As a result, it is likely that the data fed to the Output FIFO is numerically different from the data in the frame buffers. (However, they represent the same color or grayscale.)

The output FIFO formats the received data according to display modes (see [Table 13-7](#)). [Figure 13-14](#) shows the actual data output on the external pins.

#### 13.3.5.5.2 Active (TFT) Mode

As shown in [Figure 13-4](#), the gray-scaler/serializer and output FIFO are bypassed in active (TFT) mode. Namely, at each pixel clock, one pixel data (16 bits) is output to the external LCD.

**Figure 13-14. Monochrome and Color Output**

### 13.3.5.6 Subpicture Feature

A feature exists in the LCD to cover either the top or lower portion of the display with a default color. This feature is called a subpicture and is illustrated in [Figure 13-15](#). Subpictures are only allowed for Active Matrix mode (`cfg_lcdtft = '1'`).

Subpictures reduce the bandwidth to the DDR since lines containing default pixel data are not read from memory. For example, suppose the panel has 100 lines of which 50 are default pixel data lines. Then, only 50 lines of data are DMAed from DDR for this subpicture setup. That is, the `cfg_fbx_base` and `cfg_fbx_ceiling` registers only encompass 50 lines of data instead of 100.

**Figure 13-15. Example of Subpicture**

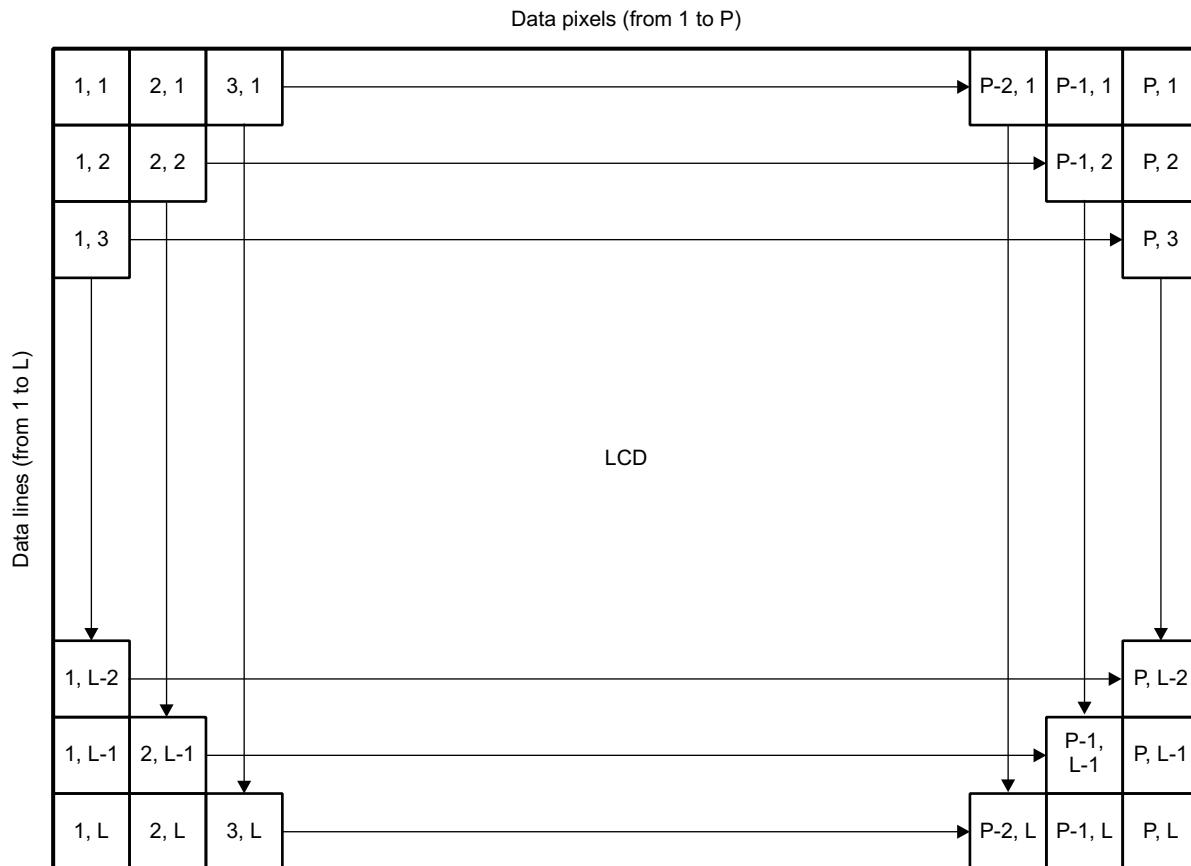

The subpicture feature is enabled when the `spen` MMR control bit is set to '1'. The `hols` bit, when set to '0,' puts the Default Pixel Data lines at the top of the screen and the active video lines at the bottom of the screen.

When the `hols` bit is set to '1,' Active video lines are at the top of the screen and Default Pixel Data lines are at the bottom of the screen. The `hols` bit behavior is shown in [Figure 13-16](#).

**Figure 13-16. Subpicture HOLS Bit**

The lines per panel threshold (LPPT) bitfield defines the number of lines at the bottom of the picture for both `holz = '1'` or `'0'`. LPPT is an encoded value in the range {0:2047} used to represent the number of lines in the range {1:2048}.

**Figure 13-17. Raster Mode Display Format**

### **13.3.6 Interrupt Conditions**

#### **13.3.6.1 Highlander 0.8 Interrupts**

##### **13.3.6.1.1 Highlander Interrupt Basics**

The interrupt mechanism is Highlander 0.8-compliant and relies on the ipgvmmodirq IP Generic. The ipgvmmodirq module supports hardware-initiated interrupts, each of which can also be individually triggered by software. An interrupt mask function allows each interrupt to be masked or enabled. The software can read all of the raw interrupts or only those that are unmasked.

All pending interrupts in the LCD module must be serviced by the Host's Interrupt Service Routine before it exits.

The Interrupt Module registers are described in the following table.

**Table 13-12. Highlander 0.8 Interrupt Module Control Registers**

| Address Offset | Name  | Description                      |
|----------------|-------|----------------------------------|
| 0x58           | Reg22 | Interrupt Raw Status Register    |
| 0x5C           | Reg23 | Interrupt Masked Status Register |
| 0x60           | Reg24 | Interrupt Enable Set (Unmask)    |
| 0x64           | Reg25 | Interrupt Enable Clear (Mask)    |
| 0x68           | Reg26 | End of Interrupt Indicator       |

##### **13.3.6.1.2 Raw Status Register**

Interrupts are associated with a bit position. For instance, Hardware Interrupt 0 is physically connected to bit 0 of the interrupt controller and all Sets, Clears, and Masks to this interrupt will reference the Bit 0 location of the interrupt vector. Likewise, Hardware Interrupt 1 is referenced by bit 1 of the interrupt vector, and so on.

The Host CPU can see all the interrupts that have been set, regardless of the interrupt mask, by reading Reg22, the Raw Status Register.

If the Host CPU writes a '1' to a bit position in Reg 22, it will do a software set for the interrupt associated with that bit position.

##### **13.3.6.1.3 Masked Status Register**

The Masked Status Register contains all the pending interrupts that are unmasked (enabled). The Interrupt Service Routine should read this register to determine which interrupts must be serviced.

##### **13.3.6.1.4 Interrupt Enable Set Register**

To unmask an interrupt, the Host CPU writes a '1' to the appropriate bit position of the Enable Set (Unmask) register.

##### **13.3.6.1.5 Interrupt Enable Clear Register**

To mask an interrupt, the Host CPU writes a '1' to the appropriate bit position of the Enable Clear (Mask) register.

##### **13.3.6.1.6 End of Interrupt Register**

The ipgvmmodirq module supports level or pulse interrupts to the CPU. For pulse interrupts, the Host must write to an end-of-interrupt (EOI), memory-mapped address to indicate that the Interrupt Service Routine has completed and is exiting. Any pending interrupts that have not been serviced will trigger another interrupt pulse to the Host CPU.

### 13.3.6.2 Interrupt Sources

#### 13.3.6.2.1 Overview of Interrupt Sources

The interrupt sources include:

- DMA End of Frame 0
- DMA End of Frame 1
- Palette Loaded
- FIFO Underflow
- AC Bias Count
- Sync Lost
- Recurrent Frame Done
- LIDD or Raster Frame Done

##### 13.3.6.2.1.1 DMA End of Frame 0 and End of Frame 1 Interrupt

The DMA End of Frame 0 and End of Frame 1 interrupts are triggered when the DMA module has completed transferring the contents of a frame buffer bounded by cfg\_fb0\_base/cfg\_bf0\_ceil or cfg\_fb1\_base/cfg\_fb1\_ceil.

##### 13.3.6.2.1.2 Palette Loaded Interrupt

When cfg\_palmode is set to Palette-only or Palette+data, the Palette Loaded interrupt is triggered when the palette portion of the DMA transfer has been stored in the Palette RAM.

##### 13.3.6.2.1.3 FIFO Underflow Interrupt

The FIFO Underflow interrupt is triggered when the real-time output needs to send a value for pixel data but one cannot be found in the FIFO.

##### 13.3.6.2.1.4 AC Bias Count Interrupt

For Passive Matrix displays, a count can be kept of the number of times the AC Bias line toggles. Once the specified number of transitions has been seen, the AC Bias Count interrupt is triggered. The module will not post any further interrupts or keep counting AC Bias transitions until the interrupt has been cleared.

##### 13.3.6.2.1.5 Sync Lost Interrupt

When the DMA module reads a frame buffer and stores it in the FIFO, it sets a start frame and an end frame indicator embedded with the data. On retrieving the data from the FIFO in the lcd\_clk domain, the Sync Lost interrupt is triggered if the start indicator is not found at the first pixel of a new frame.

##### 13.3.6.2.1.6 Recurrent Frame Done Interrupt

In raster mode, the Recurrent Frame Done interrupt is triggered each time a complete frame has been sent to the interface pins.

##### 13.3.6.2.1.7 LIDD or Raster Frame Done Interrupt

In LIDD DMA mode, a frame buffer of data is sent. When the frame buffer has completed, the LIDD Frame Done interrupt is triggered. In order to do another LIDD DMA, the DMA engine must be disabled and then re-enabled.

In Raster mode, the interrupt is triggered after cfg\_lcden is set to '0' and after the last frame is sent to the pins. After the Raster mode DMA is running, the interrupt occurs only once after the module is disabled.

### 13.3.7 DMA

DDR access is handled internally by the DMA module. For Character Displays, the DMA module can transfer a sequence of data transactions from the DDR to LCD panel. By using the DMA instead of the Host CPU, the Host will not be stalled waiting for the slow external peripheral to complete.

For Passive and Active Matrix displays, the DMA is used to read frame buffers with associated palette information from DDR. The DMA parses the frame buffer according to the frame buffer type and supplies the raster processing chain with Palette information and pixel data as needed.

### 13.3.8 Power Management

Power management within the DSS can be accomplished in several ways:

1. L4 OCP MConnect/SConnect can disable the internal L4 clock network.
2. L3 OCP MConnect/Sconnect can disable the internal L3 clock network.
3. Within the Clock Control register, there are clock enable registers to disable the clock networks to all major internal functional paths.
4. Power Compiler clock gates are automatically instantiated within datapaths to minimize active power.

Items 1 and 2 are accomplished using the standard IDLE (for L4) and STANDBY (for L3) IPGeneric modules. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shutdown applies to the external clock pins I3\_clk and I4\_clk.

All other internal clock domains (Item 3) can only be shut down by writing the appropriate register bit within the Clock Enable register. This software clock control applies to all other clock inputs.

Power Compiler clock gating is done automatically as a function of the design. There is no special control required for this operation.

Because the LCD normally drives displays, and because all video is sourced from the L3 clock domain, shutting down the L3 domain using the IPGenerics can cause undesirable display effects. In most circumstances, it will be necessary to hardware/software reset the LCD module after such an event has occurred.

## 13.4 Programming Model

### 13.4.1 LCD Character Displays

#### 13.4.1.1 Configuration Registers, Setup, and Settings

##### 13.4.1.1.1 Configuration Registers

Set the following to appropriate values for the target LCD character panel:

- cfg\_cs1\_e1\_pol
- cfg\_cs0\_e0\_pol
- ws\_dir\_pol
- cfg\_rs\_en\_pol
- cfg\_alepol

cfg\_lidd\_mode\_sel[2:0] defines the type of CPU bus that will be used in interfacing with the LCD character panel. Note that the clocked bus styles only support a single panel using CS0 since the clock pin takes a device pin that is otherwise used for CS1.

Set the following to appropriate bus timing parameters for the target LCD character panel:

- cfg\_w\_su
- cfg\_w\_strobe
- cfg\_w\_hold, cfg\_r\_su
- cfg\_r\_strobe
- cfg\_r\_hold
- cfg\_ta

A set of bus timing parameters are individually available for CS0 and CS1 such that the bus transactions can be customized for each of the two supported LCD character displays.

##### 13.4.1.1.2 Defining Panel Commands and Panel Data

In the Hitachi interface mode used for the example panel, whether the Character Panel understands a data transfer as Command or Data depends on the state of the REGSEL input pin. Writing to the cfg\_adr\_idx register will output a Command transfer. Writing to the cfg\_data register will result in a Data transfer.

Functionally, the ALE (lcd\_fp pin) from the LCD controller is tied to the REGSEL input of the character panel.

For example, to send byte 0xAB as a command to the previously described character panel, the CPU would write 0x00AB to the adr\_idx register. To send byte 0xAB as data, the CPU would write 0x00AB to the data register.

### 13.4.1.2 CPU Initiated Data Bus Transactions

#### 13.4.1.2.1 Initiating Data Bus Transactions

Writing to cfg\_cs0\_data will initiate a write transfer to the CS0 panel. Reading from cfg\_cs0\_data will initiate a read transfer from the CS0 panel.

Writing to cfg\_cs1\_data will initiate a write transfer to the CS1 panel. Reading from cfg\_cs1\_data will initiate a read transfer from the CS0 panel.

---

**NOTE:** Writes to CS1 translate to valid bus transactions only if cfg\_lidd\_mode\_sel[2:0] is configured for an asynchronous mode.

---

### 13.4.1.3 DMA Initiated Data Bus Transactions for LIDD

#### 13.4.1.3.1 DMA Overview for MPU Bus Output

Writing a long sequence of data to the Character Display Panel will ensure that the CPU will be occupied for a long time. However, the DMA module supports a mode in which this sequence of data elements can first be written in DRAM by the CPU.

The DMA can read this sequence of commands or data from the DRAM and send it to the LCD Interface Display Driver (LIDD) module such that each data element becomes a write bus transaction to the external Character Panel/MPU Bus. The data bus write transaction can target either CS0 or CS1 and use the appropriate bus timing parameters.

Functionally, in this DMA LIDD mode, the DMA module sends the sequence of data to the LIDD module by acting as another CPU.

The DMA can only perform write bus transactions. It cannot read from the external character panel a series of data elements and store them in the DRAM.

When the LIDD module is controlled by the DMA module by setting cfg\_lidd\_dma\_en = '1', CPU reads or writes to cfg\_adr\_index and cfg\_data are not allowed.

The fb0\_base and fb0\_ceil registers define the address boundary of data elements to be sent out the character display by the DMA engine. Setting cfg\_lidd\_dma\_en from '0' to '1' will initiate the DMA as if a virtual CPU is reading data from the DDR and writing the values to Reg6 or Reg9. cfg\_dma\_cs0\_cs1 determines whether the virtual CPU writes to Reg6 (CS0) or Reg7 (CS1).

---

**NOTE:** Writes to CS1 translate to valid bus transactions only if cfg\_lidd\_mode\_sel[2:0] is configured for an asynchronous mode.

---

The DMA module requires the start and end DDR addresses to be on word-aligned byte addresses. The MPU/LIDD bus is a halfword (16 bit) output, so both the upper and lower halfwords of the DDR memory will be sent out. Thus, the number of data elements sent to the LIDD by the DMA must always result in an even number of bus MPU bus transactions. In other words, a transfer of three 32-bit words from DDR will result in six 16-bit bus transactions.

### 13.4.1.3.2 MCU/LIDD DMA Setup: Example Pseudo Code

Suppose we want to send by DMA a section of DDR memory from byte address 0x4 to byte address 0x3C to the MCU bus using chip select 0. The pseudo code for such an operation is listed below.

```
// Enable Clocks
wr 006C 0000_0007

// LCD Control Register
wr 0004 0000_8000    // set clock divisor

// LIDD Control Register
wr 000C 0000_000C  // set output bus polarities and lidd_mode_sel

// LIDD CS0 Register
wr 0010 0822_1044    // set bus timing parameters for CS0

// DMA Control Register
wr 0040 0000_0030  // set DMA parameters like burst size, memory layout

// DMA FB0 Base Register
wr 0044 0000_0004  // DMA start byte address

// DMA FB0 Ceiling Register
wr 0048 0000_003C  // DMA end byte address

// LIDD Control Register - enable DMA
wr 000C 0000_010C  // Flip LIDD DMA enable bit
```

Once the DMA completes sending data to the Async FIFO, the Eof0 interrupt will occur. The Done interrupt will occur when the last word is written out the MPU bus.

The CPU must bring cfg\_lidd\_dma\_en low before the CPU can directly initiate MPU bus transactions or for the DMA module to start again.

### 13.4.1.4 Passive Matrix

#### 13.4.1.4.1 Monochrome Bitrate Awareness

In a mostly testbench related note, care must be taken when configuring the module for Passive Matrix (cfg\_lcdtft = '0') monochrome (cfg\_lcdbw = '1') modes. In passive matrix mode, the Blue component of the Grayscaler output is used as the quantized value for each scan order pixel.

When cfg\_mono8b='1', eight pixel values must be sent through the grayscaler before one 8-bit output is ready. This output data represents the passive matrix output states for eight pixels.

Likewise, when cfg\_mono8b='0', four pixel values must be sent through the grayscaler before one 4-bit output is ready. This output data represents the passive matrix output states for four pixels.

The problem arises when the output clock is fast (cfg\_clkdiv=0x2). The data path must output a value every two system clocks. However, it takes four or eight system clocks to generate a data element to be output. In this case, the LCD module returns an underflow interrupt.

In practice, such a situation does not occur because passive matrix panels are slow by design.

## 13.4.2 Active Matrix Displays

### 13.4.2.1 Interfacing to Dual LVDS Transmitters

The pixel clock rate for HD-sized pictures is approximately 148.5 MHz. At this speed, the LVDS link requires a double-wide data bus for transferring the even and odd pixels at half the pixel rate. The LCD Controller outputs one pixel per pixel clock cycle. Some LVDS transmitters accept a high speed, single pixel input and output to dual LVDS drivers, in which case external glue logic is unnecessary. For those LVDS transmitters that require the even and odd pixel to enter the LVDS transmitter at half the pixel clock rate, external logic is required.

## 13.4.3 System Interaction

### 13.4.3.1 DMA End of Frame Interrupts

The LCD module works with the DMA such that data is fetched from DDR and sent to a FIFO memory. The DMA module does this fetching independently of the logic on the output side of the FIFO.

For LIDD mode DMA, the module fetches frame buffer 0. When the last word of frame buffer 0 is stored in the FIFO memory, the Eof0 interrupt is triggered (if `cfg_eof_inten='1'`) and the DMA stops. The CPU has to set `cfg_lidd_dma_en='0'`, followed by a `cfg_lidd_dma_en='1'`, before the next burst from frame buffer 0 is read from DDR.

For Raster mode DMA, the module fetches frame buffer 0. When the last word of frame buffer 0 is stored in the FIFO memory, the Eof0 interrupt is triggered (if `cfg_eof_inten='1'`) but the DMA does not stop. The DMA module ping pongs immediately to frame buffer 1 if `cfg_frame_mode='1'`. Otherwise, the DMA fetches the frame buffer 0 address range from DDR. When the DMA module fetches frame buffer 1, and the last word of frame buffer 1 is stored in the FIFO memory, the Eof1 interrupt is triggered (if `cfg_eof_inten='1'`). This pattern would repeat.

## 13.4.4 Palette Lookup

For Active Matrix and Passive Matrix modes, the 12-bit Palette RAM Lookup can be used. For Active Matrix (`cfg_lcdtft = '1'`), palette lookup is enabled when `cfg_tft24 = '0'` and the bpp field in the Palette RAM is set to "000," "001," "010," or "011" (1, 2, 4, or 8 bpp). Palette lookup cannot be used when the bpp field is set to "100" (12/16 bpp).

For Passive Matrix (`cfg_lcdtft = '0'`), palette lookup is enabled when the bpp field in the Palette RAM is set to "000," "001," "010," or "011" (1, 2, 4, or 8 bpp). Palette lookup cannot be used when the bpp field is set to "100" (12/16 bpp).

Palette lookup scenarios are illustrated in [Figure 13-18](#).

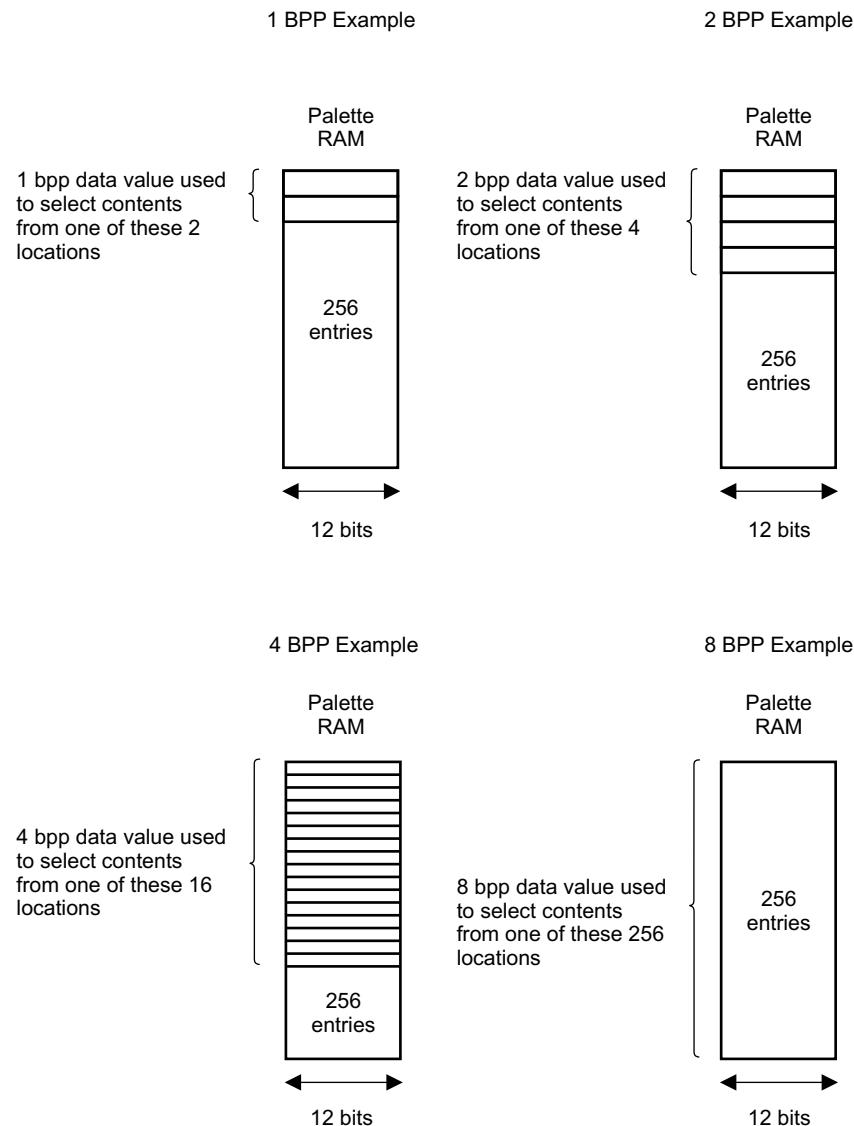

When the bpp encoding is set to 1 bpp, each bit in a 16-bit frame buffer halfword is used to index the two bottom locations of the palette RAM. Suppose the frame buffer bit value is '0', this '0' indicates that the address 0 entry in the Palette RAM should be read. If the frame buffer bit value is '1,' the address 1 entry in the Palette RAM is used. The resulting 12-bit output from the Palette RAM is the quantized pixel value of a 4-bit per color component quantized pixel value.

When the bpp encoding is set to 2 bpp, every two bits in a 16 bit frame buffer halfword is used to index the bottom 4 locations of the palette RAM. Suppose the frame buffer bit value is "00." This "00" indicates that the address 0 entry in the Palette RAM should be read. If the frame buffer bit value is "01," the address 1 entry in the Palette RAM is used. When the frame buffer bit value is "10," the address 2 entry in the Palette RAM is read. Finally, if the frame buffer bit value is "11," the address 3 entry in the Palette RAM is read. The resulting 12 bit output from the Palette RAM is the quantized pixel value of the 4 bit per color component.

The 4 bpp encoding allows every four bits from a frame buffer halfword to address 16 entries in the Palette RAM.

The 8 bpp encoding enables every byte from a frame buffer halfword to address one of the 256 entries in the Palette RAM.

Figure 13-18. Palette Lookup Examples

A 16-bit halfword is read from the DDR frame buffer. This halfword can be byte lane and halfword swapped using the DMA configuration values `cfg_byte_swap` and `cfg_bigendian`. This section will deal with the frame buffer data as it is returned post swapped from the DMA module.

The DMA module actually outputs a 32-bit word. The Palette Lookup logic uses the lower halfword first, followed by the upper halfword. The `cfg_rdorder` and `cfg_nibmode` registers determine the raster read ordering of the frame buffer data to be sent to the palette lookup table.

There are precedence rules for the hardware as it parses each 16-bit word from the frame buffer.

1. If `cfg_rdorder = '0'`, the data halfword is parsed from the least significant bit to the most significant bit.
2. Else, if `cfg_nibmode = '1'`, the data halfword is parsed byte swapped with the scan order going from the most significant bit of each byte to the least significant bit of each byte.
3. Otherwise, the data halfword is parsed from the most significant bit to the least significant bit.

The bitwise scan order for each halfword fetched from the frame buffer is shown in the following lists. The bitfields returned are used to determine the addressing of the Palette RAM.

#### **Frame buffer halfword scan order for 1 bpp**

1. If cfg\_rdorder = 0, scan order is [0] [1] [2] [3] [4] [5] [6] [7] [8] [9] [10] [11][ 12] [13] [14] [15]
2. Else if cfg\_nibmode=1, scan order is [7] [6] [5] [4] [3] [2] [1] [0] [15] [14] [13] [12] [11] [10] [9] [8]
3. Otherwise, scan order is [15] [14] [13] [12] [11] [10] [9] [8] [7] [6] [5] [4] [3] [2] [1] [0]

#### **Frame buffer halfword scan order for 2 bpp**

1. If cfg\_rdorder = 0, scan order is [1:0] [3:2] [5:4] [7:6] [9:8] [11:10][ 13:12] [15:14]
2. Else if cfg\_nibmode=1, scan order is [7:6] [5:4] [3:2] [1:0] [15:14] [13:12] [11:10] [9:8]
3. Otherwise, scan order is [15:14] [13:12] [11:10] [9:8] [7:6] [5:4] [3:2] [1:0]

#### **Frame buffer halfword scan order for 4 bpp**

1. If cfg\_rdorder = 0, scan order is [3:0] [7:4] [11:8] [15:12]
2. Else if cfg\_nibmode=1, scan order is [7:4] [3:0] [15:12] [11:8]
3. Otherwise, scan order is [15:12] [11:8] [7:4] [3:0]

#### **Frame buffer halfword scan order for 8 bpp**

1. If cfg\_rdorder = 0, scan order is [7:0] [15:8]
2. Else if cfg\_nibmode=1, scan order is [7:0] [15:8]
3. Otherwise, scan order is [15:8] [7:0]

### **13.4.5 Test Logic**

### **13.4.6 Disable and Software Reset Sequence**

In Raster Modes, the module must be disabled before applying a software reset. When cfg\_lcden is set to '0' to disable the module, the output continues to the end of the current frame.

The Done interrupt will trigger once the frame is complete. The software reset can then be applied to the module.

The software reset will clear all the frame information in the FIFO. Upon a restart, the L3 DMA will fetch from the fb0\_base address.

To summarize:

- Set cfg\_lcden='0'.
- Wait for the Done interrupt.
- Set the software reset bits high (cfg\_main\_rst='1' or [cfg\_dma\_rst='1' and cfg\_core\_rst='1']) for several cycles.
- Set the resets back low.
- Set cfg\_lcden='1'.

The disable and reset sequence must be done in this order to properly operate the LCD module and the EMIF.

### 13.4.7 Precedence Order for Determining Frame Buffer Type

The precedence order for determining frame buffer type is specified as follows:

```

If (cfg_lcdtft == 1) // active matrix
    If (cfg_tft24 == 1) // 24 bpp
        If (cfg_tft24_unpacked == 1)
            4 pixels in 4 words
        else
            4 pixels in 3 words
    else // 1/2/4/8/12/16 bpp
        if (bpp[2] == 1)
            12/16 bpp data
        else
            if (bpp == 0)
                1 bpp data
            else if (bpp == 1)
                2 bpp data
            else if (bpp == 2)
                4 bpp data
            else // if (bpp == 3)
                8 bpp data
else // passive matrix
    if (bpp[2] == 1)
        12/16 bpp data
    else
        if (bpp == 0)
            1 bpp data
        else if (bpp == 1)
            2 bpp data
        else if (bpp == 2)
            4 bpp data
        else // if (bpp == 3)
            8 bpp data

```

## 13.5 LCD Registers

Table 13-13 lists the memory-mapped registers for the LCD. All register offset addresses not listed in Table 13-13 should be considered as reserved locations and the register contents should not be modified.

**Table 13-13. LCD REGISTERS**

| Offset | Acronym            | Register Name | Section         |
|--------|--------------------|---------------|-----------------|
| 0h     | PID                |               | Section 13.5.1  |
| 4h     | CTRL               |               | Section 13.5.2  |

### 13.5.4 LIDD\_CS0\_CONF Register (offset = 10h) [reset = 0h]

LIDD\_CS0\_CONF is shown in [Figure 13-22](#) and described in [Table 13-17](#).

**Figure 13-22. LIDD\_CS0\_CONF Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

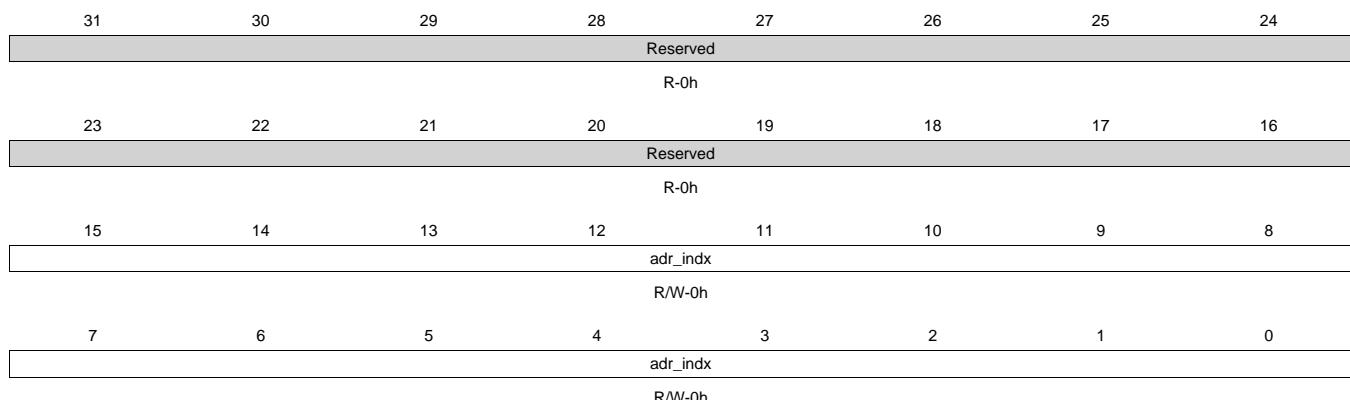

**Table 13-17. LIDD\_CS0\_CONF Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description   |
|-------|----------|------|-------|---|
| 31-27 | w_su     | R/W  | 0h    | Write Strobe Set-Up cycles<br>When performing a write access, this field defines the number of memclk cycles that Data Bus/Pad Output Enable, , the Direction bit, and Chip Select 0 have to be ready before the Write Strobe is asserted<br>The minimum value is 0x0 |
| 26-21 | w_strobe | R/W  | 0h    | Write Strobe Duration cycles<br>Field value defines the number of memclk cycles for which the Write Strobe is held active when performing a write access<br>The minimum value is 0x1  |
| 20-17 | w_hold   | R/W  | 0h    | Write Strobe Hold cycles<br>Field value defines the number of memclk cycles for which Data Bus/Pas Output Enable, ALE, the Direction bit, and Chip Select 0 are held after the Write Strobe is de-asserted when performing write access<br>The minimum value is 0x1   |
| 16-12 | r_su     | R/W  | 0h    | Read Strobe Set-Up cycles<br>When performing a read access, this field defines the number of memclk cycles that Data Bus/Pad Output Enable, , the Direction bit, and Chip Select 0 have to be ready before the Read Strobe is asserted                                |
| 11-6  | r_strobe | R/W  | 0h    | Read Strobe Duration cycles<br>Field value defines the number of memclk cycles for which the Read Strobe is held active when performing a read access<br>The minimum value is 0x1   |
| 5-2   | r_hold   | R/W  | 0h    | Read Strobe Hold cycles<br>Field value defines the number of memclk cycles for which Data Bus/Pad Output Enable, , the Direction bit, and Chip Select 0 are held after the Read Strobe is deasserted when performing a read access<br>The minimum value is 0x1        |
| 1-0   | ta       | R/W  | 0h    | Field value defines the number of memclk (ta+1) cycles between the end of one CS0 device access and the start of another CS0 device access unless the two accesses are both Reads<br>In this case, this delay is not incurred<br>The minimum value is 0x0             |

### 13.5.5 LIDD\_CS0\_ADDR Register (offset = 14h) [reset = 0h]

LIDD\_CS0\_ADDR is shown in [Figure 13-23](#) and described in [Table 13-18](#).

**Figure 13-23. LIDD\_CS0\_ADDR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

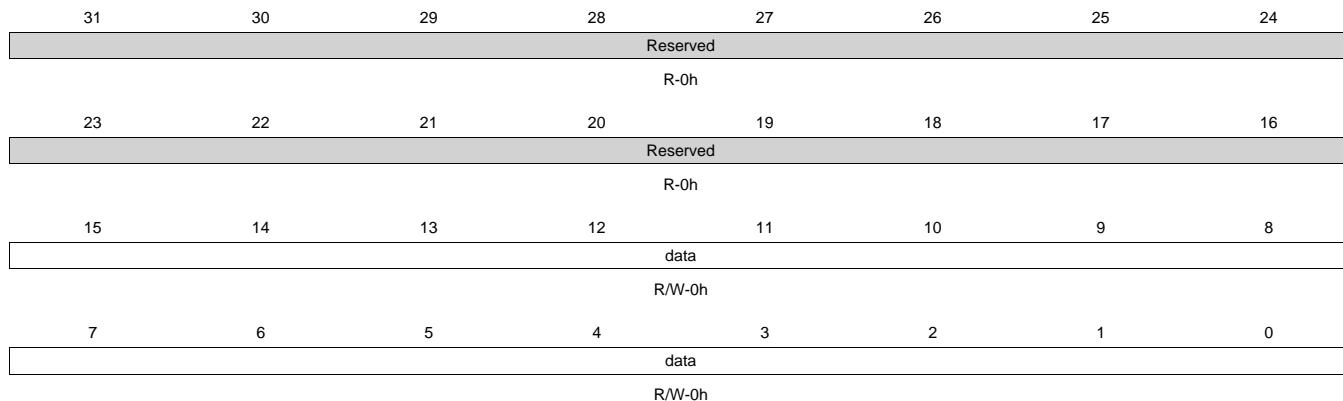

**Table 13-18. LIDD\_CS0\_ADDR Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description   |
|-------|----------|------|-------|---|
| 31-16 | Reserved | R    | 0h    |   |
| 15-0  | adr_idx  | R/W  | 0h    | The LCD Controller supports a shared Address/Data output bus<br>A write to this register would initiate a bus write transaction<br>A read from this register would initiate a bus read transaction<br>CPU reads and writes to this register are not permitted if the LIDD<br>module is in DMA mode (cfg_lidd_dma_en = 1)<br>If the LIDD is being used as a generic bus interface, writing to this<br>register can store adr_idx to an external transparent latch holding a<br>16-bit address<br>If the LIDD is being used to interface with a character based LCD<br>panel in configuration mode, reading and writing to this register can<br>be used to access the command instruction area of the panel |

### 13.5.6 LIDD\_CS0\_DATA Register (offset = 18h) [reset = 0h]

LIDD\_CS0\_DATA is shown in [Figure 13-24](#) and described in [Table 13-19](#).

**Figure 13-24. LIDD\_CS0\_DATA Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

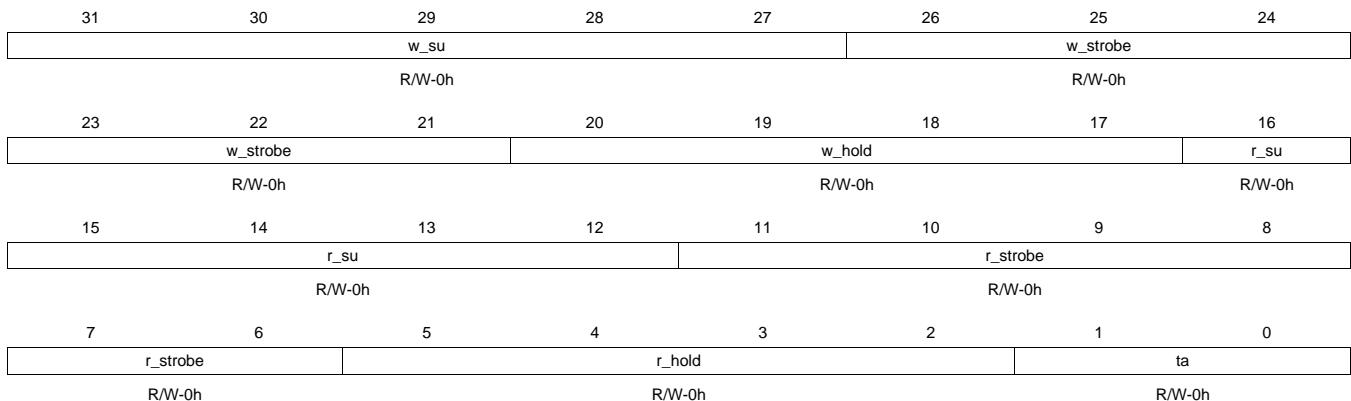

**Table 13-19. LIDD\_CS0\_DATA Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description  |
|-------|----------|------|-------|--|
| 31-16 | Reserved | R    | 0h    |  |
| 15-0  | data     | R/W  | 0h    | <p>The LCD Controller supports a shared Address/Data output bus</p> <p>A write to this register would initiate a bus write transaction</p> <p>A read from this register would initiate a bus read transaction</p> <p>CPU reads and writes to this register are not permitted if the LIDD module is in DMA mode (cfg_lidd_dma_en = 1)</p> <p>If the LIDD is being used as a generic bus interface, writing to this register can store adr_indx to an external transparent latch holding a 16-bit address</p> <p>If the LIDD is being used to interface with a character based LCD panel in configuration mode, reading and writing to this register can be used to access the command instruction area of the panel</p> |

### 13.5.7 LIDD\_CS1\_CONF Register (offset = 1Ch) [reset = 0h]

LIDD\_CS1\_CONF is shown in [Figure 13-25](#) and described in [Table 13-20](#).

**Figure 13-25. LIDD\_CS1\_CONF Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

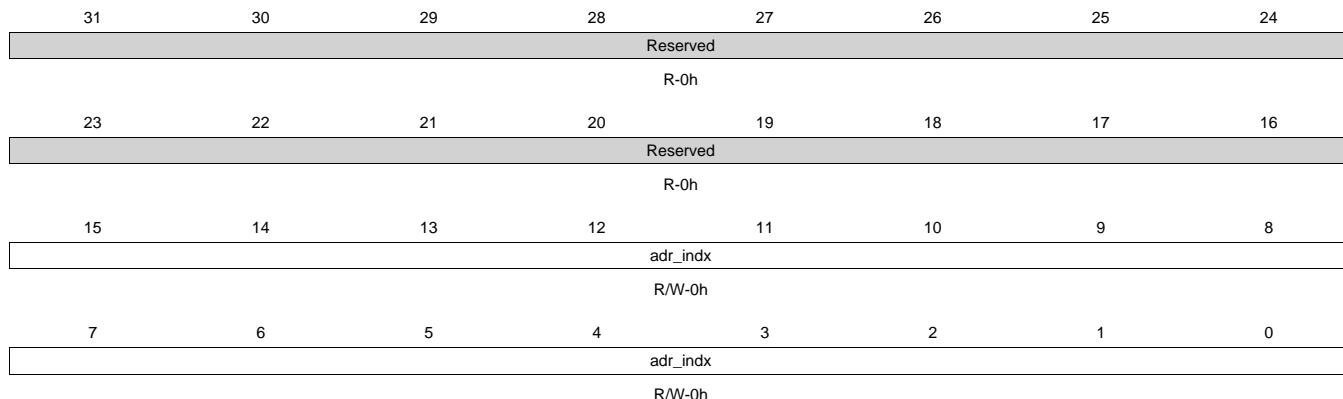

**Table 13-20. LIDD\_CS1\_CONF Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description   |

| 1-0   | ta       | R/W  | 0h    | Field value defines the number of memclk (ta+1) cycles between the end of one CS1 device access and the start of another CS1 device access unless the two accesses are both Reads<br>In this case, this delay is not incurred<br>The minimum value is 0x0             |

### 13.5.8 LIDD\_CS1\_ADDR Register (offset = 20h) [reset = 0h]

LIDD\_CS1\_ADDR is shown in [Figure 13-26](#) and described in [Table 13-21](#).

**Figure 13-26. LIDD\_CS1\_ADDR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

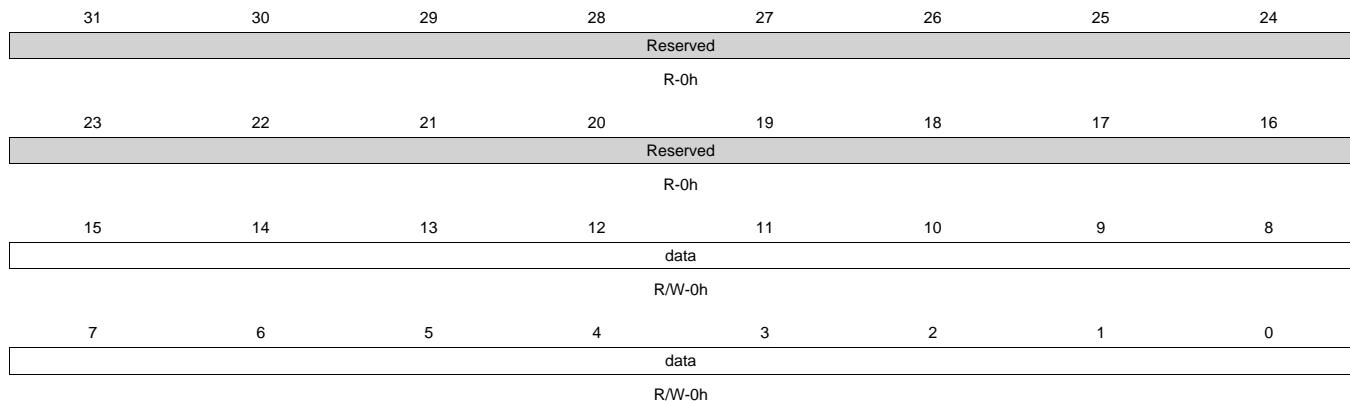

**Table 13-21. LIDD\_CS1\_ADDR Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description   |
|-------|----------|------|-------|---|
| 31-16 | Reserved | R    | 0h    |   |
| 15-0  | adr_idx  | R/W  | 0h    | The LCD Controller supports a shared Address/Data output bus<br>A write to this register would initiate a bus write transaction<br>A read from this register would initiate a bus read transaction<br>CPU reads and writes to this register are not permitted if the LIDD<br>module is in DMA mode (cfg_lidd_dma_en = 1)<br>If the LIDD is being used as a generic bus interface, writing to this<br>register can store adr_idx to an external transparent latch holding a<br>16-bit address<br>If the LIDD is being used to interface with a character based LCD<br>panel in configuration mode, reading and writing to this register can<br>be used to access the command instruction area of the panel |

### 13.5.9 LIDD\_CS1\_DATA Register (offset = 24h) [reset = 0h]

LIDD\_CS1\_DATA is shown in [Figure 13-27](#) and described in [Table 13-22](#).

**Figure 13-27. LIDD\_CS1\_DATA Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 13-22. LIDD\_CS1\_DATA Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description   |
|-------|----------|------|-------|---|
| 31-16 | Reserved | R    | 0h    |   |
| 15-0  | data     | R/W  | 0h    | The LCD Controller supports a shared Address/Data output bus<br>A write to this register would initiate a bus write transaction<br>A read from this register would initiate a bus read transaction<br>CPU reads and writes to this register are not permitted if the LIDD<br>module is in DMA mode (cfg_lidd_dma_en = 1)<br>If the LIDD is being used as a generic bus interface, writing to this<br>register can store adr_idx to an external transparent latch holding a<br>16-bit address<br>If the LIDD is being used to interface with a character based LCD<br>panel in configuration mode, reading and writing to this register can<br>be used to access the command instruction area of the panel |

### 13.5.10 RASTER\_CTRL Register (offset = 28h) [reset = 0h]

RASTER\_CTRL is shown in Figure 13-28 and described in Table 13-23.

**Figure 13-28. RASTER\_CTRL Register**

## Ethernet Subsystem

This chapter describes the ethernet subsystem of the device.

| Topic                                   | Page |
|---|------|
| 14.1 Introduction .....                 | 1156 |
| 14.2 Integration .....                  | 1158 |
| 14.3 Functional Description .....       | 1168 |
| 14.4 Software Operation .....           | 1228 |
| 14.5 Ethernet Subsystem Registers ..... | 1233 |

## 14.1 Introduction

Described in the following sections is the 3-port switch (3PSW) Ethernet subsystem. The 3-port switch gigabit ethernet subsystem provides ethernet packet communication and can be configured as an ethernet switch. It provides the gigabit media independent interface (GMII), reduced gigabit media independent interface (RGMII), reduced media independent interface (RMII), the management data input output (MDIO) for physical layer device (PHY) management.

### 14.1.1 Features

The general features of the ethernet switch subsystem are:

- Two 10/100/1000 Ethernet ports with GMII, RMII and RGMII interfaces
- Wire rate switching (802.1d)
- Non Blocking switch fabric
- Flexible logical FIFO based packet buffer structure
- Four priority level QOS support (802.1p)
- CPPI 3.1 compliant DMA controllers
- Support for IEEE 1588v2 Clock Synchronization (2008 Annex D and Annex F)
  - Timing FIFO and time stamping logic inside the SS
- Device Level Ring (DLR) Support
- Address Lookup Engine
  - 1024 addresses plus VLANs
  - Wire rate lookup
  - VLAN support
  - Host controlled time-based aging
  - Spanning tree support
  - L2 address lock and L2 filtering support
  - MAC authentication (802.1x)
  - Receive or destination based Multicast and Broadcast limits
  - MAC address blocking
  - Source port locking
  - OUI host accept/deny feature
- Flow Control Support (802.3x)
- EtherStats and 802.3Stats RMON statistics gathering (shared)
- Support for external packet dropping engine
- CPGMAC\_SL transmit to CPGMAC\_SL receive Loopback mode (digital loopback) supported
- CPGMAC\_SL receive to CPGMAC\_SL transmit Loobback mode (FIFO loopback) supported
- Maximum frame size 2016 bytes (2020 with VLAN)
- 8k (2048 x 32) internal CPPI buffer descriptor memory
- MDIO module for PHY Management
- Programmable interrupt control with selected interrupt pacing
- Emulation Support.
- Programmable transmit Inter-Packet Gap (IPG)
- Reset isolation

### **14.1.2 Unsupported Features**

There are 18 level interrupts from the CPGMAC module and 2 (used) level interrupts from the MDIO module. The CPSW\_3GSS includes an interrupt combiner/pacer to combine these interrupts together to produce 4 interrupt outputs (per processing core). This device does not split processing among multiple cores but allows servicing of the Core0 interrupts by the Cortex A8 or the PRU-ICSS.

The unsupported CPGMAC features in the device are shown in the following table.

**Table 14-1. Unsupported CPGMAC Features**

| Feature                       | Reason  |
|-------------------------------|---|
| Multi-core split processing   | Core 1 and Core 2 interrupts not connected.   |
| GMII                          | Only 4 Rx/Tx data pins are pinned out for each port. The device supports MII (on GMII interface), RGMII, and RMII interfaces only |
| Phy link status               | The MLINK inputs are not pinned out. Phy link status outputs can be connected to device GPIOs.                                    |
| Internal Delay mode for RGMII | RGMII Internal Delay mode is not supported.   |

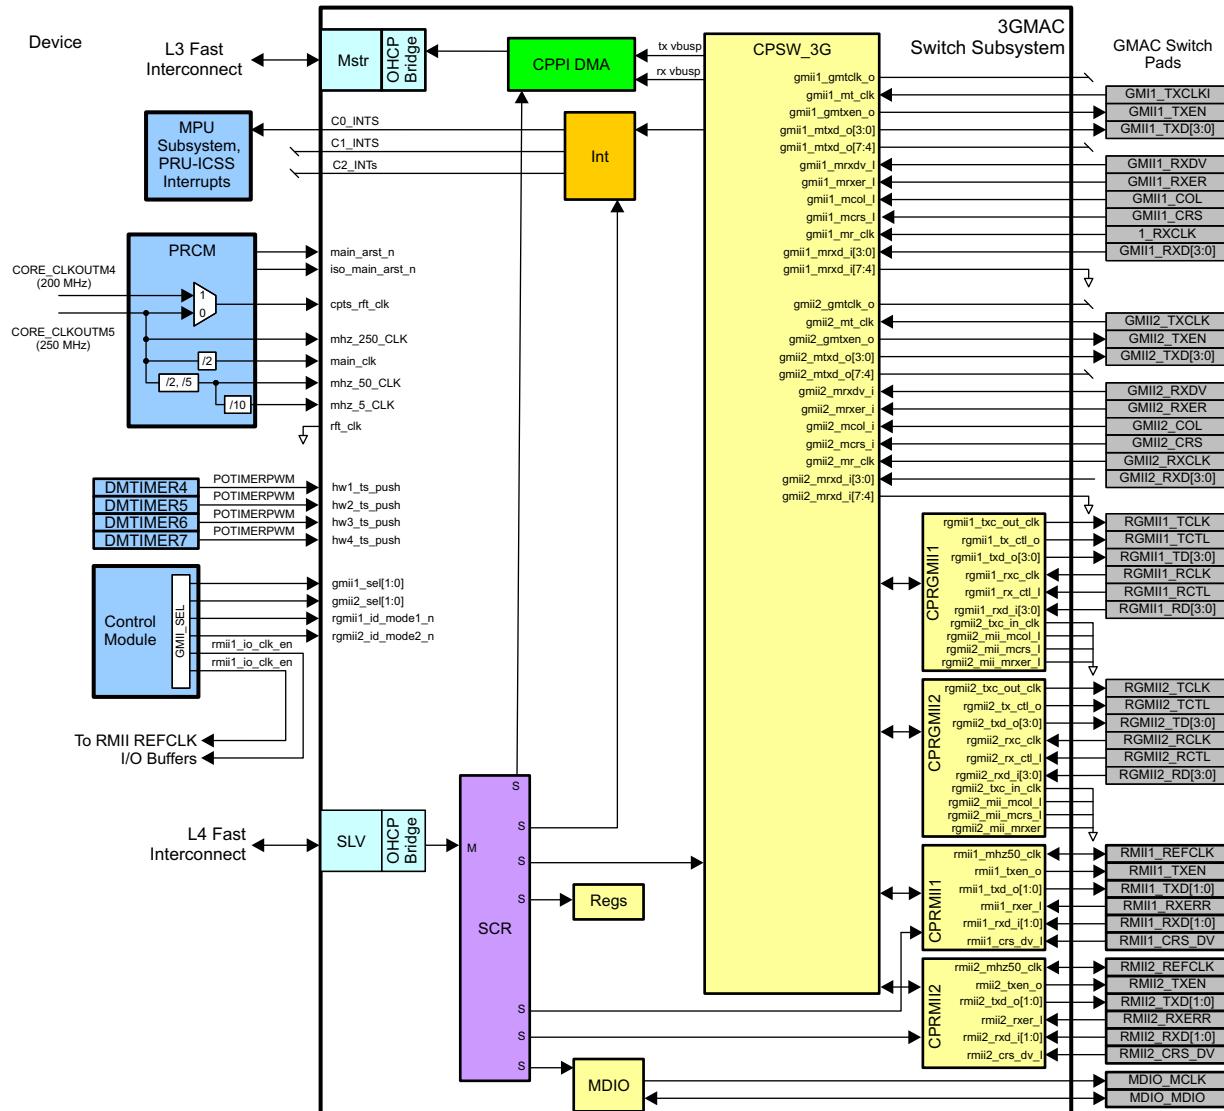

## 14.2 Integration

This device includes a single instantiation of the three-port Gigabit Ethernet Switch Subsystem (CPSW\_3GSS\_RG). The switch provides 2 external ethernet ports (ports 1 and 2) and an internal CPPI interface port (port 0) with IEEE 1588v2 and 802.1ae support. The subsystem consists of:

- One instance of the 3-port Gigabit switch CPSW-3G, which contains:
  - 2 CPGMAC\_SL 10/100/1000 ethernet port modules with GMII interface
- Two RGMII interface modules
- Two RMII interface modules
- One MDIO interface module
- One Interrupt Controller module
- Local CPPI memory of size 8K Bytes

The integration of the Ethernet Switch is shown in [Figure 14-1](#)

**Figure 14-1. Ethernet Switch Integration**

### 14.2.1 Ethernet Switch Connectivity Attributes

The general connectivity attributes for the Ethernet Switch module are shown in [Table 14-2](#).

**Table 14-2. Ethernet Switch Connectivity Attributes**

| Attributes          | Type  |
|---------------------|---|
| Power Domain        | Peripheral Domain   |
| Clock Domain        | PD_PER_CPSW_125MHZ_GCLK (Main)<br>PD_PER_CPSW_250MHZ_GCLK (MHZ_250_CLK)<br>PD_PER_CPSW_50MHZ_GCLK (MHZ_50_CLK)<br>PD_PER_CPSW_5MHZ_GCLK (MHZ_5_CLK)<br>PD_PER_CPSW_CPTS_RFT_CLK (CPTS_RFT_CLK)  |
| Reset Signals       | CPSW_MAIN_ARST_N<br>CPSW_ISO_MAIN_ARST_N  |
| Idle/Wakeup Signals | Smart Idle  |
| Interrupt Requests  | 4 Interrupts<br>RX_THRESH (3PGSWRXTHR0) – Receive Threshold interrupt (nonpaced)<br>RX (3PGSWRXINT0) – Receive interrupt (paced)<br>TX (3PGSWTXINT0) – Transmit interrupt (paced)<br>Misc (3PGSWMISC0) – Other interrupts<br>All Ethernet Switch interrupts go to MPU Subsystem and PRU-ICSS.<br>The Subsystem contains 3 sets of interrupts C0, C1, and C2 to allow for split core processing of packets. On this device, only the C0 version of the interrupts is used. |
| DMA Requests        | None  |
| Physical Address    | L4 Fast slave port<br>L3 Fast initiator port  |

### 14.2.2 Ethernet Switch Clock and Reset Management

The ethernet switch controller operates in its own clock domain and its initiator and target interfaces are connected to the L3/L4 through asynchronous bridges. The OCP interfaces are driven by the MAIN clock input. Additional reference clock inputs are provided for operating the various ethernet ports at different rates.

**Table 14-3. Ethernet Switch Clock Signals**

| Clock Signal  | Max Freq | Reference / Source             | Comments                              |

### 14.2.4 Ethernet Switch RMII Clocking Details

The RMII interface reference clock pin can operate as either an input or output. When used as an input, the clock is driven by the I/O pad. When used as an output, the pad and the RMII clock input are driven by the internal 50-MHz reference clock from the PRCM. The operation is controlled by the GMII\_SEL[RMIIx\_IO\_CLK\_EN] fields in the Control Module, as shown in [Figure 14-2](#).

**Figure 14-2. Ethernet Switch RMII Clock Detail**

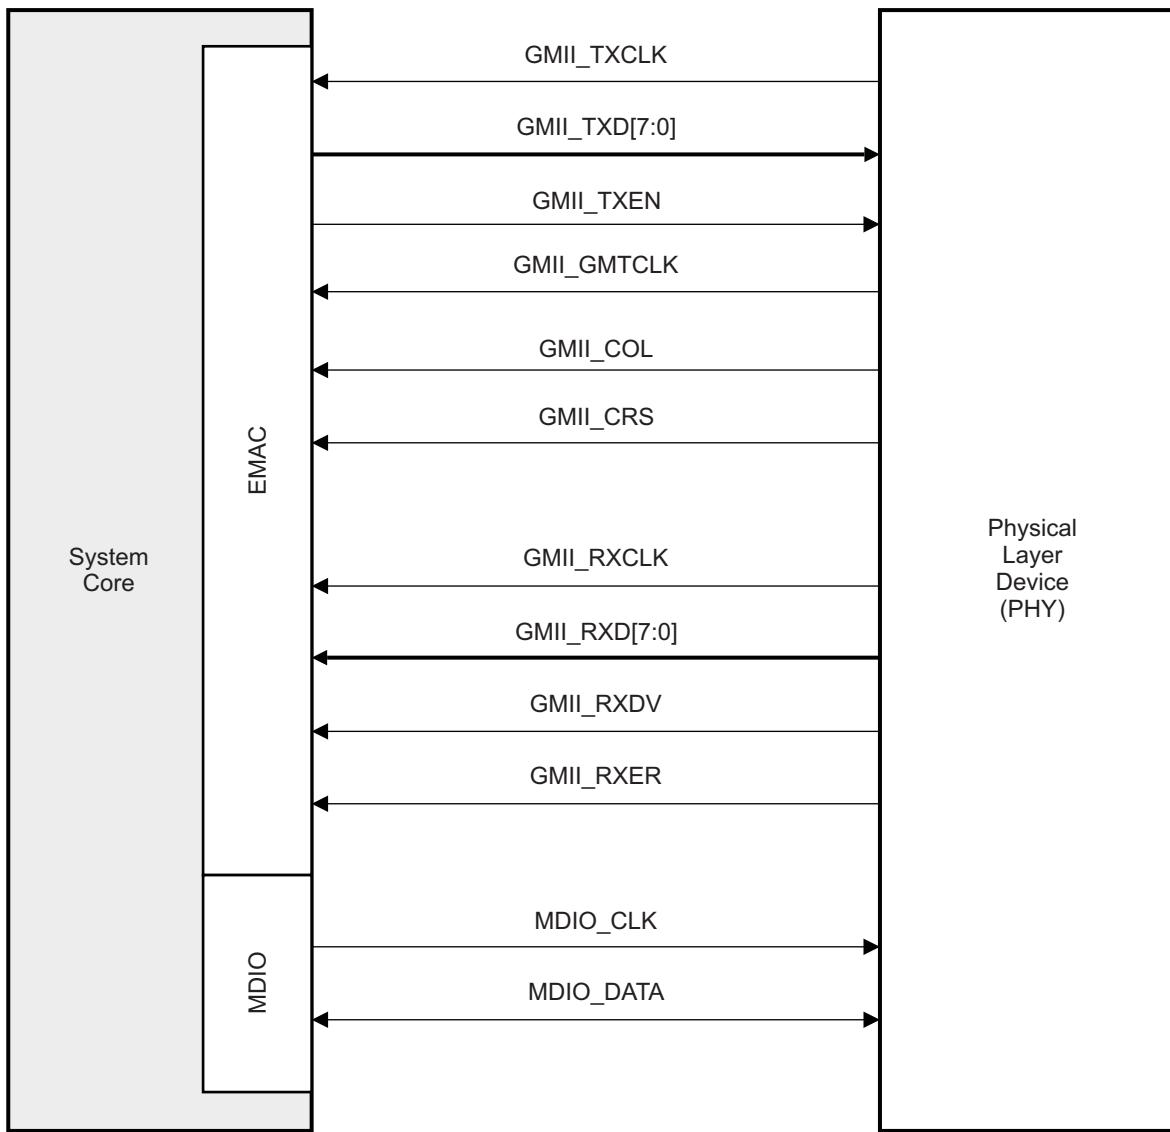

#### 14.2.5 GMII Interface Signal Connections and Descriptions

GMII Interface can operate in GIG/MII Modes.

In GIG(1000Mbps) Mode 3PSW operates only in Full duplex Mode.

In MII Mode(100/10 Mbps) 3PSW operates in Full duplex and Half Duplex.

The pin connections of the GMII Interface are shown in [Figure 14-3](#).

**Figure 14-3. MII Interface Connections**

The detailed description of the signals in GIG/MII Mode are explained in the following sections.

#### 14.2.5.1 GMII Interface Signal Descriptions in GIG (1000Mbps) Mode

**Table 14-5. GMII Interface Signal Descriptions in GIG (1000Mbps) Mode**

| Signal | Type | Description  |
|--------|------|--|
| GMTCLK | O    | The transmit clock is a continuous clock that provides the timing reference for transmit operations. The clock is generated by the CPSW and is 125 MHz at 1000 Mbps operation.                               |
| MtCLK  | I    | The transmit clock is a continuous free running clock and is generated by the PHY.   |
| Mtxd   | O    | The transmit data pins are a collection of 8 data signals comprising 8 bits of data. MTXDO is the least-significant bit (LSB). The signals are synchronized by GMTCLK and valid only when MTXEN is asserted. |
| Mtxen  | O    | The transmit enable signal indicates that the MTXD pins are generating 8bit data for use by the PHY. It is driven synchronously by GMTCLK.   |

**Table 14-5. GMII Interface Signal Descriptions in GIG (1000Mbps) Mode (continued)**

| Signal | Type | Description   |
|--------|------|---|
| MCOL   | I    | In full-duplex operation, the MCOL pin is used for hardware transmit flow control. Asserting the MCOL pin will stop packet transmissions; packets in the process of being transmitted when MCOL is asserted will complete transmission. The MCOL pin should be held low if hardware transmit flow control is not used.                    |
| MCRS   | I    | In full-duplex operation, the MCRS pin should be held low.  |
| MRCLK  | I    | The receive clock is a continuous clock that provides the timing reference for receive operations. The MRXD, MRXDV, and MRXER signals are tied to this clock. The clock is generated by the PHY and is 125 MHz at 1000Mbps of operation.  |
| MRXD   | I    | The receive data pins are a collection of 8 data signals comprising 8 bits of data. MRXD0 is the least-significant bit (LSB). The signals are synchronized by MRCLK and valid only when MRXDV is asserted.  |
| MRXDV  | I    | The receive data valid signal indicates that the MRXD pins are generating byte data for use by the 3PSW. It is driven synchronously to MRCLK.   |
| MDCLK  | O    | Management data clock (MDIO_CLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MDIO pin.  |
| MDIO   | I/O  | MDIO DATA(MDIO_D). MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MDIO_D pin acts as an output for all but the data bit cycles at which time it is an input for read operations. |

#### 14.2.5.2

**Table 14-6. GMII Interface Signal Descriptions in MII (100/10Mbps) Mode**

| Signal | Type | Description   |
|--------|------|---|
| GMTCLK | O    | The clock is generated by the CPSW and is running at 125 MHz  |
| MtCLK  | I    | The transmit clock is a continuous clock that provides the timing reference for transmit operations. The MTXD and MTXEN signals are tied to this clock. The clock is generated by the PHY and is 2.5 MHz at 10 Mbps operation and 25 MHz at 100 Mbps operation.   |
| Mtxd   | O    | MTXD[7-4] pins of MTXD data are not used. The transmit data pins are a collection of 4 data signals MTXD[3-0] comprising 4 bits of data. MTXD0 is the least-significant bit (LSB). The signals are synchronized by MTCLK and valid only when MTXEN is asserted.   |
| Mtxen  | O    | The transmit enable signal indicates that the MTXD pins are generating 4bit data for use by the PHY. It is driven synchronously by MTCLK.   |
| MCOL   | I    | In half-duplex operation, the MCOL pin is asserted by the PHY when it detects a collision on the network. It remains asserted while the collision condition persists. This signal is not necessarily synchronous to MTCLK nor MRCLK.  |
|        | I    | In full-duplex operation, the MCOL pin is used for hardware transmit flow control. Asserting the MCOL pin will stop packet transmissions; packets in the process of being transmitted when MCOL is asserted will complete transmission. The MCOL pin should be held low if hardware transmit flow control is not used |
| MCRS   | I    | In half-duplex operation, the MCRS pin is asserted by the PHY when the network is not idle in either transmit or receive. The pin is deasserted when both transmit and receive are idle. This signal is not necessarily synchronous to MTCLK nor MRCLK.   |
|        | I    | In full-duplex operation, the MCRS pin should be held low.  |
| MRCLK  | I    | The receive clock is a continuous clock that provides the timing reference for receive operations. The MRXD, MRXDV, and MRXER signals are tied to this clock. The clock is generated by the PHY and is 2.5 MHz at 10 Mbps operation and 25 MHz at 100 Mbps operation.   |
| MRXD   | I    | MRXD[7-4] bits are unused in the MII mode. The receive data pins are a collection of 4 data signals comprising 4 bits of data. MRXD0 is the least-significant bit (LSB). The signals are synchronized by MRCLK and valid only when MRXDV is asserted.   |

**Table 14-6. GMII Interface Signal Descriptions in MII (100/10Mbps) Mode (continued)**

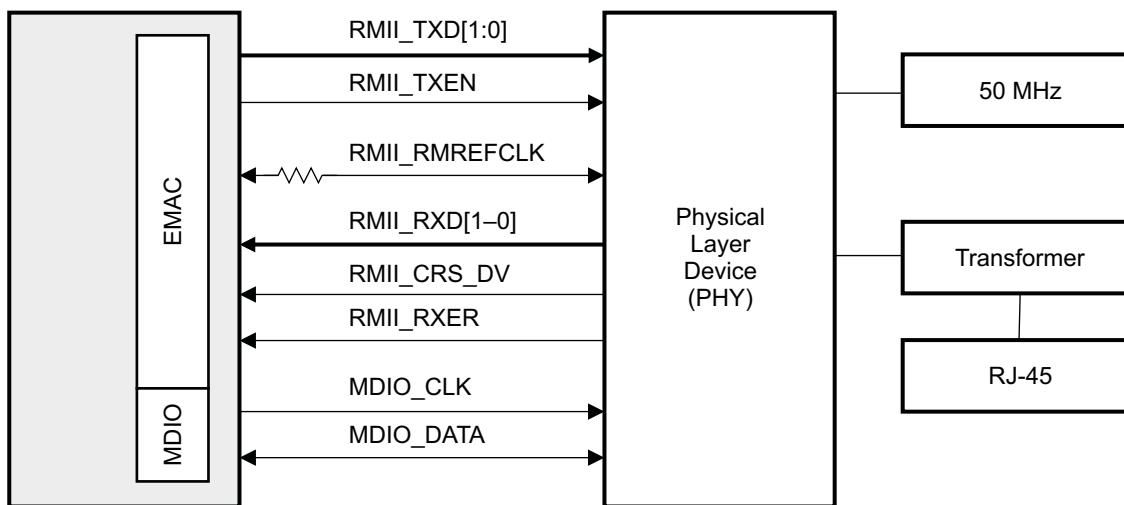

| Signal | Type | Description  |
|--------|------|--|
| MRXDV  | I    | The receive data valid signal indicates that the MRXD pins are generating nibble data for use by the 3PSW. It is driven synchronously to MRCLK.  |
| MDCLK  | O    | Management data clock (MDIO_CLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MDIO pin.   |
| MDIO   | I/O  | MDIO DATA(MDIO_D). MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication,PHY address, register address, and data bit cycles. The MDIO_D pin acts as an output for all but the data bit cycles at which time it is an input for read operations. |

#### 14.2.6 RMII Signal Connections and Descriptions

Figure 14-4 shows a device with integrated 3PSW and MDIO interfaced via a RMII connection in a typical system.

The individual CPSW and MDIO signals for the RMII interface are summarized in Table 14-7.

For more information, see either the IEEE 802.3 standard or ISO/IEC 8802-3:2000(E).

**Figure 14-4. RMII Interface Connections**

**Table 14-7. RMII Interface Signal Descriptions**

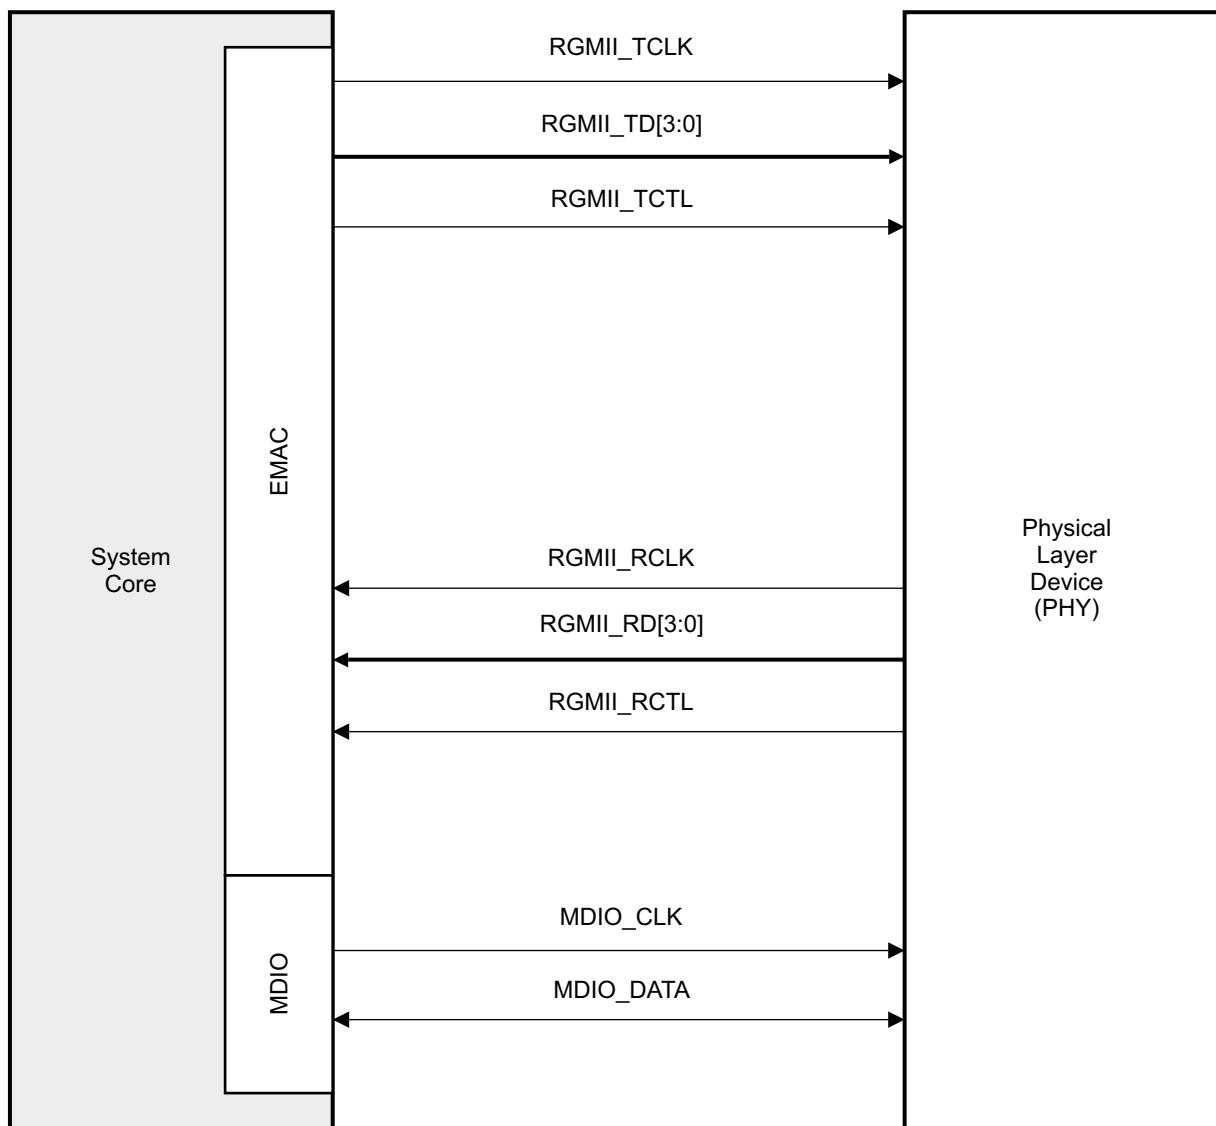

| Signal        | Type | Description  |
|---------------|------|--|
| RMII_TXD[1-0] | O    | Transmit data. The transmit data pins are a collection of 2 bits of data. RMII_TXD0 is the least-significant bit (LSB). The signals are synchronized by RMII_REFCLK and valid only when RMII_TXEN is asserted.                             |
| RMII_TXEN     | O    | Transmit enable. The transmit enable signal indicates that the RMII_TXD pins are generating data for use by the PHY. RMII_TXEN is synchronous to RMII_MHZ_50_CLK.  |
| RMII_REFCLK   | I/O  | RMII reference clock.  |
| RMII_RXD[1-0] | I    | Receive data. The receive data pins are a collection of 2 bits of data. RMII_RXD0 is the least-significant bit (LSB). The signals are synchronized by RMII_REFCLK and valid only when RMII_CRS_DV is asserted and RMII_RXER is deasserted. |
| RMII_CRS_DV   | I    | Carrier sense/receive data valid. Multiplexed signal between carrier sense and receive data valid.   |

**Table 14-7. RMII Interface Signal Descriptions (continued)**

| Signal    | Type | Description  |
|-----------|------|--|
| RMII_RXER | I    | Receive error. The receive error signal is asserted to indicate that an error was detected in the received frame.  |
| MDIO_CLK  | O    | Management data clock. The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MDIO pin.  |
| MDIO_DATA | I/O  | MDIO DATA. MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication,PHY address, register address, and data bit cycles. The MDIO_DATA signal acts as an output for all but the data bit cycles at which time it is an input for read operations. |

#### 14.2.7 RGMII Signal Connections and Descriptions

Figure 14-5 shows a device with integrated CPSW and MDIO interfaced via a RGMII connection in a typical system.

**Figure 14-5. RGMII Interface Connections**

**Table 14-8. RGMII Interface Signal Descriptions**

| <b>Signal</b> | <b>Type</b> | <b>Description</b>  |
|---------------|-------------|---|
| RGMII_TD[3-0] | O           | The transmit data pins are a collection of 4 bits of data. RGMII_RD0 is the least-significant bit (LSB).<br>The signals are valid only when RGMII_TCTL is asserted.   |
| RGMII_TCTL    | O           | Transmit Control/enable .The transmit enable signal indicates that the RGMII_TD pins are generating data for use by the PHY.  |
| RGMII_TCLK    | O           | The transmit reference clock will be 125Mhz, 25Mhz, or 2.5Mhz depending on speed of operation.  |
| RGMII_RD[3-0] | I           | The receive data pins are a collection of 4 bits of data. RGMII_RD is the least-significant bit (LSB).<br>The signals are valid only when RGMII_RCTL is asserted.   |
| RGMII_RCTL    | I           | The receive data valid/control signal indicates that the RGMII_RD pins are nibble data for use by the 3PSW.   |
| RGMII_RCLK    | I           | The receive clock is a continuous clock that provides the timing reference for receive operations.The clock is generated by the PHY and is 2.5 MHz at 10 Mbps operation and 25 MHz at 100 Mbps operation,125 MHz at 1000Mbps of operation.  |
| MDIO_CLK      | O           | Management data clock. The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MDIO pin.   |
| MDIO_DATA     | I/O         | MDIO DATA. MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication,PHY address, register address, and data bit cycles. The MDIO_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations. |

## 14.3 Functional Description

The 3 port switch (3PSW) Ethernet Subsystem peripheral are compliant to the IEEE Std 802.3 Specification. The 3PSW Ethernet Subsystem contains two RGMII/RMII interfaces, one CPPI 3.0 interface, Interrupt Controller, MDIO and CPSW\_3G which contains two GMII interfaces as shown in [Figure 14-6](#).

The subsystem modules are discussed in detail in the following sections.

### 14.3.1 CPSW\_3G Subsystem

#### 14.3.1.1 Interrupt Pacing

The receive and transmit pulse interrupts can be paced. The receive threshold and miscellaneous interrupts are not paced. The Interrupt pacing feature limits the number of interrupts that occur during a given period of time. For heavily loaded systems in which interrupts can occur at a very high rate (e.g. 148,800 packets per second for Ethernet), the performance benefit is significant due to minimizing the overhead associated with servicing each interrupt. Interrupt pacing increases the CPU cache hit ratio by minimizing the number of times that large interrupt service routines are moved to and from the CPU instruction cache.

Each CPU receive and transmit pulse interrupt contains an interrupt pacing sub-block (six total). Each sub-block is disabled by default allowing the selected interrupt inputs to pass through unaffected. The interrupt pacing module counts the number of interrupts that occur over a 1ms interval of time. At the end of each 1ms interval, the current number of interrupts is compared with a target number of interrupts (specified by the associated maximum number of interrupts register).

Based on the results of the comparison, the length of time during which interrupts are blocked is dynamically adjusted. The 1ms interval is derived from a 4us pulse that is created from a prescale counter whose value is set in the int\_prescale value in the Int\_Control register. The int\_prescale value should be written with the number of VBUSP\_CLK periods in 4us. The pacing timer determines the interval during which interrupts are blocked and decrements every 4us. It is reloaded each time a zero count is reached. The value loaded into the pacing timer is calculated by hardware every 1ms according to the following algorithm:

```
if (intr_count > 2*intr_max)
pace_timer = 255;
else if (intr_count > 1.5*intr_max)
pace_timer = last_pace_timer*2 + 1;
else if (intr_count > 1.0*intr_max)
pace_timer = last_pace_timer + 1;
else if (intr_count > 0.5*intr_max)
pace_timer = last_pace_timer - 1;
else if (intr_count != 0)
pace_timer = last_pace_timer/2;
else
pace_timer = 0;
```

If the rate of interrupt inputs is much less than the target interrupt rate specified in the associated maximum interrupts register, then the interrupt is not blocked. If the interrupt rate is greater than the target rate, the interrupt will be “paced” at the rate specified in the interrupt maximum register. The interrupt maximum register should be written with a value between 2 and 63 inclusive indicating the target number of interrupts per milli-second.

#### 14.3.1.2 Reset Isolation

Reset isolation for the Ethernet switch on Device is that the switch function of the ethernet IP remains active even in case of all device resets except for POR pin reset and ICEPICK COLD reset. Packet traffic to/from the 3PSW host will be flushed/dropped, but the ethernet switch will remain operational for all traffic between external devices on the switch even though the device is under-going a device reset. Pin mux configuration for ethernet related IO and reference clocks needed by the Ethernet switch IP to be active is controlled by a protected control module bit. If reset isolation is enabled, then only a POR pin or ICEPICK COLD reset event should fully reset the Ethernet switch IP including the actual switch and also the reference clocks and pin mux control specifically associated with the Ethernet IP.

#### 14.3.1.2.1 Modes of Operation

The device has two modes of operation concerning the reset of the 3PSW Ethernet switch.

The mode is controlled by the ISO\_CONTROL bit in **RESET\_ISO** register of the **device control module**. This bit should default to '0'. Writes to the ISO\_CONTROL bit must be supervisor mode writes.

Mode 1: ISO\_CONTROL=0 (reset isolation disabled)

- This mode is selected when ISO\_CONTROL bit of control module is = 0. This should be the default state of the bit after control module reset.
- Upon any device level resets, the entire CPSW\_3GSS\_R IP, L3/L4, control module (including all pin mux control and the ISO\_CONTROL bit) is immediately reset.

Mode 2: ISO\_CONTROL=1 (reset isolation enabled)

- This mode is selected when ISO\_CONTROL bit of control module is = 1.
- Upon any device reset source other than POR pin or ICEPICK cold (so this includes SW global cold, any watchdog reset, warm RESETn pin, ICEPICK warm, SW global warm), the following should be true:
  - The CPSW\_3GSS\_R is put into 'isolate' mode and non-switch related portions of the IP are reset.
  - The 50-MHz and 125-MHz reference clocks to the 3PSW Ethernet Subsystem remains active throughout the entire reset condition.
  - The control for pin multiplexing for all of the signals should maintain their current configuration throughout the entire reset condition.
  - The reset isolated logic inside 3PSW Ethernet Subsystem IP which maintains the switch functionality
  -
- Upon any cold reset sources, the entire 3PSW Ethernet Subsystem, control module (including all pin mux control and the ISO\_CONTROL bit itself) is reset.

### 14.3.1.3 Interrupts

The 3 Port Switch Ethernet Subsystem generates four interrupt events.

#### 14.3.1.3.1 Receive Packet Completion Pulse Interrupt (RX\_PULSE)

The RX\_PULSE interrupt is a paced pulse interrupt selected from the 3PSW RX\_PEND [7:0] interrupts. The receive DMA controller has eight channels with each channel having a corresponding (RX\_PEND[7:0]).

The following steps will enable the receive packet completion interrupt.

- Enable the required channel interrupts of the DMA engine by setting 1 to the appropriate bit in the RX\_INTMASK\_SET register.
- The receive completion interrupt(s) to be routed to RX\_PULSE is selected by setting one or more bits in the receive interrupt enable register Cn\_RX\_EN. The masked interrupt status can be read in the Receive Interrupt Masked Interrupt Status (Cn\_RX\_STAT) register.

When the 3PSW completes a packet reception, the subsystem issues an interrupt to the CPU by writing the packet's last buffer descriptor address to the appropriate channel queue's receive completion pointer located in the state RAM block. The interrupt is generated by the write when enabled by the interrupt mask, regardless of the value written.

Upon interrupt reception, the CPU processes one or more packets from the buffer chain and then acknowledges one or more interrupt(s) by writing the address of the last buffer descriptor processed to the queue's associated receive completion pointer (RXn\_CP) in the receive DMA state RAM.

Upon reception of an interrupt, software should perform the following:

- Read the RX\_STAT register to determine which channel(s) caused the interrupt.
- Process received packets for the interrupting channel(s).
- Write the 3PSW completion pointer(s) (RXn\_CP). The data written by the host (buffer descriptor address of the last processed buffer) is compared to the data in the register written by the subsystem (address of last buffer descriptor used by the subsystem). If the two values are not equal (which means that the 3PSW has received more packets than the CPU has processed), the receive packet completion interrupt signal remains asserted. If the two values are equal (which means that the host has processed all packets that the system has received), the pending interrupt is de-asserted. The value that the 3PSW is expecting is found by reading the receive channel*n* completion pointer register (RXn\_CP).
- Write the value 1h to the CPDMA\_EOI\_VECTOR register.

To disable the interrupt:

- The eight channel interrupts may be individually disabled by writing to 1 the appropriate bit in the RX\_INTMASK\_CLEAR
- The receive completion pulse interrupt could be disabled by clearing to 0 all the bits of the RX\_EN.

The software could still poll for the RX\_INTSTAT\_RAW and RX\_INTSTAT\_MASKED registers if the corresponding interrupts are enabled.

#### 14.3.1.3.2 Transmit Packet Completion Pulse Interrupt (TX\_PULSE)

The TX\_PULSE interrupt is a paced pulse interrupt selected from the 3PSW TX\_PEND [7:0] interrupts. The transmit DMA controller has eight channels with each channel having a corresponding (TX\_PEND[7:0]).

To enable the transmit packet completion interrupt:

- Enable the required channel interrupts of the DMA engine by setting 1 to the appropriate bit in the TX\_INTMASK\_SET register.
- The transmit completion interrupt(s) to be routed to TX\_PULSE is selected by setting one or more bits in the transmit interrupt enable register Cn\_TX\_EN .The masked interrupt status can be read in the Transmit Interrupt Masked Interrupt Status (Cn\_TX\_STAT) register.

When the 3PSW completes the transmission of a packet, the 3PSW subsystem issues an interrupt to the CPU by writing the packet's last buffer descriptor address to the appropriate channel queue's transmit completion pointer located in the state RAM block. The interrupt is generated by the write when enabled by the interrupt mask, regardless of the value written.

Upon receiving an interrupt, software should perform the following:

- Read the TX\_STAT register to determine which channel(s) caused the interrupt
- Process received packets for the interrupting channel(s).
- Write the 3PSW completion pointer(s) (TX<sub>n</sub>\_CP). The data written by the host (buffer descriptor address of the last processed buffer) is compared to the data in the register written by the 3PSW (address of last buffer descriptor used by the 3PSW). If the two values are not equal (which means that the 3PSW has transmitted more packets than the CPU has processed), the transmit packet completion interrupt signal remains asserted. If the two values are equal (which means that the host has processed all packets that the subsystem has transferred), the pending interrupt is cleared. The value that the 3PSW is expecting is found by reading the transmit channel<sub>n</sub> completion pointer register (TX<sub>n</sub>\_CP).
- Write the 2h to the CPDMA\_EOI\_VECTOR register.

To disable the interrupt:

- The eight channel interrupts may be individually disabled by writing to 1 the appropriate bit in the TX\_INTMASK\_CLEAR.
- The receive completion pulse interrupt could be disabled by clearing to 0 all the bits of the TX\_EN. The software could still poll for the TX\_INTSTAT\_RAW and TX\_INTSTAT\_MASKED registers if the corresponding interrupts are enabled.

#### **14.3.1.3.3 Receive Threshold Pulse Interrupt (RX\_THRESH\_PULSE)**

The RX\_THRESH\_PULSE interrupt is an immediate (non-paced) pulse interrupt selected from the CPSW\_3G RX\_THRESH\_PEND[7:0] interrupts. The receive DMA controller has eight channels with each channel having a corresponding threshold pulse interrupt (RX\_THRESH\_PEND [7:0]).

To enable the receive threshold pulse Interrupt:

- Enable the required channel interrupts of the DMA engine by setting 1 to the appropriate bit in the RX\_INTMASK\_SET register.
- The receive threshold interrupt(s) to be routed to RX\_THRESH\_PULSE is selected by setting one or more bits in the receive threshold interrupt enable register RX\_THRESH\_EN. The masked interrupt status can be read in the Receive Threshold Masked Interrupt Status (C<sub>n</sub>\_RX\_THRESH\_STAT) register.

The RX\_THRESH\_PULSE is asserted when enabled when the channel's associated free buffer count RX<sub>n</sub>\_FREEBUFFER is less than or equal to the corresponding RX<sub>n</sub>\_PENDTHRESH register.

Upon receiving an interrupt, software should perform the following:

- Read the C<sub>n</sub>\_RX\_THRESH\_STAT bit address location to determine which channel(s) caused the interrupt.
- Process the received packets in order to add more buffers to any channel that is below the threshold value.
- Write the CPSW\_3G completion pointer(s).
- Write the value 0h to the CPDMA\_EOI\_VECTOR register.

The threshold pulse interrupt is an immediate interrupt intended to indicate that software should immediately process packets to preclude an overrun condition from occurring for the particular channels.

To disable the interrupt:

- The eight channel receive threshold interrupts may be individually disabled by writing to 1 the appropriate bit in the RX\_INTMASK\_CLEAR register.
- The receive threshold pulse interrupt could be disabled by clearing to Zero the corresponding bits of the RX\_THRESH\_EN. The software could still poll for the RX\_INTSTAT\_RAW and INTSTAT\_MASKED registers if the corresponding interrupts are enabled.

#### 14.3.1.3.4 Miscellaneous Pulse Interrupt (MISC\_PULSE)

The MISC\_PULSE interrupt is an immediate, non-paced, pulse interrupt selected from the miscellaneous interrupts (EVNT\_PEND, STAT\_PEND, HOST\_PEND, MDIO\_LINKINT, MDIO\_USERINT). The miscellaneous interrupt(s) is selected by setting one or more bits in the  $C_n\text{-MISC\_EN}[4:0]$  register. The masked interrupt status can be read in the  $C_n\text{-MISC\_STAT}[4:0]$  register. Upon reception of an interrupt, software should perform the following:

- Read the Misc\_Stat[4:0] register to determine which caused the interrupt.
- Process the interrupt.
- Write the appropriate value (0x3) to the CPDMA\_EOI\_VECTOR register
- MDIO\_LINTINT[1] and MDIO\_USERINT[1] are unused.

##### 14.3.1.3.4.1 EVNT\_PEND (CPTS\_PEND) Interrupt

See [Section 14.3.7, Common Platform Time Sync \(CPTS\)](#), for information on the time sync event interrupt.

##### 14.3.1.3.4.2 Statistics Interrupt

The statistics level interrupt (STAT\_PEND) will be asserted if enabled when any statistics value is greater than or equal to 0x80000000. The statistics interrupt is cleared by writing to decrement all statistics values greater than 0x80000000 (such that their new values are less than 0x80000000). The statistics interrupt is enabled by setting to one the appropriate bit in the INTMASK\_SET register in the CPDMA submodule.

The statistics interrupt is disabled by writing one to the appropriate bit in the INTMASK\_CLEAR register. The raw and masked statistics interrupt status may be read by reading the TX\_IntStat\_Raw and TX\_IntStat\_Masked registers, respectively

##### 14.3.1.3.4.3 Host Error Interrupt

The host error interrupt (HOST\_PEND) will be asserted if enabled when a host error is detected during transmit or receive CPDMA transactions. The host error interrupt is intended for software debug, and is cleared by a warm reset or a system reset. The raw and masked statistics interrupt status can be read by reading the TX\_INTSTAT\_RAW and TXINTSTAT\_MASKED registers, respectively.

The following list shows the transmit host error conditions:

- SOP error
- OWNERSHIP bit not set in SOP buffer
- next buffer descriptor pointer without EOP set to 0
- buffer pointer set to 0
- buffer length set to 0
- packet length error

The receive host error conditions are show in the following list:

- Ownership bit not set in input buffer.
- Zero buffer pointer.
- Zero buffer Length on non-SOP descriptor.
- SOP buffer length not greater than offset.

The host error interrupt is disabled by clearing to 0 the appropriate bit in the CPDMA\_INTMASK\_CLEAR register.

#### 14.3.1.3.4.4 MDIO Interrupts

MDIO\_LINKINT is set if there is a change in the link state of the PHY corresponding to the address in the PHYADDRMON field of the MDIouserPHYSEL $n$  register and the corresponding LINKINTENB bit is set. The MDIO\_LINKINT event is also captured in the MDIOLINKINTMASKED register. When the GO bit in the MDIouserACCESS $n$  registers transitions from 1 to 0, indicating the completion of a user access, and the corresponding USERINTMASKSET bit in the MDIouserINTMASKSET register is set, the MDIO\_USERINT signal is asserted 1. The MDIO\_USERINT event is also captured in the MDIouserINTMASKED register.

To enable the miscellaneous pulse interrupt:

The miscellaneous interrupt(s) is selected by setting one or more bits in the miscellaneous interrupt enable register (MISC\_EN).

- The Statistics interrupt is enabled by setting to 1 the STAT\_INT\_MASK bit in the DMA\_INTMASK\_SET register.
- The HOST\_PEND is enabled by setting to 1 the HOST\_ERR\_INT\_MASK in the DMA\_INTMASK\_SET register.

Upon receiving of an interrupt, software should perform the following:

- Read the Cn\_MISC\_STAT register to determine the source of the interrupt.
- Process the interrupt.
- Write the value 3h to the CPDMA\_EOI\_VECTOR register.

#### 14.3.1.4 Embedded Memories

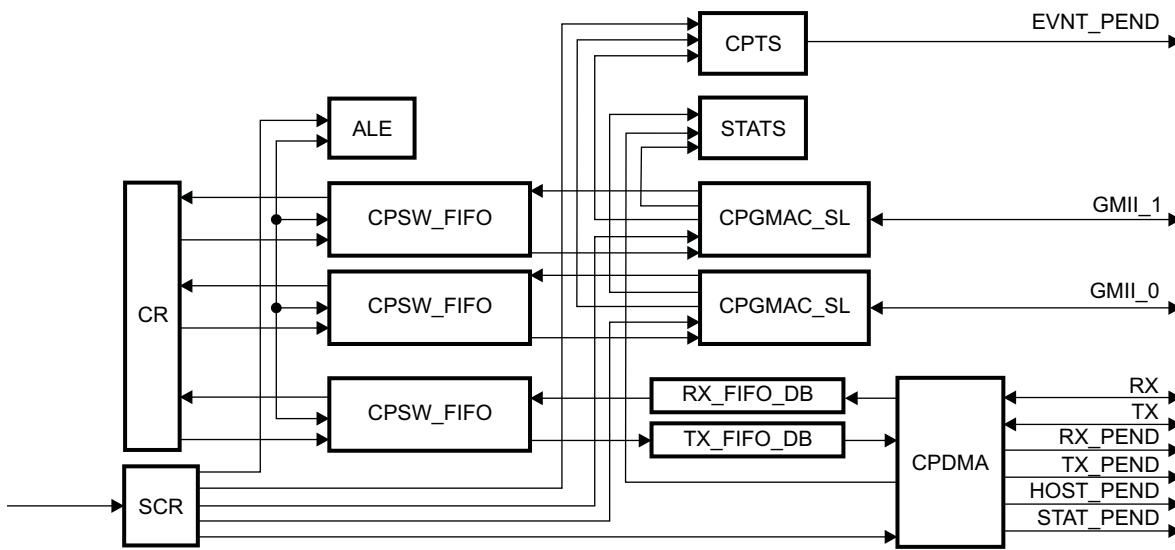

| Memory Type Description             | Number of Instances |
|-------------------------------------|---------------------|
| Single port 2560 by 64 RAM          | 3 (Packet FIFOs)    |
| Single port 64-word by 1152-bit RAM | 1 (ALE)             |
| Single port 2048-word by 32-bit RAM | 1 (CPPI)            |

#### 14.3.2 CPSW\_3G

The CPSW\_3G GMII interfaces are compliant to the IEEE Std 802.3 Specification.

The CPSW\_3G contains two CPGMAC\_SL interfaces (ports 1 and 2), one CPPI 3.0 interface Host Port (port 0), Common Platform Time Sync (CPTS), ALE Engine and CPDMA.

The top level block diagram of CPSW\_3G is shown below:

**Figure 14-6. CPSW\_3G Block Diagram**

#### 14.3.2.1 Media Independent Interface (GMII)

The CPSW\_3G contains two CPGMAC\_SL submodules. Each CPGMAC\_SL has a single GMII interface. The CPGMAC\_SL submodules are ports 1 and 2. For more details, see [Section 14.3.3, Ethernet Mac Sliver \(CPGMAC\\_SL\)](#).

#### 14.3.2.2 IEEE 1588v2 Clock Synchronization Support

The CPSW\_3G supports IEEE 1588v2 clock synchronization. Ethernet GMII Transmit (egress) and receive (ingress) time sync operation are also supported.

##### 14.3.2.2.1 IEEE 1588v2 Receive Packet Operation

There are two CPSW\_3G receive time sync interfaces for each ethernet port. The first is the TS\_RX\_MII interface and the second is the TS\_RX\_DEC interface. Both interfaces are generated in the switch and are input to the CPTS module. There are register bits in the CPSW\_3G that control time sync operations in addition to the registers in the CPTS module. The pX\_ts\_rx\_en bit in the switch Px\_Control register must be set for receive time sync operation to be enabled (TS\_RX\_MII).

The TS\_RX\_MII interface issues a record signal (pX\_ts\_rx\_mii\_rec) along with a handle (pX\_ts\_rx\_mii\_hdl[3:0]) to the CPTS controller for each packet that is received. The record signal is a single clock pulse indicating that a receive packet has been detected at the associated port MII interface.

The handle value is incremented with each packet and rolls over to zero after 15. There are 16 possible handle values so there can be a maximum of 16 packets “in flight” from the TS\_RX\_MII to the TS\_RX\_DEC block (through the CPGMAC\_SL) at any given time. A handle value is reused (not incremented) for any received packet that is shorter than about 31 octets (including preamble). Handle reuse on short packets prevents any possible overrun condition if multiple fragments are consecutively received.

The TS\_RX\_MII logic is in the receive wireside clock domain. There is no decode logic in the TS\_RX\_MII to determine if the packet is a time sync event packet or not. Each received packet generates a record signal and new handle. The handle is sent to the CPTS controller with the record pulse and the handle is also sent to the TS\_RX\_DEC block along with the packet. The packet decode is performed in the TS\_RX\_DEC block. The decode function is separated from the record function because in some systems the incoming packet can be encrypted. The decode function would be after packet decryption in those systems.

The TS\_RX\_DEC function decodes each received packet and determines if the packet meets the time sync event packet criteria. If the packet is determined to be a time sync event packet, then the time sync event packet is signaled to the CPTS controller via the TS\_RX\_DEC interface (pX\_ts\_rx\_dec\_evnt, pX\_ts\_rx\_dec\_hdl[3:0], pX\_ts\_rx\_dec\_msg\_type, pX\_ts\_rx\_dec\_seq\_id). The event signal is a single clock pulse indicating that the packet matched the time sync event packet criteria and that the associated packet handle, message type, and sequence ID are valid. No indication is given for received packets that do not meet the time sync event criteria. The 16-bit sequence ID is found in the time sync event packet at the sequence ID offset into the PTP message header (pX\_ts\_seq\_id\_offset). A packet is determined to be a receive event packet under the following conditions:

#### **14.3.2.2.1.1 Annex F**

1. Receive time sync is enabled (pX\_ts\_rx\_en is set in the switch Px\_Control register).

2. One of the following sequences is true:

Where the first packet ltype matches:

- ts\_ltype1 and pX\_ts\_ltype1\_en is set
- ts\_ltype2 and pX\_ts\_ltype2\_en is set
- vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
- vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set
- vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet ltype matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
- vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet ltype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set
- vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet ltype matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
- vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet ltype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set

3. The PTP message begins in the byte after the LTYPE.

4. The packet message type is enabled in the pX\_ts\_msg\_type\_en field in the Px\_TS\_SEQ\_MTYPE register.

5. The packet was received without error (not long/short/mac\_ctl/crc/code/align).

6. The ALE determined that the packet is to be sent only to the host (port 0).

#### **14.3.2.2.1.2 Annex D**

1. Receive time sync is enabled (pX\_ts\_rx\_en is set in the switch Px\_Control register).

2. One of the following sequences is true:

Where the first packet ltype matches:

- 0x0800 and pX\_ts\_annex\_d\_en is set
- vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches 0x0800 and pX\_ts\_annex\_d\_en is set
- vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet ltype matches 0x0800 and pX\_ts\_annex\_d\_en is set
- vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet ltype matches 0x0800 and pX\_ts\_annex\_d\_en is set

3. Byte 14 (the byte after the LTYPE) contains 0x45 (IP\_VERSION).

**Note:** The byte numbering assumes that there are no vlans. The byte number is intended to show the relative order of the bytes.

4. Byte 22 contains 0x00 if the pX\_ts\_ttl\_nonzero bit in the switch Px\_Control register is zero or byte 22 contains any value if pX\_ts\_ttl\_nonzero is set. Byte 22 is the time to live field.

5. Byte 23 contains 0x11 (UDP Fixed).
6. Byte 30 contains decimal 224 (0xe0).
7. Byte 31 contains 0x00.
8. Byte 32 contains 0x01.
9. Byte 33 contains one of the following:
  - Decimal 129 and the pX\_ts\_129 bit in the switch Px\_Control register is set
  - Decimal 130 and the pX\_ts\_130 bit in the switch Px\_Control register is set
  - Decimal 131 and the pX\_ts\_131 bit in the switch Px\_Control register is set
  - Decimal 129 and the pX\_ts\_132 bit in the switch Px\_Control register is set
10. Bytes 36 and 37 contain one of the following:
  - Decimal 0x01 and 0x3f respectively and the pX\_ts\_319 bit in the switch Px\_Control register is set.
  - Decimal 0x01 and 0x40 respectively and the pX\_ts\_320 bit in the switch Px\_Control register is set.
11. The PTP message begins in byte 42.
12. The packet message type is enabled in the pX\_ts\_msg\_type\_en field in Px\_Control.
13. The packet was received without error (not long/short/mac\_ctl/crc/code/align).
14. The ALE determined that the packet is to be sent only to the host (port 0).

#### **14.3.2.2.2 IEEE 1588v2 Transmit Packet Operation**

There are two CPSW\_3G transmit time sync interfaces for each ethernet port. The first is the TS\_TX\_DEC interface and the second is the TS\_TX\_MII interface. Both interfaces are generated in the switch and are input to the CPTS module. The pX\_ts\_tx\_en bit in the Px\_Control register must be set for transmit time sync operation to be enabled.

The TS\_TX\_DEC function decodes each packet to be transmitted and determines if the packet meets the time sync event packet criteria. If the packet is determined to be a time sync event packet, then the time sync event is signaled to the CPTS controller via the TS\_TX\_DEC interface (pX\_ts\_tx\_dec\_evnt, pX\_ts\_tx\_dec\_hdl[3:0], pX\_ts\_tx\_dec\_msg\_type, pX\_ts\_tx\_dec\_seq\_id). The event signal is a single clock pulse indicating that the packet matched the time sync event packet criteria and that the associated packet handle, message type, and sequence ID are valid.

The 16-bit sequence ID is found in the time sync event packet at the sequence ID offset into the message header (pX\_ts\_seq\_id\_offset). No indication is given for transmit packets that do not meet the time sync event criteria. The time sync event packet handle is also passed along with the packet to the TS\_TX\_MII with an indication that the packet is a time sync event packet. Unlike receive, only transmit event packets increment the handle value. The decode function is separated from the record function because some systems may encrypt the packet. The encryption is after the decode function on transmit (egress). A packet is determined to be a transmit event packet if the following is met:

##### **14.3.2.2.2.1 Annex F**

1. Transmit time sync is enabled (pX\_ts\_tx\_en is set in the switch Px\_Control register).
2. One of the following sequences is true:
  - The first packet ltype matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
  - The first packet ltype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set
  - The first packet ltype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
  - The first packet ltype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set
  - The first packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet ltype matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
  - The first packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet ltype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set

- Itype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set
- The first packet Itype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet Itype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet Itype matches ts\_ltype1 and pX\_ts\_ltype1\_en is set
  - The first packet Itype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet Itype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet Itype matches ts\_ltype2 and pX\_ts\_ltype2\_en is set
3. The packet message type is enabled in pX\_ts\_msg\_type\_en.
  4. The packet was received by the host (port 0).

#### 14.3.2.2.2 Annex D

1. Transmit time sync is enabled (pX\_ts\_tx\_en is set in the switch Px\_Control register).
2. One of the following sequences is true:
  - The first packet Itype matches 0x0800 and pX\_ts\_annex\_d\_en is set
  - The first packet Itype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet Itype matches 0x0800 and pX\_ts\_annex\_d\_en is set
  - The first packet Itype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet Itype matches 0x0800 and pX\_ts\_annex\_d\_en is set
  - The first packet Itype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet Itype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet Itype matches 0x0800 and pX\_ts\_annex\_d\_en is set
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IP\_VERSION).
 

**Note:** The byte numbering assumes that there are no vlans. The byte number is intended to show the relative order of the bytes. If VLAN(s) are present, then the byte numbers push down.
4. Byte 22 contains 0x00 if the pX\_ts\_ttl\_nonzero bit in the switch Px\_Control register is zero or byte 22 contains any value if pX\_ts\_ttl\_nonzero is set. Byte 22 is the time to live field.
5. Byte 23 contains 0x11 (UDP Fixed).
6. Byte 30 contains decimal 224 (0xe0)
7. Byte 31 contains 0x00
8. Byte 32 contains 0x01
9. Byte 33 contains one of the following:
  - Decimal 129 and the pX\_ts\_129 bit in the switch Px\_Control register is set
  - Decimal 130 and the pX\_ts\_130 bit in the switch Px\_Control register is set
  - Decimal 131 and the pX\_ts\_131 bit in the switch Px\_Control register is set
  - Decimal 132 and the pX\_ts\_132 bit in the switch Px\_Control register is set
10. Bytes 36 and 37 contain either of the following:
  - Decimal 1 (hex 0x01) and decimal 63 (hex 0x3f) respectively and and the pX\_ts\_319 bit in the switch Px\_Control register is set
  - Decimal 1 (hex 0x01) and decimal 64 (hex 0x40) respectively and and the pX\_ts\_320 bit in the switch Px\_Control register is set
11. The PTP message begins in byte 42 (this is offset 0).
12. The packet message type is enabled in pX\_ts\_msg\_type\_en.
13. The packet was received by the host (port 0).

The TS\_TX\_MII interface issues a single clock record signal (pX\_ts\_tx\_mii\_rec) at the beginning of each transmitted packet. If the packet is a time sync event packet then a single clock event signal (pX\_ts\_tx\_mii\_evnt) along with a handle (pX\_ts\_rx\_mii\_hdl[2:0]) will be issued before the next record signal for the next packet. The event signal will not be issued for packets that did not meet the time sync event criteria in the TS\_TX\_DEC function. If consecutive record indications occur without an interleaving event indication, then the packet associated with the first record was not a time sync event packet.

The record signal is a single clock pulse indicating that a transmit packet egress has been detected at the associated port MII interface. The handle value is incremented with each time sync event packet and rolls over to zero after 7. There are 8 possible handle values so there can be a maximum of eight time sync event packets “in flight” from the TS\_TX\_DEC to the TS\_TX\_MII block at any given time. The handle value increments only on time sync event packets. The TS\_TX\_MII logic is in the transmit wireside clock domain.

#### 14.3.2.3 Device Level Ring (DLR) Support

Device Level Ring (DLR) support is enabled by setting the dlr\_en bit in the CPSW\_Control register. When enabled, incoming received DLR packets are detected and sent to queue 3 (highest priority) of the egress port(s). If the host port is the egress port for a DLR packet then the packet is sent on the CPDMA Rx channel selected by the p0\_dlr\_cpdma\_ch field in the P0\_Control register. The supervisor node MAC address feature is supported with the dlr\_unicast bit in the unicast address table entry.

When set, the dlr\_unicast bit causes a packet with the matching destination address to be flooded to the vlan\_member\_list minus the receive port and minus the host port (the port\_number field in the unicast address table entry is a don't care). Matching dlr\_unicast packets are flooded regardless of whether the packet is a DLR packet or not. The en\_p0\_uni\_flood bit in the ALE\_Control register has no effect on DLR unicast packets. Packets are determined to be DLR packets, as shown:

1. DLR is enabled (dlr\_en is set in the switch CPSW\_Control register).
2. One of the following sequences is true:
  - The first packet ltype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches dlr\_ltype.
  - The first packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the second packet ltype matches dlr\_ltype.
  - The first packet ltype matches vlan\_ltype1 and pX\_vlan\_ltype1\_en is set and the second packet ltype matches vlan\_ltype2 and pX\_vlan\_ltype2\_en is set and the third packet ltype matches dlr\_ltype.

#### 14.3.2.4 CPDMA RX and TX Interfaces

The CPDMA submodule is a CPPI 3.0 compliant packet DMA transfer controller. The CPPI 3.0 interface is port 0.

After reset, initialization, and configuration the host may initiate transmit operations. Transmit operations are initiated by host writes to the appropriate transmit channel head descriptor pointer contained in the STATERAM block. The transmit DMA controller then fetches the first packet in the packet chain from memory in accordance with CPPI 3.0 protocol. The DMA controller writes the packet into the external transmit FIFO in 64-byte bursts (maximum).

Receive operations are initiated by host writes to the appropriate receive channel head descriptor pointer after host initialization and configuration. The receive DMA controller writes the receive packet data to external memory in accordance with CPPI 3.0 protocol. See the CPPI Buffer Descriptors section for detailed description of Buffer Descriptors

#### 14.3.2.4.1 CPPI Buffer Descriptors

The buffer descriptor is a central part of the 3PSW Ethernet Subsystem and is how the application software describes Ethernet packets to be sent and empty buffers to be filled with incoming packet data.

Host Software sends and receives network frames via the CPPI 3.0 compliant host interface. The host interface includes module registers and host memory data structures. The host memory data structures are buffer descriptors and data buffers. Buffer descriptors are data structures that contain information about a single data buffer. Buffer descriptors may be linked together to describe frames or queues of frames for transmission of data and free buffer queues available for received data.

Note: The 8k bytes of Ethernet Subsystem CPPI RAM begin at address 0x4a102000 and end at 0x4a103FFF from the 3PSW perspective. The buffer descriptors programmed to access the CPPI RAM memory should use the address range from 0x4a102000.

##### 14.3.2.4.1.1 TX Buffer Descriptors

A TX buffer descriptor is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

**Figure 14-7. Tx Buffer Descriptor Format**

|                         |       |               |     |                       |             |          |                |               |          |            |    |    |    |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

##### 14.3.2.4.1.1.1 CPPI Tx Data Word – 0

###### Next Descriptor Pointer

The next descriptor pointer points to the 32-bit word aligned memory address of the next buffer descriptor in the transmit queue. This pointer is used to create a linked list of buffer descriptors. If the value of this pointer is zero, then the current buffer is the last buffer in the queue. The software application must set this value prior to adding the descriptor to the active transmit list. This pointer is not altered by the EMAC. The value of pNext should never be altered once the descriptor is in an active transmit queue, unless its current value is NULL.

If the pNext pointer is initially NULL, and more packets need to be queued for transmit, the software application may alter this pointer to point to a newly appended descriptor. The EMAC will use the new pointer value and proceed to the next descriptor unless the pNext value has already been read. In this latter case, the transmitter will halt on the transmit channel in question, and the software application may restart it at that time. The software can detect this case by checking for an end of queue (EOQ) condition flag on the updated packet descriptor when it is returned by the EMAC.

##### 14.3.2.4.1.1.2 CPPI Tx Data Word – 1

###### Buffer Pointer

The byte aligned memory address of the buffer associated with the buffer descriptor. The host sets the **buffer\_pointer**. The software application must set this value prior to adding the descriptor to the active transmit list. This pointer is not altered by the EMAC.

#### 14.3.2.4.1.1.3 CPPI Tx Data Word – 2

##### **Buffer\_Offset**

Buffer Offset – Indicates how many unused bytes are at the start of the buffer. A value of 0x0000 indicates that no unused bytes are at the start of the buffer and that valid data begins on the first byte of the buffer. A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. The host sets the buffer\_offset value (which may be zero to the buffer length minus 1). Valid only on sop.

##### **Buffer\_Length**

Buffer Length – Indicates how many valid data bytes are in the buffer. Unused or protocol specific bytes at the beginning of the buffer are not counted in the Buffer Length field. The host sets the buffer\_length. The buffer\_length must be greater than zero.

#### 14.3.2.4.1.1.4 CPPI Tx Data Word – 3

##### **Start of Packet (SOP) Flag**

When set, this flag indicates that the descriptor points to a packet buffer that is the start of a new packet. In the case of a single fragment packet, both the SOP and end of packet (EOP) flags are set. Otherwise, the descriptor pointing to the last packet buffer for the packet sets the EOP flag. This bit is set by the software application and is not altered by the EMAC.

0 - Not start of packet buffer

1 - Start of packet buffer

##### **End of Packet (EOP) Flag**

When set, this flag indicates that the descriptor points to a packet buffer that is last for a given packet. In the case of a single fragment packet, both the start of packet (SOP) and EOP flags are set. Otherwise, the descriptor pointing to the last packet buffer for the packet sets the EOP flag. This bit is set by the software application and is not altered by the EMAC.

0 - Not end of packet buffer.

1 - End of packet buffer.

##### **Ownership**

When set this flag indicates that all the descriptors for the given packet (from SOP to EOP) are currently owned by the EMAC. This flag is set by the software application on the SOP packet descriptor before adding the descriptor to the transmit descriptor queue. For a single fragment packet, the SOP, EOP, and OWNER flags are all set. The OWNER flag is cleared by the EMAC once it is finished with all the descriptors for the given packet. Note that this flag is valid on SOP descriptors only.

0 - The packet is owned by the host

1 - The packet is owned by the port

##### **EOQ**

When set, this flag indicates that the descriptor in question was the last descriptor in the transmit queue for a given transmit channel, and that the transmitter has halted. This flag is initially cleared by the software application prior to adding the descriptor to the transmit queue. This bit is set by the EMAC when the EMAC identifies that a descriptor is the last for a given packet (the EOP flag is set), and there are no more descriptors in the transmit list (next descriptor pointer is NULL).

The software application can use this bit to detect when the EMAC transmitter for the corresponding channel has halted. This is useful when the application appends additional packet descriptors to a transmit queue list that is already owned by the EMAC. Note that this flag is valid on EOP descriptors only.

- 0 - The Tx queue has more packets to transfer.
- 1 - The Descriptor buffer is the last buffer in the last packet in the queue.

#### **teardown\_Complete**

This flag is used when a transmit queue is being torn down, or aborted, instead of allowing it to be transmitted. This would happen under device driver reset or shutdown conditions. The EMAC sets this bit in the SOP descriptor of each packet as it is aborted from transmission. Note that this flag is valid on SOP descriptors only. Also note that only the first packet in an unsent list has the TDOWNCMPLT flag set. Subsequent descriptors are not processed by the EMAC.

- 0 - The port has not completed the teardown process.
- 1 - The port has completed the commanded teardown process.

#### **pass\_crc**

This flag is set by the software application in the SOP packet descriptor before it adds the descriptor to the transmit queue. Setting this bit indicates to the EMAC that the 4 byte Ethernet CRC is already present in the packet data, and that the EMAC should not generate its own version of the CRC. When the CRC flag is cleared, the EMAC generates and appends the 4-byte CRC. The buffer length and packet length fields do not include the CRC bytes. When the CRC flag is set, the 4-byte CRC is supplied by the software application and is already appended to the end of the packet data. The buffer length and packet length fields include the CRC bytes, as they are part of the valid packet data. Note that this flag is valid on SOP descriptors only.

- 0 – The CRC is not included with the packet data and packet length.
- 1 – The CRC is included with the packet data and packet length.

#### **to\_port**

To Port – Port number to send the directed packet to. This field is set by the host. This field is valid on SOP. Directed packets go to the directed port, but an ALE lookup is performed to determine untagged egress in VLAN\_AWARE mode.

- 1 – Send the packet to port 1 if to\_port\_en is asserted.
- 2 – Send the packet to port 2 if to\_port\_en is asserted.

#### **To\_port\_enable**

To Port Enable – Indicates when set that the packet is a directed packet to be sent to the to\_port field port number. This field is set by the host. The packet is sent to one port only (index not mask). This bit is valid on SOP.

- 0 – not a directed packet
- 1 – directed packet

#### **Packet Length**

Specifies the number of bytes in the entire packet. Offset bytes are not included. The sum of the buffer\_length fields should equal the packet\_length. Valid only on SOP. The packet length must be greater than zero. The packet data will be truncated to the packet length if the packet length is shorter than the sum of the packet buffer descriptor buffer lengths. A host error occurs if the packet length is greater than the sum of the packet buffer descriptor buffer lengths

#### **14.3.2.4.1.2 RX Buffer Descriptors**

An RX buffer descriptor is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

**Figure 14-8. Rx Buffer Descriptor Format**

|                         |          |               |               |                           |                    |               |       |             |             |         |               |           |    |    |    |
|-------------------------|----------|---------------|---------------|---------------------------|--------------------|---------------|-------|-------------|-------------|---------|---------------|-----------|----|----|----|
| Word 0                  | 31       | 0             |               |                           |                    |               |       |             |             |         |               |           |    |    |    |
| Next Descriptor Pointer |          |               |               |                           |                    |               |       |             |             |         |               |           |    |    |    |
| Word 1                  | 31       | 0             |               |                           |                    |               |       |             |             |         |               |           |    |    |    |
| Buffer Pointer          |          |               |               |                           |                    |               |       |             |             |         |               |           |    |    |    |
| Word 2                  | 31       | 27 26         | 16 15         | 11 10                     | 0                  |               |       |             |             |         |               |           |    |    |    |
|                         | Reserved | Buffer Offset |               |                           | Reserved           | Buffer Length |       |             |             |         |               |           |    |    |    |
| Word 3                  | 31       | 30            | 29            | 28                        | 27                 | 26            | 25    | 24          | 23          | 22      | 21            | 20        | 19 | 18 | 16 |

| 15                      |          |               | 11            |                           | 10                 |               |       |             |             |         |               |           |    |    | 0  |
| Reserved                |          |               | packet_length |                           |                    |               |       |             |             |         |               |           |    |    |    |

**14.3.2.4.1.2.1 CPPI Rx Data Word – 0****next\_descriptor\_pointer**

The 32-bit word aligned memory address of the next buffer descriptor in the RX queue. This is the mechanism used to reference the next buffer descriptor from the current buffer descriptor. If the value of this pointer is zero then the current buffer is the last buffer in the queue. The host sets the **next\_descriptor\_pointer**.

**14.3.2.4.1.2.2 CPPI Rx Data Word – 1****buffer\_pointer**

The byte aligned memory address of the buffer associated with the buffer descriptor. The host sets the **buffer\_pointer**.

**14.3.2.4.1.2.3 CPPI Rx Data Word – 2****Buffer\_Offset**

Buffer Offset – Indicates how many unused bytes are at the start of the buffer. A value of 0x0000 indicates that there are no unused bytes at the start of the buffer and that valid data begins on the first byte of the buffer. A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. The port writes the **buffer\_offset** with the value from the **rx\_buffer\_offset** register value. The host initializes the **buffer\_offset** to zero for free buffers. The **buffer\_length** must be greater than the **rx\_buffer\_offset** value. The buffer offset is valid only on **sop**.

**Buffer\_Length**

Buffer Length – Indicates how many valid data bytes are in the buffer. Unused or protocol specific bytes at the beginning of the buffer are not counted in the Buffer Length field. The host initializes the **buffer\_length**, but the port may overwrite the host initiated value with the actual buffer length value on SOP and/or EOP buffer descriptors. SOP buffer length values will be overwritten if the packet size is less than the size of the buffer or if the offset is nonzero. EOP buffer length values will be overwritten if the entire buffer is not filled up with data. The **buffer\_length** must be greater than zero.

#### 14.3.2.4.1.2.4 CPPI Rx Data Word – 3

##### Start of Packet (SOP) Flag

When set, this flag indicates that the descriptor points to a packet buffer that is the start of a new packet. In the case of a single fragment packet, both the SOP and end of packet (EOP) flags are set. Otherwise, the descriptor pointing to the last packet buffer for the packet has the EOP flag set. This flag is initially cleared by the software application before adding the descriptor to the receive queue. This bit is set by the EMAC on SOP descriptors.

##### End of Packet (EOP) Flag

When set, this flag indicates that the descriptor points to a packet buffer that is last for a given packet. In the case of a single fragment packet, both the start of packet (SOP) and EOP flags are set. Otherwise, the descriptor pointing to the last packet buffer for the packet has the EOP flag set. This flag is initially cleared by the software application before adding the descriptor to the receive queue. This bit is set by the EMAC on EOP descriptors.

##### Ownership (OWNER) Flag

When set, this flag indicates that the descriptor is currently owned by the EMAC. This flag is set by the software application before adding the descriptor to the receive descriptor queue. This flag is cleared by the EMAC once it is finished with a given set of descriptors, associated with a received packet. The flag is updated by the EMAC on SOP descriptor only. So when the application identifies that the OWNER flag is cleared on an SOP descriptor, it may assume that all descriptors up to and including the first with the EOP flag set have been released by the EMAC. (Note that in the case of single buffer packets, the same descriptor will have both the SOP and EOP flags set.)

##### End of Queue (EOQ) Flag

When set, this flag indicates that the descriptor in question was the last descriptor in the receive queue for a given receive channel, and that the corresponding receiver channel has halted. This flag is initially cleared by the software application prior to adding the descriptor to the receive queue. This bit is set by the EMAC when the EMAC identifies that a descriptor is the last for a given packet received (also sets the EOP flag), and there are no more descriptors in the receive list (next descriptor pointer is NULL). The software application can use this bit to detect when the EMAC receiver for the corresponding channel has halted. This is useful when the application appends additional free buffer descriptors to an active receive queue. Note that this flag is valid on EOP descriptors only.

##### Teardown Complete (TDOWNCMPLT) Flag

This flag is used when a receive queue is being torn down, or aborted, instead of being filled with received data. This would happen under device driver reset or shutdown conditions. The EMAC sets this bit in the descriptor of the first free buffer when the tear down occurs. No additional queue processing is performed.

##### Pass CRC (PASSCRC) Flag

This flag is set by the EMAC in the SOP buffer descriptor if the received packet includes the 4-byte CRC. This flag should be cleared by the software application before submitting the descriptor to the receive queue.

##### Long (Jabber) Flag

This flag is set by the EMAC in the SOP buffer descriptor, if the received packet is a jabber frame and was not discarded because the RX\_CEF\_EN bit was set in the MacControl. Jabber frames are frames that exceed the RXMAXLEN in length, and have CRC, code, or alignment errors.

##### Short (Fragment) Flag

This flag is set by the EMAC in the SOP buffer descriptor, if the received packet is only a packet fragment and was not discarded because the RX\_CSF\_EN bit was set in the MacControl.

##### Control Flag

This flag is set by the EMAC in the SOP buffer descriptor, if the received packet is an EMAC control frame and was not discarded because the RX\_CMF\_EN bit was set in the MacControl.

##### Overrun Flag

This flag is set by the EMAC in the SOP buffer descriptor, if the received packet was aborted due to a receive overrun.

#### **Pkt\_error Flag**

Packet Contained Error on Ingress –

00 – no error

01 – CRC error on ingress

10 – Code error on ingress

11 – Align error on ingress

#### **rx\_vlan\_encap**

VLAN Encapsulated Packet – Indicates when set that the packet data contains a 32-bit VLAN header word that is included in the packet byte count. This field is set by the port to be the value of the CPSW control register rx\_vlan\_encap bit

#### **from\_port**

From Port – Indicates the port number that the packet was received on (ingress to the switch).

#### **Packet Length**

Specifies the number of bytes in the entire packet. The packet length is reduced to 12-bits. Offset bytes are not included. The sum of the buffer\_length fields should equal the packet\_length. Valid only on SOP.

### **14.3.2.4.2 Receive DMA Interface**

The Receive DMA is an eight channel CPPI 3.0 compliant interface. Each channel has a single queue for frame reception.

#### **14.3.2.4.2.1 Receive DMA Host Configuration**

To configure the Rx DMA for operation the host must perform the following:

- Initialize the receive addresses.
- Initialize the Rx\_HDP Registers to zero.
- Enable the desired receive interrupts in the IntMask register.
- Write the rx\_buffer\_offset register value.
- Setup the receive channel(s) buffer descriptors in host memory as required by CPPI 3.0.
- Enable the RX DMA controller by setting the rx\_en bit in the Rx\_Control register.

#### **14.3.2.4.2.2 Receive Channel Teardown**

The host commands a receive channel teardown by writing the channel number to the Rx\_Teardown register. When a teardown command is issued to an enabled receive channel the following will occur:

- Any current frame in reception will complete normally.
- The teardown\_complete bit will be set in the next buffer descriptor in the chain if there is one.
- The channel head descriptor pointer will be cleared to zero
- A receive interrupt for the channel will be issued to the host.
- The host should acknowledge a teardown interrupt with a 0xffffffffc acknowledge value.

Channel teardown may be commanded on any channel at any time. The host is informed of the teardown completion by the set teardown complete buffer descriptor bit. The port does not clear any channel enables due to a teardown command. A teardown command to an inactive channel issues an interrupt that software should acknowledge with a 0xffffffffc acknowledge value (note that there is no buffer descriptor in this case). Software may read the interrupt acknowledge location to determine if the interrupt was due to a commanded teardown. The read value will be 0xffffffffc if the interrupt was due to a teardown command.

#### **14.3.2.4.3 Transmit DMA Interface**

The Transmit DMA is an eight channel CPPI 3.0 compliant interface. Priority between the eight queues may be either fixed or round robin as selected by tx\_ptype in the DMAControl register. If the priority type is fixed, then channel 7 has the highest priority and channel 0 has the lowest priority. Round robin priority proceeds from channel 0 to channel 7. Packet Data transfers occur on the TX\_VBUSP interface in 64-byte maximum burst transfers

##### **14.3.2.4.3.1 Transmit DMA Host Configuration**

To configure the TX DMA for operation the host must do the following:

- Initialize the Tx\_HDP registers to a zero value.
- Enable the desired transmit interrupts in the IntMask register.
- Setup the transmit channel(s) buffer descriptors in host memory as defined in CPPI 3.0.
- Configure and enable the transmit operation as desired in the TxControl register.
- Write the appropriate Tx\_HDP registers with the appropriate values to start transmit operations.

##### **14.3.2.4.3.2 Transmit Channel Teardown**

The host commands a transmit channel teardown by writing the channel number to the Tx\_Teardown register. When a teardown command is issued to an enabled transmit channel the following will occur:

- Any frame currently in transmission will complete normally
- The teardown complete bit will be set in the next sop buffer descriptor (if there is one).
- The channel head descriptor pointer will be set to zero.
- An interrupt will be issued to inform the host of the channel teardown.
- The host should acknowledge a teardown interrupt with a 0xffffffffc acknowledge value

Channel teardown may be commanded on any channel at any time. The host is informed of the teardown completion by the set teardown complete buffer descriptor bit. The port does not clear any channel enables due to a teardown command. A teardown command to an inactive channel issues an interrupt that software should acknowledge with a 0xffffffffc acknowledge value (note that there is no buffer descriptor in this case). Software may read the interrupt acknowledge location to determine if the interrupt was due to a commanded teardown. The read value will be 0xffffffffc if the interrupt was due to a teardown command.

#### **14.3.2.4.4 Transmit Rate Limiting**

Transmit operations can be configured to rate limit the transmit data for each transmit priority. Rate limiting is enabled for a channel when the tx\_rlim[7:0] bit associated with that channel is set in the DMAControl register. Rate limited channels must be the highest priority channels. For example, if two rate limited channels are required then tx\_rlim[7:0] should be set to 11000000 with the msb corresponding to channel 7.

When any channels are configured to be rate-limiting, the priority type must be fixed for transmit. Round-robin priority type is not allowed when rate-limiting. Each of the eight transmit priorities has an associated register to control the rate at which the priority is allowed to send data (Tx\_Pri(7..0)\_Rate) when the channel is rate-limiting. Each priority has a send count (pri(7..0)\_send\_cnt[13:0]) and an idle count (pri(7..0)\_idle\_cnt[13:0]). The transfer rate includes the inter-packet gap (12 bytes) and the preamble (8 bytes). The rate in Mbits/second that each priority is allowed to send is controlled by the below equation.

$$\text{Priority Transfer rate in Mbit/s} = ((\text{priN}_\text{idle\_cnt}/(\text{priN}_\text{idle\_cnt} + \text{priN}_\text{send\_cnt})) * \text{frequency}) * 32$$

Where the frequency is the CLK frequency.

#### 14.3.2.4.5 Command IDLE

The cmd\_idle bit in the DMA\_Control register allows CPDMA operation to be suspended. When the idle state is commanded, the CPDMA will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For transmission, any complete or partial frame in the tx cell fifo will be transmitted. For receive, frames that are detected by the CPDMA after the suspend state is entered are ignored. No statistics will be kept for ignored frames. Commanded idle is similar in operation to emulation control and clock stop.

#### 14.3.2.5 VLAN Aware Mode

The CPSW\_3G is in VLAN aware mode when the CPSW Control register vlan\_aware bit is set. In VLAN aware mode ports 0 receive packets (out of the CPSW\_3G) may or may not be VLAN encapsulated depending on the CPSW Control register rx\_vlan\_encap bit. The header packet VLAN is generated as described in [Section 14.3.3, Ethernet Mac Sliver \(CPGMAC\\_SL\)](#). Port 0 receive packet data is never modified. VLAN is not removed regardless of the force untagged egress bit for Port 0. VLAN encapsulated receive packets have a 32-bit VLAN header encapsulation word added to the packet data. VLAN encapsulated packets are specified by a set rx\_vlan\_encap bit in the packet buffer descriptor.

Port 0 transmit packets are never VLAN encapsulated (encapsulation is not allowed).

In VLAN aware mode, transmitted packet data is changed depending on the packet type (pkt\_type), packet priority (pkt\_pri), and VLAN information as shown in the below tables:

**Figure 14-9. VLAN Header Encapsulation Word**

| 31               | 29 | 28          | 27 |             |   |   |   |          |   |   |   |   |   | 16 |  |
|------------------|----|-------------|----|-------------|---|---|---|----------|---|---|---|---|---|----|--|
| HDR_PKT_Priority |    | HDR_PKT_CFI |    | HDR_PKT_Vid |   |   |   |          |   |   |   |   |   |    |  |
| 15               |    |             | 10 | 9           | 8 | 7 | 6 | 5        | 4 | 3 | 2 | 1 | 0 |    |  |
| Reserved         |    |             |    | PKT_Type    |   |   |   | Reserved |   |   |   |   |   |    |  |

**Table 14-9. VLAN Header Encapsulation Word Field Descriptions**

| Field            | Description  |
|------------------|--|
| HDR_PKT_Priority | Header Packet VLAN priority (Highest priority: 7)  |
| HDR_PKT_CFI      | Header Packet VLAN CFI bit.  |
| HDR_PKT_Vid      | Header Packet VLAN ID  |
| PKT_Type         | Packet Type. Indicates whether the packet is VLAN-tagged, priority-tagged, or non-tagged.<br>00: VLAN-tagged packet<br>01: Reserved<br>10: Priority-tagged packet<br>11: Non-tagged packet |

#### 14.3.2.6 VLAN Unaware Mode

The CPSW\_3G is in VLAN unaware mode when the CPSW Control register vlan\_aware bit is cleared. Port 0 receive packets (out of the CPSW\_3G) may or may not be VLAN encapsulated depending on the CPSW Control register rx\_vlan\_encap bit. Port 0 transmit packets are never VLAN encapsulated.

#### 14.3.2.7 Address Lookup Engine (ALE)

The address lookup engine (ALE) processes all received packets to determine which port(s) if any that the packet should be forwarded to. The ALE uses the incoming packet received port number, destination address, source address, length/type, and VLAN information to determine how the packet should be forwarded. The ALE outputs the port mask to the switch fabric that indicates the port(s) the packet should be forwarded to. The ALE is enabled when the ale\_enable bit in the ALE\_Control register is set. All packets are dropped when the ale\_enable bit is cleared to zero.

In normal operation, the CPGMAC\_SL modules are configured to issue an abort, instead of an end of packet, at the end of a packet that contains an error (runt, frag, oversize, jabber, crc, alignment, code etc.) or at the end of a mac control packet. However, when the CPGMAC\_SL configuration bit(s) cef, csf, or cmf are set, error frames, short frames or mac control frames have a normal end of packet instead of an abort at the end of the packet. When the ALE receives a packet that contains errors (due to a set header error bit), or a mac control frame and does not receive an abort, the packet will be forwarded only to the host port (port 0). No ALE learning occurs on packets with errors or mac control frames. Learning is based on source address and lookup is based on destination address.

The ALE may be configured to operate in bypass mode by setting the ale\_bypass bit in the ALE\_Control register. When in bypass mode, all CPGMAC\_SL received packets are forwarded only to the host port (port 0). Packets from the two ports can be on separate Rx DMA channels by configuring the CPDMA\_Rx\_Ch\_Map register. In bypass mode, the ALE processes host port transmit packets the same as in normal mode. In general, packets would be directed by the host in bypass mode.

The ALE may be configured to operate in OUI deny mode by setting the enable\_oui\_deny bit in the ALE\_Control register. When in OUI deny mode, a packet with a non-matching OUI source address will be dropped unless the destination address matches a multicast table entry with the super bit set. Broadcast packets will be dropped unless the broadcast address is entered into the table with the super bit set. Unicast packets will be dropped unless the unicast address is in the table with block and secure both set (supervisory unicast packet).

Multicast supervisory packets are designated by the super bit in the table entry. Unicast supervisory packets are indicated when block and secure are both set. Supervisory packets are not dropped due to rate limiting, OUI, or VLAN processing.

#### **14.3.2.7.1 Address Table Entry**

The ALE table contains 1024 entries. Each table entry represents a free entry, an address, a VLAN, an address/VLAN pair, or an OUI address. Software should ensure that there are not double address entries in the table. The double entry used would be indeterminate. Reserved table bits must be written with zeroes.

Source Address learning occurs for packets with a unicast, multicast or broadcast destination address and a unicast or multicast (including broadcast) source address. Multicast source addresses have the group bit (bit 40) cleared before ALE processing begins, changing the multicast source address to a unicast source address. A multicast address of all ones is the broadcast address which may be added to the table. A learned unicast source address is added to the table with the following control bits:

**Table 14-10. Learned Address Control Bits**

|              |    |
|--------------|----|
| unicast_type | 11 |
| Block        | 0  |
| Secure       | 0  |

If a received packet has a source address that is equal to the destination address then the following occurs:

- The address is learned if the address is not found in the table.
- The address is updated if the address is found.
- The packet is dropped.

#### **14.3.2.7.1.1 Free Table Entry**

**Table 14-11. Free (Unused) Address Table Entry Bit Values**

| 71:62    | 61:60           | 59:0     |
|----------|-----------------|----------|
| Reserved | Entry Type (00) | Reserved |

#### 14.3.2.7.1.2 Multicast Address Table Entry

**Table 14-12. Multicast Address Table Entry Bit Values**

| 71:70    | 68:66     | 65    | 64       | 63:62           | 61:60           | 59:48    | 47:0              |
|----------|-----------|-------|----------|-----------------|-----------------|----------|-------------------|
| Reserved | Port Mask | Super | Reserved | Mcast Fwd State | Entry Type (01) | Reserved | Multicast Address |

##### Table Entry Type

00: Free Entry

01: Address Entry : unicast or multicast determined by dest **address bit 40** .

10: VLAN entry

11: VLAN Address Entry : unicast or multicast determined by **address bit 40**.

##### Supervisory Packet (SUPER)

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

##### Port Mask(2:0) (PORT\_MASK)

This three bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

##### Multicast Forward State (MCAST\_FWD\_STATE)

Multicast Forward State – Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit port\_mask has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00: Forwarding

01: Blocking/Forwarding/Learning

10: Forwarding/Learning

11: Forwarding

The forward state test returns a true value if both the Rx and Tx ports are in the required state.

##### Table Entry Type (ENTRY\_TYPE)

Address entry type. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

##### Packet Address (MULTICAST\_ADDRESS)

This is the 48-bit packet MAC address. For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup. Otherwise, all 48-bits are used in the lookup.

#### 14.3.2.7.1.3 VLAN/Multicast Address Table Entry

**Table 14-13. VLAN/Multicast Address Table Entry Bit Values**

| 71:69    | 68:66     | 65    | 64       | 63:62           | 61:60           | 59:48   | 47:0              |
|----------|-----------|-------|----------|-----------------|-----------------|---------|-------------------|
| Reserved | Port Mask | Super | Reserved | Mcast Fwd State | Entry Type (11) | vlan_id | Multicast Address |

### **Supervisory Packet (SUPER)**

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

### **Port Mask(2:0) (PORT\_MASK)**

This three bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

### **Multicast Forward State (MCAST\_FWD\_STATE)**

Multicast Forward State – Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit port\_mask has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00 – Forwarding

01 – Blocking/Forwarding/Learning

10 – Forwarding/Learning

11 – Forwarding

The forward state test returns a true value if both the Rx and Tx ports are in the required state.

### **Table Entry Type (ENTRY\_TYPE)**

Address entry type. Unicast or multicast determined by address bit 40.

11: VLAN address entry. Unicast or multicast determined by address bit 40.

### **VLAN ID (VLAN\_ID)**

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

### **Packet Address (MULTICAST\_ADDRESS)**

This is the 48-bit packet MAC address. For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup. Otherwise, all 48-bits are used in the lookup.

#### **14.3.2.7.1.4 Unicast Address Table Entry**

**Table 14-14. Unicast Address Table Entry Bit Values**

| <b>71:70</b> | <b>69</b>   | <b>68</b> | <b>67:66</b> | <b>65</b> | <b>64</b> | <b>63:62</b>              | <b>61:60</b>    | <b>59:48</b> | <b>47:0</b>     |
|--------------|-------------|-----------|--------------|-----------|-----------|---------------------------|-----------------|--------------|-----------------|
| Reserved     | DLR Unicast | Reserved  | Port Number  | Block     | Secure    | Unicast Type (00) or (X1) | Entry Type (01) | Reserved     | Unicast Address |

### **DLR Unicast**

DLR Unicast – When set, this bit indicates that the address is a Device Level Ring (DLR) unicast address. Received packets with a matching destination address will be flooded to the vlan\_member\_list (minus the receive port and the host port). The port\_number field is a don't care when this bit is set. Matching packets received on port 1 egress on port 2. Matching packets received on port 2 egress on port 1. Matching packets received on port 0 egress on ports 1 and 2.

### **Port Number (PORT\_NUMBER)**

Port Number – This field indicates the port number (not port mask) that the packet with a unicast destination address may be forwarded to. Packets with unicast destination addresses are forwarded only to a single port (but not the receiving port).

### **Block (BLOCK)**

Block – The block bit indicates that a packet with a matching source or destination address should be dropped (block the address).

0 – Address is not blocked.

1 – Drop a packet with a matching source or destination address (secure must be zero)

If block and secure are both set, then they no longer mean block and secure. When both are set, the block and secure bits indicate that the packet is a unicast supervisory (super) packet and they determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state.

### **Secure (SECURE)**

Secure – This bit indicates that a packet with a matching source address should be dropped if the received port number is not equal to the table entry port\_number.

0 – Received port number is a don't care.

1 – Drop the packet if the received port is not the secure port for the source address and do not update the address (block must be zero)

### **Unicast Type (UNICAST\_TYPE)**

Unicast Type – This field indicates the type of unicast address the table entry contains.

00 – Unicast address that is not ageable.

01 – Ageable unicast address that has not been touched.

10 – OUI address - lower 24-bits are don't cares (not ageable).

11 – Ageable unicast address that has been touched.

### **Table Entry Type (ENTRY\_TYPE)**

Address entry. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

### **Packet Address (UNICAST\_ADDRESS)**

This is the 48-bit packet MAC address. All 48-bits are used in the lookup.

#### **14.3.2.7.1.5 OUI Unicast Address Table Entry**

**Table 14-15. OUI Unicast Address Table Entry Bit Values**

| 71:64    | 63:62             | 61:60           | 59:48    | 47:24       | 23:0     |
|----------|-------------------|-----------------|----------|-------------|----------|
| Reserved | Unicast Type (10) | Entry Type (01) | Reserved | Unicast OUI | Reserved |

### **Unicast Type (UNICAST\_TYPE)**

Unicast Type – This field indicates the type of unicast address the table entry contains.

00 – Unicast address that is not ageable.

01 – Ageable unicast address that has not been touched.

10 – OUI address - lower 24-bits are don't cares (not ageable).

11 – Ageable unicast address that has been touched.

### **Table Entry Type (ENTRY\_TYPE)**

Address entry. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

#### **Packet Address (UNICAST\_OUI)**

For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup.

#### **14.3.2.7.1.6 VLAN/Unicast Address Table Entry**

**Table 14-16. Unicast Address Table Entry Bit Values**

| 71:68    | 67:66       | 65    | 64     | 63:62                     | 61:60           | 59:48   | 47:0            |
|----------|-------------|-------|--------|---------------------------|-----------------|---------|-----------------|
| Reserved | Port Number | Block | Secure | Unicast Type (00) or (X1) | Entry Type (11) | vlan_id | Unicast Address |

#### **Port Number (PORT\_NUMBER)**

Port Number – This field indicates the port number (not port mask) that the packet with a unicast destination address may be forwarded to. Packets with unicast destination addresses are forwarded only to a single port (but not the receiving port).]

#### **Block (BLOCK)**

Block – The block bit indicates that a packet with a matching source or destination address should be dropped (block the address).

0 – Address is not blocked.

1 – Drop a packet with a matching source or destination address (secure must be zero)

If block and secure are both set, then they no longer mean block and secure. When both are set, the block and secure bits indicate that the packet is a unicast supervisory (super) packet and they determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state.

#### **Secure (SECURE)**

Secure – This bit indicates that a packet with a matching source address should be dropped if the received port number is not equal to the table entry port\_number.

0 – Received port number is a don't care.

1 – Drop the packet if the received port is not the secure port for the source address and do not update the address (block must be zero)

#### **Unicast Type (UNICAST\_TYPE)**

Unicast Type – This field indicates the type of unicast address the table entry contains.

00 – Unicast address that is not ageable.

01 – Ageable unicast address that has not been touched.

10 – OUI address - lower 24-bits are don't cares (not ageable).

11 – Ageable unicast address that has been touched.

#### **Table Entry Type (ENTRY\_TYPE)**

Address entry. Unicast or multicast determined by address bit 40.

11 – VLAN address entry. Unicast or multicast determined by address bit 40.

#### **VLAN ID (VLAN\_ID)**

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

### Packet Address (UNICAST\_ADDRESS)

This is the 48-bit packet MAC address. All 48-bits are used in the lookup.

#### 14.3.2.7.1.7 VLAN Table Entry

**Table 14-17. VLAN Table Entry**

| 71:62    | 61:60           | 59:48   | 47:27    | 26:24                 | 23:19    | 18:16                | 15:11    | 10:8                   | 7:3      | 2:0              |
|----------|-----------------|---------|----------|-----------------------|----------|----------------------|----------|------------------------|----------|------------------|
| Reserved | Entry Type (10) | vlan_id | Reserved | Force Untagged Egress | Reserved | Reg Mcast Flood Mask | Reserved | Unreg Mcast Flood Mask | Reserved | Vlan Member List |

### Table Entry Type (ENTRY\_TYPE)

10: VLAN entry

### VLAN ID (VLAN\_ID)

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

### Force Untagged Packet Egress (FORCE\_UNTAGGED\_EGRESS)

This field causes the packet VLAN tag to be removed on egress (except on port 0).

### Registered Multicast Flood Mask (REG\_MCAST\_FLOOD\_MASK)

Mask used for multicast when the multicast address is found

### Unregistered Multicast Flood Mask (UNREG\_MCAST\_FLOOD\_MASK)

Mask used for multicast when the multicast address is not found

### VLAN Member List (VLAN\_MEMBER\_LIST)

This three bit field indicates which port(s) are members of the associated VLAN.

#### 14.3.2.7.2 Packet Forwarding Processes

There are four processes that an incoming received packet may go through to determine packet forwarding. The processes are Ingress Filtering, VLAN\_Aware Lookup, VLAN\_Unaware Lookup, and Egress.

Packet processing begins in the Ingress Filtering process. Each port has an associated packet forwarding state that can be one of four values (Disabled, Blocked, Learning, or Forwarding). The default state for all ports is disabled. The host sets the packet forwarding state for each port. The receive packet processes are described in the following sections.

In the packet ingress process (receive packet process), there is a forward state test for unicast destination addresses and a forward state test for multicast addresses. The multicast forward state test indicates the port states required for the receiving port in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state for the packet to be forwarded for transmission. The mcast\_fwd\_state indicates the required port state for the receiving port as indicated in [Table 14-13](#).

The unicast forward state test indicates the port state required for the receiving port in order to forward the unicast packet. The transmit port must be in the Forwarding state in order to forward the packet. The block and secure bits determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state. The transmit port must be in the Forwarding state regardless. The forward state test used in the ingress process is determined by the destination address packet type (multicast/unicast).

In general, packets received with errors are dropped by the address lookup engine without learning, updating, or touching the address. The error condition and the abort are indicated by the CPGMAC\_SL to the ALE. Packets with errors may be passed to the host (not aborted) by a CPGMAC\_SL port if the port has a set rx\_cmf\_en, rx\_cef\_en, or rx\_csf\_en bit(s).

Error packets that are passed to the host by the CPGMAC\_SL are considered to be bypass packets by the ALE and are sent only to the host. Error packets do not learn, update, or touch addresses regardless of whether they are aborted or sent to the host. Packets with errors received by the host are forwarded as normal.

The following control bits are in the CPGMAC\_SL1/2\_MacControl register.

**rx\_cef\_en:** This CPGMAC\_SL control bit enables frames that are fragments, long, jabber, CRC, code, and alignment errors to be forwarded.

**rx\_csf\_en:** This CPGMAC\_SL bit enables short frames to be forwarded.

**rx\_cmf\_en:** This CPGMAC\_SL control bit enables mac control frames to be forwarded.

#### 14.3.2.7.2.1 Ingress Filtering Process

```

If (Rx port_state is Disabled)
then discard the packet

if (directed packet)
then use directed port number and go to Egress process

if ((ale_bypass or error packet) and (host port is not the receive port))
then use host portmask and go to Egress process

if (((block) and (unicast source address found)) or ((block) and (unicast destination address found)))
then discard the packet

if ((enable_rate_limit) and (rate limit exceeded) and (not rate_limit_tx))
then if (((mcast/bcast destination address found) and (not super)) or (mcast/bcast destination address not found))
      then discard the packet

if ((not forward state test valid) and (destination address found))
then discard the packet to any port not meeting the requirements
  • Unicast destination addresses use the unicast forward state test and multicast destination addresses use the multicast forward state test.

if ((destination address not found) and ((not transmit port forwarding) or (not receive port forwarding)))
then discard the packet to any ports not meeting the above requirements

if (source address found) and (secure) and (receive port number != port_number)
then discard the packet

if ((not super) and (drop_untagged) and ((non-tagged packet) or ((priority tagged) and not(en_vid0_mode)))
then discard the packet

If (VLAN_Unaware)
  force_untagged_egress = "000000"
  reg_mcast_flood_mask = "111111"
  unreg_mcast_flood_mask = "111111"

| If portmask is zero then discard packet   |
| Send packet to portmask ports.  |

#### **14.3.2.7.3 Learning/Updating/Touching Processes**

The learning, updating, and touching processes are applied to each receive packet that is not aborted. The processes are concurrent with the packet forwarding process. In addition to the following, a packet must be received without error in order to learn/update/touch an address.

##### **14.3.2.7.3.1 Learning Process**

|  |
|--|
| If (not(Learning or Forwarding) or (enable_auth_mode) or (packet error) or (no_learn))<br>then do not learn address        |
| if ((Non-tagged packet) and (drop_untagged))<br>then do not learn address  |
| if ((vlan_aware) and (VLAN not found) and (unknown_vlan_member_list = "000"))<br>then do not learn address                 |
| if ((vid_ingress_check) and (Rx port is not VLAN member) and (VLAN found))<br>then do not learn address                    |
| if ((source address not found) and (vlan_aware) and not(learn_no_vid))<br>then learn address with VLAN                     |
| if ((source address not found) and ((not vlan_aware) or (vlan_aware and learn_no_vid)))<br>then learn address without VLAN |

##### **14.3.2.7.3.2 Updating Process**

|  |
|--|
| if (dlr_unicast)<br>then do not update address   |
| If (not(Learning or Forwarding) or (enable_auth_mode) or (packet error) or (no_sa_update))<br>then do not update address |
| if ((Non-tagged packet) and (drop_untagged))<br>then do not update address   |
| if ((vlan_aware) and (VLAN not found) and (unknown_vlan_member_list = "000"))<br>then do not update address              |

```

if ((vid_ingress_check) and (Rx port is not VLAN member) and (VLAN found))
then do not update address

if ((source address found) and (receive port number != port_number) and (secure or block))
then do not update address

if ((source address found) and (receive port number != port_number))
then update address

```

#### 14.3.2.7.3.3 Touching Process

```

if ((source address found) and (ageable) and (not touched))
then set touched

```

#### 14.3.2.8 Packet Priority Handling

Packets are received on three ports, two of which are CPGMAC\_SL Ethernet ports and the third port is the CPPI host port. Received packets have a received packet priority (0 to 7 with 7 being the highest priority). The received packet priority is determined as shown:

1. If the first packet LTYPE = 0x8100 then the received packet priority is the packet priority (VLAN tagged and priority tagged packets).
2. If the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x45 then the received packet priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping register (IPV4 packet).
3. The received packet priority is the source (ingress) port priority (untagged non-IPV4 packet).

The received packet priority is mapped through the receive ports associated "packet priority to header packet priority mapping register" to obtain the header packet priority (the CPDMA Rx and Tx nomenclature is reversed from the CPGMAC\_SL nomenclature for legacy reasons). The header packet priority is mapped through the "header priority to switch priority mapping register" to obtain the hardware switch priority (0 to 3 with 3 being the highest priority). The header packet priority is then used as the actual transmit packet priority if the VLAN information is to be sent on egress.

#### 14.3.2.9 FIFO Memory Control

Each of the three CPSW\_3G ports has an identical associated FIFO. Each FIFO contains a single logical receive (ingress) queue and four logical transmit queues (priority 0 through 3). Each FIFO memory contains 20,480 bytes (20k) total organized as 2560 by 64-bit words contained in a single memory instance. The FIFO memory is used for the associated port transmit and receive queues. The tx\_max\_blk field in the FIFO's associated Max\_Blk register determines the maximum number of 1k FIFO memory blocks to be allocated to the four logical transmit queues (transmit total).

The rx\_max\_blk field in the FIFO's associated Max\_Blk register determines the maximum number of 1k memory blocks to be allocated to the logical receive queue. The tx\_max\_blk value plus the rx\_max\_blk value must sum to 20 (the total number of blocks in the FIFO). If the sum were less than 20 then some memory blocks would be unused. The default is 17 (decimal) transmit blocks and three receive blocks. The FIFO's follow the naming convention of the Ethernet ports. Host Port is Port0 and External Ports are Port1,2

#### 14.3.2.10 FIFO Transmit Queue Control

There are four transmit queues in each transmit FIFO. Software has some flexibility in determining how packets are loaded into the queues and on how packet priorities are selected for transmission (how packets are removed and transmitted from queues). All ports on the switch have identical FIFO's. For the purposes of the below the transmit FIFO is switch egress even though the port 0 transmit FIFO is connected to the CPDMA receive (also switch egress). The CPDMA nomenclature is reversed from the CPGMAC\_SL nomenclature due to legacy reasons.

#### **14.3.2.10.1 Normal Priority Mode**

When operating in normal mode, lower priority frames are dropped before higher priority frames. The intention is to give preference to higher priority frames. Priority 3 is the highest priority and is allowed to fill the FIFO. Priority 2 will drop packets if the packet is going to take space in the last 2k available. Priority 1 will drop packets if the packet is going to take space in the last 4k available. Priority 0 will drop packets if the packet is going to take space in the last 6k available. If fewer than 4 priorities are to be implemented then the priorities should be mapped such that the highest priorities are used.

For example, if two priorities are going to be used then all packets should be mapped to priorities 3 and 2 and priorities 1 and 0 should be unused. Priority escalation may be used in normal priority mode if desired. Normal priority mode is configured as described below:

- Select normal priority mode by setting tx\_in\_sel[1:0] = 00 for all ports (default value in P0/1/2\_Tx\_In\_Ctl)
- Configure priority mapping to use only the highest priorities if less than 4 priorities are used. Refer to the Packet Priority Handling section of this chapter.

#### **14.3.2.10.2 Dual Mac Mode**

When operating in dual mac mode the intention is to transfer packets between ports 0 and 1 and ports 0 and 2, but not between ports 1 and 2. Each CPGMAC\_SL appears as a single MAC with no bridging between MAC's. Each CPGMAC\_SL has at least one unique (not the same) mac address.

Dual mac mode is configured as described below:

- Set the ale\_vlan\_aware bit in the ALE\_Control register. This bit configures the ALE to process in vlan aware mode. The CPSW\_3G vlan aware bit (vlan\_aware in CPSW\_Control) determines how packets VLAN's are processed on CPGMAC\_SL egress and does not affect how the ALE processes packets or the packet destination. The CPSW\_3G vlan aware bit may be set or not as required (must be set if VLAN's are to exit the switch).
- **Configure the Port 1 to Port 0 VLAN**

Add a VLAN Table Entry with ports 0 and 1 as members (clear the flood masks).

Add a VLAN/Unicast Address Table Entry with the Port1/0 VLAN and a port number of 0. Packets received on port 1 with this unicast address will be sent only to port 0 (egress). If multiple mac addresses are desired for this port then multiple entries of this type may be configured.

- **Configure the Port 2 to Port 0 VLAN**

Add a VLAN Table Entry with ports 0 and 2 as members (clear the flood masks).

Add a VLAN/Unicast Address Table Entry with the Port2/0 VLAN and a port number of 0. Packets received on port 2 with this unicast address will be sent only to port 0 (egress). If multiple mac addresses are desired for this port then multiple entries of this type may be configured.

- Packets from the host (port 0) to ports 1 and 2 should be directed. If directed packets are not desired then VLAN with addresses can be added for both destination ports.
- Select the dual mac mode on the port 0 FIFO by setting tx\_in\_sel[1:0] = 01 in P0\_Tx\_In\_Ctl. The intention of this mode is to allow packets from both ethernet ports to be written into the FIFO without one port starving the other port.
- The priority levels may be configured such that packets received on port 1 egress on one CPDMA RX channel while packets received on port 2 egress on a different CPDMA RX channel.

#### **14.3.2.10.3 Rate Limit Mode**

Rate-limit mode is intended to allow some CPDMA transmit (switch ingress) channels and some CPGMAC\_SL FIFO priorities (switch egress) to be rate-limited. Non rate-limited traffic (bulk traffic) is allowed on non rate-limited channels and FIFO priorities. The bulk traffic does not impact the rate-limited traffic. Rate-limited traffic must be configured to be sent to rate-limited queues (via packet priority handling).

The allocated rates for rate-limited traffic must not be oversubscribed. For example, if port 1 is sending 15% rate limited traffic to port 2 priority 3, and port 0 is also sending 10% rate-limited traffic to port 2 priority 3, then the port 2 priority 3 egress rate must be configured to be 25% plus a percent or two for margin. The switch must be configured to allow some percentage of non rate-limited traffic. Non-rate-limited traffic must be configured to be sent to non rate-limited queues. No packets from the host should be dropped, but non rate-limited traffic received on an ethernet port can be dropped. Rate-limited mode is configured as shown:

- Set tx\_in\_sel[1:0] = 10 in P1/2\_Tx\_In\_Ctl to enable ports 1 and 2 transmit FIFO inputs to be configured for rate-limiting queues. Enabling a queue to be rate-limiting with this field affects only the packet being loaded into the FIFO, it does not configure the transmit for queue shaping.
  - Configure the number of rate-limited queues for port 1 and 2 transmit FIFO's by setting the tx\_rate\_en[3:0] field in P1/2\_Tx\_In\_Ctl. Rate limited queues must be the highest number. For example, if there are two rate limited queues then 1100 would be written to this field for priorities 3 and 2. This field enables the FIFO to allow rate-limited traffic into rate-limited queues while discriminating against non rate-limited queues.
  - Set p1\_priN\_shape\_en and p2\_priN\_shape\_en in the CPSW\_3G\_PTYPE register. These bits determine which queues actually shape the output data stream. In general, the same priorities that are set in tx\_rate\_en are set in these bits as well, but the FIFO input and output enable bits are separate to allow rate-limiting from the host to non shaped channels if desired.
- When queue shaping is not enabled for a queue then packets are selected for egress based on priority. When queue shaping is enabled then packets are selected for egress based on queue percentages. If shaping is required on a single queue then it must be priority 3 (priorities 2, 1 and 0 are strict priority). If shaping is required on two queues then it must be on priorities 2 and 3 (priorities 1 and 0 are strict priority). If shaping is required on three queues then it must be priorities 3, 2, and 1 (priority 0 would then get the leftovers). Priority shaping follows the requirements in the IEEE P802.1Qav/D6.0 specification. Priority shaping is not compatible with priority escalation (escalation must be disabled).
- P0\_Tx\_In\_Ctl[1:0] should remain at the default 00 value. Port 0 egress (CPDMA RX) should not be rate-limited.
  - The CPDMA is configured for rate-limited transmit (switch ingress) channels by setting the highest bits of the tx\_rlim[7:0] field in the CPDMA DMA\_Control register. If there are two rate limited channels then tx\_rlim[7:0] = 11000000 (the rate limited channels must be the highest priorities). Also, tx\_ptype in the DMA\_Control register must be set (fixed priority mode). Rate limited channels must go to rate-limited FIFO queues, and the FIFO queue rate must not be oversubscribed.

#### 14.3.2.11 Packet Padding

VLAN tagged ingress packets of 64 to 67-bytes will be padded to 64-bytes on egress (all ports) if the VLAN is removed on egress.

#### 14.3.2.12 Flow Control

There are two types of switch flow control – CPPI port flow control and Ethernet port flow control. The CPPI and Ethernet port naming conventions for data flow into and out of the switch are reversed. For the CPPI port (port 0), transmit operations move packets from external memory into the switch and then out to either or both Ethernet transmit ports (ports 1 and 2). CPPI receive operations move packets that were received on either or both Ethernet receive ports to external memory.

##### 14.3.2.12.1 CPPI Port Flow Control

The CPPI port has flow control available for transmit (switch ingress). CPPI receive operations (switch egress) do not require flow control. CPPI Transmit flow control is initiated when enabled and triggered. CPPI transmit flow control is enabled by setting the p0\_flow\_en bit in the **CPSW\_Flow\_Control** register. CPPI transmit flow control is enabled by default on reset because host packets should not be dropped in any mode of operation.

#### **14.3.2.12.2 Ethernet Port Flow Control**

The Ethernet ports have flow control available for transmit and receive. Transmit flow control stops the Ethernet port from transmitting packets to the wire (switch egress) in response to a received pause frame. Transmit flow control does not depend on FIFO usage.

The ethernet ports have flow control available for receive operations (packet ingress). Ethernet port receive flow control is initiated when enabled and triggered. Packets received on an ethernet port can be sent to the other ethernet port or the CPPI port (or both). Each destination port can trigger the receive ethernet port flow control. An ethernet destination port triggers another ethernet receive flow control when the destination port is full.

When a packet is received on an ethernet port interface with enabled flow control the below occurs:

- The packet will be sent to all ports that currently have room to take the entire packet.
- The packet will be retried until successful to all ports that indicate they don't have room for the packet.

The flow control trigger to the CPGMAC\_SL will be asserted until the packet has been sent, and there is room in the logical receive FIFO for packet runout from another flow control trigger (**rx\_pkt\_cnt** = 0). Ethernet port receive flow control is disabled by default on reset. Ethernet port receive flow control requires that the **rx\_flow\_en** bit in the associated CPGMAC\_SL be set to one.

When receive flow control is enabled on a port, the port's associated FIFO block allocation must be adjusted. The port RX allocation must increase from the default three blocks to accommodate the flow control runout. A corresponding decrease in the TX block allocation is required. If a sending port ignores a pause frame then packets may overrun on receive (and be dropped) but will not be dropped on transmit. If flow control is disabled for gmii ports, then any packets that are dropped are dropped on transmit and not on receive.

##### **14.3.2.12.2.1 Receive Flow Control**

When enabled and triggered, receive flow control is initiated to limit the CPGMAC\_SL from further frame reception. Half-duplex mode receive flow control is collision based while full duplex mode issues 802.3X pause frames. In either case, receive flow control prevents frame reception by issuing the flow control appropriate for the current mode of operation. Receive flow control is enabled by the **rx\_flow\_en** bit in the **MacControl** register. Receive flow control is triggered (when enabled) when the **RX\_FLOW\_TRIGGER** input is asserted. The CPGMAC\_SL is configured for collision or IEEE 802.3X flow control via the **fullduplex** bit in the **MacControl** register.

###### **14.3.2.12.2.1.1 Collision Based Receive Buffer Flow Control**

Collision-based receive buffer flow control provides a means of preventing frame reception when the port is operating in half-duplex mode (**fullduplex** is cleared in **MacControl**). When receive flow control is enabled and triggered, the port will generate collisions for received frames. The jam sequence transmitted will be the twelve byte sequence C3.C3.C3.C3.C3.C3.C3.C3.C3.C3.C3.C3 (hex). The jam sequence will begin no later than approximately as the source address starts to be received. Note that these forced collisions will not be limited to a maximum of 16 consecutive collisions, and are independent of the normal back-off algorithm. Receive flow control does not depend on the value of the incoming frame destination address. A collision will be generated for any incoming packet, regardless of the destination address.

###### **14.3.2.12.2.1.2 IEEE 802.3X Based Receive Flow Control**

IEEE 802.3x based receive flow control provides a means of preventing frame reception when the port is operating in full-duplex mode (**fullduplex** is set in **MacControl**). When receive flow control is enabled and triggered, the port will transmit a pause frame to request that the sending station stop transmitting for the period indicated within the transmitted pause frame.

The CPGMAC\_SL will transmit a pause frame to the reserved multicast address at the first available opportunity (immediately if currently idle, or following the completion of the frame currently being transmitted). The pause frame will contain the maximum possible value for the pause time (0xFFFF). The MAC will count the receive pause frame time (decrements 0xFF00 down to zero) and retransmit an outgoing pause frame if the count reaches zero. When the flow control request is removed, the MAC will transmit a pause frame with a zero pause time to cancel the pause request.

Note that transmitted pause frames are only a request to the other end station to stop transmitting. Frames that are received during the pause interval will be received normally (provided the Rx FIFO is not full).

Pause frames will be transmitted if enabled and triggered regardless of whether or not the port is observing the pause time period from an incoming pause frame.

The CPGMAC\_SL will transmit pause frames as described below:

- The 48-bit reserved multicast destination address 01.80.C2.00.00.01.
- The 48-bit source address — SL\_SA(47:0).
- The 16-bit length/type field containing the value 88.08
- The 16-bit pause opcode equal to 00.01
- The 16-bit pause time value FF.FF. A pause-quantum is 512 bit-times. Pause frames sent to cancel a pause request will have a pause time value of 00.00.
- Zero padding to 64-byte data length (The CPGMAC\_SL will transmit only 64 byte pause frames).
- The 32-bit frame-check sequence (CRC word).

All quantities above are hexadecimal and are transmitted most-significant byte first. The least-significant bit is transferred first in each byte.

If **rx\_flow\_en** is cleared to zero while the pause time is nonzero, then the pause time will be cleared to zero and a zero count pause frame will be sent.

#### 14.3.2.12.2.2 Transmit Flow Control

Incoming pause frames are acted upon, when enabled, to prevent the CPGMAC\_SL from transmitting any further frames. Incoming pause frames are only acted upon when the **fullduplex** and **tx\_flow\_en** bits in the **MacControl** register are set. Pause frames are not acted upon in half-duplex mode. Pause frame action will be taken if enabled, but normally the frame will be filtered and not transferred to memory.

MAC control frames will be transferred to memory if the **rx\_cmf\_en** (Copy MAC Frames) bit in the **MacControl** register is set. The **tx\_flow\_en** and **fullduplex** bits effect whether or not MAC control frames are acted upon, but they have no effect upon whether or not MAC control frames are transferred to memory or filtered.

Pause frames are a subset of MAC Control Frames with an opcode field=0x0001. Incoming pause frames will only be acted upon by the port if:

- **tx\_flow\_en** is set in **MacControl**, and
- the frame's length is 64 to **rx\_maxlen** bytes inclusive, and
- the frame contains no crc error or align/code errors.

The pause time value from valid frames will be extracted from the two bytes following the opcode. The pause time will be loaded into the port's transmit pause timer and the transmit pause time period will begin.

If a valid pause frame is received during the transmit pause time period of a previous transmit pause frame then:

- if the destination address is not equal to the reserved multicast address or any enabled or disabled unicast address, then the transmit pause timer will immediately expire, or
- if the new pause time value is zero then the transmit pause timer will immediately expire, else
- the port transmit pause timer will immediately be set to the new pause frame pause time value. (Any remaining pause time from the previous pause frame will be discarded).

If **tx\_flow\_en** in **MacControl** is cleared, then the pause-timer will immediately expire.

The port will not start the transmission of a new data frame any sooner than 512-bit times after a pause frame with a non-zero pause time has finished being received (**MRXDV** going inactive). No transmission will begin until the pause timer has expired (the port may transmit pause frames in order to initiate outgoing flow control). Any frame already in transmission when a pause frame is received will be completed and unaffected.

Incoming pause frames consist of the below:

- A 48-bit destination address equal to:
- The reserved multicast destination address 01.80.C2.00.00.01, or
- The SL\_SA(47:0) input mac source address.
- The 48-bit source address of the transmitting device.
- The 16-bit length/type field containing the value 88.08
- The 16-bit pause opcode equal to 00.01
- The 16-bit pause\_time. A pause-quantum is 512 bit-times.
- Padding to 64-byte data length.
- The 32-bit frame-check sequence (CRC word).

All quantities above are hexadecimal and are transmitted most-significant byte first. The least-significant bit is transferred first in each byte.

The padding is required to make up the frame to a minimum of 64 bytes. The standard allows pause frames longer than 64 bytes to be discarded or interpreted as valid pause frames. The CPGMAC\_SL will recognize any pause frame between 64 bytes and **rx\_maxlen** bytes in length.

#### 14.3.2.13 Packet Drop Interface

The packet drop interface supports an external packet drop engine. The port 1 (and port 2) CPGMAC\_SL receive FIFO VBUSP interface signals are CPSW\_3G outputs. The receive packet interface has an associated packet drop input P1\_RFIFO\_DROP (P2\_RFIFO\_DROP). An external packet drop engine may "snoop" the received packet header and data to determine whether or not the packet should be dropped.

If the packet is to be dropped the external logic must assert the drop signal by no later than the second clock after the end of packet (or abort) indication from the CPGMAC\_SL. The drop signal should remain asserted until the second clock after the end of packet (or abort) indication. If the packet is not to be dropped then the drop signal should remain deasserted. The CPGMAC\_SL section contains more information on the receive FIFO VBUSP interface signals and end of packet indication.

#### 14.3.2.14 Short Gap

The port 1 (and port 2) transmit inter-packet gap (IPG) may be shortened by eight bit times when enabled and triggered. The **tx\_short\_gap\_en** bit in the **SL1\_MacControl (SL2\_MacControl)** register enables the gap to be shortened when triggered. The condition is triggered when the port 1 (port 2) transmit FIFO has a user defined number of FIFO blocks used. The port 1 transmit FIFO blocks used determines if the port 1 gap is shortened, and the port 2 transmit FIFO blocks used determines if the port 2 gap is shortened. The **CPSW\_Gap\_Thresh** register value determines the port 1 short gap threshold, and the **CPSW\_Gap\_Thresh** register value determines the port 2 short gap threshold.

#### 14.3.2.15 Switch Latency

The CPSW\_3G is a store and forward switch. The switch latency is defined as the amount of time between the end of packet reception of the received packet to the start of the output packet transmit.

| Mode       | Latency |
|------------|---------|
| Gig (1000) | 880ns   |
| 100        | 1.3us   |
| 10         | 6.5us   |

#### 14.3.2.16 Emulation Control

The emulation control input (EMUSU) and submodule emulation control registers allow CPSW\_3G operation to be completely or partially suspended. There are three CPSW\_3G submodules that contain emulation control registers (CPGMAC\_SL1, CPGMAC\_SL2, and CPDMA). The submodule emulation control registers must be accessed to facilitate CPSW\_3G emulation control. The CPSW\_3G module enters the emulation suspend state if all three submodules are configured for emulation suspend and the emulation suspend input is asserted.

A partial emulation suspend state is entered if one or two submodules are configured for emulation suspend and the emulation suspend input is asserted. Emulation suspend occurs at packet boundaries. The emulation control feature is implemented for compatibility with other peripherals.

##### CPGMAC\_SL Emulation Control

The emulation control input (**TBEMUSUP**) and register bits (**soft** and **free** in the **EMControl** register) allow CPGMAC\_SL operation to be suspended. When the emulation suspend state is entered, the CPGMAC\_SL will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For receive, frames that are detected by the CPGMAC\_SL after the suspend state is entered are ignored. Emulation control is implemented for compatibility with other peripherals.

##### CPDMA Emulation Control

The emulation control input (**TBEMUSUP**) and register bits (**soft** and **free** in the **EMControl** register) allow CPDMA operation to be suspended. When the emulation suspend state is entered, the CPDMA will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For transmission, any complete or partial frame in the tx cell fifo will be transmitted. For receive, frames that are detected by the CPDMA after the suspend state is entered are ignored. No statistics will be kept for ignored frames. Emulation control is implemented for compatibility with other peripherals

The following table shows the operations of the emulation control input and register bits:

**Table 14-18. Operations of Emulation Control Input and Register Bits**

| EMUSU | soft | free | Description       |
|-------|------|------|-------------------|
| 0     | X    | X    | Normal Operation  |
| 1     | 0    | 0    | Normal Operation  |
| 1     | 1    | 0    | Emulation Suspend |
| 1     | X    | 1    | Normal Operation  |

#### 14.3.2.17 Software IDLE

The submodule software idle register bits enable CPSW\_3G operation to be completely or partially suspended by software control. There are three CPSW\_3G submodules that contain software idle register bits (CPGMAC\_SL1, CPGMAC\_SL2, and CPDMA). Each of the three submodules may be individually commanded to enter the idle state. The idle state is entered at packet boundaries, and no further packet operations will occur on an idled submodule until the idle command is removed. The CPSW\_3G module enters the idle state when all three submodules are commanded to enter and have entered the idle state. Idle status is determined by reading or polling the three submodule idle bits. The CPSW\_3G is in the idle state when all three submodules are in the idle state. The **CPSW\_Soft\_Idle** bit may be set if desired after the submodules are in the idle state. The **CPSW\_Soft\_Idle** bit causes packets to not be transferred from one FIFO to another FIFO internal to the switch.

#### 14.3.2.18 Software Reset

The CPSW\_3G software reset register, CPSW\_3GSS software reset register and the three submodule software reset registers enable the CPSW\_3GSS to be reset by software. There are three CPSW\_3G submodules that contain software reset registers (CPGMAC\_SL1, CPGMAC\_SL2, and CPDMA). Each of the three submodules may be individually commanded to be reset by software.

For the CPDMA, the reset state is entered at packet boundaries, at which time the CPDMA reset occurs. The CPGMAC\_SL soft reset is immediate. Submodule reset status is determined by reading or polling the submodule reset bit. If the submodule reset bit is read as a one, then the reset process has not yet completed. The submodule soft reset process could take up to 2ms each. The reset has completed if the submodule reset bit is read as a zero.

After all three submodules (in any order) have been reset and a read of each submodule reset bit indicates that the reset process is complete, the CPSW\_3G software reset register bit may be written to complete the CPSW\_3G module software reset operation. The CPSW\_3G software reset bit controls the reset of the FIFO's, the statistics submodule, and the address lookup engine (ALE). The CPSW\_3G software reset is immediate and will be indicated by reading a zero from the soft reset bit.

The CPSW\_3GSS software reset bit controls the reset of the INT, REGS and CPPI. The CPSW\_3GSS software reset is immediate and will be indicated by reading a zero from the soft reset bit.

#### **14.3.2.19 FIFO Loopback**

FIFO loopback mode is entered when the fifo\_loopback bit in the CPSW\_Control register is set. FIFO loopback mode causes packets received on a port to be turned around and transmitted back on the same port. Port 0 receive is fixed on channel zero in FIFO loopback mode. The RXSOFOVERRUN statistic is incremented for each packet sent in FIFO loopback mode. Packets sent in with errors are returned with errors (they are not dropped). FIFO loopback is intended as a simple mechanism for test purposes. FIFO loopback should be performed in fullduplex mode only.

#### **14.3.2.20 CPSW\_3G Network Statistics**

The CPSW\_3G has a set of statistics that record events associated with frame traffic on selected switch ports. The statistics values are cleared to zero 38 clocks after the rising edge of VBUSP\_RST\_N. When one or more port enable bits (stat\_port\_en[2:0]) are set, all statistics registers are write to decrement. The value written will be subtracted from the register value with the result being stored in the register. If a value greater than the statistics value is written, then zero will be written to the register (writing 0xffffffff will clear a statistics location).

When all port enable bits are cleared to zero, all statistics registers are read/write (normal write direct, so writing 0x00000000 will clear a statistics location). All write accesses must be 32-bit accesses. In the below statistics descriptions, "the port" refers to any enabled port (with a corresponding set stat\_port\_en[2:0] bit).

The statistics interrupt (STAT\_PEND) will be issued if enabled when any statistics value is greater than or equal to 0x80000000. The statistics interrupt is removed by writing to decrement any statistics value greater than 0x80000000. The statistics are mapped into internal memory space and are 32-bits wide. All statistics rollover from 0xFFFFFFFF to 0x00000000.

##### **14.3.2.20.1 Rx-only Statistics Descriptions**

###### **14.3.2.20.1.1 Good Rx Frames (Offset = 0h)**

The total number of good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Had a length of 64 to rx\_maxlen bytes inclusive
- Had no CRC error, alignment error or code error.

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

###### **14.3.2.20.1.2 Broadcast Rx Frames (Offset = 4h)**

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- Any data or MAC control frame which was destined for only address 0xFFFFFFFFFFFF

- Had a length of 64 to rx\_maxlen bytes inclusive
- Had no CRC error, alignment error or code error.

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### **14.3.2.20.1.3 Multicast Rx Frames (Offset = 8h)**

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- Any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFFFFFF
- Had a length of 64 to rx\_maxlen bytes inclusive
- Had no CRC error, alignment error or code error

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### **14.3.2.20.1.4 Pause Rx Frames (Offset = Ch)**

The total number of IEEE 802.3X pause frames received by the port (whether acted upon or not). Such a frame:

- Contained any unicast, broadcast, or multicast address
- Contained the length/type field value 88.08 (hex) and the opcode 0x0001
- Was of length 64 to rx\_maxlen bytes inclusive
- Had no CRC error, alignment error or code error
- Pause-frames had been enabled on the port (tx\_flow\_en = 1).

The port could have been in either half or full-duplex mode.

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### **14.3.2.20.1.5 Rx CRC Errors (Offset = 10h)**

The total number of frames received on the port that experienced a CRC error. Such a frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was of length 64 to rx\_maxlen bytes inclusive
- Had no code/align error,
- Had a CRC error

Overruns have no effect upon this statistic.

A CRC error is defined to be:

- A frame containing an even number of nibbles
- Failing the Frame Check Sequence test

#### **14.3.2.20.1.6 Rx Align/Code Errors (Offset = 14h)**

The total number of frames received on the port that experienced an alignment error or code error. Such a frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was of length 64 to rx\_maxlen bytes inclusive
- Had either an alignment error or a code error

Overruns have no effect upon this statistic.

An alignment error is defined to be:

- A frame containing an odd number of nibbles
- Failing the Frame Check Sequence test if the final nibble is ignored

A code error is defined to be a frame which has been discarded because the port's MRXER pin driven with a one for at least one bit-time's duration at any point during the frame's reception.

Note: RFC 1757 etherStatsCRCAlignErrors Ref. 1.5 can be calculated by summing Rx Align/Code Errors and Rx CRC errors.

#### 14.3.2.20.1.7 Oversize Rx Frames (Offset = 18h)

The total number of oversized frames received on the port. An oversized frame is defined to be:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than rx\_maxlen in bytes
- Had no CRC error, alignment error or code error

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### 14.3.2.20.1.8 Rx Jabbers (Offset = 1Ch)

The total number of jabber frames received on the port. A jabber frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than rx\_maxlen in bytes
- Had no CRC error, alignment error or code error

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### 14.3.2.20.1.9 Undersize (Short) Rx Frames (Offset = 20h)

The total number of undersized frames received on the port. An undersized frame is defined to be:

- Was any data frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than rx\_maxlen in bytes
- Had no CRC error, alignment error or code error

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### 14.3.2.20.1.10 Rx Fragments (Offset = 24h)

The total number of frame fragments received on the port. A frame fragment is defined to be:

- Any data frame (address matching does not matter)
- Less than 64 bytes long
- Having a CRC error, an alignment error, or a code error
- Not the result of a collision caused by half duplex, collision based flow control

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### 14.3.2.20.1.11 Rx Start of Frame Overruns (Offset = 84h)

The total number of frames received on the port that had a CPDMA start of frame (SOF) overrun or were dropped by due to FIFO resource limitations. SOF overrun frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Any length (including less than 64 bytes and greater than rx\_maxlen bytes)
- The CPDMA had a start of frame overrun or the packet was dropped due to FIFO resource limitations

#### **14.3.2.20.1.12 Rx Middle of Frame Overruns (Offset = 88h)**

The total number of frames received on the port that had a CPDMA middle of frame (MOF) overrun. MOF overrun frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Any length (including less than 64 bytes and greater than rx\_maxlen bytes)
- The CPDMA had a middle of frame overrun

#### **14.3.2.20.1.13 Rx DMA Overruns (Offset = 8Ch)**

The total number of frames received on the port that had either a DMA start of frame (SOF) overrun or a DMA MOF overrun. An Rx DMA overrun frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Any length (including less than 64 bytes and greater than rx\_maxlen bytes)
- The CPGMAC\_SL was unable to receive it because it did not have the DMA buffer resources to receive it (zero head descriptor pointer at the start or during the middle of the frame reception)

CRC errors, alignment errors and code errors have no effect upon this statistic.

#### **14.3.2.20.1.14 Rx Octets (Offset = 30h)**

The total number of bytes in all good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Of length 64 to rx\_maxlen bytes inclusive
- Had no CRC error, alignment error or code error

See the Rx Align/Code Errors and Rx CRC errors statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

#### **14.3.2.20.1.15 Net Octets (Offset = 80h)**

The total number of bytes of frame data received and transmitted on the port. Each frame counted:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address (address match does not matter)
- Any length (including less than 64 bytes and greater than rx\_maxlen bytes)

Also counted in this statistic is:

- Every byte transmitted before a carrier-loss was experienced
- Every byte transmitted before each collision was experienced, (i.e. multiple retries are counted each time)
- Every byte received if the port is in half-duplex mode until a jam sequence was transmitted to initiate flow control. (The jam sequence was not counted to prevent double-counting)

Error conditions such as alignment errors, CRC errors, code errors, overruns and underruns do not affect the recording of bytes by this statistic.

The objective of this statistic is to give a reasonable indication of ethernet utilization

#### 14.3.2.20.2 Tx-only Statistics Descriptions

The maximum and minimum transmit frame size is software controllable.

##### 14.3.2.20.2.1 Good Tx Frames (Offset = 34h)

The total number of good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Any length
- Had no late or excessive collisions, no carrier loss and no underrun

##### 14.3.2.20.2.2 Broadcast Tx Frames (Offset = 38h)

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- Any data or MAC control frame which was destined for only address 0xFFFFFFFFFFFF
- Any length
- Had no late or excessive collisions, no carrier loss and no underrun

##### 14.3.2.20.2.3 Multicast Tx Frames (Offset = 3Ch)

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- Any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFFFFFF
- Any length
- Had no late or excessive collisions, no carrier loss and no underrun

##### 14.3.2.20.2.4 Pause Tx Frames (Offset = 40h)

This statistic indicates the number of IEEE 802.3X pause frames transmitted by the port.

Pause frames cannot underrun or contain a CRC error because they are created in the transmitting MAC, so these error conditions have no effect upon the statistic. Pause frames sent by software will not be included in this count.

Since pause frames are only transmitted in full duplex carrier loss and collisions have no effect upon this statistic.

Transmitted pause frames are always 64 byte multicast frames so will appear in the Tx Multicast Frames and 64octet Frames statistics.

##### 14.3.2.20.2.5 Collisions (Offset = 48h)

This statistic records the total number of times that the port experienced a collision. Collisions occur under two circumstances.

1. When a transmit data or MAC control frame:

- Was destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced a collision. A jam sequence is sent for every non-late collision, so this statistic will increment on each occasion if a frame experiences multiple collisions (and increments on late collisions)

CRC errors have no effect upon this statistic.

2. When the port is in half-duplex mode, flow control is active, and a frame reception begins.

#### **14.3.2.20.2.6 Single Collision Tx Frames (Offset = 4Ch)**

The total number of frames transmitted on the port that experienced exactly one collision. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced one collision before successful transmission. The collision was not late.

CRC errors have no effect upon this statistic.

#### **14.3.2.20.2.7 Multiple Collision Tx Frames (Offset = 50h)**

The total number of frames transmitted on the port that experienced multiple collisions. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced 2 to 15 collisions before being successfully transmitted. None of the collisions were late.

CRC errors have no effect upon this statistic.

#### **14.3.2.20.2.8 Excessive Collisions (Offset = 54h)**

The total number of frames for which transmission was abandoned due to excessive collisions. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced 16 collisions before abandoning all attempts at transmitting the frame. None of the collisions were late.

CRC errors have no effect upon this statistic.

#### **14.3.2.20.2.9 Late Collisions (Offset = 58h)**

The total number of frames on the port for which transmission was abandoned because they experienced a late collision. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Experienced a collision later than 512 bit-times into the transmission. There may have been up to 15 previous (non-late) collisions which had previously required the transmission to be re-attempted. The Late Collisions statistic dominates over the single, multiple and excessive Collisions statistics - if a late collision occurs the frame will not be counted in any of these other three statistics.

CRC errors have no effect upon this statistic.

#### **14.3.2.20.2.10 Tx Underrun (Offset = 5Ch)**

There should be no transmitted frames that experience underrun.

#### **14.3.2.20.2.11 Deferred Tx Frames (Offset = 44h)**

The total number of frames transmitted on the port that first experienced deferment. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced no collisions before being successfully transmitted

- Found the medium busy when transmission was first attempted, so had to wait.
- CRC errors have no effect upon this statistic.

#### **14.3.2.20.2.12 Carrier Sense Errors (Offset = 60h)**

The total number of frames received on the port that had a CPDMA middle of frame (MOF) overrun. MOF overrun frame is defined to be:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- The carrier sense condition was lost or never asserted when transmitting the frame (the frame is not retransmitted). This is a transmit only statistic. Carrier Sense is a don't care for received frames.
- Transmit frames with carrier sense errors are sent until completion and are not aborted.

CRC errors have no effect upon this statistic.

#### **14.3.2.20.2.13 Tx Octets (Offset = 64h)**

The total number of bytes in all good frames transmitted on the port. A good frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Was any size
- Had no late or excessive collisions, no carrier loss and no underrun.

#### **14.3.2.20.3 Rx- and Tx-Shared Statistics Descriptions**

##### **14.3.2.20.3.1 Rx + Tx 64 Octet Frames (Offset = 68h)**

The total number of 64-byte frames received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was exactly 64 bytes long. (If the frame was being transmitted and experienced carrier loss that resulted in a frame of this size being transmitted, then the frame will be recorded in this statistic).

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

##### **14.3.2.20.3.2 Rx + Tx 65–127 Octet Frames (Offset = 6Ch)**

The total number of frames of size 65 to 127 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 65 to 127 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

##### **14.3.2.20.3.3 Rx + Tx 128–255 Octet Frames (Offset = 70h)**

The total number of frames of size 128 to 255 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 128 to 255 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

**14.3.2.20.3.4 Rx + Tx 256–511 Octet Frames (Offset = 74h)**

The total number of frames of size 256 to 511 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 256 to 511 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

**14.3.2.20.3.5 Rx + Tx 512–1023 Octet Frames (Offset = 78h)**

The total number of frames of size 512 to 1023 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 512 to 1023 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

**14.3.2.20.3.6 Rx + Tx 1024\_Up Octet Frames (Offset = 7Ch)**

The total number of frames of size 1024 to rx\_maxlen bytes for receive or 1024 up for transmit on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 1024 to rx\_maxlen bytes long on receive, or any size on transmit

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

**Table 14-19. Rx Statistics Summary**

| Rx Statistic         | Frame/<br>Oct | Rx/<br>Rx+Tx | Frame Type     |                    |                |                | Frame Size (bytes) |    |            |             |             |              |                        |                | Event         |              |                |              |                |   |   |
|----------------------|---------------|--------------|----------------|--------------------|----------------|----------------|--------------------|----|------------|-------------|-------------|--------------|------------------------|----------------|---------------|--------------|----------------|--------------|----------------|---|---|
|                      |               |              | MAC control    |                    | Data           |                | <64                | 64 | 65-<br>127 | 128-<br>255 | 256-<br>511 | 512-<br>1023 | 1024-<br>rx_<br>maxlen | >rx_<br>maxlen | Flow<br>Coll. | CRC<br>Error | Align/<br>Code | Over-<br>run | Addr.<br>Disc. |   |   |
|                      |               |              | Pause<br>frame | Non-<br>paus-<br>e | Multi-<br>cast | Broad-<br>cast | Uni-<br>cast       |    |            |             |             |              |                        |                |               |              |                |              |                |   |   |
| Good Rx Frames       | F             | Rx           | (y             | y                  | y              | y              | y)                 | n  | (y         | y           | y           | y            | y                      | y              | n             | -            | n              | n            | -              | n |   |
| Broadcast Rx Frames  | F             | Rx           | (%             | %                  | n              | y)             | n                  | n  | (y         | y           | y           | y            | y                      | y              | n             | -            | n              | n            | -              | n |   |
| Multicast Rx Frames  | F             | Rx           | (%             | %                  | y)             | n              | n                  | n  | (y         | y           | y           | y            | y                      | y              | n             | -            | n              | n            | -              | n |   |
| Pause Rx Frames      | F             | Rx           | y              | n                  | n              | n              | n                  | (y | y          | y           | y           | y            | y                      | y              | n             | -            | n              | n            | -              | - |   |
| Rx CRC Errors        | F             | Rx           | (y             | y                  | y              | y              | y)                 | n  | (y         | y           | y           | y            | y                      | y              | n             | -            | y              | n            | -              | n |   |
| Rx Align/Code Errors | F             | Rx           | (y             | y                  | y              | y              | y)                 | n  | (y         | y           | y           | y            | y                      | y              | n             | -            | -              | y            | -              | n |   |
| Oversized Rx Frames  | F             | Rx           | (y             | y                  | y              | y              | y)                 | n  | n          | n           | n           | n            | n                      | n              | y             | -            | n              | n            | -              | n |   |
| Rx Jabbers           | F             | Rx           | (y             | y                  | y              | y              | y)                 | n  | n          | n           | n           | n            | n                      | n              | y             | -            | (y             | y)           | -              | n |   |
| Undersized Rx Frames | F             | Rx           | n              | n                  | (y             | y              | y)                 | y  | n          | n           | n           | n            | n                      | n              | n             | -            | n              | n            | -              | n |   |
| Rx Fragments         | F             | Rx           | n              | n                  | (y             | y              | y)                 | y^ | n          | n           | n           | n            | n                      | n              | n             | -            | (y             | y)           | -              | - |   |
| Rx Overruns          | F             | Rx           | (y             | y                  | y              | y              | y)                 | (y | y          | y           | y           | y            | y                      | y              | y             | -            | -              | -            | y              | n |   |
| 64octet Frames       | F             | Rx+Tx        | (y             | y                  | y              | y              | y)                 | n  | y          | n           | n           | n            | n                      | n              | n             | -            | -              | -            | -              | - | n |
| 65-127octet Frames   | F             | Rx+Tx        | (y             | y                  | y              | y              | y)                 | n  | n          | y           | n           | n            | n                      | n              | n             | -            | -              | -            | -              | - | n |

**Notes for the Rx Statistics Summary:**

1. "AND" is assumed horizontally across the table between all conditions which form the statistic (marked y or n) except where (y|y), meaning "OR" is indicated. Parentheses are significant.
2. "-" indicates conditions which are ignored in the formations of the statistic.
3. Statistics marked "Rx+Tx" are formed by summing the Rx and Tx statistics, each of which is formed independently.
4. The non-pause column refers to all MAC control frames (i.e. frames with length/type=88.08) with opcodes other than 0x0001. The pauseframe column refers to MAC frames with the opcode=0x0001.
5. The multicast, broadcast and unicast columns in the table refer to non-MAC Control/non-pause frames (i.e. data frames).
6. "%" If either a MAC control frame or pause frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
7. "y^" Frame fragments are not counted if less than 8 bytes.
8. flow coll. are half-duplex collisions forced by the MAC to achieve flow-control. A collision will be forced during the first 8 bytes so should not show in frame fragments. Some of the '-'s in this column might in reality be 'n's.
9. The rx\_overruns stat show above is for rx\_mof\_overruns and rx\_sof\_overruns added together.

**Table 14-20. Tx Statistics Summary**

| Tx Statistic                 | Frame/<br>Oct | Tx/<br>Rx+<br>Tx | Frame Type         |                  |                    |                    |                  | Frame Size (bytes) |            |             |             |              |               |           |              | Event          |          |    |      |   |                   |            |              |                   |   |   |

**Notes for the Tx Statistics Summary:**

1. "AND" is assumed horizontally across the table between all conditions which form the statistic (marked y or n) except where (y|y), meaning "OR" is indicated. Parentheses are significant.
2. "-" indicates conditions which are ignored in the formations of the statistic.
3. Statistics marked "Rx+Tx" are formed by summing the Rx and Tx statistics, each of which is formed independently.
4. Pause (MAC) frames are issued in the MAC as perfect (no CRC error) 64 byte frames in full duplex only, so they cannot collide.
5. "%" If a CPU sourced MAC control frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
6. "+" indicates collisions which are "summed" (i.e. every collision is counted in the Collisions statistic). Jam sequences used for halfduplex flow control are also counted.
7. "\$" Every byte written on the wire during each retry attempt is also counted in addition to frames which experience no collisions or carrier loss.
8. The flow collision type is for half-duplex collisions forced by the MAC to achieve flow control. Some of the '-'s in this column might in reality be 'n's. To prevent double-counting, Net Octets are unaffected by the jam sequence – the 'received' bytes, however, are counted. (See [Table 14-19](#).)
9. When the transmit Tx FIFO is drained due to the MAC being disabled or link being lost, then the frames being purged will not appear in the Tx statistics.

### 14.3.3 Ethernet Mac Sliver (CPGMAC\_SL)

The CPGMAC\_SL peripheral shall be compliant to the IEEE Std 802.3 Specification. Half duplex mode is supported in 10/100 Mbps mode, but not in 1000 Mbps (gigabit) mode.

Features:

- Synchronous 10/100/1000 Mbit operation.
- G/MII Interface.
- Hardware Error handling including CRC.
- Full Duplex Gigabit operation (half duplex gigabit is not supported).
- EtherStats and 802.3Stats RMON statistics gathering support for external statistics collection module.
- Transmit CRC generation selectable on a per channel basis.
- Emulation Support.
- VLAN Aware Mode Support.
- Hardware flow control.
- Programmable Inter Packet Gap (IPG)

#### 14.3.3.1 GMII/MII Media Independent Interface

The following sections cover operation of the Media Independent Interface in 10/100/1000 Mbps modes. An IEEE 802.3 compliant Ethernet MAC controls the interface.

##### 14.3.3.1.1 Data Reception

###### 14.3.3.1.1.1 Receive Control

Data received from the PHY is interpreted and output. Interpretation involves detection and removal of the preamble and start of frame delimiter, extraction of the address and frame length, data handling, error checking and reporting, cyclic redundancy checking (CRC), and statistics control signal generation.

###### 14.3.3.1.1.2 Receive Inter-Frame Interval

The 802.3 required inter-packet gap (IPG) is 24 GMII clocks (96 bit times) for 10/100 Mbit modes, and 12 GMII clocks (96 bit times) for 1000 Mbit mode. However, the MAC can tolerate a reduced IPG (2 GMII clocks in 10/100 mode and 5 GMII clocks in 1000 mode) with a correct preamble and start frame delimiter.

This interval between frames must comprise (in the following order):

- An Inter-Packet Gap (IPG).
- A seven octet preamble (all octets 0x55).
- A one octet start frame delimiter (0x5D).

#### **14.3.3.1.2 Data Transmission**

The Gigabit Ethernet Mac Sliver (GMII) passes data to the PHY when enabled. Data is synchronized to the transmit clock rate. The smallest frame that can be sent is two bytes of data with four bytes of CRC (6 byte frame).

##### **14.3.3.1.2.1 Transmit Control**

A jam sequence is output if a collision is detected on a transmit packet. If the collision was late (after the first 64 bytes have been transmitted) the collision is ignored. If the collision is not late, the controller will back off before retrying the frame transmission. When operating in full duplex mode the carrier sense (CRS) and collision sensing modes are disabled.

##### **14.3.3.1.2.2 CRC Insertion**

The MAC generates and appends a 32-bit Ethernet CRC onto the transmitted data if the transmit packet header **pass\_crc** bit is zero. For the CPMAC\_SL generated CRC case, a CRC at the end of the input packet data is not allowed.

If the header word **pass\_crc** bit is set, then the last four bytes of the TX data are transmitted as the frame CRC. The four CRC data bytes should be the last four bytes of the frame and should be included in the packet byte count value. The MAC performs no error checking on the outgoing CRC when the **pass\_crc** bit is set.

##### **14.3.3.1.2.3 MTXER**

The GMII\_MTXER signal is not used. If an underflow condition occurs on a transmitted frame, the frame CRC will be inverted to indicate the error to the network. Underflow is a hardware error.

##### **14.3.3.1.2.4 Adaptive Performance Optimization (APO)**

The Ethernet MAC port incorporates Adaptive Performance Optimization (APO) logic that may be enabled by setting the **tx\_pace** bit in the **MacControl** register. Transmission pacing to enhance performance is enabled when set. Adaptive performance pacing introduces delays into the normal transmission of frames, delaying transmission attempts between stations, reducing the probability of collisions occurring during heavy traffic (as indicated by frame deferrals and collisions) thereby increasing the chance of successful transmission.

When a frame is deferred, suffers a single collision, multiple collisions or excessive collisions, the pacing counter is loaded with an initial value of 31. When a frame is transmitted successfully (without experiencing a deferral, single collision, multiple collision or excessive collision) the pacing counter is decremented by one, down to zero.

With pacing enabled, a new frame is permitted to immediately (after one IPG) attempt transmission only if the pacing counter is zero. If the pacing counter is non zero, the frame is delayed by the pacing delay, a delay of approximately four inter-packet gap delays. APO only affects the IPG preceding the first attempt at transmitting a frame. It does not affect the back-off algorithm for retransmitted frames.

##### **14.3.3.1.2.5 Inter-Packet-Gap Enforcement**

The measurement reference for the IPG of 96 bit times is changed depending on frame traffic conditions. If a frame is successfully transmitted without collision, and **MCRS** is de-asserted within approximately 48 bit times of **MTXEN** being de-asserted, then 96 bit times is measured from **MTXEN**. If the frame suffered a collision, or if **MCRS** is not de-asserted until more than approximately 48 bit times after **MTXEN** is de-asserted, then 96 bit times (approximately, but not less) is measured from **MCRS**.

The transmit IPG can be shortened by eight bit times when enabled and triggered. The **tx\_short\_gap\_en** bit in the **MacControl** register enables the **TX\_SHORT\_GAP** input to determine whether the transmit IPG is shorted by eight bit times.

#### **14.3.3.1.2.6 Back Off**

The Gigabit Ethernet Mac Sliver (GMII) implements the 802.3 binary exponential back-off algorithm.

#### **14.3.3.1.2.7 Programmable Transmit Inter-Packet Gap**

The transmit inter-packet gap (IPG) is programmable through the **Tx\_Gap** register. The default value is decimal 12. The transmit IPG may be increased to the maximum value of 0x1ff. Increasing the IPG is not compatible with transmit pacing. The short gap feature will override the increased gap value, so the short gap feature may not be compatible with an increased IPG.

#### **14.3.3.1.2.8 Speed, Duplex, and Pause Frame Support Negotiation**

The CPMAC\_SL can operate in half duplex or full duplex in 10/100 Mbit modes, and can operate in full duplex only in 1000 Mbit mode. Pause frame support is included in 10/100/1000 Mbit modes as configured by the host.

### **14.3.3.2 Frame Classification**

Received frames are proper (good) frames if they are between 64 and **rx maxlen** in length (inclusive) and contain no errors (code/align/CRC).

Received frames are long frames if their frame count exceeds the value in the **rx maxlen** register. The **rx maxlen** register reset (default) value is 1518 (dec). Long received frames are either oversized or jabber frames. Long frames with no errors are oversized frames. Long frames with CRC, code, or alignment errors are jabber frames.

Received frames are short frames if their frame count is less than 64 bytes. Short frames that contain no errors are undersized frames. Short frames with CRC, code, or alignment errors are fragment frames.

A received long packet will always contain **rx maxlen** number of bytes transferred to memory (if **rx\_cef\_en** = 1). An example with **rx maxlen** = 1518 is below:

- If the frame length is 1518, then the packet is not a long packet and there will be 1518 bytes transferred to memory.
- If the frame length is 1519, there will be 1518 bytes transferred to memory. The last three bytes will be the first three CRC bytes.
- If the frame length is 1520, there will be 1518 bytes transferred to memory. The last two bytes will be the first two CRC bytes.
- If the frame length is 1521, there will be 1518 bytes transferred to memory. The last byte will be the first CRC byte.

If the frame length is 1522, there will be 1518 bytes transferred to memory. The last byte will be the last data byte.

### **14.3.4 Command IDLE**

The **cmd\_idle** bit in the **MAC\_CONTROL** register allows CPGMAC\_SL operation to be suspended. When the idle state is commanded, the CPGMAC\_SL will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. Received frames that are detected after the suspend state is entered are ignored. Commanded idle is similar in operation to emulation control and clock stop.

### 14.3.5 RMII Interface

The CPRMII peripheral shall be compliant to the RMII specification document.

Features:

- Source Synchronous 10/100 Mbit operation.
- Full and Half Duplex support.

#### 14.3.5.1 RMII Receive (RX)

The CPRMII receive (RX) interface converts the input data from the external RMII PHY (or switch) into the required MII (CPGMAC) signals. The carrier sense and collision signals are determined from the RMII input data stream and transmit inputs as defined in the RMII specification.

An asserted RMII\_RXER on any di-bit in the received packet will cause an MII\_RXER assertion to the CPGMAC during the packet. In 10Mbps mode, the error is not required to be duplicated on 10 successive clocks. Any di-bit which has an asserted RMII\_RXER during any of the 10 replications of the data will cause the error to be propagated.

Any received packet that ends with an improper nibble boundary aligned RMII\_CRS\_DV toggle will issue an MII\_RXER during the packet to the CPGMAC. Also, a change in speed or duplex mode during packet operations will cause packet corruption.

The CPRMII can accept receive packets with shortened preambles, but 0x55 followed by a 0x5d is the shortest preamble that will be recognized (1 preamble byte with the start of frame byte). At least one byte of preamble with the start of frame indicator is required to begin a packet. An asserted RMII\_CRS\_DV without at least a single correct preamble byte followed by the start of frame indicator will be ignored.

#### 14.3.5.2 RMII Transmit (TX)

The CPRMII transmit (TX) interface converts the 3PSW MII input data into the RMII transmit format. The data is then output to the external RMII PHY.

The 3PSW does not source the transmit error (MII TXERR) signal. Any transmit frame from the CPGMAC with an error (ie. underrun) will be indicated as an error by an error CRC. Transmit error is assumed to be deasserted at all times and is not an input into the CPRMII module. Zeroes are output on RMII\_TXD[1:0] for each clock that RMII\_TXEN is deasserted.

### 14.3.6 RGMII Interface

The CPRGMII peripheral shall be compliant to the RGMII specification document.

Features:

- Supports 1000/100/10 Mbps Speed.
- MII mode is not supported.

#### 14.3.6.1 RGMII Receive (RX)

The CPRGMII receive (RX) interface converts the source synchronous DDR input data from the external RGMII PHY into the required G/MII (CPGMAC) signals.

#### 14.3.6.2 In-Band Mode of Operation

The CPRGMII is operating in the in-band mode of operation when the **RGMII\_RX\_INBAND** input is asserted. RGMII\_RX\_INPUT is asserted by configuring the ext\_en bit to 1 of sl\_mac\_control register. The link status, duplexity, and speed are determined from the RGMII input data stream as defined in the RGMII specification. The link speed is indicated as shown in the following table:

|                  |               |
|------------------|---------------|
| RGMII_SPEED(1:0) | Link Speed    |
| 00               | 10 Mbs mode   |
| 01               | 100 Mbs mode  |
| 10               | 1000 Mbs mode |
| 11               | reserved      |

#### 14.3.6.3 Forced Mode of Operation

The CPRGMII is operating in the forced mode of operation when the **RGMII\_RX\_INBAND** input is deasserted. In the forced mode of operation, the in-band data is ignored if present. The link status is forced high, and the duplexity and speed are determined from the **RGMII\_FULLDUPLEX\_IN** and **RGMII\_GIG\_IN** inputs. If the **RGMII\_GIG\_IN** input is asserted, then operation is gigabit mode (**RGMII\_SPEED (1:0) = 10**). If the **RGMII\_GIG\_IN** input is deasserted, the operation is 100mbps mode (**RGMII\_SPEED (1:0) = 01**).

#### 14.3.6.4 RGMII Transmit (TX)

The CPRGMII transmit (TX) interface converts the CPGMAC G/MII input data into the DDR RGMII format. The DDR data is then output to the external PHY.

The CPGMAC does not source the transmit error (MTXERR) signal. Any transmit frame from the CPGMAC with an error (ie. underrun) will be indicated as an error by an error CRC. Transmit error is assumed to be deasserted at all times and is not an input into the CPRGMII module.

In 10/100 mode, the MTXD (7:0) data bus uses only the lower nibble. The CPRGMII will output the lower nibble twice in 10/100 mode to avoid unnecessary signal switching.

Packets will be precluded from transmission through the CPRGMII module for 4096 transmit clocks after the rising edge of **RGMII\_LINK**. Packet transmission will begin on the first **GMII\_MTXEN** rising edge after the 4096 transmit clock count has expired.

The RGMII0/1\_ID\_MODE bit value in the GMII\_SEL register should only be set to 1 for 'no internal delay'. The device does not support internal delay mode for RGMII.

### 14.3.7 Common Platform Time Sync (CPTS)

The CPTS module is used to facilitate host control of time sync operations. It enables compliance with the IEEE 1588-2008(v2) standard for a precision clock synchronization protocol.

#### 14.3.7.1 Architecture

**Figure 14-10. CPTS Block Diagram**

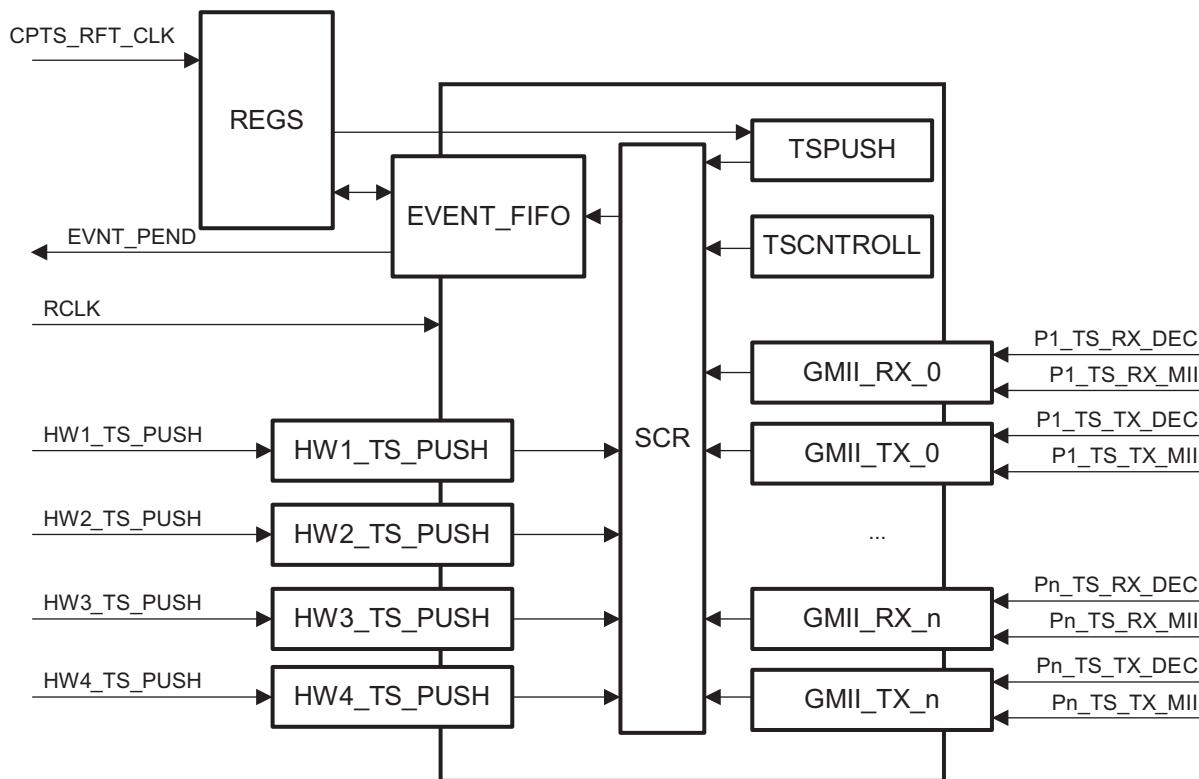

Figure 14-10 shows the architecture of the CPTS module inside the 3PSW Ethernet Subsystem. Time stamp values for every packet transmitted or received on either port of the 3PSW are recorded. At the same time, each packet is decoded to determine if it is a valid time sync event. If so, an event is loaded into the Event FIFO for processing containing the recorded time stamp value when the packet was transmitted or received.

In addition, both hardware (HW<sub>x</sub>\_TS\_PUSH) and software (TS\_PUSH) can be used to read the current time stamp value through the Event FIFO.

The reference clock used for the time stamp (RCLK) is sourced from one of the two sources, as shown in Figure 14-10. The source can be selected by configuring the CM\_CPTS\_RFT\_CLKSEL register in the Control Module. For more details, see Chapter 9, Control Module.

#### 14.3.7.2 Time Sync Overview

The CPTS module is used to facilitate host control of time sync operations. The CPTS collects time sync events and then presents them to the host for processing. There are five types of time sync events (ethernet receive event, ethernet transmit event, time stamp push event, time stamp rollover event, and time stamp half-rollover event). Each ethernet port can cause transmit and receive events. The time stamp push is initiated by software.

##### 14.3.7.2.1 Time Sync Initialization

The CPTS module should be configured as shown:

- Complete the reset sequence (VBUSP\_RST\_N) to reset the module.

- Write the rftclk\_sel[4:0] value in the RFTCLK\_Sel register with the desired reference clock multiplexor value. This value is allowed to be written only when the cpts\_en bit is cleared to zero.
- Write a one to the cpts\_en bit in the TS\_Control register. The RCLK domain is in reset while this bit is low.
- Enable the interrupt by writing a one to the ts\_pend\_en bit in the TS\_Int\_Enable register (if using interrupts and not polling).

#### 14.3.7.2.2 Time Stamp Value

The time stamp value is a 32-bit value that increments on each RCLK rising edge when CPTS\_EN is set to one. When CPTS\_EN is cleared to zero the time stamp value is reset to zero. If more than 32-bits of time stamp are required by the application, the host software must maintain the necessary number of upper bits. The upper time stamp value should be incremented by the host when the rollover event is detected.

For test purposes, the time stamp can be written via the time stamp load function (CPTS\_LOAD\_VAL and CPTS\_LOAD\_EN registers).

#### 14.3.7.2.3 Event FIFO

All time sync events are pushed onto the Event FIFO. There are 16 locations in the event FIFO with no overrun indication supported. Software must service the event FIFO in a timely manner to prevent FIFO overrun.

#### 14.3.7.2.4 Time Sync Events

Time Sync events are 64-bit values that are pushed onto the event FIFO and read in two 32-bit reads. CPTS\_EVENT\_LOW and CPTS\_EVENT\_HIGH are defined in [Section 14.5.3.10](#) and [Section 14.5.3.11](#), respectively.

There are six types of sync events

- Time stamp push event
- Hardware time stamp push event
- Time stamp counter rollover event
- Time stamp counter half-rollover event
- Ethernet receive event
- Ethernet transmit event

##### 14.3.7.2.4.1 Time Stamp Push Event

Software can obtain the current time stamp value (at the time of the write) by initiating a time stamp push event. The push event is initiated by setting the TS\_PUSH bit of the CPTS\_TS\_PUSH register. The time stamp value is returned in the event, along with a time stamp push event code. Software should not push a second time stamp event on to the FIFO until the first time stamp value has been read from the event FIFO.

##### 14.3.7.2.4.2 Time Stamp Counter Rollover Event

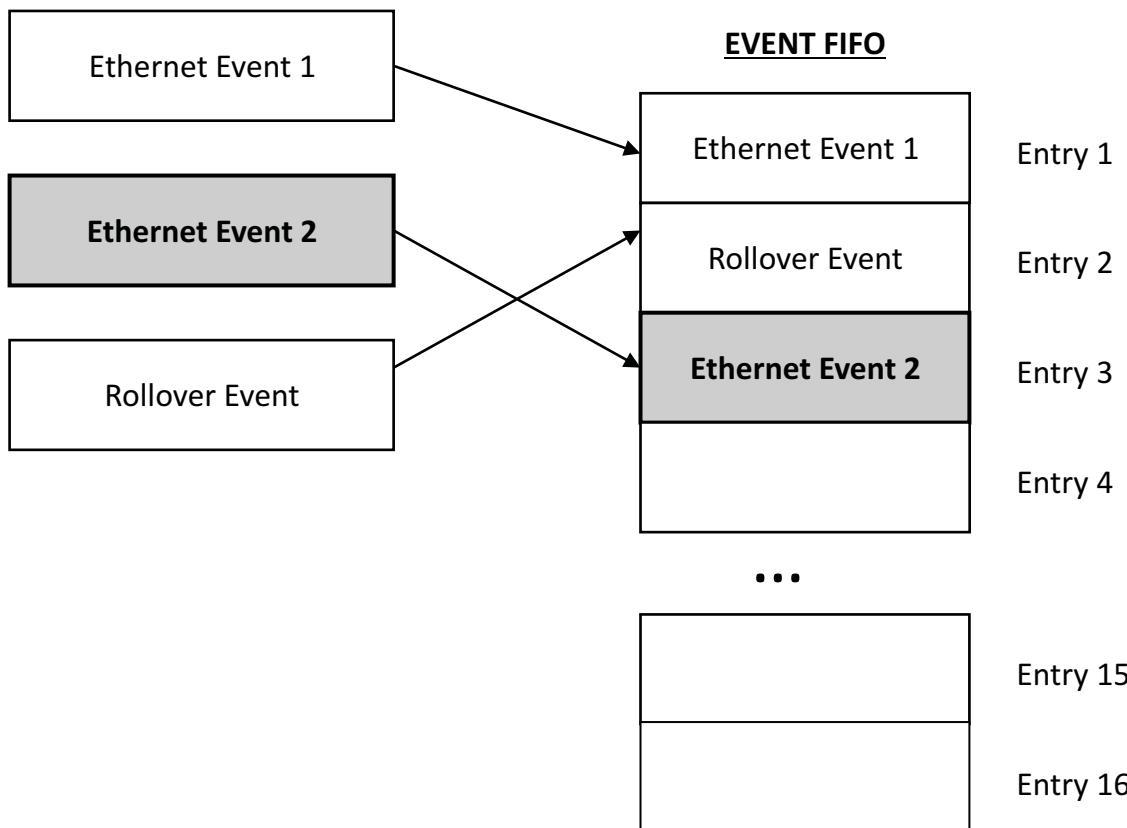

The CPTS module contains a 32-bit time stamp value. The counter upper bits are maintained by host software. The rollover event indicates to software that the time stamp counter has rolled over from 0xFFFF\_FFFF to 0x0000\_0000, and the software maintained upper count value should be incremented.

#### 14.3.7.2.4.3 Time Stamp Counter Half-Rollover Event

The CPTS includes a time stamp counter half-rollover event. The half-rollover event indicates to software that the time stamp value has incremented from 0x7FFF\_FFFF to 0x8000\_0000. The half-rollover event is included to enable software to correct a misaligned event condition. The half-rollover event is included to enable software to determine the correct time for each event that contains a valid time stamp value – such as an Ethernet event. If an Ethernet event occurs around a counter rollover (full rollover), the rollover event could possibly be loaded into the event FIFO before the Ethernet event, even though the Ethernet event time was actually taken before the rollover. Figure 3 below shows a misalignment condition.

This misaligned event condition arises because an ethernet event time stamp occurs at the beginning of a packet and time passes before the packet is determined to be a valid synchronization packet. The misaligned event condition occurs if the rollover occurs in the middle, after the packet time stamp has been taken, but before the packet has been determined to be a valid time sync packet.

**Figure 14-11. Event FIFO Misalignment Condition**

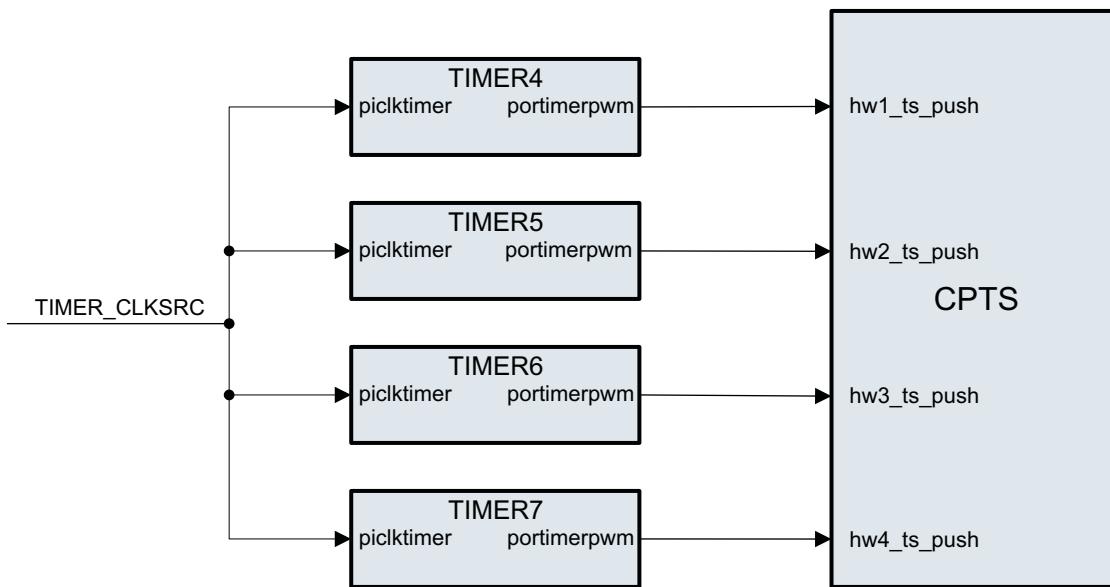

Host software must detect and correct for misaligned event conditions. For every event after a rollover and before a half-rollover, software must examine the time stamp most significant bit. If bit 31 of the time stamp value is low (0x0000\_0000 through 0x7FFF\_FFFF), then the event time stamp was taken after the rollover and no correction is required.

If the value is high (0x8000\_0000 through 0xFFFF\_FFFF), the time stamp value was taken before the rollover and a misalignment is detected. The misaligned case indicates to software that it must subtract one from the upper count value stored in software to calculate the correct time for the misaligned event. The misaligned event occurs only on the rollover boundary and not on the half-rollover boundary. Software only needs to check for misalignment from a rollover event to a half-rollover event.

#### 14.3.7.2.4.4 Hardware Time Stamp Push Event

There are four hardware time stamp inputs (HW1/4\_TS\_PUSH) that can cause hardware time stamp push events to be loaded into the Event FIFO. Each hardware time stamp input is internally connected to the PORTIMERPW output of each timer as shown in Figure 4.

Figure 14-12. HW1/4\_TSP\_PUSH Connection

The event is loaded into the event FIFO on the rising edge of the timer, and the PORT\_NUMBER field in the EVENT\_HIGH register indicates the hardware time stamp input that caused the event.

Each hardware time stamp input must be asserted for at least 10 periods of the selected RCLK clock. Each input can be enabled or disabled by setting the respective bits in the **CONTROL** register.

Hardware time stamps are intended to be an extremely low frequency signals, such that the event FIFO does not overrun. Software must keep up with the event FIFO and ensure that there is no overrun, or events will be lost.

#### 14.3.7.2.4.5 Ethernet Port Events

##### 14.3.7.2.4.5.1 Ethernet Port Receive Event

Each ethernet port can generate a receive ethernet event. Receive ethernet events are generated for valid received time sync packets. There are two CPTS interfaces for each ethernet receive port. The first is the Px\_TS\_RX\_MII interface and the second is the Px\_TS\_RX\_DEC interface. Information from these interfaces is used to generates an ethernet receive event for each ethernet time sync packet received on the associated port.

The Px\_TS\_RX\_MII interface issues a record signal (pX\_ts\_rx\_mii\_rec) along with a handle (pX\_ts\_rx\_mii\_hdl) for each packet (every packet) that is received on the associated ethernet port. The record signal is a single clock pulse indicating that a receive packet has been detected at the associated port MII interface. The handle value is incremented with each packet and rolls over to zero after 15.

There are 16 possible handle values so there can be a maximum of 16 packets “in flight” from the TS\_RX\_MII to the TS\_RX\_DEC block at any given time. A handle value is reused (not incremented) for any received packet that is shorter than about 31 octets (including preamble). Handle reuse on short packets prevents any possible overrun condition (more than 16 “in flight” packets) if multiple fragments are consecutively received.

Valid receive ethernet time sync events are signaled to the CPTS via the Px\_TS\_RX\_DEC interface. When the pX\_ts\_rx\_dec\_evt is asserted, a valid event is detected and will be loaded into the event FIFO. Only valid receive time sync packets are indicated on the Px\_TS\_RX\_DEC interface. The pX\_ts\_rx\_dec\_hdl, pX\_ts\_rx\_dec\_msg\_type, and pX\_ts\_rx\_dec\_seq\_id signals are registered on an asserted pX\_ts\_rx\_dec\_evt. When a Tx\_TS\_RX\_DEC event is asserted, the handle value is used to retrieve the time stamp that was loaded with the same handle value from the Px\_TS\_RX\_MII interface.

#### 14.3.7.2.4.5.2 Ethernet Port Transmit Event

Each ethernet port can generate a transmit ethernet event. Transmit ethernet events are generated for valid transmitted time sync packets. There are two CPTS interfaces for each ethernet transmit port. The first is the Px\_TS\_TX\_DEC interface and the second is the Px\_TS\_TX\_MII interface. Information from these interfaces is used to generates an ethernet transmit event for each ethernet time sync packet transmitted on the associated port.

Valid ethernet transmit time sync events are signaled to the CPTS via the Px\_TS\_TX\_DEC interface. When the pX\_ts\_tx\_dec\_evnt signal is asserted, a valid time sync event has been detected and will be loaded into the event FIFO. Only valid transmit time sync packets are indicated on the Px\_TS\_RX\_DEC interface. The pX\_ts\_tx\_dec\_hdl, pX\_ts\_tx\_dec\_msg\_type, pX\_ts\_tx\_dec\_seq\_id signals are registered on an asserted pX\_ts\_tx\_dec\_evnt.

The time stamp for the event will be generated and signaled from the Px\_TS\_TX\_MII interface when the packet is actually transmitted. The event will be loaded into the event FIFO when the time stamp is recorded as controlled by the Px\_TS\_TX\_MII interface. The handle value is incremented with each time sync event packet and rolls over to zero after 7. There are 8 possible handle values so there can be a maximum of 8 time sync event packets “in flight” from the TS\_TX\_DEC to the TS\_TX\_MII block at any given time. The handle value increments only on time sync event packets.

The Px\_TS\_TX\_MII interface issues a single clock record signal (pX\_ts\_tx\_mii\_rec) at the beginning of each transmitted packet. If the packet is a time sync event packet then a single clock event signal (pX\_ts\_tx\_mii\_evnt) along with a handle (pX\_ts\_rx\_mii\_hdl) will be issued before the next record signal for the next transmitted packet. The event signal will not be issued for packets that were not indicated as valid time sync event packets on the Px\_TS\_TX\_DEC interface. If consecutive record indications occur without an interleaving event indication, then the packet associated with the first record was not a time sync event packet. The record signal is a single clock pulse indicating that a transmit packet egress has been detected at the associated port MII interface.

**Table 14-21. Values of messageType field**

| Message Type          | Value (hex) |
|-----------------------|-------------|
| Sync                  | 0           |
| Delay_Req             | 1           |
| Pdelay_Req            | 2           |
| Pdelay_Resp           | 3           |
| Reserved              | 4-7         |
| Follow_Up             | 8           |
| Delay_Resp            | 9           |
| Pdelay_Resp_Follow_Up | A           |
| Announce              | B           |
| Signaling             | C           |
| Management            | D           |
| Reserved              | E-F         |

#### 14.3.7.3 Interrupt Handling

When an event is push onto the Event FIFO, an interrupt can be generated to indicate to software that a time sync event occurred. The following steps should be taken to process time sync events using interrupts:

- Enable the TS\_PEND interrupt by setting the TS\_PEND\_EN bit of the CPTS\_INT\_ENABLE register.
- Upon interrupt, read the CPTS\_EVENT\_LOW and CPTS\_EVENT\_HIGH register values.
- Set the EVENT\_POP field (bit zero) of the CPTS\_EVENT\_POP register to pop the previously read value off of the event FIFO.
- Process the interrupt as required by the application software

Software has the option of processing more than a single event from the event FIFO in the interrupt service routine in the following way:

1. Enable the TS\_PEND interrupt by setting the TS\_PEND\_EN bit of the CPTS\_INT\_ENABLE register.
2. Upon interrupt enter the CPTS service routine.
3. Read the CPTS\_EVENT\_LOW and CPTS\_EVENT\_HIGH register values.
4. Set the EVENT\_POP bit of the CPTS\_EVENT\_POP register to pop the previously read value off of the event FIFO.
5. Wait for an amount of time greater than eight CPTS\_RFT\_CLK periods
6. Read the ts\_pend\_raw bit in the CPTS\_INTSTAT\_RAW register to determine if another valid event is in the event FIFO. If it is asserted then goto step 3. Otherwise goto step 7.
7. Process the interrupt(s) as required by the application software

Software also has the option of disabling the interrupt and polling the ts\_pend\_raw bit of the CPTS\_INTSTAT\_RAW register to determine if a valid event is on the event FIFO.

### 14.3.8 MDIO

The MII Management I/F module implements the 802.3 serial management interface to interrogate and control two Ethernet PHYs simultaneously using a shared two-wire bus. Two user access registers to control and monitor up to two PHYs simultaneously.

#### 14.3.8.1 MII Management Interface Frame Formats

The following tables show the read and write format of the 32-bit MII Management interface frames, respectively.

**Table 14-22. MDIO Read Frame Format**

| Preamble       | Start Delimiter | Operation Code | PHY Address | Register Address | Turnaround | Data                    |
|----------------|-----------------|----------------|-------------|------------------|------------|-------------------------|
| 0xFFFFF<br>FFF | 01              | 10             | AAAAA       | RRRRR            | Z0         | DDDD.DDDD.DDD<br>D.DDDD |

**Table 14-23. MDIO Write Frame Format**

| Preamble       | Start Delimiter | Operation Code | PHY Address | Register Address | Turnaround | Data                    |
|----------------|-----------------|----------------|-------------|------------------|------------|-------------------------|
| 0xFFFFF<br>FFF | 01              | 00             | AAAAA       | RRRRR            | 10         | DDDD.DDDD.DDD<br>D.DDDD |

The default or idle state of the two wire serial interface is a logic one. All tri-state drivers should be disabled and the PHY's pull-up resistor will pull the **MDIO** line to a logic one. Prior to initiating any other transaction, the station management entity shall send a preamble sequence of 32 contiguous logic one bits on the **MDIO** line with 32 corresponding cycles on **MDCLK** to provide the PHY with a pattern that it can use to establish synchronization. A PHY shall observe a sequence of 32 contiguous logic one bits on **MDIO** with 32 corresponding **MDCLK** cycles before it responds to any other transaction.

#### Preamble

The start of a frame is indicated by a preamble, which consists of a sequence of 32 contiguous bits all of which are a "1". This sequence provides the PHY a pattern to use to establish synchronization.

#### Start Delimiter

The preamble is followed by the start delimiter which is indicated by a "01" pattern. The pattern assures transitions from the default logic one state to zero and back to one.

#### Operation Code

The operation code for a read is "10", while the operation code for a write is a "00".

#### PHY Address

The PHY address is 5 bits allowing 32 unique values. The first bit transmitted is the MSB of the PHY address.

### Register Address

The Register address is 5 bits allowing 32 registers to be addressed within each PHY. Refer to the 10/100 PHY address map for addresses of individual registers.

### Turnaround

An idle bit time during which no device actively drives the MDIO signal shall be inserted between the register address field and the data field of a read frame in order to avoid contention. During a read frame, the PHY shall drive a zero bit onto MDIO for the first bit time following the idle bit and preceding the Data field. During a write frame, this field shall consist of a one bit followed by a zero bit.

### Data

The Data field is 16 bits. The first bit transmitted and received is the MSB of the data word.

#### 14.3.8.2 Functional Description

The MII Management I/F will remain idle until enabled by setting the enable bit in the MDIOControl register. The MII Management I/F will then continuously poll the link status from within the Generic Status Register of all possible 32 PHY addresses in turn recording the results in the MDIOLink register.

The linksel bit in the MDIOUserPhySel register determines the status input that is used. A change in the link status of the two PHYs being monitored will set the appropriate bit in the MDIOLinkIntRaw register and the MDIOLinkIntMasked register, if enabled by the linkint\_enable bit in the MDIOUserPhySel register.

The MDIOAlive register is updated by the MII Management I/F module if the PHY acknowledged the read of the generic status register. In addition, any PHY register read transactions initiated by the host also cause the MDIOAlive register to be updated.

At any time, the host can define a transaction for the MII Management interface module to undertake using the data, phyadr, regadr, and write fields in a MDIOUserAccess register. When the host sets the go bit in this register, the MII Management interface module will begin the transaction without any further intervention from the host. Upon completion, the MII Management interface will clear the go bit and set the userinraw bit in the MDIOUserIntRaw register corresponding to the MDIOUserAccess register being used.

The corresponding bit in the MDIOUserIntMasked register may also be set depending on the mask setting in the MDIOUserIntMaskSet and MDIOUserIntMaskClr registers. A round-robin arbitration scheme is used to schedule transactions which may queued by the host in different MDIOUserAccess registers. The host should check the status of the go bit in the MDIOUserAccess register before initiating a new transaction to ensure that the previous transaction has completed. The host can use the ack bit in the MDIOUserAccess register to determine the status of a read transaction.

It is necessary for software to use the MII Management interface module to setup the auto-negotiation parameters of each PHY attached to a MAC port, retrieve the negotiation results, and setup the MACControl register in the corresponding MAC.

## 14.4 Software Operation

### 14.4.1 Transmit Operation

After reset the host must write zeroes to all Tx DMA State head descriptor pointers. The Tx port may then be enabled. To initiate packet transmission the host constructs transmit queues in memory (one or more packets for transmission) and then writes the appropriate Tx DMA state head descriptor pointers. For each buffer added to a transmit queue, the host must initialize the Tx buffer descriptor values as follows:

1. Write the Next Descriptor Pointer with the 32-bit aligned address of the next descriptor in the queue (zero if last descriptor).
2. Write the Buffer Pointer with the byte aligned address of the buffer data.
3. Write the Buffer Length with the number of bytes in the buffer.
4. Write the Buffer Offset with the number of bytes in the offset to the data (nonzero with SOP only).
5. Set the SOP, EOP, and Ownership bits as appropriate.
6. Clear the End Of Queue bit.

The port begins Tx packet transmission on a given channel when the host writes the channel's Tx queue head descriptor pointer with the address of the first buffer descriptor in the queue (nonzero value). Each channel may have one or more queues, so each channel may have one or more head descriptor pointers. The first buffer descriptor for each Tx packet must have the Start of Packet (SOP) bit and the Ownership bit set to one by the host. The last buffer descriptor for each Tx packet must have the End of Packet (EOP) bit set to one by the host.

The port will transmit packets until all queued packets have been transmitted and the queue(s) are empty. When each packet transmission is complete, the port will clear the Ownership bit in the packet's SOP buffer descriptor and issue an interrupt to the host by writing the packet's last buffer descriptor address to the queue's Tx DMA State Completion Pointer. The interrupt is generated by the write, regardless of the value written.

When the last packet in a queue has been transmitted, the port sets the End Of Queue bit in the EOP buffer descriptor, clears the Ownership bit in the SOP Descriptor, zeroes the appropriate DMA state head descriptor pointer, and then issues a Tx interrupt to the host by writing to the queue's associated Tx completion pointer (address of the last buffer descriptor processed by the port). The port issues a maskable level interrupt (which may then be routed through external interrupt control logic to the host).

On interrupt from the port, the host processes the buffer queue, detecting transmitted packets by the status of the Ownership bit in the SOP buffer descriptor. If the Ownership bit is cleared to zero, then the packet has been transmitted and the host may reclaim the buffers associated with the packet. The host continues queue processing until the end of the queue or until a SOP buffer descriptor is read that contains a set Ownership bit indicating that the packet transmission is not complete.

The host determines that all packets in the queue have been transmitted when the last packet in the queue has a cleared Ownership bit in the SOP buffer descriptor, the End of Queue bit is set in the last packet EOP buffer descriptor, and the Next Descriptor Pointer of the last packet EOP buffer descriptor is zero. The host acknowledges an interrupt by writing the address of the last buffer descriptor to the queue's associated Tx Completion Pointer in the Tx DMA State.

If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted. If the host written buffer address value is equal to the port written value, then the level interrupt is deasserted. The port write to the completion pointer actually stores the value in the state register (ram). The host written value is actually not written to the register location. The host written value is compared to the register contents (which was written by the port) and if the two values are equal, the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

A misqueued packet condition may occur when the host adds a packet to a queue for transmission as the port finishes transmitting the previous last packet in the queue. The misqueued packet is detected by the host when queue processing detects a cleared Ownership bit in the SOP buffer descriptor, a set End of Queue bit in the EOP buffer descriptor, and a nonzero Next Descriptor Pointer in the EOP buffer descriptor.

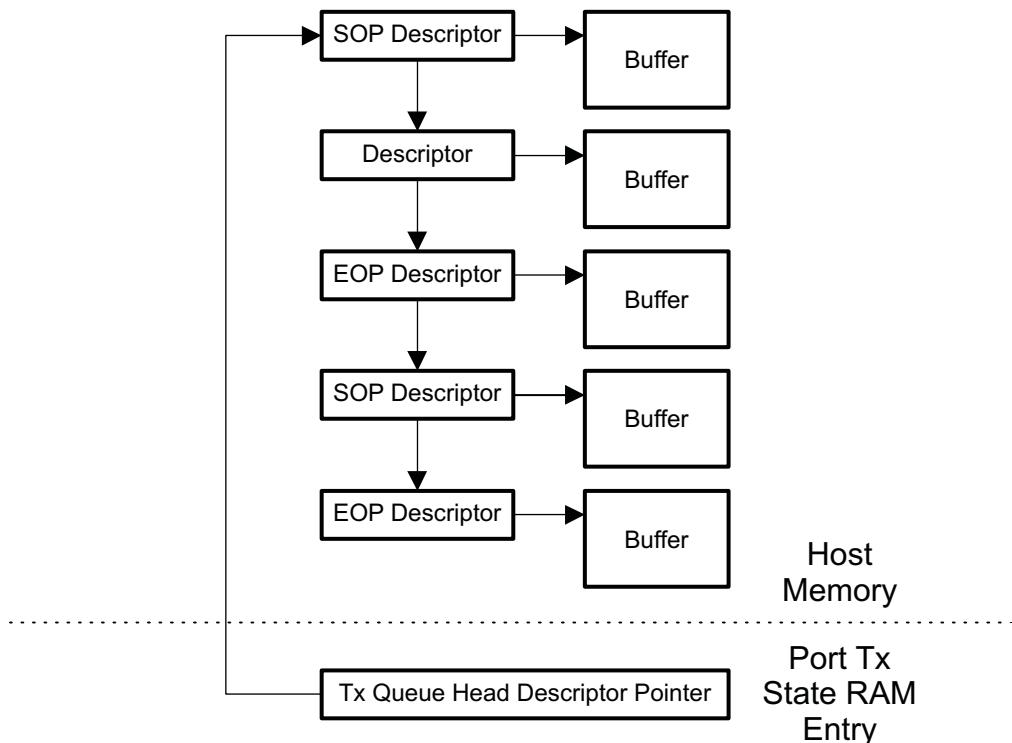

A misqueued packet means that the port read the last EOP buffer descriptor before the host added the new last packet to the queue, so the port determined queue empty just before the last packet was added. The host corrects the misqueued packet condition by initiating a new packet transfer for the misqueued packet by writing the misqueued packet's SOP buffer descriptor address to the appropriate DMA State Tx Queue head Descriptor Pointer.

The host may add packets to the tail end of an active Tx queue at any time by writing the Next Descriptor Pointer to the current last descriptor in the queue. If a Tx queue is empty (inactive), the host may initiate packet transmission at any time by writing the appropriate Tx DMA State head descriptor pointer.

The host software should always check for and reinitiate transmission for misqueued packets during queue processing on interrupt from the port. In order to preclude software underrun, the host should avoid adding buffers to an active queue for any Tx packet that is not complete and ready for transmission.

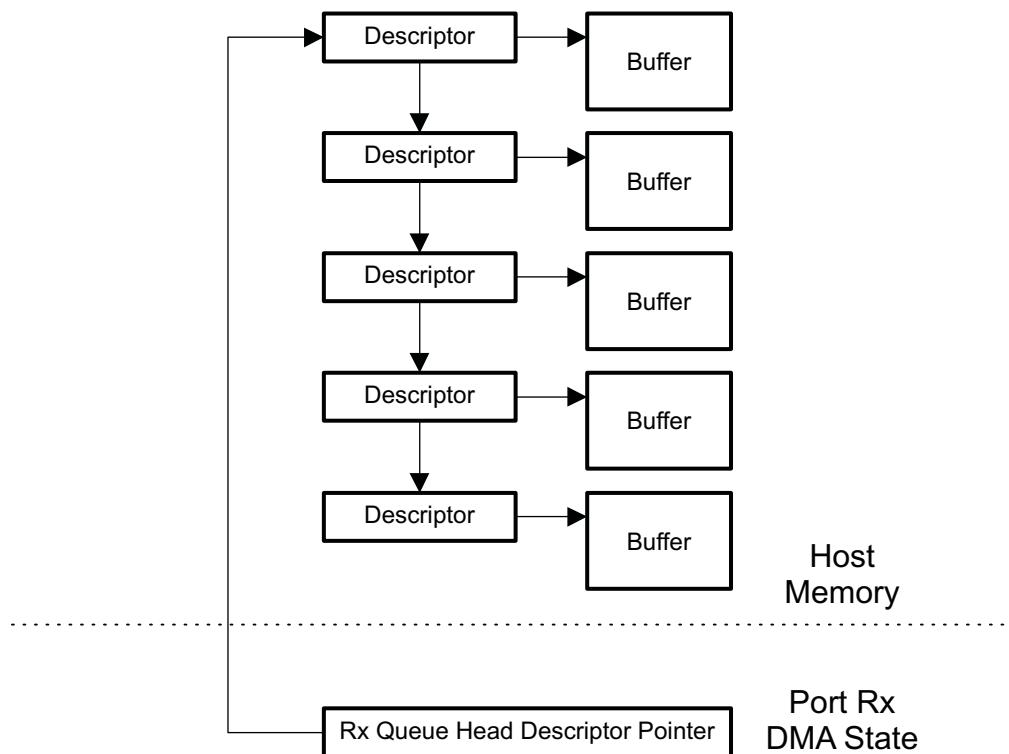

The port determines that a packet is the last packet in the queue by detecting the End of Packet bit set with a zero Next Descriptor Pointer in the packet buffer descriptor. If the End of Packet bit is set and the Next Descriptor Pointer is nonzero, then the queue still contains one or more packets to be transmitted. If the EOP bit is set with a zero Next Descriptor Pointer, then the port will set the EOQ bit in the packet's EOP buffer descriptor and then zero the appropriate head descriptor pointer previous to interrupting the port (by writing the completion pointer) when the packet transmission is complete.

**Figure 14-13. Port TX State RAM Entry**

#### 14.4.2 Receive Operation

**Figure 14-14. Port RX DMA State**

After reset the host must write zeroes to all Rx DMA State head descriptor pointers. The Rx port may then be enabled. To initiate packet reception, the host constructs receive queues in memory and then writes the appropriate Rx DMA state head descriptor pointer. For each Rx buffer descriptor added to the queue, the host must initialize the Rx buffer descriptor values as follows:

- Write the Next Descriptor Pointer with the 32-bit aligned address of the next descriptor in the queue (zero if last descriptor)
- Write the Buffer Pointer with the byte aligned address of the buffer data
- Clear the Offset field
- Write the Buffer Length with the number of bytes in the buffer
- Clear the SOP, EOP, and EOQ bits
- Set the Ownership bit

The host enables packet reception on a given channel by writing the address of the first buffer descriptor in the queue (nonzero value) to the channel's head descriptor pointer in the channel's Rx DMA state.

When packet reception begins on a given channel, the port fills each Rx buffer with data in order starting with the first buffer and proceeding through the Rx queue. If the Buffer Offset in the Rx DMA State is nonzero, then the port will begin writing data after the offset number of bytes in the SOP buffer. The port performs the following operations at the end of each packet reception:

- Overwrite the buffer length in the packet's EOP buffer descriptor with the number of bytes actually received in the packet's last buffer. The host initialized value is the buffer size. The overwritten value will be less than or equal to the host initialized value.
- Set the EOP bit in the packet's EOP buffer descriptor.
- Set the EOQ bit in the packet's EOP buffer descriptor if the current packet is the last packet in the queue.
- Overwrite the packet's SOP buffer descriptor Buffer Offset with the Rx DMA state value (the host initialized the buffer descriptor Buffer Offset value to zero). All non SOP buffer descriptors must have a zero Buffer Offset initialized by the host.

- Overwrite the packet's SOP buffer descriptor buffer length with the number of valid data bytes in the buffer. If the buffer is filled up, the buffer length will be the buffer size minus buffer offset.
- Set the SOP bit in the packet's SOP buffer descriptor.
- Write the SOP buffer descriptor Packet Length field.
- Clear the Ownership bit in the packet's SOP buffer descriptor.
- Issue an Rx host interrupt by writing the address of the packet's last buffer descriptor to the queue's Rx DMA State Completion Pointer. The interrupt is generated by the write to the Rx DMA State Completion Pointer address location, regardless of the value written.

On interrupt the host processes the Rx buffer queue detecting received packets by the status of the Ownership bit in each packet's SOP buffer descriptor. If the Ownership bit is cleared then the packet has been completely received and is available to be processed by the host.

The host may continue Rx queue processing until the end of the queue or until a buffer descriptor is read that contains a set Ownership bit indicating that the next packet's reception is not complete. The host determines that the Rx queue is empty when the last packet in the queue has a cleared Ownership bit in the SOP buffer descriptor, a set End of Queue bit in the EOP buffer descriptor, and the Next Descriptor Pointer in the EOP buffer descriptor is zero.

A misqueued buffer may occur when the host adds buffers to a queue as the port finishes the reception of the previous last packet in the queue. The misqueued buffer is detected by the host when queue processing detects a cleared Ownership bit in the SOP buffer descriptor, a set End of Queue bit in the EOP buffer descriptor, and a nonzero Next Descriptor Pointer in the EOP buffer descriptor.

A misqueued buffer means that the port read the last EOP buffer descriptor before the host added buffer descriptor(s) to the queue, so the port determined queue empty just before the host added more buffer descriptor(s). In the transmit case, the packet transmission is delayed by the time required for the host to determine the condition and reinitiate the transaction, but the packet is not actually lost. In the receive case, receive overrun condition may occur in the misqueued buffer case.

If a new packet reception is begun during the time that the port has determined the end of queue condition, then the received packet will overrun (start of packet overrun). If the misqueued buffer occurs during the middle of a packet reception then middle of packet overrun may occur. If the misqueued buffer occurs after the last packet has completed, and is corrected before the next packet reception begins, then overrun will not occur. The host acts on the misqueued buffer condition by writing the added buffer descriptor address to the appropriate Rx DMA State Head Descriptor Pointer.

#### **14.4.3 Initializing the MDIO Module**

The following steps are performed by the application software or device driver to initialize the MDIO device:

1. Configure the PREAMBLE and CLKDIV bits in the MDIO control register (MDIOCONTROL).
2. Enable the MDIO module by setting the ENABLE bit in MDIOCONTROL.
3. The MDIO PHY alive status register (MDIOALIVE) can be read in polling fashion until a PHY connected to the system responded, and the MDIO PHY link status register (MDIOLINK) can determine whether this PHY already has a link.
4. Setup the appropriate PHY addresses in the MDIO user PHY select register (MDIOUSERPHYSEL $n$ ), and set the LINKINTENB bit to enable a link change event interrupt if desirable.
- If an interrupt on general MDIO register access is desired, set the corresponding bit in the MDIO user command complete interrupt mask set register (MDIOUSERINTMASKSET) to use the MDIO user access register (MDIOUSERACCESS $n$ ). Since only one PHY is used in this device, the application software can use one MDIOUSERACCESS $n$  to trigger a completion interrupt; the other MDIOUSERACCESS $n$  is not setup.

#### **14.4.4 Writing Data to a PHY Register**

The MDIO module includes a user access register (MDIOUSERACCESS $n$ ) to directly access a specified PHY device. To write a PHY register, perform the following:

1. Check to ensure that the GO bit in the MDIO user access register (MDIOUSERACCESS $n$ ) is cleared.

2. Write to the GO, WRITE, REGADR, PHYADR, and DATA bits in MDIOUSERACCESS $n$  corresponding to the PHY and PHY register you want to write.
3. The write operation to the PHY is scheduled and completed by the MDIO module. Completion of the write operation can be determined by polling the GO bit in MDIOUSERACCESS $n$  for a 0.
4. Completion of the operation sets the corresponding USERINTRAW bit (0 or 1) in the MDIO user command complete interrupt register (MDIOUSERINTRAW) corresponding to USERACCESS $n$  used. If interrupts have been enabled on this bit using the MDIO user command complete interrupt mask set register (MDIOUSERINTMASKSET), then the bit is also set in the MDIO user command complete interrupt register (MDIOUSERINTMASKED) and an interrupt is triggered on the CPU.

#### **14.4.5 Reading Data from a PHY Register**

The MDIO module includes a user access register (MDIOUSERACCESS $n$ ) to directly access a specified PHY device. To read a PHY register, perform the following:

1. Check to ensure that the GO bit in the MDIO user access register (MDIOUSERACCESS $n$ ) is cleared.
2. Write to the GO, REGADR, and PHYADR bits in MDIOUSERACCESS $n$  corresponding to the PHY and PHY register you want to read.
3. The read data value is available in the DATA bits in MDIOUSERACCESS $n$  after the module completes the read operation on the serial bus. Completion of the read operation can be determined by polling the GO and ACK bits in MDIOUSERACCESS $n$ . After the GO bit has cleared, the ACK bit is set on a successful read.
4. Completion of the operation sets the corresponding USERINTRAW bit (0 or 1) in the MDIO user command complete interrupt register (MDIOUSERINTRAW) corresponding to USERACCESS $n$  used. If interrupts have been enabled on this bit using the MDIO user command complete interrupt mask set register (MDIOUSERINTMASKSET), then the bit is also set in the MDIO user command complete interrupt register (MDIOUSERINTMASKED) and an interrupt is triggered on the CPU.

#### **14.4.6 Initialization and Configuration of CPSW**

To configure the 3PSW Ethernet Subsystem for operation the host must perform the following:

- Select the Interface (GMII/RGMII/MII) Mode in the Control Module.
- Configure pads (PIN muxing) as per the Interface Selected using the appropriate pin muxing conf\_xxx registers in the Control Module.
- Enable the 3PSW Ethernet Subsystem Clocks. See [Section 14.2.2](#) and [Section 8.1](#) to enable the appropriate clocks.
- Configure the PRCM Registers CM\_PER\_CPSW\_CLKSTCTRL and CM\_PER\_CPSW\_CLKSTCTRL to enable power and clocks to the 3PSW Ethernet Subsystem. See [Section 8.1](#) for register details.
- Apply soft reset to 3PSW Subsystem, CPSW\_3G, CPGMAC\_SL1/2, and CPDMA (see the soft reset registers in the following sections).
- Initialize the HDPs (Header Description Pointer) and CPs (Completion Pointer) to NULL
- Configure the Interrupts (see [Chapter 6](#)).
- Configure the CPSW\_3G Control register.
- Configure the Statistics Port Enable register
- Configure the ALE. (See [Section 14.3.2.7](#).)
- Configure the MDIO.
- Configure the CPDMA receive DMA controller.
- Configure the CPDMA transmit DMA controller.
- Configure the CPPI Tx and Rx Descriptors.
- Configure CPGMAC\_SL1 and CPGMAC\_SL2 as per the desired mode of operations.
- Start up RX and TX DMA (write to HDP of Rx and Tx).
- Wait for the completion of the transfer (HDP cleared to zero).

## 14.5 Ethernet Subsystem Registers

### 14.5.1 CPSW\_ALE Registers

Table 14-24 lists the memory-mapped registers for the CPSW\_ALE. All register offset addresses not listed in Table 14-24 should be considered as reserved locations and the register contents should not be modified.

**Table 14-24. CPSW\_ALE REGISTERS**

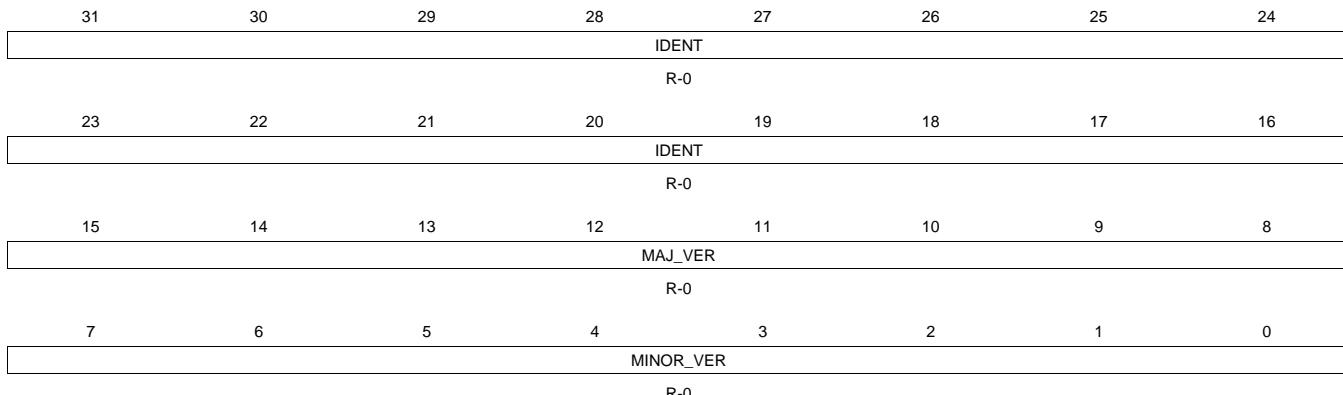

| Offset | Acronym      | Register Name                                 | Section                           |
|--------|--------------|---|-----------------------------------|

|           |    |          |    |               | R/W-0         |    |    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-29. TBLCTL Register Field Descriptions**

| Bit | Field         | Type  | Reset | Description   |
|-----|---------------|-------|-------|---|
| 31  | WRITE_RDZ     | R/W-0 | 0     | Write Bit - This bit is always read as zero. Writing a 1 to this bit causes the three table word register values to be written to the entry_pointer location in the address table. Writing a 0 to this bit causes the three table word register values to be loaded from the entry_pointer location in the address table so that they may be subsequently read. A read of any ALE address location will be stalled until the read or write has completed. |
| 9-0 | ENTRY_POINTER | R/W-0 | 0     | Table Entry Pointer - The entry_pointer contains the table entry value that will be read/written with accesses to the table word registers.   |

#### 14.5.1.6 TBLW2 Register (offset = 34h) [reset = 0h]

#### 14.5.2.1 TX\_IDVER Register (offset = 0h) [reset = 180108h]

TX\_IDVER is shown in [Figure 14-29](#) and described in [Table 14-40](#).

##### CPDMA\_REGS TX IDENTIFICATION AND VERSION REGISTER

**Figure 14-29. TX\_IDVER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-40. TX\_IDVER Register Field Descriptions**

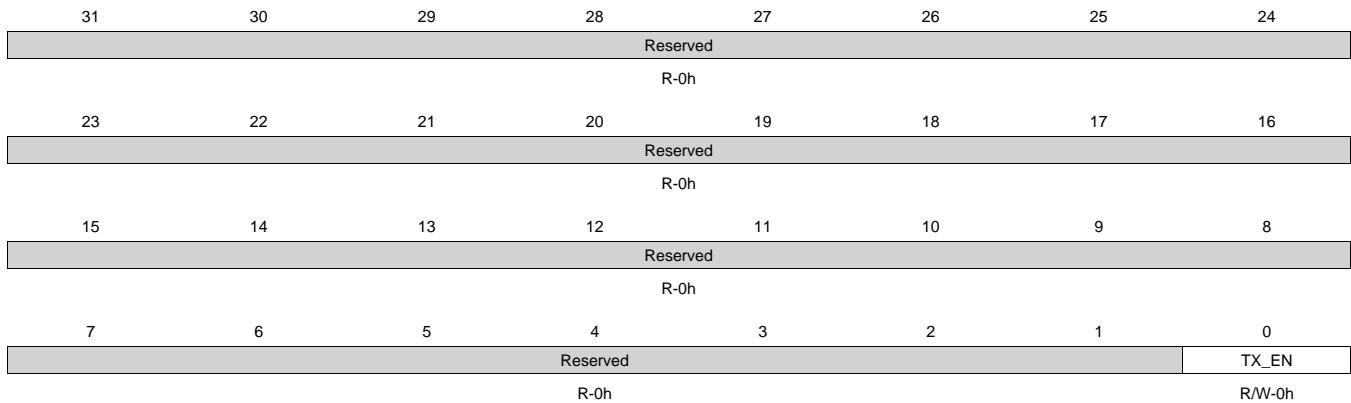

| Bit   | Field        | Type | Reset | Description   |
|-------|--------------|------|-------|---|
| 31-16 | TX_IDENT     | R    | 18h   | TX Identification Value   |
| 15-8  | TX_MAJOR_VER | R    | 1h    | TX Major Version Value - The value read is the major version number |
| 7-0   | TX_MINOR_VER | R    | 8h    | TX Minor Version Value - The value read is the minor version number |

#### 14.5.2.2 TX\_CONTROL Register (offset = 4h) [reset = 0h]

TX\_CONTROL is shown in [Figure 14-30](#) and described in [Table 14-41](#).

##### CPDMA\_REGS TX CONTROL REGISTER

**Figure 14-30. TX\_CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-41. TX\_CONTROL Register Field Descriptions**

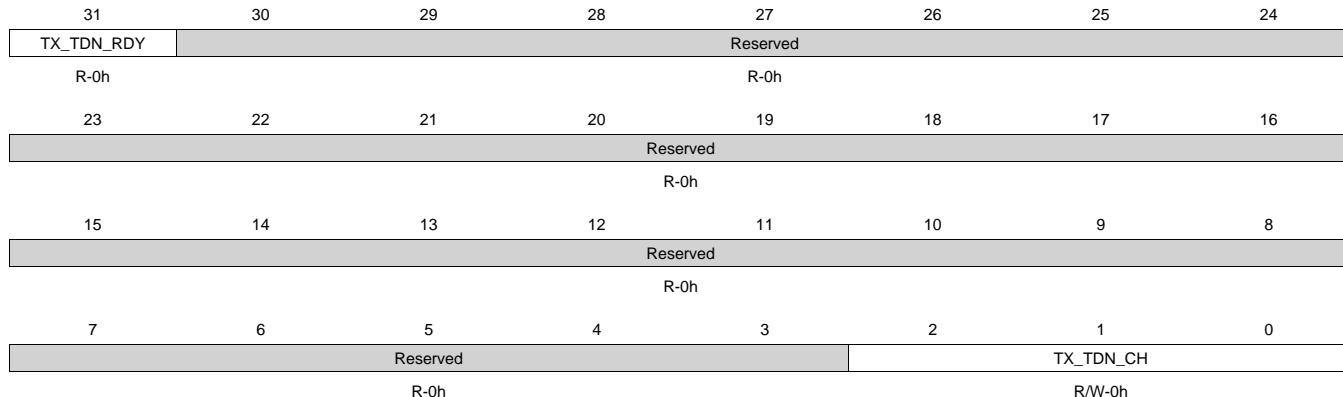

| Bit  | Field    | Type | Reset | Description                              |
|------|----------|------|-------|--|
| 31-1 | Reserved | R    | 0h    |  |
| 0    | TX_EN    | R/W  | 0h    | TX Enable<br>0 - Disabled<br>1 - Enabled |

#### 14.5.2.3 TX\_TEARDOWN Register (offset = 8h) [reset = 0h]

TX\_TEARDOWN is shown in [Figure 14-31](#) and described in [Table 14-42](#).

##### CPDMA\_REGS TX TEARDOWN REGISTER

**Figure 14-31. TX\_TEARDOWN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-42. TX\_TEARDOWN Register Field Descriptions**

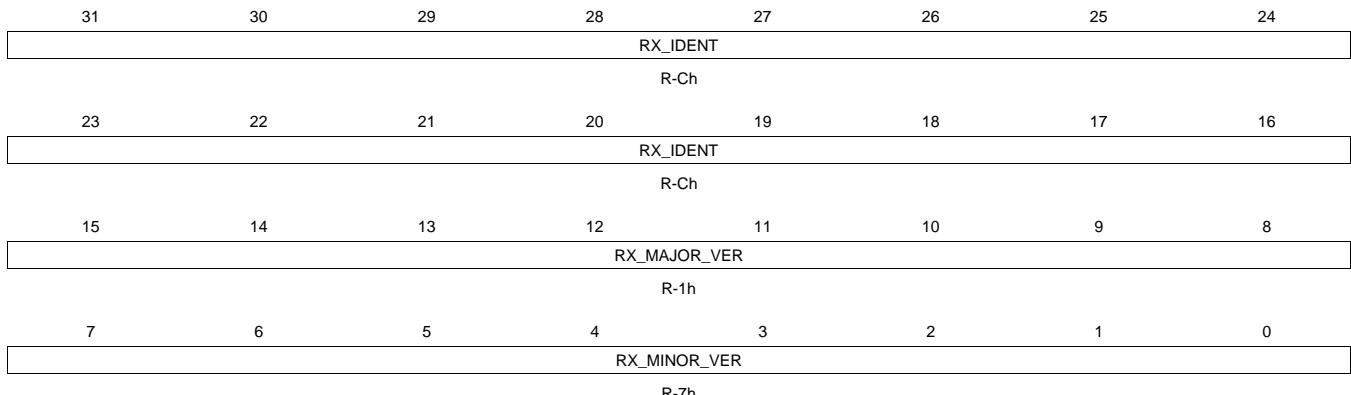

| Bit  | Field     | Type | Reset | Description  |
|------|-----------|------|-------|--|
| 31   | TX_TDNRDY | R    | 0h    | Tx Teardown Ready - read as zero, but is always assumed to be one (unused).  |
| 30-3 | Reserved  | R    | 0h    |  |
| 2-0  | TX_TDNRDY | R/W  | 0h    | Tx Teardown Channel - Transmit channel teardown is commanded by writing the encoded value of the transmit channel to be torn down.<br>The teardown register is read as zero.<br>000 - teardown transmit channel 0 ...<br>111 - teardown transmit channel 7 |

#### 14.5.2.4 RX\_IDVER Register (offset = 10h) [reset = C0107h]

RX\_IDVER is shown in [Figure 14-32](#) and described in [Table 14-43](#).

##### CPDMA\_REGS RX IDENTIFICATION AND VERSION REGISTER

**Figure 14-32. RX\_IDVER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-43. RX\_IDVER Register Field Descriptions**

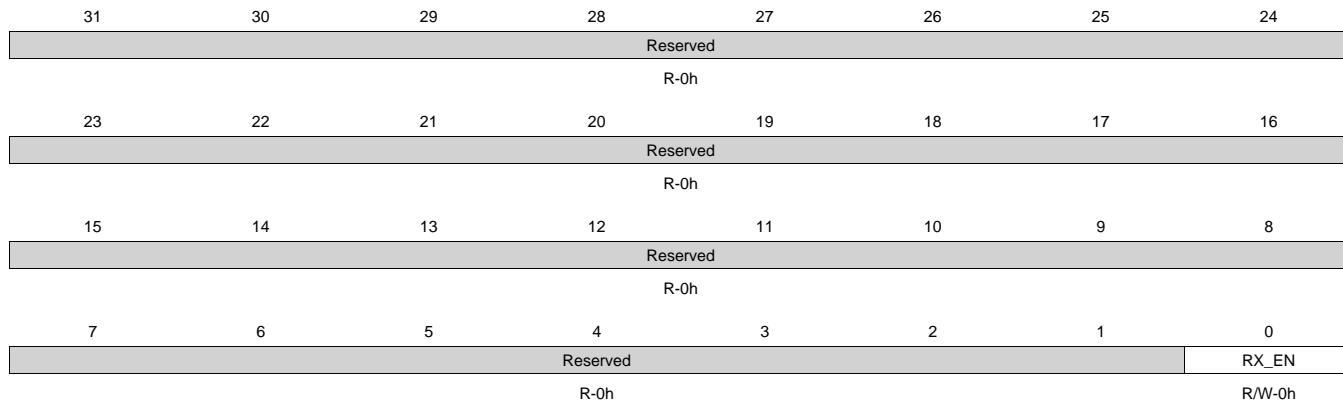

| Bit   | Field        | Type | Reset | Description             |
|-------|--------------|------|-------|-------------------------|
| 31-16 | RX_IDENT     | R    | Ch    | RX Identification Value |
| 15-8  | RX_MAJOR_VER | R    | 1h    | RX Major Version Value  |
| 7-0   | RX_MINOR_VER | R    | 7h    | RX Minor Version Value  |

#### 14.5.2.5 RX\_CONTROL Register (offset = 14h) [reset = 0h]

RX\_CONTROL is shown in [Figure 14-33](#) and described in [Table 14-44](#).

##### CPDMA\_REGS RX CONTROL REGISTER

**Figure 14-33. RX\_CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-44. RX\_CONTROL Register Field Descriptions**

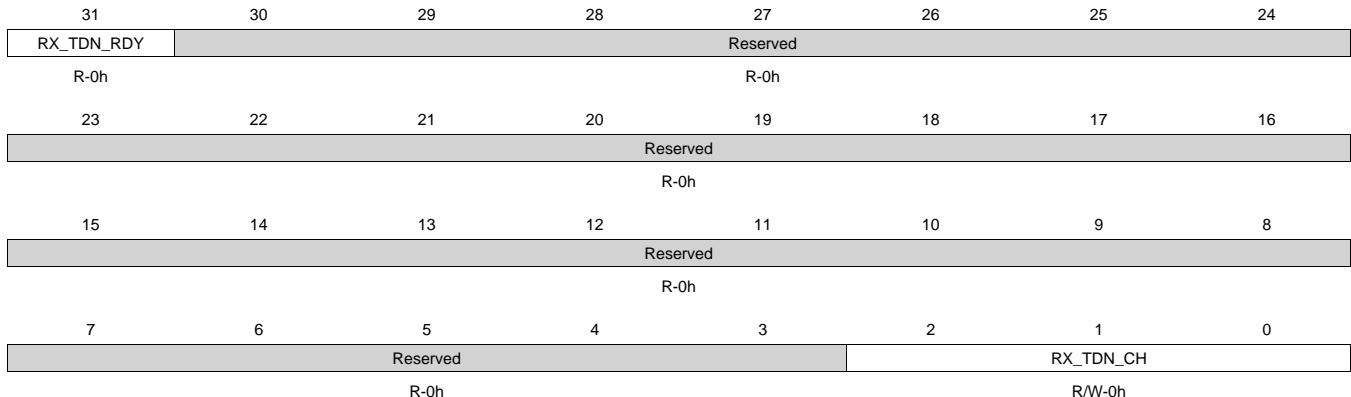

| Bit  | Field    | Type | Reset | Description                                  |
|------|----------|------|-------|--|
| 31-1 | Reserved | R    | 0h    |  |
| 0    | RX_EN    | R/W  | 0h    | RX DMA Enable<br>0 - Disabled<br>1 - Enabled |

#### 14.5.2.6 RX\_TEARDOWN Register (offset = 18h) [reset = 0h]

RX\_TEARDOWN is shown in [Figure 14-34](#) and described in [Table 14-45](#).

##### CPDMA\_REGS RX TEARDOWN REGISTER

**Figure 14-34. RX\_TEARDOWN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-45. RX\_TEARDOWN Register Field Descriptions**

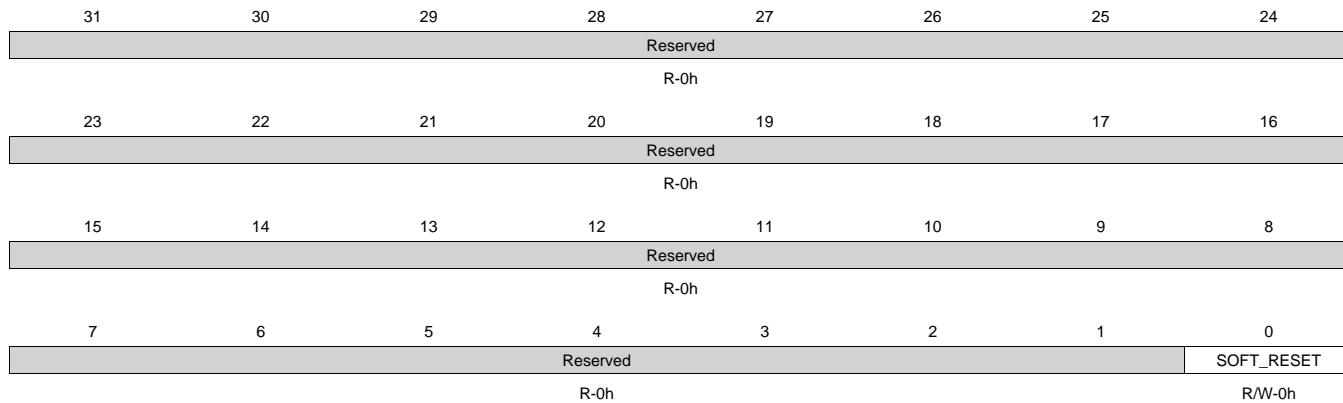

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31   | RX_TDN_RDY | R    | 0h    | Teardown Ready - read as zero, but is always assumed to be one (unused).   |
| 30-3 | Reserved   | R    | 0h    |  |
| 2-0  | RX_TDN_CH  | R/W  | 0h    | Rx Teardown Channel -Receive channel teardown is commanded by writing the encoded value of the receive channel to be torn down. The teardown register is read as zero.<br>000 - teardown receive channel 0 ...<br>111 - teardown receive channel 7 |

#### 14.5.2.7 CPDMA\_SOFT\_RESET Register (offset = 1Ch) [reset = 0h]

CPDMA\_SOFT\_RESET is shown in [Figure 14-35](#) and described in [Table 14-46](#).

##### CPDMA\_REGS SOFT RESET REGISTER

**Figure 14-35. CPDMA\_SOFT\_RESET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-46. CPDMA\_SOFT\_RESET Register Field Descriptions**

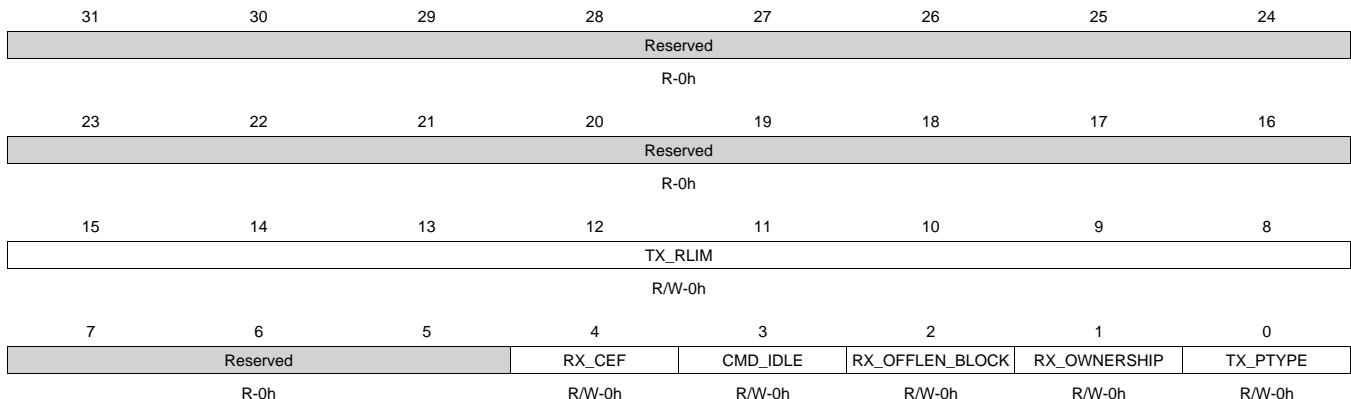

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-1 | Reserved   | R    | 0h    |   |
| 0    | SOFT_RESET | R/W  | 0h    | <p>Software reset - Writing a one to this bit causes the CPDMA logic to be reset.</p> <p>Software reset occurs when the RX and TX DMA Controllers are in an idle state to avoid locking up the VBUSP bus.</p> <p>After writing a one to this bit, it may be polled to determine if the reset has occurred.</p> <p>If a one is read, the reset has not yet occurred.</p> <p>If a zero is read then reset has occurred.</p> |

#### 14.5.2.8 DMACONTROL Register (offset = 20h) [reset = 0h]

DMACONTROL is shown in [Figure 14-36](#) and described in [Table 14-47](#).

##### CPDMA\_REGS CPDMA CONTROL REGISTER

**Figure 14-36. DMACONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-47. DMACONTROL Register Field Descriptions**

| Bit   | Field           | Type | Reset | Description   |
|-------|-----------------|------|-------|---|
| 31-16 | Reserved        | R    | 0h    |   |
| 15-8  | TX_RLIM         | R/W  | 0h    | Transmit Rate Limit Channel Bus<br>00000000 - no rate-limited channels<br>10000000 - channel 7 is rate-limited<br>11000000 - channels 7 downto 6 are rate-limited<br>11100000 - channels 7 downto 5 are rate-limited<br>11110000 - channels 7 downto 4 are rate-limited<br>11111000 - channels 7 downto 3 are rate-limited<br>11111100 - channels 7 downto 2 are rate-limited<br>11111110 - channels 7 downto 1 are rate-limited<br>11111111 - channels 7 downto 0 are rate-limited all others invalid -<br>this bus must be set msb towards lsb.<br>tx_ptype must be set if any tx_rlim bit is set for fixed priority. |
| 7-5   | Reserved        | R    | 0h    |   |
| 4     | RX_CEF          | R/W  | 0h    | RX Copy Error Frames Enable - Enables DMA overrun frames to be transferred to memory (up to the point of overrun).<br>The overrun error bit will be set in the frame EOP buffer descriptor.<br>Overrun frame data will be filtered when rx_cef is not set.<br>Frames coming from the receive FIFO with other error bits set are not effected by this bit.<br>0 - Frames containing overrun errors are filtered.<br>1 - Frames containing overrun errors are transferred to memory.  |
| 3     | CMD_IDLE        | R/W  | 0h    | Command Idle<br>0 - Idle not commanded<br>1 - Idle Commanded (read idle in DMAStatus)   |
| 2     | RX_OFFSET_BLOCK | R/W  | 0h    | Receive Offset/Length word write block.<br>0 - Do not block the DMA writes to the receive buffer descriptor offset/buffer length word.<br>The offset/buffer length word is written as specified in CPPI 3.0.<br>1 - Block all CPDMA DMA controller writes to the receive buffer descriptor offset/buffer length words during CPPI packet processing.<br>when this bit is set, the CPDMA will never write the third word to any receive buffer descriptor.   |

**Table 14-47. DMACONTROL Register Field Descriptions (continued)**

| Bit | Field        | Type | Reset | Description   |
|-----|--------------|------|-------|---|
| 1   | RX_OWNERSHIP | R/W  | 0h    | <p>Receive Ownership Write Bit Value.</p> <p>0 - The CPDMA writes the receive ownership bit to zero at the end of packet processing as specified in CPPI 3.0.</p> <p>1 - The CPDMA writes the receive ownership bit to one at the end of packet processing.</p> <p>Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used.</p> |
| 0   | TX_PTYPE     | R/W  | 0h    | <p>Transmit Queue Priority Type</p> <p>0 - The queue uses a round robin scheme to select the next channel for transmission.</p> <p>1 - The queue uses a fixed (channel 7 highest priority) priority scheme to select the next channel for transmission</p>  |

#### 14.5.2.9 DMASTATUS Register (offset = 24h) [reset = 0h]

DMASTATUS is shown in [Figure 14-37](#) and described in [Table 14-48](#).

##### CPDMA\_REGS CPDMA STATUS REGISTER

**Figure 14-37. DMASTATUS Register**

| 7-0  | Reserved  | R    | 0h    |  |

#### 14.5.2.10 RX\_BUFFER\_OFFSET Register (offset = 28h) [reset = 0h]

RX\_BUFFER\_OFFSET is shown in [Figure 14-38](#) and described in [Table 14-49](#).

CPDMA\_REGS RECEIVE BUFFER OFFSET

**Figure 14-38. RX\_BUFFER\_OFFSET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-49. RX\_BUFFER\_OFFSET Register Field Descriptions**

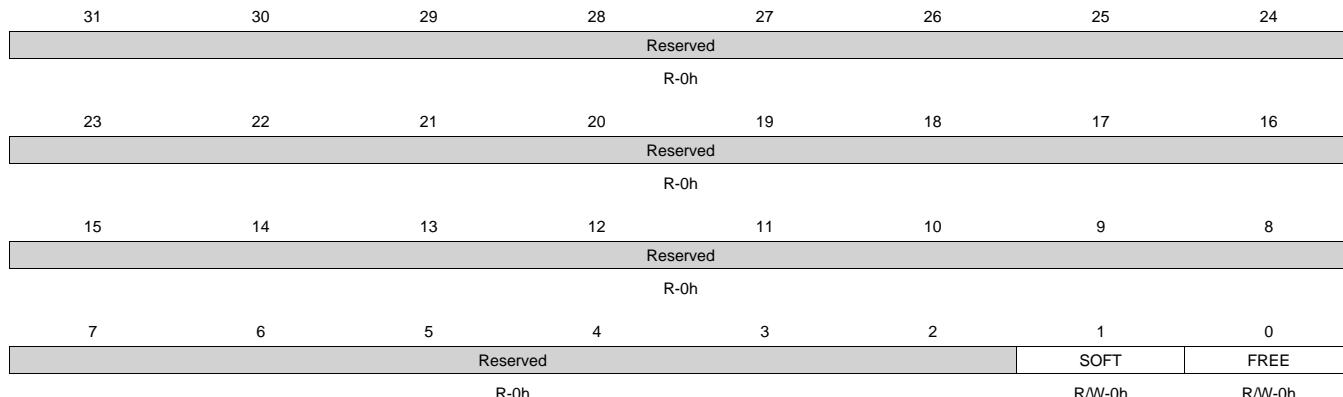

| Bit   | Field            | Type | Reset | Description   |
|-------|------------------|------|-------|---|
| 31-16 | Reserved         | R    | 0h    |   |
| 15-0  | RX_BUFFER_OFFSET | R/W  | 0h    | <p>Receive Buffer Offset Value - The rx_buffer_offset will be written by the port into each frame SOP buffer descriptor buffer_offset field. The frame data will begin after the rx_buffer_offset value of bytes. A value of 0x0000 indicates that there are no unused bytes at the beginning of the data and that valid data begins on the first byte of the buffer.</p> <p>A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer.</p> <p>This value is used for all channels.</p> |

#### 14.5.2.11 EMCONTROL Register (offset = 2Ch) [reset = 0h]

EMCONTROL is shown in [Figure 14-39](#) and described in [Table 14-50](#).

CPDMA\_REGS EMULATION CONTROL

**Figure 14-39. EMCONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-50. EMCONTROL Register Field Descriptions**

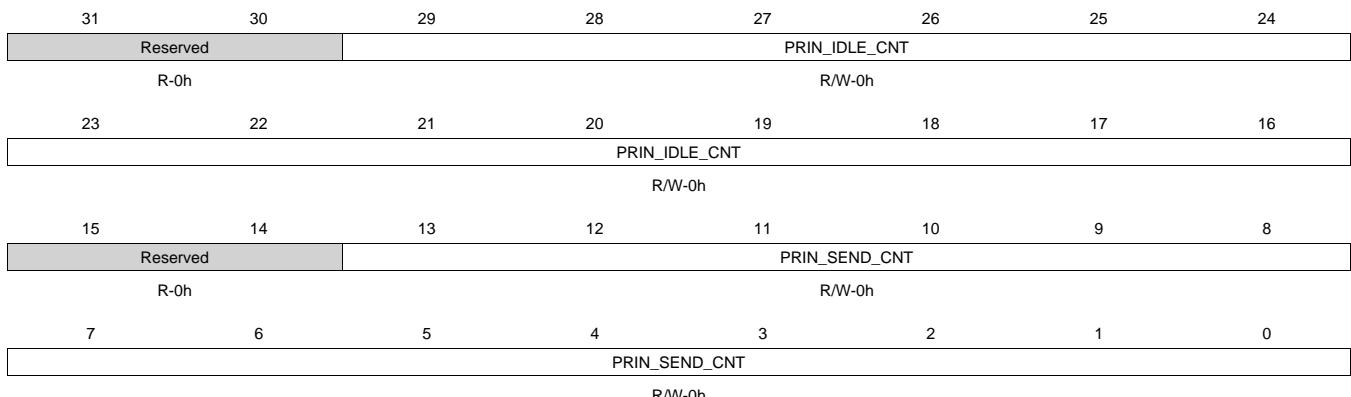

| Bit  | Field    | Type | Reset | Description        |
|------|----------|------|-------|--------------------|
| 31-2 | Reserved | R    | 0h    |                    |
| 1    | SOFT     | R/W  | 0h    | Emulation Soft Bit |
| 0    | FREE     | R/W  | 0h    | Emulation Free Bit |

#### 14.5.2.12 TX\_PRI0\_RATE Register (offset = 30h) [reset = 0h]

TX\_PRI0\_RATE is shown in [Figure 14-40](#) and described in [Table 14-51](#).

CPDMA\_REGS TRANSMIT (INGRESS) PRIORITY 0 RATE

**Figure 14-40. TX\_PRI0\_RATE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-51. TX\_PRI0\_RATE Register Field Descriptions**

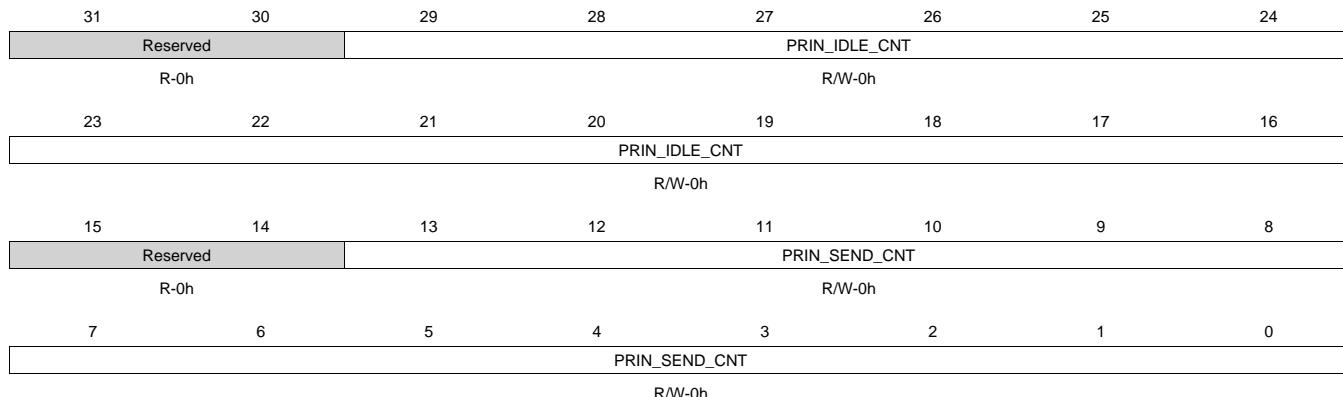

| Bit   | Field         | Type | Reset | Description               |
|-------|---------------|------|-------|---------------------------|
| 31-30 | Reserved      | R    | 0h    |                           |

| 0    | TX0_PEND | R    | 0h    | TX0_PEND masked interrupt read. |

#### 14.5.2.22 TX\_INTMASK\_SET Register (offset = 88h) [reset = 0h]

TX\_INTMASK\_SET is shown in [Figure 14-50](#) and described in [Table 14-61](#).

##### CPDMA\_INT TX INTERRUPT MASK SET REGISTER

**Figure 14-50. TX\_INTMASK\_SET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-61. TX\_INTMASK\_SET Register Field Descriptions**

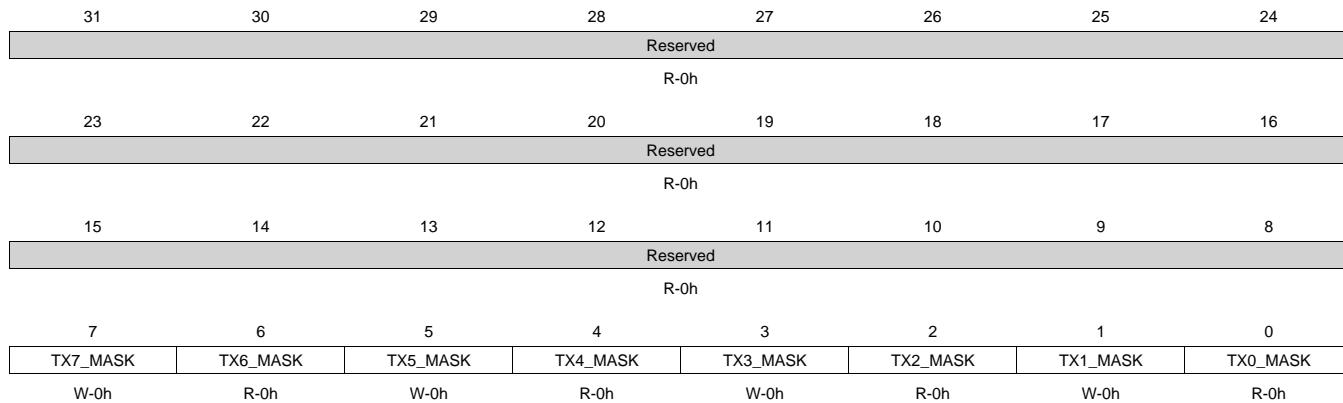

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    |  |
| 7    | TX7_MASK | W    | 0h    | TX Channel 7 Mask - Write one to enable interrupt. |
| 6    | TX6_MASK | R    | 0h    | TX Channel 6 Mask - Write one to enable interrupt. |
| 5    | TX5_MASK | W    | 0h    | TX Channel 5 Mask - Write one to enable interrupt. |
| 4    | TX4_MASK | R    | 0h    | TX Channel 4 Mask - Write one to enable interrupt. |
| 3    | TX3_MASK | W    | 0h    | TX Channel 3 Mask - Write one to enable interrupt. |
| 2    | TX2_MASK | R    | 0h    | TX Channel 2 Mask - Write one to enable interrupt. |
| 1    | TX1_MASK | W    | 0h    | TX Channel 1 Mask - Write one to enable interrupt. |
| 0    | TX0_MASK | R    | 0h    | TX Channel 0 Mask - Write one to enable interrupt. |

#### 14.5.2.23 TX\_INTMASK\_CLEAR Register (offset = 8Ch) [reset = 0h]

TX\_INTMASK\_CLEAR is shown in [Figure 14-51](#) and described in [Table 14-62](#).

##### CPDMA\_INT TX INTERRUPT MASK CLEAR REGISTER

**Figure 14-51. TX\_INTMASK\_CLEAR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-62. TX\_INTMASK\_CLEAR Register Field Descriptions**

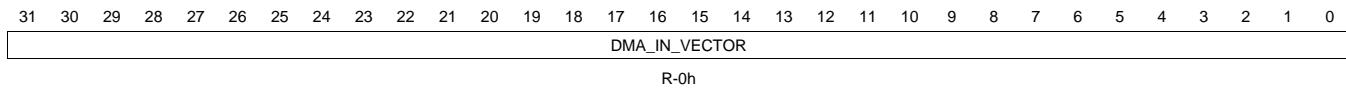

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-8 | Reserved | R    | 0h    |   |
| 7    | TX7_MASK | W    | 0h    | TX Channel 7 Mask - Write one to disable interrupt. |
| 6    | TX6_MASK | R    | 0h    | TX Channel 6 Mask - Write one to disable interrupt. |
| 5    | TX5_MASK | W    | 0h    | TX Channel 5 Mask - Write one to disable interrupt. |
| 4    | TX4_MASK | R    | 0h    | TX Channel 4 Mask - Write one to disable interrupt. |
| 3    | TX3_MASK | W    | 0h    | TX Channel 3 Mask - Write one to disable interrupt. |
| 2    | TX2_MASK | R    | 0h    | TX Channel 2 Mask - Write one to disable interrupt. |
| 1    | TX1_MASK | W    | 0h    | TX Channel 1 Mask - Write one to disable interrupt. |
| 0    | TX0_MASK | R    | 0h    | TX Channel 0 Mask - Write one to disable interrupt. |

#### 14.5.2.24 CPDMA\_IN\_VECTOR Register (offset = 90h) [reset = 0h]

CPDMA\_IN\_VECTOR is shown in [Figure 14-52](#) and described in [Table 14-63](#).

CPDMA\_INT INPUT VECTOR (READ ONLY)

**Figure 14-52. CPDMA\_IN\_VECTOR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-63. CPDMA\_IN\_VECTOR Register Field Descriptions**

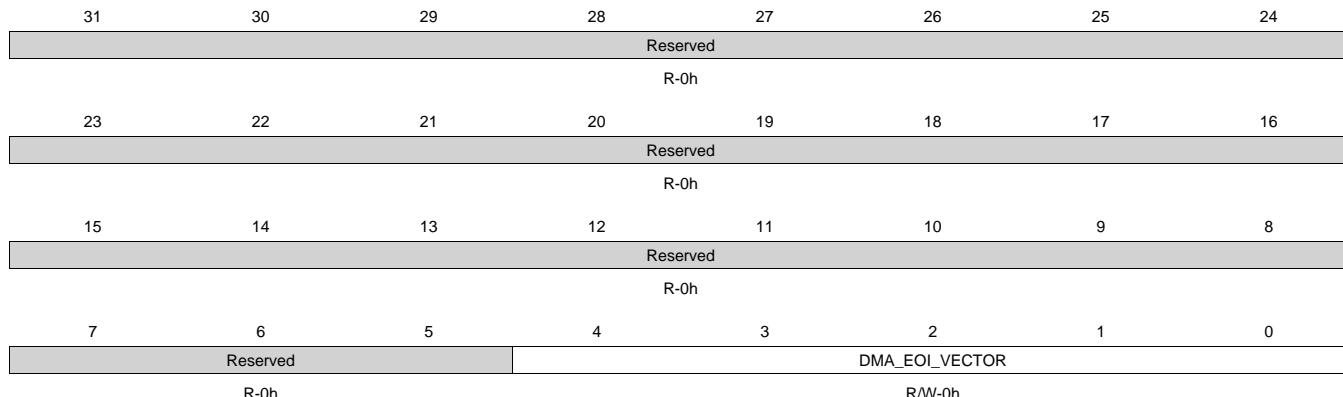

| Bit  | Field         | Type | Reset | Description   |
|------|---------------|------|-------|---|
| 31-0 | DMA_IN_VECTOR | R    | 0h    | DMA Input Vector - The value of DMA_In_Vector is reset to zero, but will change to the IN_VECTOR bus value one clock after reset is deasserted.<br>Thereafter, this value will change to a new IN_VECTOR value one clock after the IN_VECTOR value changes. |

#### 14.5.2.25 CPDMA\_EOI\_VECTOR Register (offset = 94h) [reset = 0h]

CPDMA\_EOI\_VECTOR is shown in [Figure 14-53](#) and described in [Table 14-64](#).

CPDMA\_INT END OF INTERRUPT VECTOR

**Figure 14-53. CPDMA\_EOI\_VECTOR Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-64. CPDMA\_EOI\_VECTOR Register Field Descriptions**

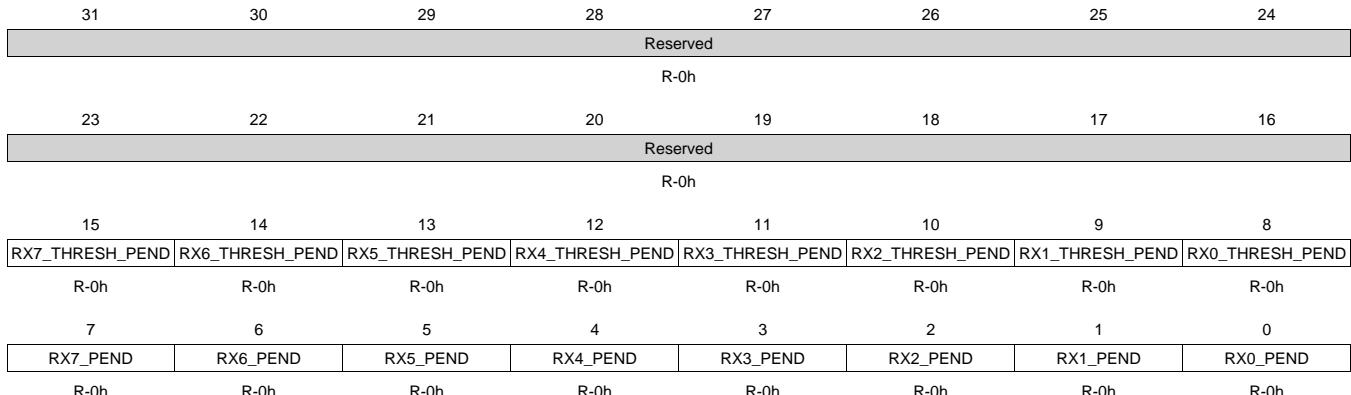

| Bit  | Field          | Type | Reset | Description   |
|------|----------------|------|-------|---|
| 31-5 | Reserved       | R    | 0h    |   |
| 4-0  | DMA_EOI_VECTOR | R/W  | 0h    | DMA End of Interrupt Vector - The EOI_VECTOR(4:0) pins reflect the value written to this location one CLK cycle after a write to this location.<br>The EOI_WR signal is asserted for a single clock cycle after a latency of two CLK cycles when a write is performed to this location. |

#### 14.5.2.26 RX\_INTSTAT\_RAW Register (offset = A0h) [reset = 0h]

RX\_INTSTAT\_RAW is shown in [Figure 14-54](#) and described in [Table 14-65](#).

CPDMA\_INT RX INTERRUPT STATUS REGISTER (RAW VALUE)

**Figure 14-54. RX\_INTSTAT\_RAW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

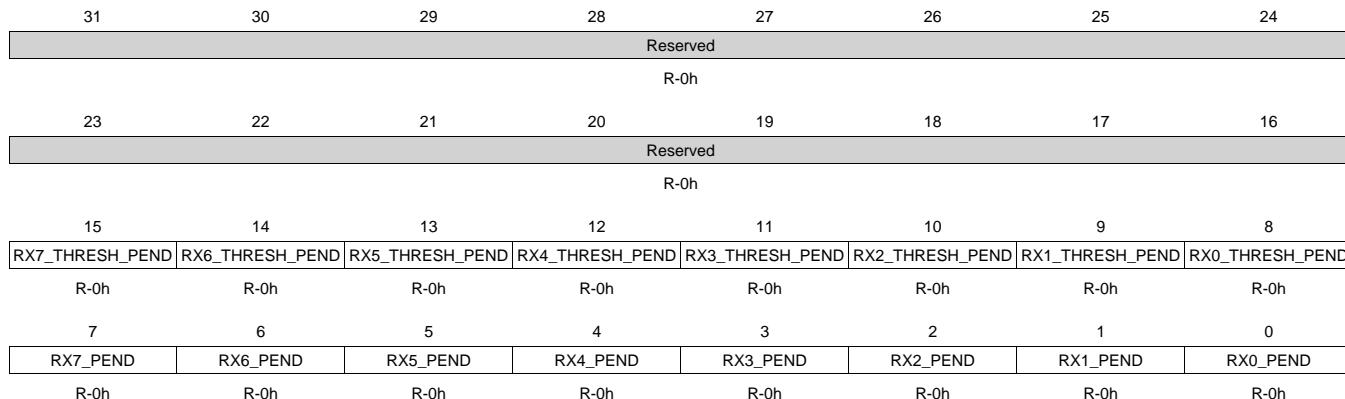

**Table 14-65. RX\_INTSTAT\_RAW Register Field Descriptions**

| Bit   | Field           | Type | Reset | Description                                 |
|-------|-----------------|------|-------|---|
| 31-16 | Reserved        | R    | 0h    |   |
| 15    | RX7_THRESH_PEND | R    | 0h    | RX7_THRESH_PEND raw int read (before mask). |
| 14    | RX6_THRESH_PEND | R    | 0h    | RX6_THRESH_PEND raw int read (before mask). |
| 13    | RX5_THRESH_PEND | R    | 0h    | RX5_THRESH_PEND raw int read (before mask). |
| 12    | RX4_THRESH_PEND | R    | 0h    | RX4_THRESH_PEND raw int read (before mask). |
| 11    | RX3_THRESH_PEND | R    | 0h    | RX3_THRESH_PEND raw int read (before mask). |
| 10    | RX2_THRESH_PEND | R    | 0h    | RX2_THRESH_PEND raw int read (before mask). |

| 31-8 | Reserved      | R    | 0h    |  |
| 7-0  | RX_PENDTHRESH | R/W  | 0h    | Rx Flow Threshold - This field contains the threshold value for issuing receive threshold pending interrupts (when enabled). |

**14.5.2.38 RX4\_PENDTHRESH Register (offset = D0h) [reset = 0h]**

RX4\_PENDTHRESH is shown in [Figure 14-66](#) and described in [Table 14-77](#).

CPDMA\_INT RECEIVE THRESHOLD PENDING REGISTER CHANNEL 4

**Figure 14-66. RX4\_PENDTHRESH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

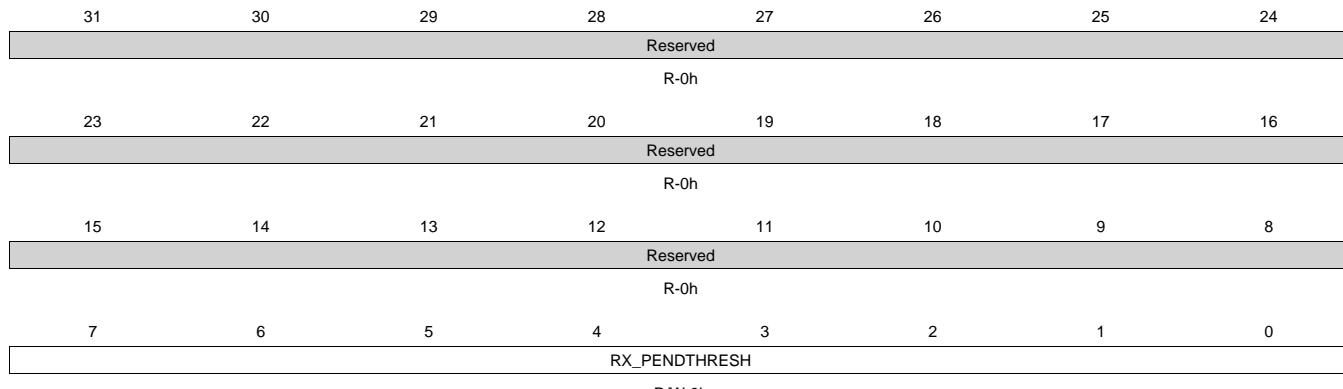

**Table 14-77. RX4\_PENDTHRESH Register Field Descriptions**

| Bit  | Field         | Type | Reset | Description  |
|------|---------------|------|-------|--|
| 31-8 | Reserved      | R    | 0h    |  |
| 7-0  | RX_PENDTHRESH | R/W  | 0h    | Rx Flow Threshold - This field contains the threshold value for issuing receive threshold pending interrupts (when enabled). |

**14.5.2.39 RX5\_PENDTHRESH Register (offset = D4h) [reset = 0h]**

 RX5\_PENDTHRESH is shown in [Figure 14-67](#) and described in [Table 14-78](#).

CPDMA\_INT RECEIVE THRESHOLD PENDING REGISTER CHANNEL 5

**Figure 14-67. RX5\_PENDTHRESH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-78. RX5\_PENDTHRESH Register Field Descriptions**

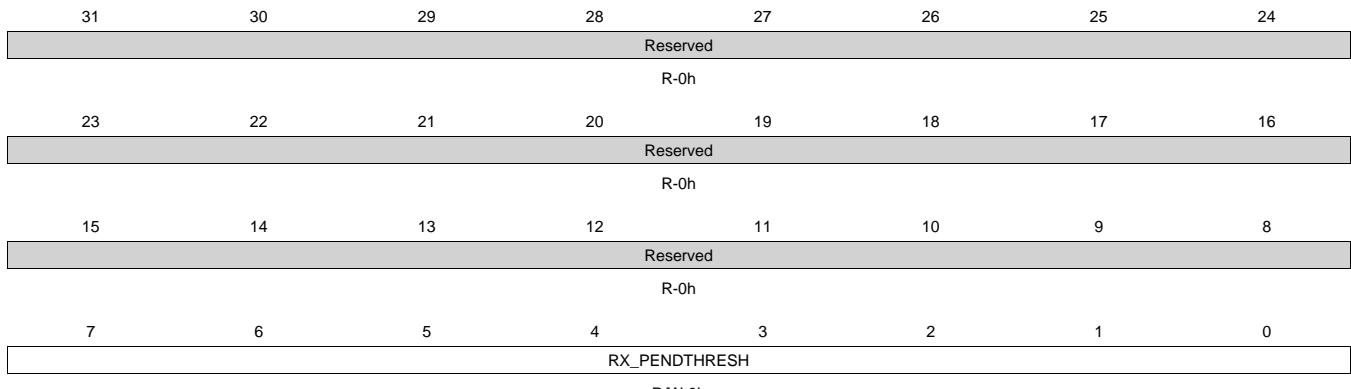

| Bit  | Field         | Type | Reset | Description  |
|------|---------------|------|-------|--|
| 31-8 | Reserved      | R    | 0h    |  |
| 7-0  | RX_PENDTHRESH | R/W  | 0h    | Rx Flow Threshold - This field contains the threshold value for issuing receive threshold pending interrupts (when enabled). |

**14.5.2.40 RX6\_PENDTHRESH Register (offset = D8h) [reset = 0h]**

RX6\_PENDTHRESH is shown in [Figure 14-68](#) and described in [Table 14-79](#).

CPDMA\_INT RECEIVE THRESHOLD PENDING REGISTER CHANNEL 6

**Figure 14-68. RX6\_PENDTHRESH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-79. RX6\_PENDTHRESH Register Field Descriptions**

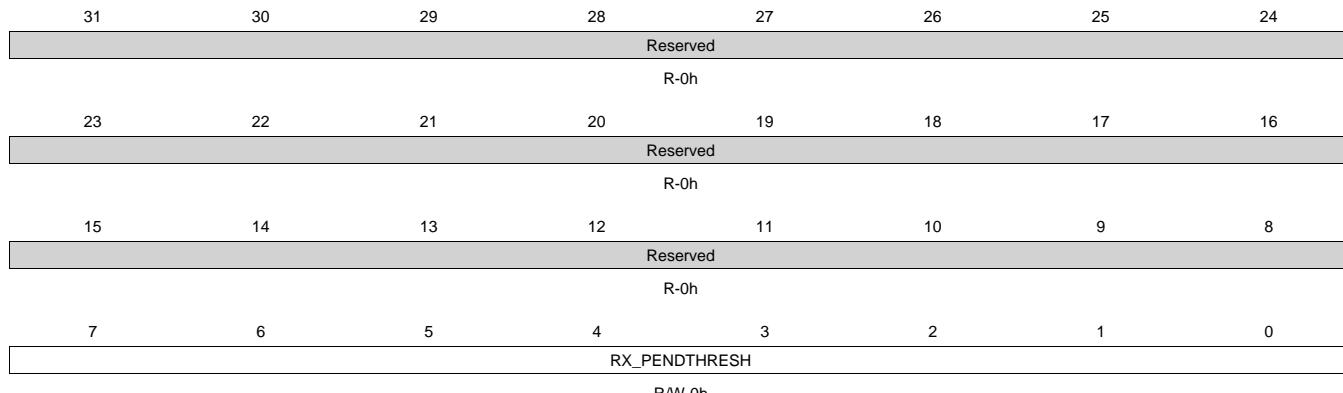

| Bit  | Field         | Type | Reset | Description  |
|------|---------------|------|-------|--|
| 31-8 | Reserved      | R    | 0h    |  |
| 7-0  | RX_PENDTHRESH | R/W  | 0h    | Rx Flow Threshold - This field contains the threshold value for issuing receive threshold pending interrupts (when enabled). |

#### 14.5.2.41 RX7\_PENDTHRESH Register (offset = DCh) [reset = 0h]

RX7\_PENDTHRESH is shown in [Figure 14-69](#) and described in [Table 14-80](#).

CPDMA\_INT RECEIVE THRESHOLD PENDING REGISTER CHANNEL 7

**Figure 14-69. RX7\_PENDTHRESH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-80. RX7\_PENDTHRESH Register Field Descriptions**

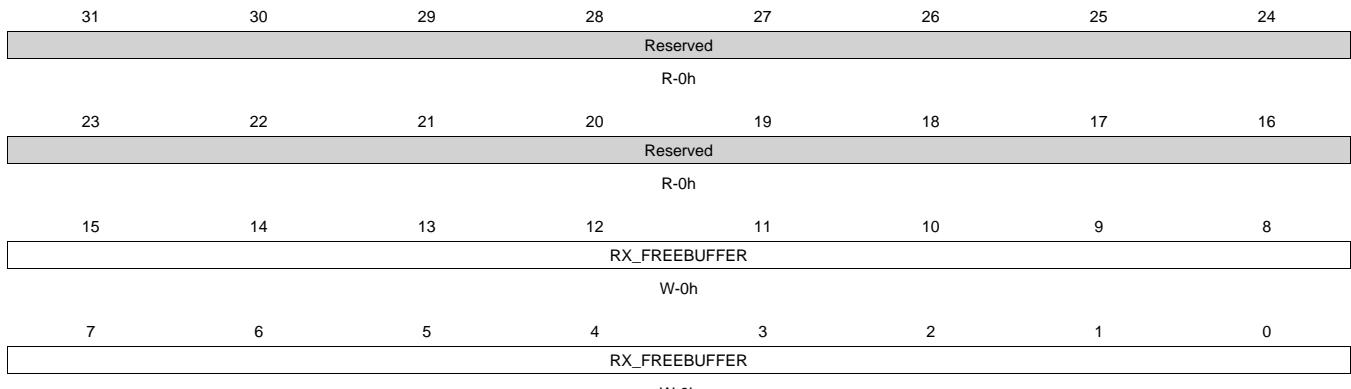

| Bit  | Field         | Type | Reset | Description  |
|------|---------------|------|-------|--|
| 31-8 | Reserved      | R    | 0h    |  |
| 7-0  | RX_PENDTHRESH | R/W  | 0h    | Rx Flow Threshold - This field contains the threshold value for issuing receive threshold pending interrupts (when enabled). |

#### 14.5.2.42 RX0\_FREEBUFFER Register (offset = E0h) [reset = 0h]

RX0\_FREEBUFFER is shown in [Figure 14-70](#) and described in [Table 14-81](#).

CPDMA\_INT RECEIVE FREE BUFFER REGISTER CHANNEL 0

**Figure 14-70. RX0\_FREEBUFFER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-81. RX0\_FREEBUFFER Register Field Descriptions**

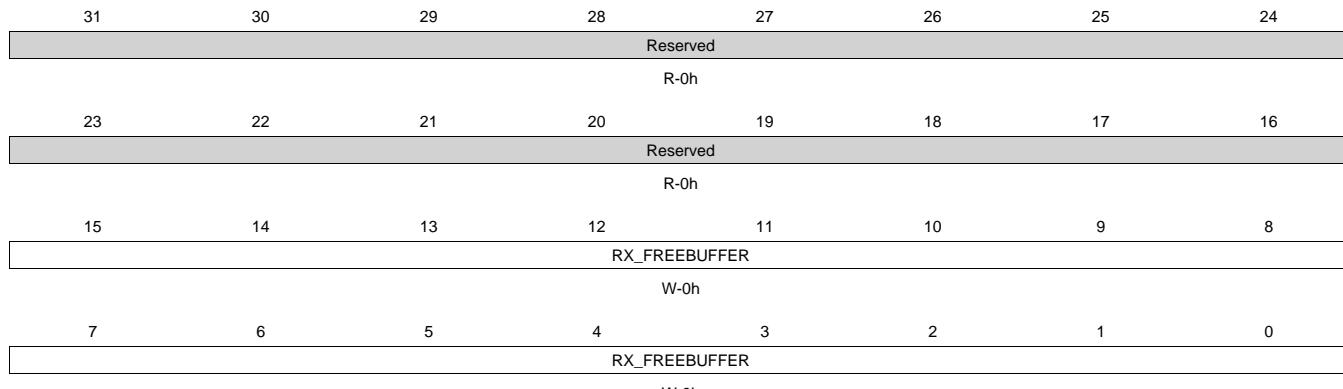

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-16 | Reserved      | R    | 0h    |   |
| 15-0  | RX_FREEBUFFER | W    | 0h    | <p>Rx Free Buffer Count - This field contains the count of free buffers available.</p> <p>The rx_pendthresh value is compared with this field to determine if the receive threshold pending interrupt should be asserted (if enabled).</p> <p>This is a write to increment field.</p> <p>This field rolls over to zero on overflow.</p> <p>If receive threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel).</p> <p>The port decrements (by the number of buffers in the received frame) the associated channel register for each received frame.</p> <p>This is a write to increment field.</p> <p>The host must write this field with the number of buffers that have been freed due to host processing.</p> |

#### 14.5.2.43 RX1\_FREEBUFFER Register (offset = E4h) [reset = 0h]

RX1\_FREEBUFFER is shown in [Figure 14-71](#) and described in [Table 14-82](#).

CPDMA\_INT RECEIVE FREE BUFFER REGISTER CHANNEL 1

**Figure 14-71. RX1\_FREEBUFFER Register**

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-16 | Reserved      | R    | 0h    |   |
| 15-0  | RX_FREEBUFFER | W    | 0h    | <p>Rx Free Buffer Count - This field contains the count of free buffers available.</p> <p>The rx_pendthresh value is compared with this field to determine if the receive threshold pending interrupt should be asserted (if enabled).</p> <p>This is a write to increment field.</p> <p>This field rolls over to zero on overflow.</p> <p>If receive threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel).</p> <p>The port decrements (by the number of buffers in the received frame) the associated channel register for each received frame.</p> <p>This is a write to increment field.</p> <p>The host must write this field with the number of buffers that have been freed due to host processing.</p> |

#### 14.5.2.47 RX5\_FREEBUFFER Register (offset = F4h) [reset = 0h]

RX5\_FREEBUFFER is shown in [Figure 14-75](#) and described in [Table 14-86](#).

CPDMA\_INT RECEIVE FREE BUFFER REGISTER CHANNEL 5

**Figure 14-75. RX5\_FREEBUFFER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-86. RX5\_FREEBUFFER Register Field Descriptions**

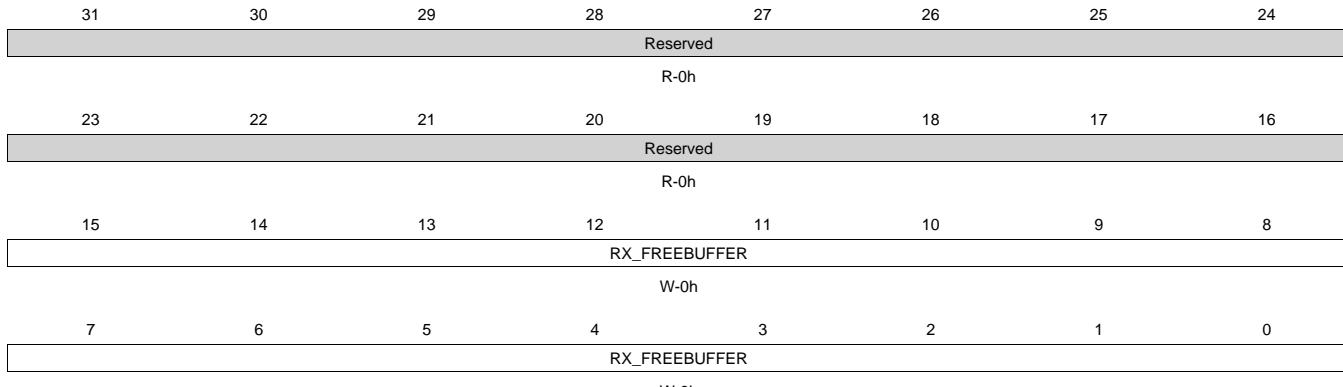

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-16 | Reserved      | R    | 0h    |   |
| 15-0  | RX_FREEBUFFER | W    | 0h    | <p>Rx Free Buffer Count - This field contains the count of free buffers available.</p> <p>The rx_pendthresh value is compared with this field to determine if the receive threshold pending interrupt should be asserted (if enabled).</p> <p>This is a write to increment field.</p> <p>This field rolls over to zero on overflow.</p> <p>If receive threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel).</p> <p>The port decrements (by the number of buffers in the received frame) the associated channel register for each received frame.</p> <p>This is a write to increment field.</p> <p>The host must write this field with the number of buffers that have been freed due to host processing.</p> |

#### 14.5.2.48 RX6\_FREEBUFFER Register (offset = F8h) [reset = 0h]

RX6\_FREEBUFFER is shown in [Figure 14-76](#) and described in [Table 14-87](#).

CPDMA\_INT RECEIVE FREE BUFFER REGISTER CHANNEL 6

**Figure 14-76. RX6\_FREEBUFFER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-87. RX6\_FREEBUFFER Register Field Descriptions**

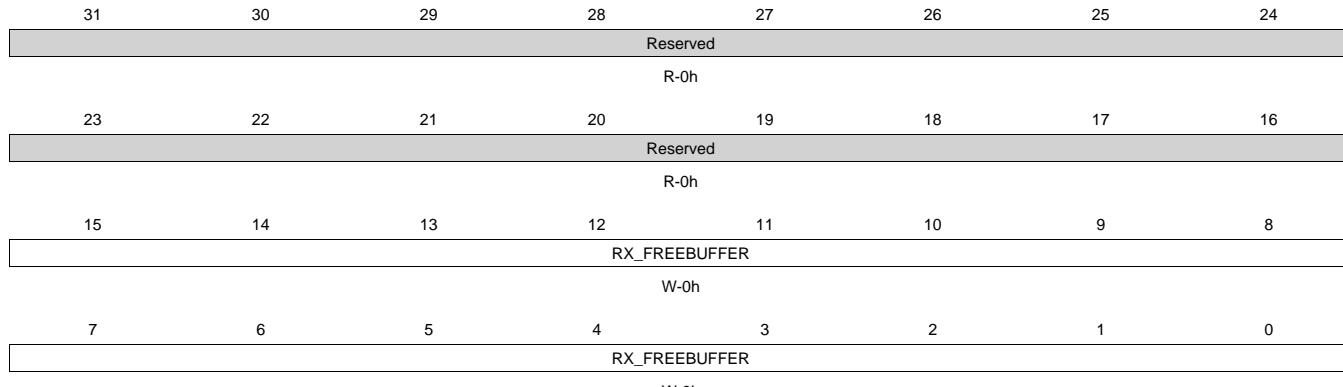

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-16 | Reserved      | R    | 0h    |   |
| 15-0  | RX_FREEBUFFER | W    | 0h    | <p>Rx Free Buffer Count - This field contains the count of free buffers available.</p> <p>The rx_pendthresh value is compared with this field to determine if the receive threshold pending interrupt should be asserted (if enabled).</p> <p>This is a write to increment field.</p> <p>This field rolls over to zero on overflow.</p> <p>If receive threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel).</p> <p>The port decrements (by the number of buffers in the received frame) the associated channel register for each received frame.</p> <p>This is a write to increment field.</p> <p>The host must write this field with the number of buffers that have been freed due to host processing.</p> |

#### 14.5.2.49 RX7\_FREEBUFFER Register (offset = FCh) [reset = 0h]

RX7\_FREEBUFFER is shown in [Figure 14-77](#) and described in [Table 14-88](#).

CPDMA\_INT RECEIVE FREE BUFFER REGISTER CHANNEL 7

**Figure 14-77. RX7\_FREEBUFFER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-88. RX7\_FREEBUFFER Register Field Descriptions**

| Bit   | Field         | Type | Reset | Description   |
|-------|---------------|------|-------|---|
| 31-16 | Reserved      | R    | 0h    |   |
| 15-0  | RX_FREEBUFFER | W    | 0h    | <p>Rx Free Buffer Count - This field contains the count of free buffers available.</p> <p>The rx_pendthresh value is compared with this field to determine if the receive threshold pending interrupt should be asserted (if enabled).</p> <p>This is a write to increment field.</p> <p>This field rolls over to zero on overflow.</p> <p>If receive threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel).</p> <p>The port decrements (by the number of buffers in the received frame) the associated channel register for each received frame.</p> <p>This is a write to increment field.</p> <p>The host must write this field with the number of buffers that have been freed due to host processing.</p> |

#### 14.5.3 CPSW\_CPTS Registers

[Table 14-89](#) lists the memory-mapped registers for the CPSW\_CPTS. All register offset addresses not listed in [Table 14-89](#) should be considered as reserved locations and the register contents should not be modified.

**Table 14-89. CPSW\_CPTS REGISTERS**

| Offset | Acronym             | Register Name                              | Section                          |
|--------|---------------------|--|----------------------------------|
| 0h     | CPTS_IDVER          | IDENTIFICATION AND VERSION REGISTER        | <a href="#">Section 14.5.3.1</a> |
| 4h     | CPTS_CONTROL        | TIME SYNC CONTROL REGISTER                 | <a href="#">Section 14.5.3.2</a> |
| Ch     | CPTS_TS_PUSH        | TIME STAMP EVENT PUSH REGISTER             | <a href="#">Section 14.5.3.3</a> |
| 10h    | CPTS_TS_LOAD_VAL    | TIME STAMP LOAD VALUE REGISTER             | <a href="#">Section 14.5.3.4</a> |
| 14h    | CPTS_TS_LOAD_EN     | TIME STAMP LOAD ENABLE REGISTER            | <a href="#">Section 14.5.3.5</a> |
| 20h    | CPTS_INTSTAT_RAW    | TIME SYNC INTERRUPT STATUS RAW REGISTER    | <a href="#">Section 14.5.3.6</a> |
| 24h    | CPTS_INTSTAT_MASKED | TIME SYNC INTERRUPT STATUS MASKED REGISTER | <a href="#">Section 14.5.3.7</a> |
| 28h    | CPTS_INT_ENABLE     | TIME SYNC INTERRUPT ENABLE REGISTER        | <a href="#">Section 14.5.3.8</a> |

**Table 14-89. CPSW\_CPTS REGISTERS (continued)**

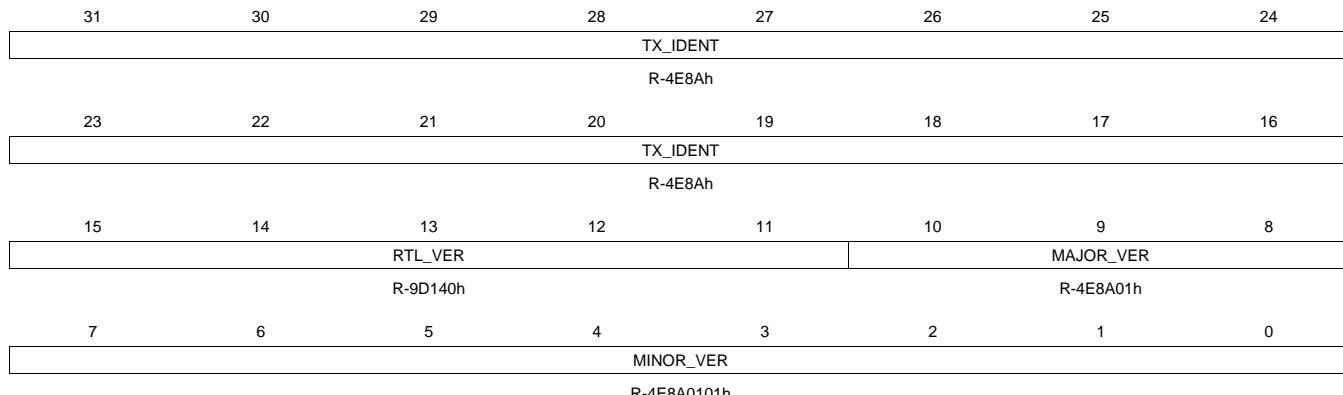

| <b>Offset</b> | <b>Acronym</b>  | <b>Register Name</b>             | <b>Section</b>                    |
|---------------|-----------------|----------------------------------|-----------------------------------|
| 30h           | CPTS_EVENT_POP  | EVENT INTERRUPT POP REGISTER     | <a href="#">Section 14.5.3.9</a>  |
| 34h           | CPTS_EVENT_LOW  | LOWER 32-BITS OF THE EVENT VALUE | <a href="#">Section 14.5.3.10</a> |
| 38h           | CPTS_EVENT_HIGH | UPPER 32-BITS OF THE EVENT VALUE | <a href="#">Section 14.5.3.11</a> |

#### 14.5.3.1 CPTS\_IDVER Register (offset = 0h) [reset = 4E8A0101h]

CPTS\_IDVER is shown in [Figure 14-78](#) and described in [Table 14-90](#).

##### IDENTIFICATION AND VERSION REGISTER

**Figure 14-78. CPTS\_IDVER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-90. CPTS\_IDVER Register Field Descriptions**

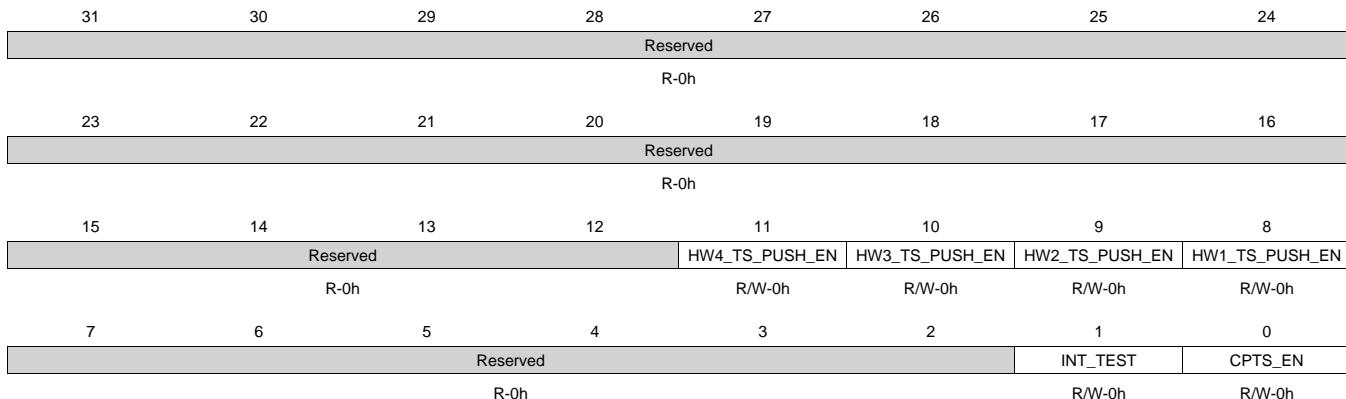

| Bit   | Field     | Type | Reset     | Description             |
|-------|-----------|------|-----------|-------------------------|
| 31-16 | TX_IDENT  | R    | 4E8Ah     | TX Identification Value |
| 15-11 | RTL_VER   | R    | 9D140h    | RTL Version Value       |
| 10-8  | MAJOR_VER | R    | 4E8A01h   | Major Version Value     |
| 7-0   | MINOR_VER | R    | 4E8A0101h | Minor Version Value     |

#### 14.5.3.2 CPTS\_CONTROL Register (offset = 4h) [reset = 0h]

CPTS\_CONTROL is shown in [Figure 14-79](#) and described in [Table 14-91](#).

##### TIME SYNC CONTROL REGISTER

**Figure 14-79. CPTS\_CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-91. CPTS\_CONTROL Register Field Descriptions**

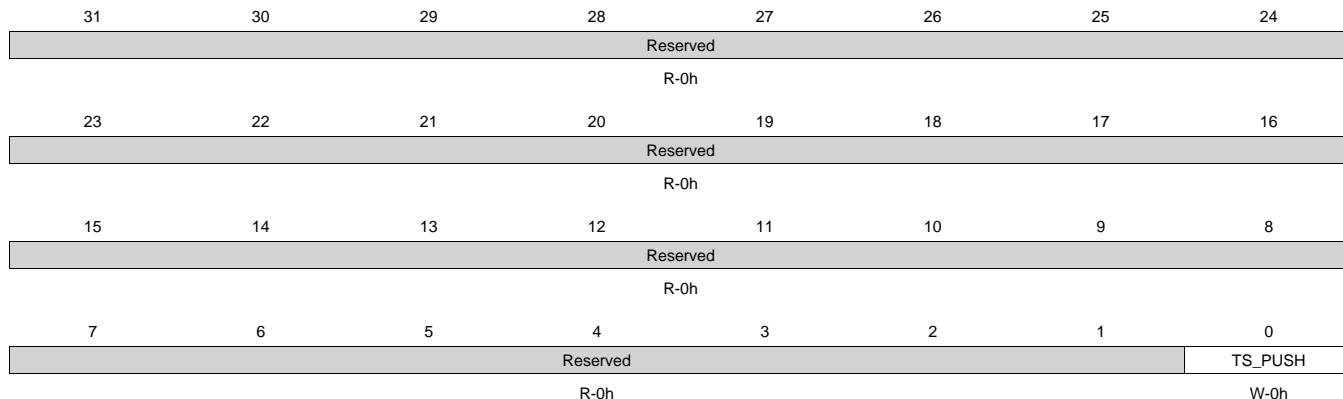

| Bit   | Field          | Type | Reset | Description  |
|-------|----------------|------|-------|--|
| 31-12 | Reserved       | R    | 0h    |  |
| 11    | HW4_TS_PUSH_EN | R/W  | 0h    | Hardware push 4 enable   |
| 10    | HW3_TS_PUSH_EN | R/W  | 0h    | Hardware push 3 enable   |
| 9     | HW2_TS_PUSH_EN | R/W  | 0h    | Hardware push 2 enable   |
| 8     | HW1_TS_PUSH_EN | R/W  | 0h    | Hardware push 1 enable   |
| 7-2   | Reserved       | R    | 0h    |  |
| 1     | INT_TEST       | R/W  | 0h    | Interrupt Test - When set, this bit allows the raw interrupt to be written to facilitate interrupt test.                                 |
| 0     | CPTS_EN        | R/W  | 0h    | Time Sync Enable - When disabled (cleared to zero), the RCLK domain is held in reset.<br>0 - Time Sync Disabled<br>1 - Time Sync Enabled |

#### 14.5.3.3 CPTS\_TS\_PUSH Register (offset = Ch) [reset = 0h]

CPTS\_TS\_PUSH is shown in [Figure 14-80](#) and described in [Table 14-92](#).

##### TIME STAMP EVENT PUSH REGISTER

**Figure 14-80. CPTS\_TS\_PUSH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-92. CPTS\_TS\_PUSH Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-1 | Reserved | R    | 0h    |  |
| 0    | TS_PUSH  | W    | 0h    | <p>Time stamp event push - When a logic high is written to this bit a time stamp event is pushed onto the event FIFO.</p> <p>The time stamp value is the time of the write of this register, not the time of the event read.</p> <p>The time stamp value can then be read on interrupt via the event registers.</p> <p>Software should not push a second time stamp event onto the event FIFO until the first time stamp value has been read from the event FIFO (there should be only one time stamp event in the event FIFO at any given time).</p> <p>This bit is write only and always reads zero.</p> |

#### 14.5.3.4 CPTS\_TS\_LOAD\_VAL Register (offset = 10h) [reset = 0h]

CPTS\_TS\_LOAD\_VAL is shown in [Figure 14-81](#) and described in [Table 14-93](#).

##### TIME STAMP LOAD VALUE REGISTER

**Figure 14-81. CPTS\_TS\_LOAD\_VAL Register**

| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| TS_LOAD_VAL |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0h      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-93. CPTS\_TS\_LOAD\_VAL Register Field Descriptions**

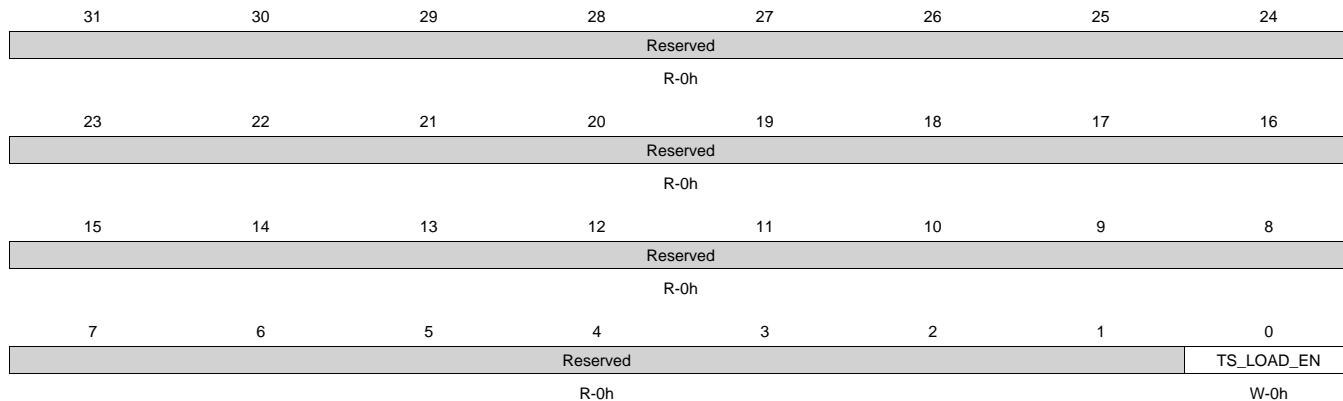

| Bit  | Field       | Type | Reset | Description  |
|------|-------------|------|-------|--|
| 31-0 | TS_LOAD_VAL | R/W  | 0h    | Time Stamp Load Value - Writing the ts_load_en bit causes the value contained in this register to be written into the time stamp. The time stamp value is read by initiating a time stamp push event, not by reading this register. When reading this register, the value read is not the time stamp, but is the value that was last written to this register. |

#### 14.5.3.5 CPTS\_TS\_LOAD\_EN Register (offset = 14h) [reset = 0h]

CPTS\_TS\_LOAD\_EN is shown in [Figure 14-82](#) and described in [Table 14-94](#).

##### TIME STAMP LOAD ENABLE REGISTER

**Figure 14-82. CPTS\_TS\_LOAD\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-94. CPTS\_TS\_LOAD\_EN Register Field Descriptions**

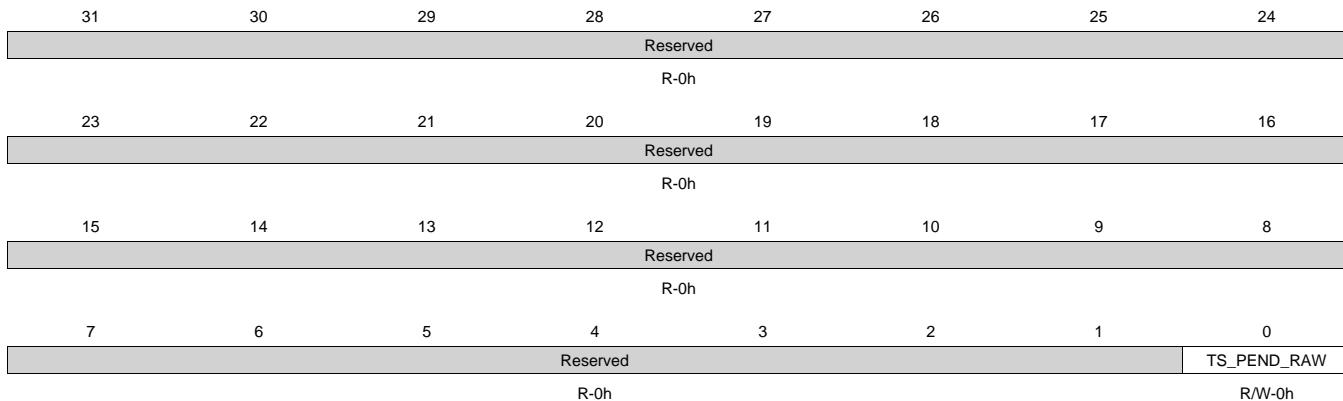

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-1 | Reserved   | R    | 0h    |  |
| 0    | TS_LOAD_EN | W    | 0h    | Time Stamp Load - Writing a one to this bit enables the time stamp value to be written via the ts_load_val[31:0] register.<br>This feature is included for test purposes.<br>This bit is write only. |

#### 14.5.3.6 CPTS\_INTSTAT\_RAW Register (offset = 20h) [reset = 0h]

CPTS\_INTSTAT\_RAW is shown in [Figure 14-83](#) and described in [Table 14-95](#).

##### TIME SYNC INTERRUPT STATUS RAW REGISTER

**Figure 14-83. CPTS\_INTSTAT\_RAW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-95. CPTS\_INTSTAT\_RAW Register Field Descriptions**

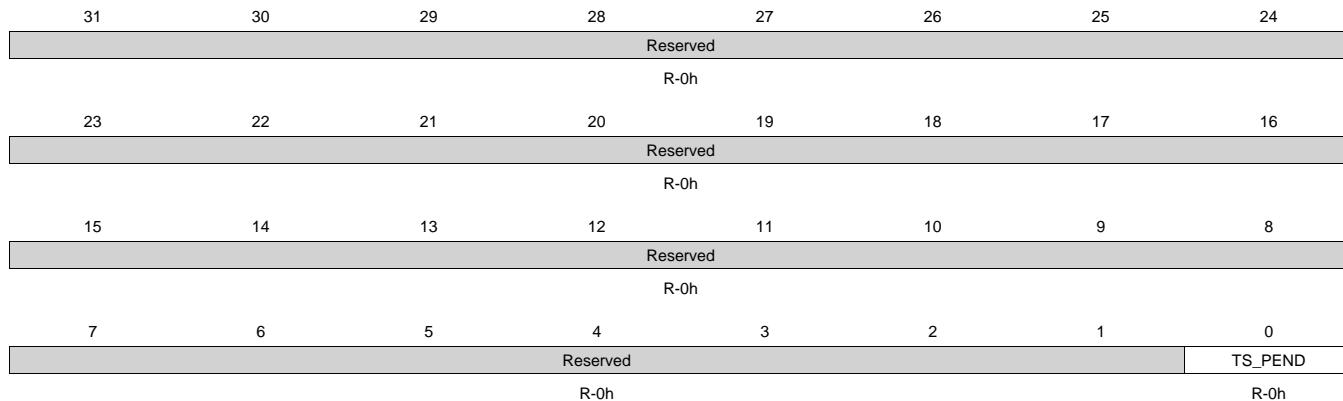

| Bit  | Field       | Type | Reset | Description  |
|------|-------------|------|-------|--|
| 31-1 | Reserved    | R    | 0h    |  |
| 0    | TS_PEND_RAW | R/W  | 0h    | TS_PEND_RAW int read (before enable). Writable when int_test = 1 A one in this bit indicates that there is one or more events in the event FIFO. |

#### 14.5.3.7 CPTS\_INTSTAT\_MASKED Register (offset = 24h) [reset = 0h]

CPTS\_INTSTAT\_MASKED is shown in [Figure 14-84](#) and described in [Table 14-96](#).

##### TIME SYNC INTERRUPT STATUS MASKED REGISTER

**Figure 14-84. CPTS\_INTSTAT\_MASKED Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-96. CPTS\_INTSTAT\_MASKED Register Field Descriptions**

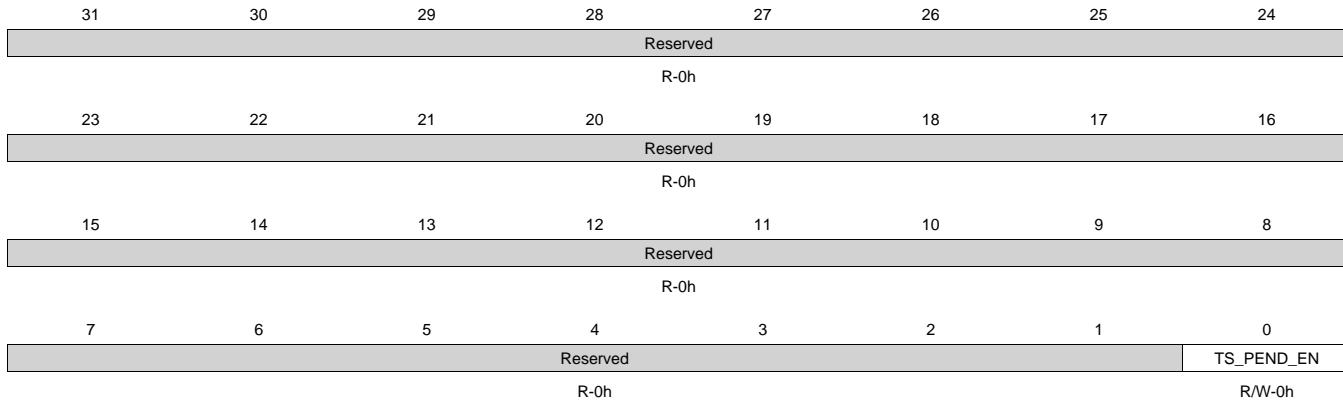

| Bit  | Field    | Type | Reset | Description                                   |
|------|----------|------|-------|---|
| 31-1 | Reserved | R    | 0h    |   |
| 0    | TS_PEND  | R    | 0h    | TS_PEND masked interrupt read (after enable). |

#### 14.5.3.8 CPTS\_INT\_ENABLE Register (offset = 28h) [reset = 0h]

CPTS\_INT\_ENABLE is shown in [Figure 14-85](#) and described in [Table 14-97](#).

##### TIME SYNC INTERRUPT ENABLE REGISTER

**Figure 14-85. CPTS\_INT\_ENABLE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-97. CPTS\_INT\_ENABLE Register Field Descriptions**

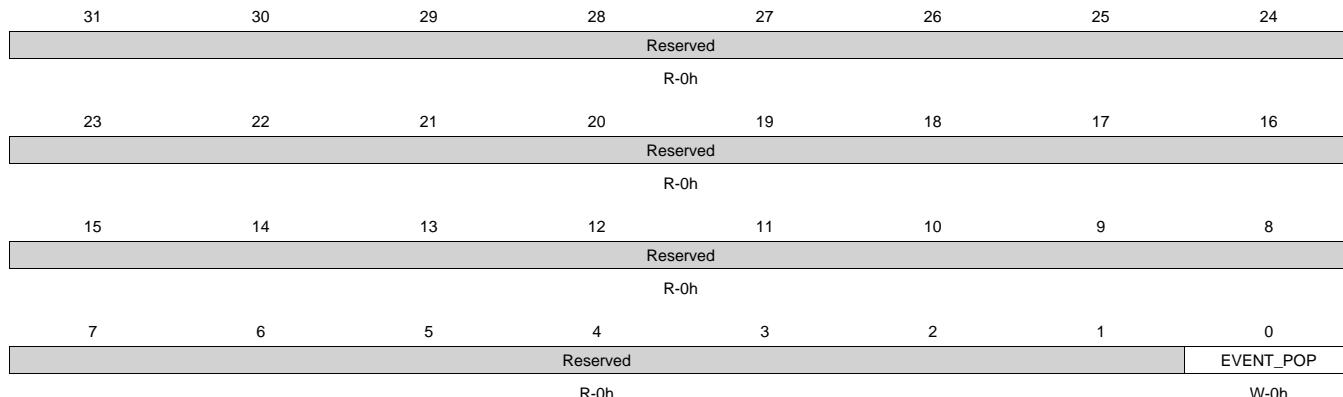

| Bit  | Field      | Type | Reset | Description                      |
|------|------------|------|-------|----------------------------------|
| 31-1 | Reserved   | R    | 0h    |                                  |
| 0    | TS_PEND_EN | R/W  | 0h    | TS_PEND masked interrupt enable. |

#### 14.5.3.9 CPTS\_EVENT\_POP Register (offset = 30h) [reset = 0h]

CPTS\_EVENT\_POP is shown in [Figure 14-86](#) and described in [Table 14-98](#).

##### EVENT INTERRUPT POP REGISTER

**Figure 14-86. CPTS\_EVENT\_POP Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-98. CPTS\_EVENT\_POP Register Field Descriptions**

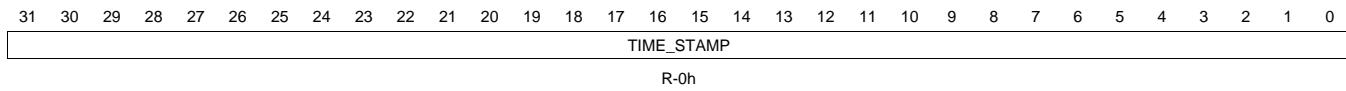

| Bit  | Field     | Type | Reset | Description  |
|------|-----------|------|-------|--|
| 31-1 | Reserved  | R    | 0h    |  |
| 0    | EVENT_POP | W    | 0h    | Event Pop - When a logic high is written to this bit an event is popped off the event FIFO.<br>The event FIFO pop occurs as part of the interrupt process after the event has been read in the Event_Low and Event_High registers.<br>Popping an event discards the event and causes the next event, if any, to be moved to the top of the FIFO ready to be read by software on interrupt. |

#### 14.5.3.10 CPTS\_EVENT\_LOW Register (offset = 34h) [reset = 0h]

CPTS\_EVENT\_LOW is shown in [Figure 14-87](#) and described in [Table 14-99](#).

LOWER 32-BITS OF THE EVENT VALUE

**Figure 14-87. CPTS\_EVENT\_LOW Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-99. CPTS\_EVENT\_LOW Register Field Descriptions**

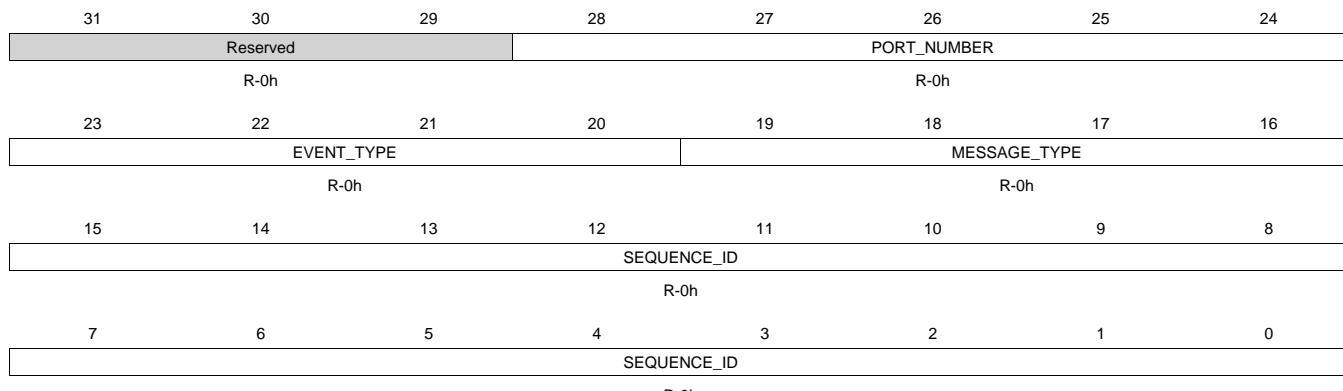

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-0 | TIME_STAMP | R    | 0h    | Time Stamp - The timestamp is valid for transmit, receive, and time stamp push event types.<br>The timestamp value is not valid for counter roll event types. |

#### 14.5.3.11 CPTS\_EVENT\_HIGH Register (offset = 38h) [reset = 0h]

CPTS\_EVENT\_HIGH is shown in [Figure 14-88](#) and described in [Table 14-100](#).

UPPER 32-BITS OF THE EVENT VALUE

**Figure 14-88. CPTS\_EVENT\_HIGH Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-100. CPTS\_EVENT\_HIGH Register Field Descriptions**

| Bit   | Field        | Type | Reset | Description   |
|-------|--------------|------|-------|---|
| 31-29 | Reserved     | R    | 0h    |   |
| 28-24 | PORT_NUMBER  | R    | 0h    | Port Number - indicates the port number of an ethernet event or the hardware push pin number (1 to 4).  |
| 23-20 | EVENT_TYPE   | R    | 0h    | Time Sync Event Type<br>0000 - Time Stamp Push Event<br>0001 - Time Stamp Rollover Event<br>0010 - Time Stamp Half Rollover Event<br>0011 - Hardware Time Stamp Push Event<br>0100 - Ethernet Receive Event<br>0101 - Ethernet Transmit Event |
| 19-16 | MESSAGE_TYPE | R    | 0h    | Message type - The message type value that was contained in an ethernet transmit or receive time sync packet.<br>This field is valid only for ethernet transmit or receive events.  |
| 15-0  | SEQUENCE_ID  | R    | 0h    | Sequence ID - The 16-bit sequence id is the value that was contained in an ethernet transmit or receive time sync packet.<br>This field is valid only for ethernet transmit or receive events.  |

#### 14.5.4 CPSW\_STATS Registers

For a full description of the CPSW\_STATS registers, see [Section 14.3.2.20, CPSW\\_3G Network Statistics](#). The registers are summarized in [Table 14-101](#).

**Table 14-101. CPSW\_STATS REGISTERS**

| Offset | Acronym | Register Name                 | Section                                |
|--------|---------|-------------------------------|--|
| 00h    |         | Good Rx Frames                | <a href="#">Section 14.3.2.20.1.1</a>  |
| 04h    |         | Broadcast Rx Frames           | <a href="#">Section 14.3.2.20.1.2</a>  |
| 08h    |         | Multicast Rx Frames           | <a href="#">Section 14.3.2.20.1.3</a>  |
| 0Ch    |         | Pause Rx Frames               | <a href="#">Section 14.3.2.20.1.4</a>  |
| 10h    |         | Rx CRC Errors                 | <a href="#">Section 14.3.2.20.1.5</a>  |
| 14h    |         | Rx Align/Code Errors          | <a href="#">Section 14.3.2.20.1.6</a>  |
| 18h    |         | Oversize Rx Frames            | <a href="#">Section 14.3.2.20.1.7</a>  |
| 1Ch    |         | Rx Jabbers                    | <a href="#">Section 14.3.2.20.1.8</a>  |
| 20h    |         | Undersize (Short) Rx Frames   | <a href="#">Section 14.3.2.20.1.9</a>  |
| 24h    |         | Rx Fragments                  | <a href="#">Section 14.3.2.20.1.10</a> |
| 30h    |         | Rx Octets                     | <a href="#">Section 14.3.2.20.1.14</a> |
| 34h    |         | Good Tx Frames                | <a href="#">Section 14.3.2.20.2.1</a>  |
| 38h    |         | Broadcast Tx Frames           | <a href="#">Section 14.3.2.20.2.2</a>  |
| 3Ch    |         | Multicast Tx Frames           | <a href="#">Section 14.3.2.20.2.3</a>  |
| 40h    |         | Pause Tx Frames               | <a href="#">Section 14.3.2.20.2.4</a>  |
| 44h    |         | Deferred Tx Frames            | <a href="#">Section 14.3.2.20.2.11</a> |
| 48h    |         | Collisions                    | <a href="#">Section 14.3.2.20.2.5</a>  |

#### 14.5.5 CPDMA\_STATERAM Registers

[Table 14-102](#) lists the memory-mapped registers for the CPSW\_CPDMA. All register offset addresses not listed in [Table 14-102](#) should be considered as reserved locations and the register contents should not be modified.

**Table 14-102. CPDMA\_STATERAM REGISTERS**

| Offset | Acronym | Register Name                                      | Section                          |
|--------|---------|--|----------------------------------|
| 00h    | TX0_HDP | CPDMA_STATERAM TX CHANNEL 0 HEAD DESC<br>POINTER * | <a href="#">Section 14.5.5.1</a> |

**Table 14-102. CPDMA\_STATERAM REGISTERS (continued)**

| <b>Offset</b> | <b>Acronym</b> | <b>Register Name</b>   | <b>Section</b>                    |
|---------------|----------------|--|-----------------------------------|
| 04h           | TX1_HDP        | CPDMA_STATERAM TX CHANNEL 1 HEAD DESC<br>POINTER *           | <a href="#">Section 14.5.5.2</a>  |
| 08h           | TX2_HDP        | CPDMA_STATERAM TX CHANNEL 2 HEAD DESC<br>POINTER *           | <a href="#">Section 14.5.5.3</a>  |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-134. RX7\_CP Register Field Descriptions**

| Bit  | Field | Type | Reset | Description  |
|------|-------|------|-------|--|
| 31-0 | RX_CP | R/W  | 0h    | <p>Rx Completion Pointer Register - This register is written by the host with the buffer descriptor address for the last buffer processed by the host during interrupt processing.</p> <p>The port uses the value written to determine if the interrupt should be deasserted.</p> <p>Note: The value read is the completion pointer (interrupt acknowledge) value that was written by the CPDMA DMA controller (port).</p> <p>The value written to this register by the host is compared with the value that the port wrote to determine if the interrupt should remain asserted.</p> <p>The value written is not actually stored in the location.</p> <p>The interrupt is deasserted if the two values are equal.</p> |

#### 14.5.6 CPSW\_PORT Registers

[Table 14-135](#) lists the memory-mapped registers for the CPSW\_PORT. All register offset addresses not listed in [Table 14-135](#) should be considered as reserved locations and the register contents should not be modified.

**Table 14-135. CPSW\_PORT REGISTERS**

| Offset | Acronym             | Register Name | Section                           |
|--------|---------------------|---------------|-----------------------------------|
| 0h     | P0_CONTROL          |               | <a href="#">Section 14.5.6.1</a>  |

| Reserved |    |                   |                   |          |          |    |                    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-136. P0\_CONTROL Register Field Descriptions**

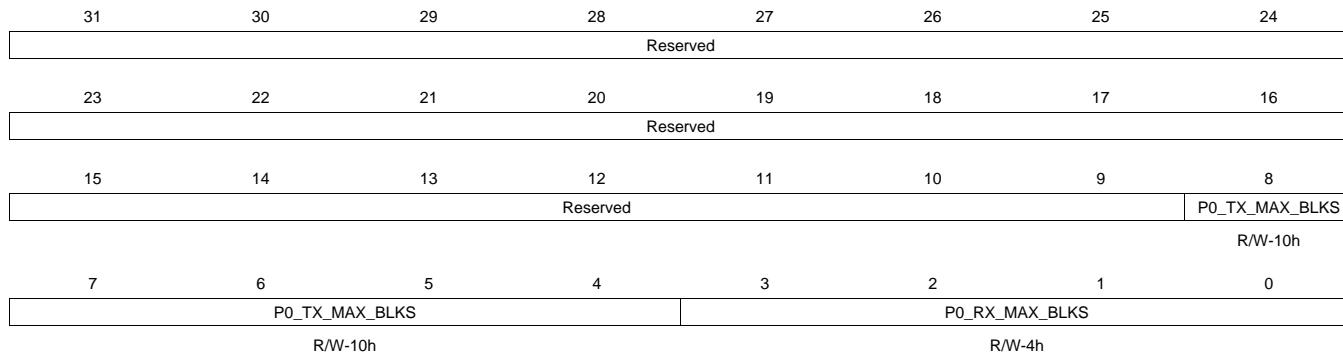

| Bit   | Field              | Type | Reset | Description   |
|-------|--------------------|------|-------|---|
| 30-28 | P0_DLR_CPDMA_CH    | R/W  | 0h    | Port 0 DLR CPDMA Channel This field indicates the CPDMA channel that DLR packets will be received on.   |
| 24    | P0_PASS_PRI_TAGGED | R/W  | 0h    | Port 0 Pass Priority Tagged<br>0 - Priority tagged packets have the zero VID replaced with the input port P0_PORT_VLAN [11:0]<br>1 - Priority tagged packets are processed unchanged.   |
| 21    | P0_VLAN_LTYPE2_EN  | R/W  | 0h    | Port 0 VLAN LTYPE 2 enable<br>0 - disabled<br>1 - enabled   |
| 20    | P0_VLAN_LTYPE1_EN  | R/W  | 0h    | Port 0 VLAN LTYPE 1 enable<br>0 - disabled<br>1 - enabled   |
| 16    | P0_DSCP_PRI_EN     | R/W  | 0h    | Port 0 DSCP Priority Enable<br>0 - DSCP priority disabled<br>1 - DSCP priority enabled.<br>All non-tagged IPV4 packets have their received packet priority determined by mapping the 6 TOS bits through the port DSCP priority mapping registers. |

#### 14.5.6.2 P0\_MAX\_BLKS Register (offset = 8h) [reset = 104h]

P0\_MAX\_BLKS is shown in [Figure 14-122](#) and described in [Table 14-137](#).

##### CPSW PORT 0 MAXIMUM FIFO BLOCKS REGISTER

**Figure 14-122. P0\_MAX\_BLKS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-137. P0\_MAX\_BLKS Register Field Descriptions**

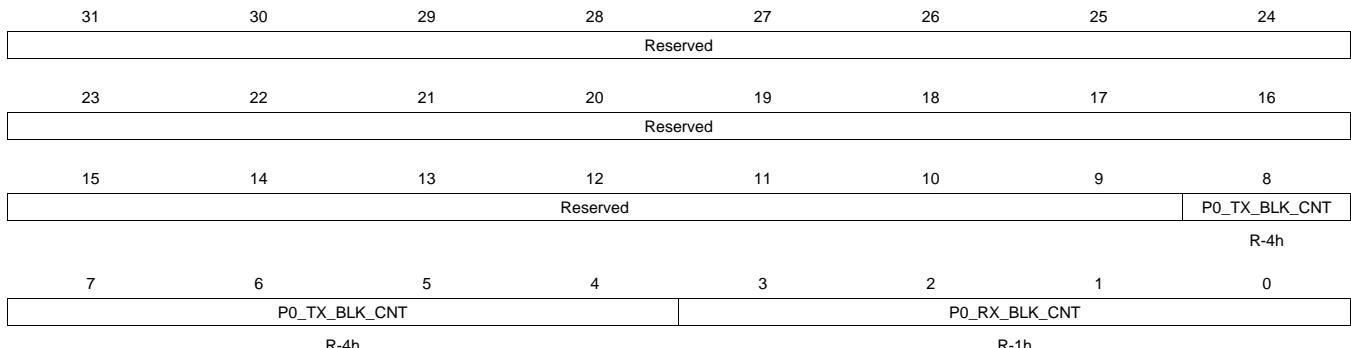

| Bit | Field          | Type | Reset | Description  |
|-----|----------------|------|-------|--|
| 8-4 | P0_TX_MAX_BLKS | R/W  | 10h   | Transmit FIFO Maximum Blocks - This value is the maximum number of 1k memory blocks that may be allocated to the FIFO's logical transmit priority queues.<br>0x10 is the recommended value of p0_tx_max_blks.<br>Port 0 should remain in flow control mode.<br>0xe is the minimum value tx max blks. |
| 3-0 | P0_RX_MAX_BLKS | R/W  | 4h    | Receive FIFO Maximum Blocks - This value is the maximum number of 1k memory blocks that may be allocated to the FIFO's logical receive queue.<br>0x4 is the recommended value.<br>0x3 is the minimum value rx max blks and 0x6 is the maximum value.   |

#### 14.5.6.3 P0\_BLK\_CNT Register (offset = Ch) [reset = 41h]

P0\_BLK\_CNT is shown in [Figure 14-123](#) and described in [Table 14-138](#).

CPSW PORT 0 FIFO BLOCK USAGE COUNT (READ ONLY)

**Figure 14-123. P0\_BLK\_CNT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-138. P0\_BLK\_CNT Register Field Descriptions**

| Bit | Field         | Type | Reset | Description   |
|-----|---------------|------|-------|---|
| 8-4 | P0_TX_BLK_CNT | R    | 4h    | Port 0 Transmit Block Count Usage - This value is the number of blocks allocated to the FIFO logical transmit queues. |
| 3-0 | P0_RX_BLK_CNT | R    | 1h    | Port 0 Receive Block Count Usage - This value is the number of blocks allocated to the FIFO logical receive queues.   |

#### 14.5.6.4 P0\_TX\_IN\_CTL Register (offset = 10h) [reset = 40C0h]

P0\_TX\_IN\_CTL is shown in Figure 14-124 and described in Table 14-139.

CPSW PORT 0 TRANSMIT FIFO CONTROL

**Figure 14-124. P0\_TX\_IN\_CTL Register**

| 31          | 30 | 29 | 28 | 27       | 26 | 25         | 24 |
|-------------|----|----|----|----------|----|------------|----|
| Reserved    |    |    |    |          |    |            |    |
| 23          | 22 | 21 | 20 | 19       | 18 | 17         | 16 |
| TX_RATE_EN  |    |    |    | Reserved |    | TX_IN_SEL  |    |
| R/W-0h      |    |    |    | R/W-0h   |    | R/W-0h     |    |
| 15          | 14 | 13 | 12 | 11       | 10 | 9          | 8  |
| TX_BLKS_Rem |    |    |    | Reserved |    | TX_PRI_WDS |    |
| R/W-4h      |    |    |    | R/W-C0h  |    | R/W-C0h    |    |
| 7           | 6  | 5  | 4  | 3        | 2  | 1          | 0  |
| TX_PRI_WDS  |    |    |    |          |    |            |    |
| R/W-C0h     |    |    |    |          |    |            |    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-139. P0\_TX\_IN\_CTL Register Field Descriptions**

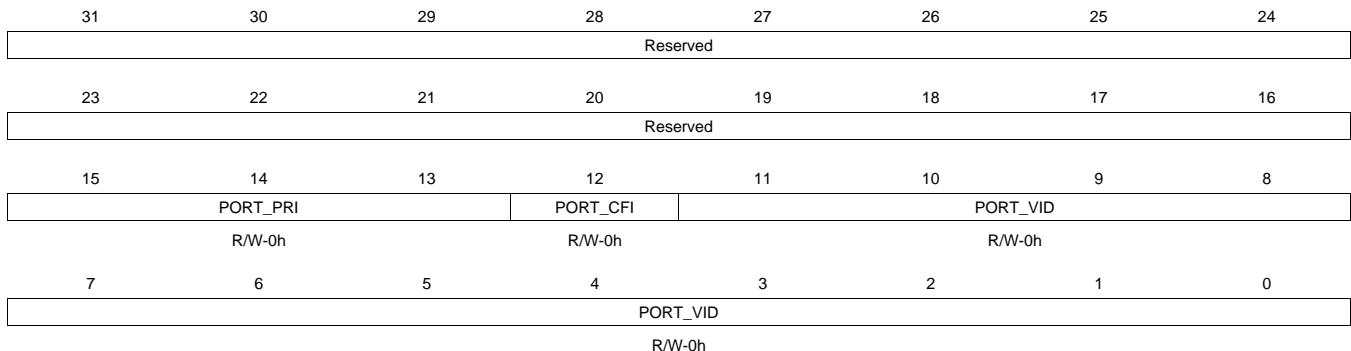

| Bit   | Field       | Type | Reset | Description  |
|-------|-------------|------|-------|--|
| 23-20 | TX_RATE_EN  | R/W  | 0h    | Transmit FIFO Input Rate Enable  |
| 17-16 | TX_IN_SEL   | R/W  | 0h    | Transmit FIFO Input Queue Type Select<br>00 - Normal priority mode<br>01 - Dual MAC mode<br>10 - Rate Limit mode<br>11 - reserved Note that Dual MAC mode is not compatible with escalation or shaping because dual mac mode forces round robin priority on FIFO egress. |
| 15-12 | TX_BLKS_Rem | R/W  | 4h    | Transmit FIFO Input Blocks to subtract in dual mac mode  |
| 9-0   | TX_PRI_WDS  | R/W  | C0h   | Transmit FIFO Words in queue   |

#### 14.5.6.5 P0\_PORT\_VLAN Register (offset = 14h) [reset = 0h]

P0\_PORT\_VLAN is shown in [Figure 14-125](#) and described in [Table 14-140](#).

##### CPSW PORT 0 VLAN REGISTER

**Figure 14-125. P0\_PORT\_VLAN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-140. P0\_PORT\_VLAN Register Field Descriptions**

| Bit   | Field    | Type | Reset | Description                                |
|-------|----------|------|-------|--|
| 15-13 | PORT_PRI | R/W  | 0h    | Port VLAN Priority (7 is highest priority) |
| 12    | PORT_CFI | R/W  | 0h    | Port CFI bit                               |
| 11-0  | PORT_VID | R/W  | 0h    | Port VLAN ID                               |

#### 14.5.6.6 P0\_TX\_PRI\_MAP Register (offset = 18h) [reset = 33221001h]

P0\_TX\_PRI\_MAP is shown in [Figure 14-126](#) and described in [Table 14-141](#).

CPSW PORT 0 TX HEADER PRI TO SWITCH PRI MAPPING REGISTER

**Figure 14-126. P0\_TX\_PRI\_MAP Register**

| 10    | TX_SHORT_GAP_EN | R/W  | 0h    | Transmit Short Gap Enable<br>0 - Transmit with a short IPG is disabled<br>1 - Transmit with a short IPG (when TX_SHORT_GAP input is asserted) is enabled.  |
| 9-8   | Reserved        | R    | 0h    |  |
| 7     | GIG             | R/W  | 0h    | Gigabit Mode -<br>0 - 10/100 mode<br>1 - Gigabit mode (full duplex only) The GIG_OUT output is the value of this bit.  |
| 6     | TX_PACE         | R/W  | 0h    | Transmit Pacing Enable<br>0 - Transmit Pacing Disabled<br>1 - Transmit Pacing Enabled  |
| 5     | GMII_EN         | R/W  | 0h    | GMII Enable -<br>0 - GMII RX and TX held in reset.<br>1 - GMII RX and TX released from reset.  |
| 4     | TX_FLOW_EN      | R/W  | 0h    | Transmit Flow Control Enable - Determines if incoming pause frames are acted upon in full-duplex mode.<br>Incoming pause frames are not acted upon in half-duplex mode regardless of this bit setting.<br>The RX_MBP_Enable bits determine whether or not received pause frames are transferred to memory.<br>0 - Transmit Flow Control Disabled.<br>Full-duplex mode - Incoming pause frames are not acted upon.<br>1 - Transmit Flow Control Enabled .<br>Full-duplex mode - Incoming pause frames are acted upon. |
| 3     | RX_FLOW_EN      | R/W  | 0h    | Receive Flow Control Enable -<br>0 - Receive Flow Control Disabled Half-duplex mode - No flow control generated collisions are sent.<br>Full-duplex mode - No outgoing pause frames are sent.<br>1 - Receive Flow Control Enabled Half-duplex mode - Collisions are initiated when receive flow control is triggered.<br>Full-duplex mode - Outgoing pause frames are sent when receive flow control is triggered.   |
| 2     | MTEST           | R/W  | 0h    | Manufacturing Test mode - This bit must be set to allow writes to the Backoff_Test and PauseTimer registers.   |
| 1     | LOOPBACK        | R/W  | 0h    | Loop Back Mode - Loopback mode forces internal fullduplex mode regardless of whether the fullduplex bit is set or not.<br>The loopback bit should be changed only when GMII_en is deasserted.<br>0 - Not looped back<br>1 - Loop Back Mode enabled   |

**Table 14-190. MACCONTROL Register Field Descriptions (continued)**

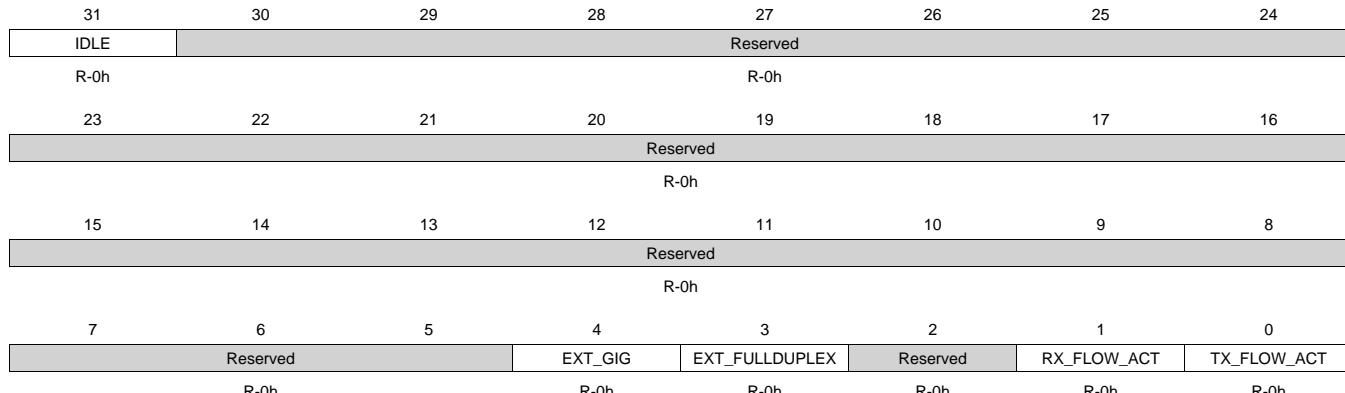

| Bit | Field      | Type | Reset | Description   |
|-----|------------|------|-------|---|
| 0   | FULLDUPLEX | R/W  | 0h    | Full Duplex mode - Gigabit mode forces fullduplex mode regardless of whether the fullduplex bit is set or not.<br>The FULLDUPLEX_OUT output is the value of this register bit<br>0 - half duplex mode<br>1 - full duplex mode |

#### 14.5.7.3 MACSTATUS Register (offset = 8h) [reset = 0h]

MACSTATUS is shown in [Figure 14-175](#) and described in [Table 14-191](#).

##### CPGMAC\_SL MAC STATUS REGISTER

**Figure 14-175. MACSTATUS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-191. MACSTATUS Register Field Descriptions**

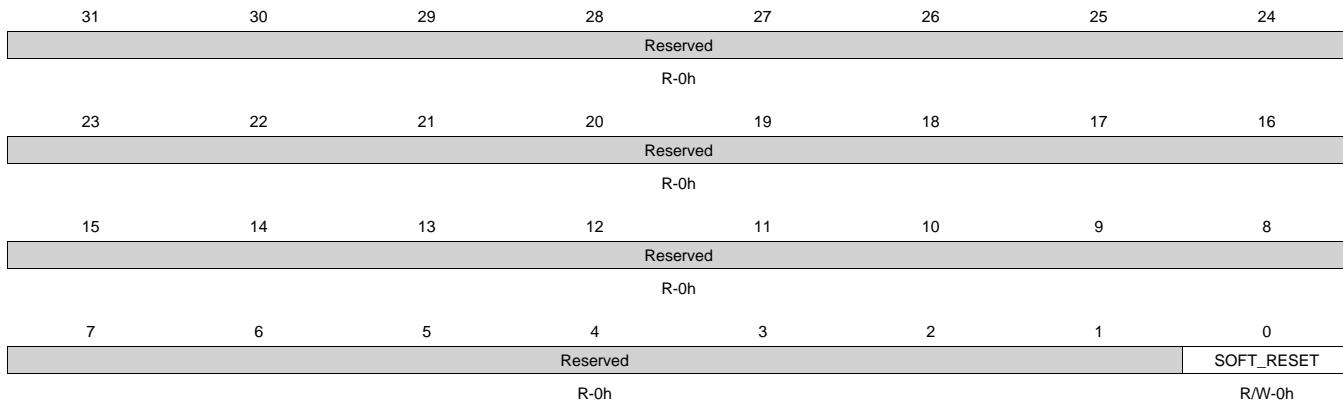

| Bit  | Field          | Type | Reset | Description  |
|------|----------------|------|-------|--|
| 31   | IDLE           | R    | 0h    | CPGMAC_SL IDLE - The CPGMAC_SL is in the idle state (valid after an idle command)<br>0 - The CPGMAC_SL is not in the idle state.<br>1 - The CPGMAC_SL is in the idle state.  |
| 30-5 | Reserved       | R    | 0h    |  |
| 4    | EXT_GIG        | R    | 0h    | External GIG - This is the value of the EXT_GIG input bit.   |
| 3    | EXT_FULLDUPLEX | R    | 0h    | External Fullduplex - This is the value of the EXT_FULLDUPLEX input bit.   |
| 2    | Reserved       | R    | 0h    |  |
| 1    | RX_FLOW_ACT    | R    | 0h    | Receive Flow Control Active - When asserted, indicates that receive flow control is enabled and triggered.   |
| 0    | TX_FLOW_ACT    | R    | 0h    | Transmit Flow Control Active - When asserted, this bit indicates that the pause time period is being observed for a received pause frame. No new transmissions will begin while this bit is asserted except for the transmission of pause frames.<br>Any transmission in progress when this bit is asserted will complete. |

#### 14.5.7.4 SOFT\_RESET Register (offset = Ch) [reset = 0h]

SOFT\_RESET is shown in [Figure 14-176](#) and described in [Table 14-192](#).

##### CPGMAC\_SL SOFT RESET REGISTER

**Figure 14-176. SOFT\_RESET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-192. SOFT\_RESET Register Field Descriptions**

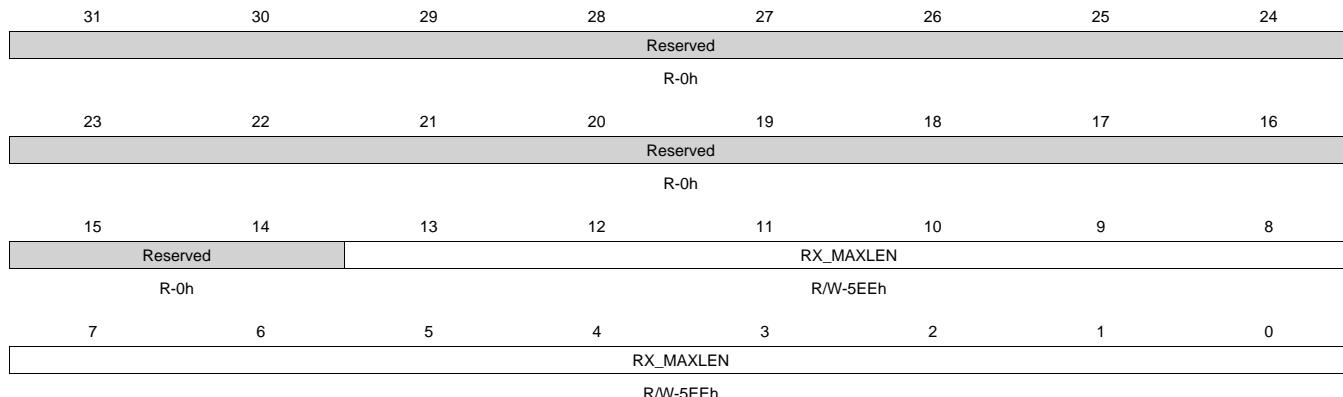

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-1 | Reserved   | R    | 0h    |  |
| 0    | SOFT_RESET | R/W  | 0h    | Software reset - Writing a one to this bit causes the CPGMAC_SL logic to be reset.<br>After writing a one to this bit, it may be polled to determine if the reset has occurred.<br>If a one is read, the reset has not yet occurred.<br>If a zero is read then reset has occurred. |

#### 14.5.7.5 RX\_MAXLEN Register (offset = 10h) [reset = 5EEh]

RX\_MAXLEN is shown in [Figure 14-177](#) and described in [Table 14-193](#).

##### CPGMAC\_SL RX MAXIMUM LENGTH REGISTER

**Figure 14-177. RX\_MAXLEN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-193. RX\_MAXLEN Register Field Descriptions**

| Bit   | Field     | Type | Reset | Description   |
|-------|-----------|------|-------|---|
| 31-14 | Reserved  | R    | 0h    |   |
| 13-0  | RX_MAXLEN | R/W  | 5EEh  | RX Maximum Frame Length - This field determines the maximum length of a received frame.<br>The reset value is 1518 (dec).<br>Frames with byte counts greater than rx_maxlen are long frames.<br>Long frames with no errors are oversized frames.<br>Long frames with CRC, code, or alignment error are jabber frames.<br>The maximum value is 16,383. |

#### 14.5.7.6 BOFFTEST Register (offset = 14h) [reset = 0h]

BOFFTEST is shown in [Figure 14-178](#) and described in [Table 14-194](#).

##### CPGMAC\_SL BACKOFF TEST REGISTER

**Figure 14-178. BOFFTEST Register**

| 31       | 30         | 29 | 28         | 27       | 26 | 25         | 24 |
|----------|------------|----|------------|----------|----|------------|----|

|          | COLL_COUNT |    |            | Reserved |    | TX_BACKOFF |    |
| R-0h     |            |    |            | R-0h     |    | R-0h       |    |
| 7        | 6          | 5  | 4          | 3        | 2  | 1          | 0  |
|          |            |    | TX_BACKOFF |          |    | R-0h       |    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-194. BOFFTEST Register Field Descriptions**

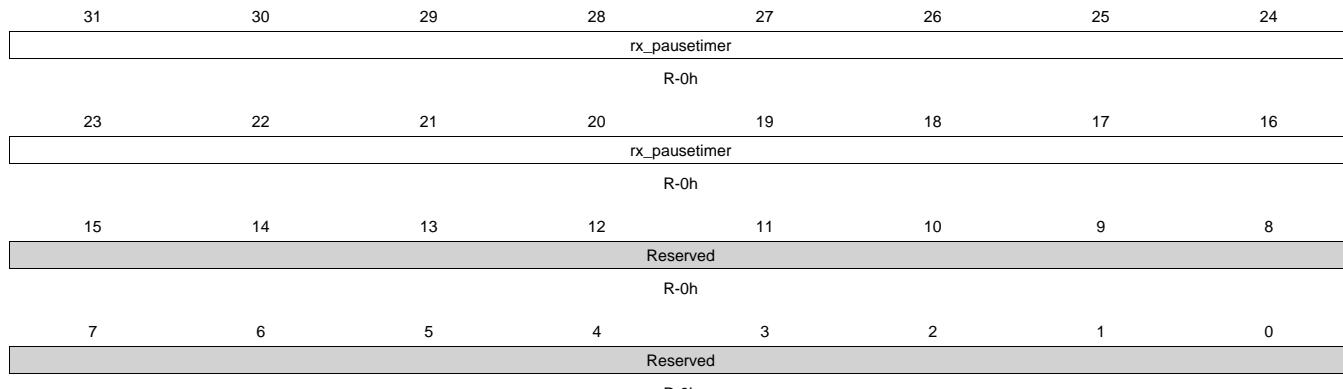

| Bit   | Field      | Type | Reset | Description   |
|-------|------------|------|-------|---|
| 31    | Reserved   | R    | 0h    |   |
| 30-26 | PACEVAL    | R/W  | 0h    | Pacing Register Current Value.<br>A non-zero value in this field indicates that transmit pacing is active. A transmit frame collision or deferral causes paceval to loaded with decimal 31, good frame transmissions (with no collisions or deferrals) cause paceval to be decremented down to zero. When paceval is nonzero, the transmitter delays 4 IPGs between new frame transmissions after each successfully transmitted frame that had no deferrals or collisions.<br>Transmit pacing helps reduce "capture" effects improving overall network bandwidth. |
| 25-16 | RNDNUM     | R/W  | 0h    | Backoff Random Number Generator - This field allows the Backoff Random Number Generator to be read (or written in test mode only). This field can be written only when mtest has previously been set. Reading this field returns the generator's current value.<br>The value is reset to zero and begins counting on the clock after the deassertion of reset.  |
| 15-12 | COLL_COUNT | R    | 0h    | Collision Count - The number of collisions the current frame has experienced.   |
| 11-10 | Reserved   | R    | 0h    |   |
| 9-0   | TX_BACKOFF | R    | 0h    | Backoff Count - This field allows the current value of the backoff counter to be observed for test purposes.<br>This field is loaded automatically according to the backoff algorithm, and is decremented by one for each slot time after the collision.  |

#### 14.5.7.7 RX\_PAUSE Register (offset = 18h) [reset = 0h]

RX\_PAUSE is shown in [Figure 14-179](#) and described in [Table 14-195](#).

##### CPGMAC\_SL RECEIVE PAUSE TIMER REGISTER

**Figure 14-179. RX\_PAUSE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-195. RX\_PAUSE Register Field Descriptions**

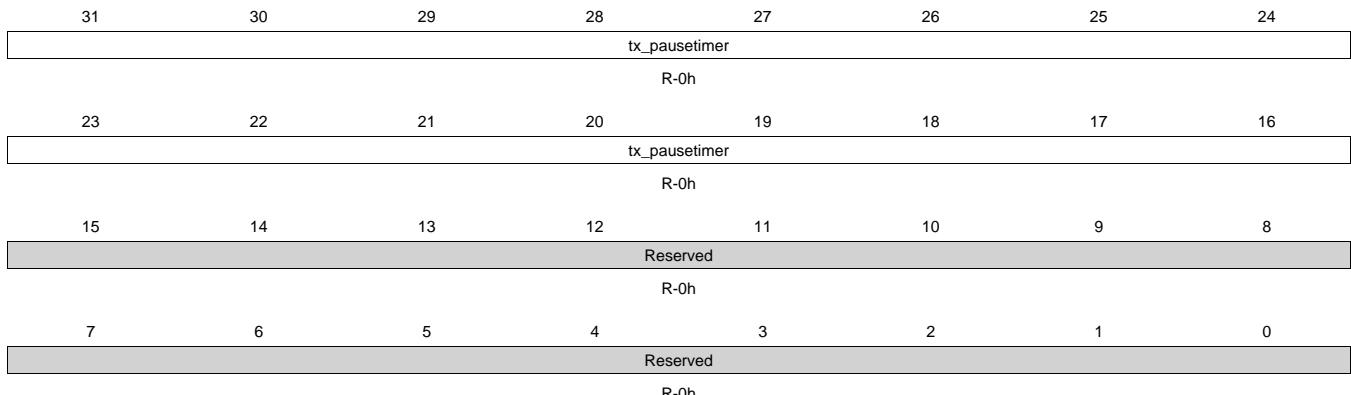

| Bit   | Field         | Type | Reset | Description  |
|-------|---------------|------|-------|--|
| 31-16 | rx_pausetimer | R    | 0h    | RX Pause Timer Value - This field allows the contents of the receive pause timer to be observed (and written in test mode).<br>The receive pause timer is loaded with 0xFF00 when the CPGMAC_SL sends an outgoing pause frame (with pause time of 0xFFFF).<br>The receive pause timer is decremented at slot time intervals.<br>If the receive pause timer decrements to zero, then another outgoing pause frame will be sent and the load/decrement process will be repeated. |
| 15-0  | Reserved      | R    | 0h    |  |

#### 14.5.7.8 TX\_PAUSE Register (offset = 1Ch) [reset = 0h]

TX\_PAUSE is shown in [Figure 14-180](#) and described in [Table 14-196](#).

##### CPGMAC\_SL TRANSMIT PAUSE TIMER REGISTER

**Figure 14-180. TX\_PAUSE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-196. TX\_PAUSE Register Field Descriptions**

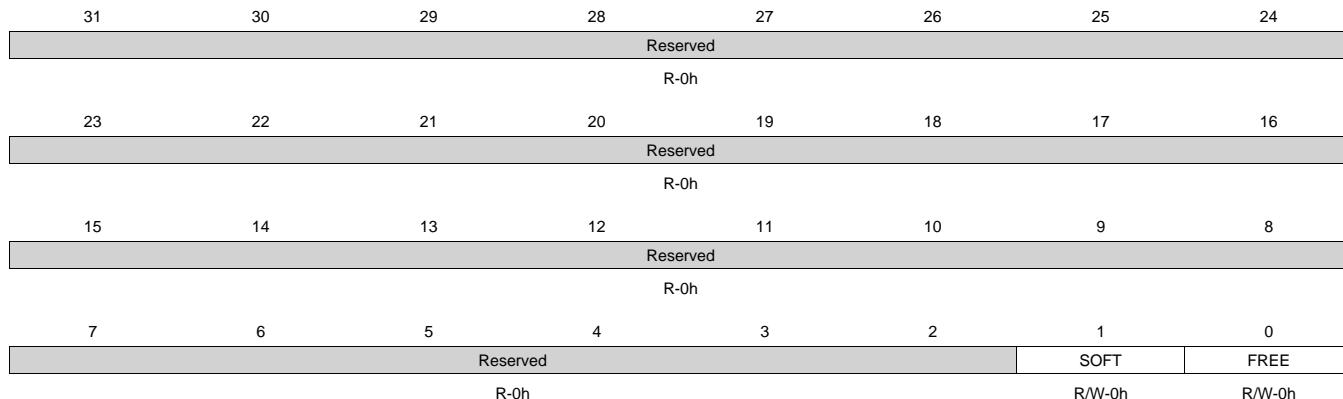

| Bit   | Field         | Type | Reset | Description  |
|-------|---------------|------|-------|--|
| 31-16 | tx_pausetimer | R    | 0h    | TX Pause Timer Value - This field allows the contents of the transmit pause timer to be observed (and written in test mode). The transmit pause timer is loaded by a received (incoming) pause frame, and then decremented, at slottime intervals, down to zero at which time CPGMAC_SL transmit frames are again enabled. |
| 15-0  | Reserved      | R    | 0h    |  |

#### 14.5.7.9 EMCONTROL Register (offset = 20h) [reset = 0h]

EMCONTROL is shown in [Figure 14-181](#) and described in [Table 14-197](#).

##### CPGMAC\_SL EMULATION CONTROL REGISTER

**Figure 14-181. EMCONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-197. EMCONTROL Register Field Descriptions**

| Bit  | Field    | Type | Reset | Description        |
|------|----------|------|-------|--------------------|
| 31-2 | Reserved | R    | 0h    |                    |
| 1    | SOFT     | R/W  | 0h    | Emulation Soft Bit |
| 0    | FREE     | R/W  | 0h    | Emulation Free Bit |

#### 14.5.7.10 RX\_PRI\_MAP Register (offset = 24h) [reset = 76543210h]

RX\_PRI\_MAP is shown in [Figure 14-182](#) and described in [Table 14-198](#).

CPGMAC\_SL RX PKT PRIORITY TO HEADER PRIORITY MAPPING REGISTER

**Figure 14-182. RX\_PRI\_MAP Register**

#### 14.5.8.1 ID\_VER Register (offset = 0h) [reset = 190112h]

ID\_VER is shown in [Figure 14-184](#) and described in [Table 14-201](#).

##### ID VERSION REGISTER

**Figure 14-184. ID\_VER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-201. ID\_VER Register Field Descriptions**

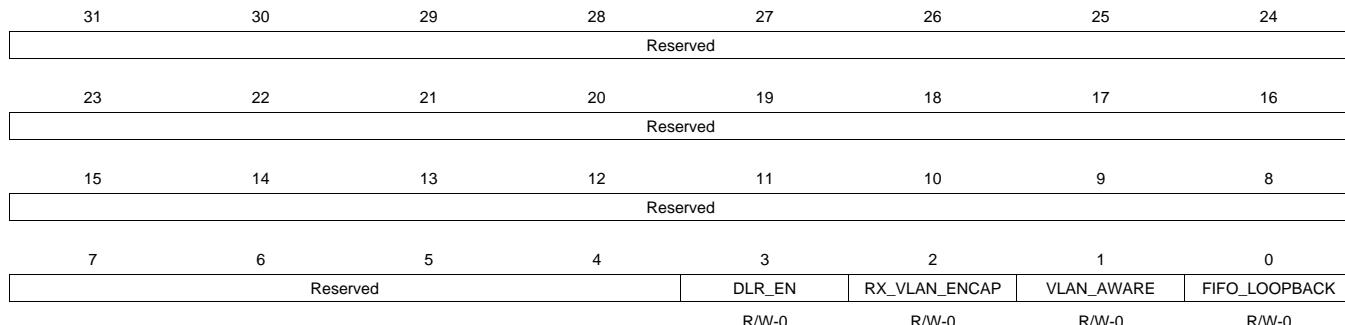

| Bit   | Field             | Type | Reset | Description             |
|-------|-------------------|------|-------|-------------------------|
| 31-16 | CPSW_3G_IDENT     | R-0  | 0     | 3G Identification Value |
| 15-11 | CPSW_3G RTL_VER   | R-0  | 0     | 3G RTL Version Value    |
| 10-8  | CPSW_3G MAJ_VER   | R-0  | 0     | 3G Major Version Value  |
| 7-0   | CPSW_3G_MINOR_VER | R-0  | 0     | 3G Minor Version Value  |

#### 14.5.8.2 CONTROL Register (offset = 4h) [reset = 0h]

CONTROL is shown in [Figure 14-185](#) and described in [Table 14-202](#).

##### SWITCH CONTROL REGISTER

**Figure 14-185. CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-202. CONTROL Register Field Descriptions**

| Bit | Field         | Type  | Reset | Description  |
|-----|---------------|-------|-------|--|
| 3   | DLR_EN        | R/W-0 | 0     | DLR enable<br>0 - DLR is disabled.<br>DLR packets will not be moved to queue priority 3 and will not be separated out onto dlr_cpdma_ch.<br>1 - DLR is disabled.<br>DLR packets be moved to destination port transmit queue priority 3 and will be separated out onto dlr_cpdma_ch when packet is to egress on port 0. |
| 2   | RX_VLAN_ENCAP | R/W-0 | 0     | Port 0 VLAN Encapsulation (egress):<br>0 - Port 2 receive packets (from 3G) are not VLAN encapsulated.<br>1 - Port 2 receive packets (from 3G) are VLAN encapsulated.  |
| 1   | VLAN_AWARE    | R/W-0 | 0     | VLAN Aware Mode:<br>0 - 3G is in the VLAN unaware mode.<br>1 - 3G is in the VLAN aware mode.   |
| 0   | FIFO_LOOPBACK | R/W-0 | 0     | FIFO Loopback Mode<br>0 - Loopback is disabled<br>1 - FIFO Loopback mode enabled.<br>Each packet received is turned around and sent out on the same port's transmit path.<br>Port 2 receive is fixed on channel zero.<br>The RXSOFOVERRUN statistic will increment for every packet sent in FIFO loopback mode.        |

#### 14.5.8.3 SOFT\_RESET Register (offset = 8h) [reset = 0h]

SOFT\_RESET is shown in [Figure 14-186](#) and described in [Table 14-203](#).

##### SOFT RESET REGISTER

**Figure 14-186. SOFT\_RESET Register**

| 31                     | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Reserved               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| SOF<br>T_R<br>ESE<br>T |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/<br>W-<br>0          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-203. SOFT\_RESET Register Field Descriptions**

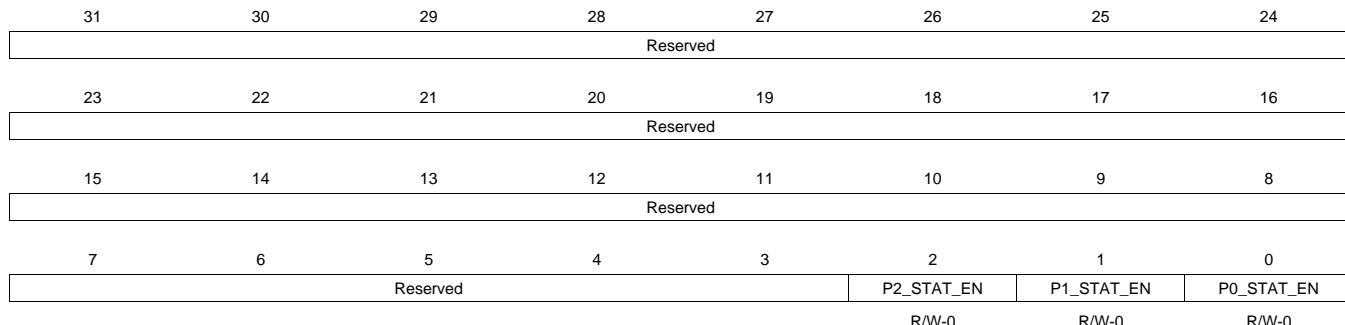

| Bit | Field      | Type  | Reset | Description  |
|-----|------------|-------|-------|--|
| 0   | SOFT_RESET | R/W-0 | 0     | <p>Software reset - Writing a one to this bit causes the 3G logic to be reset.</p> <p>After writing a one to this bit, it may be polled to determine if the reset has occurred.</p> <p>If a one is read, the reset has not yet occurred.</p> <p>If a zero is read then reset has occurred.</p> |

#### 14.5.8.4 STAT\_PORT\_EN Register (offset = Ch) [reset = 0h]

STAT\_PORT\_EN is shown in [Figure 14-187](#) and described in [Table 14-204](#).

##### STATISTICS PORT ENABLE REGISTER

**Figure 14-187. STAT\_PORT\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-204. STAT\_PORT\_EN Register Field Descriptions**

| Bit | Field      | Type  | Reset | Description  |
|-----|------------|-------|-------|--|
| 2   | P2_STAT_EN | R/W-0 | 0     | Port 2 (GMII2 and Port 2 FIFO) Statistics Enable<br>0 - Port 2 statistics are not enabled.<br>1 - Port 2 statistics are enabled.   |
| 1   | P1_STAT_EN | R/W-0 | 0     | Port 1 (GMII1 and Port 1 FIFO) Statistics Enable<br>0 - Port 1 statistics are not enabled.<br>1 - Port 1 statistics are enabled.   |
| 0   | P0_STAT_EN | R/W-0 | 0     | Port 0 Statistics Enable<br>0 - Port 0 statistics are not enabled<br>1 - Port 0 statistics are enabled.<br>FIFO overruns (SOFOVERRUNS) are the only port 0 statistics that are enabled to be kept. |

#### 14.5.8.5 PTYPE Register (offset = 10h) [reset = 0h]

PTYPE is shown in [Figure 14-188](#) and described in [Table 14-205](#).

##### TRANSMIT PRIORITY TYPE REGISTER

**Figure 14-188. PTYPE Register**

| 31       | 30 | 29               | 28               | 27               | 26               | 25               | 24               |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-205. PTYPE Register Field Descriptions**

| Bit | Field            | Type  | Reset | Description  |
|-----|------------------|-------|-------|--|
| 21  | P2_PRI3_SHAPE_EN | R/W-0 | 0     | Port 2 Queue Priority 3 Transmit Shape Enable - If there is only one shaping queue then it must be priority 3.   |
| 20  | P2_PRI2_SHAPE_EN | R/W-0 | 0     | Port 2 Queue Priority 2 Transmit Shape Enable - If there are two shaping queues then they must be priorities 3 and 2.  |
| 19  | P2_PRI1_SHAPE_EN | R/W-0 | 0     | Port 2 Queue Priority 1 Transmit Shape Enable - If there are three shaping queues all three bits should be set.  |
| 18  | P1_PRI3_SHAPE_EN | R/W-0 | 0     | Port 1 Queue Priority 3 Transmit Shape Enable - If there is only one shaping queue then it must be priority 3.   |
| 17  | P1_PRI2_SHAPE_EN | R/W-0 | 0     | Port 1 Queue Priority 2 Transmit Shape Enable- If there are two shaping queues then they must be priorities 3 and 2.   |
| 16  | P1_PRI1_SHAPE_EN | R/W-0 | 0     | Port 1 Queue Priority 1 Transmit Shape Enable- If there are three shaping queues all three bits should be set.   |
| 10  | P2_PTYPE_ESC     | R/W-0 | 0     | Port 2 Priority Type Escalate -<br>0 - Port 2 priority type fixed<br>1 - Port 2 priority type escalate Escalate should not be used with queue shaping.   |
| 9   | P1_PTYPE_ESC     | R/W-0 | 0     | Port 1 Priority Type Escalate -<br>0 - Port 1 priority type fixed<br>1 - Port 1 priority type escalate Escalate should not be used with queue shaping.   |
| 8   | P0_PTYPE_ESC     | R/W-0 | 0     | Port 0 Priority Type Escalate -<br>0 - Port 0 priority type fixed<br>1 - Port 0 priority type escalate Escalate should not be used with queue shaping.   |
| 4-0 | ESC_PRI_LD_VAL   | R/W-0 | 0     | Escalate Priority Load Value When a port is in escalate priority, this is the number of higher priority packets sent before the next lower priority is allowed to send a packet.<br>Escalate priority allows lower priority packets to be sent at a fixed rate relative to the next higher priority. |

#### 14.5.8.6 SOFT\_IDLE Register (offset = 14h) [reset = 0h]

SOFT\_IDLE is shown in Figure 14-189 and described in Table 14-206.

SOFTWARE IDLE

**Figure 14-189. SOFT\_IDLE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-206. SOFT IDLE Register Field Descriptions**

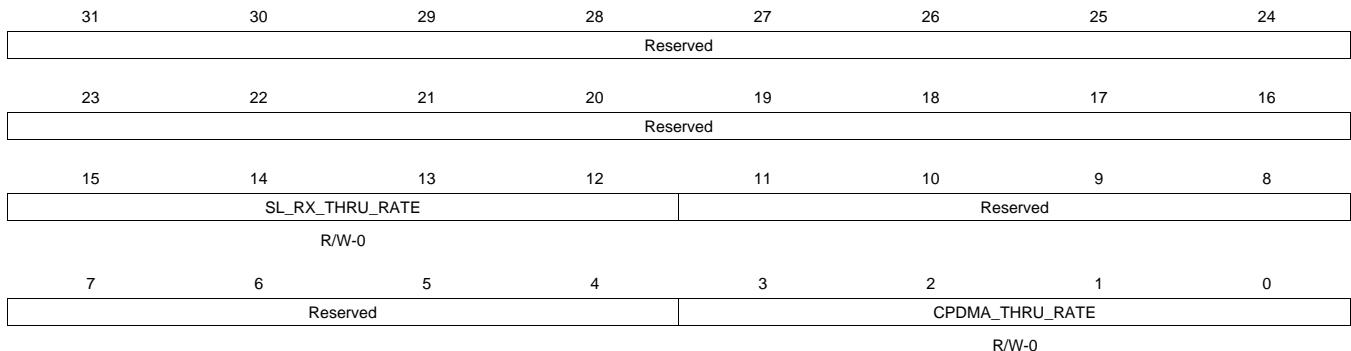

| Bit | Field     | Type  | Reset | Description   |
|-----|-----------|-------|-------|---|
| 0   | SOFT_IDLE | R/W-0 | 0     | Software Idle - Setting this bit causes the switch fabric to stop forwarding packets at the next start of packet. |

#### 14.5.8.7 THRU\_RATE Register (offset = 18h) [reset = 3003h]

THRU\_RATE is shown in [Figure 14-190](#) and described in [Table 14-207](#).

THROUGHPUT RATE

**Figure 14-190. THRU\_RATE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-207. THRU\_RATE Register Field Descriptions**

| Bit   | Field           | Type  | Reset | Description  |
|-------|-----------------|-------|-------|--|
| 15-12 | SL_RX_THRU_RATE | R/W-0 | 0     | CPGMAC_SL Switch FIFO receive through rate.<br>This register value is the maximum throughput of the ethernet ports to the crossbar SCR.<br>The default is one 8-byte word for every 3 CLK periods maximum. |
| 3-0   | CPDMA_THRU_RATE | R/W-0 | 0     | CPDMA Switch FIFO receive through rate.<br>This register value is the maximum throughput of the CPDMA host port to the crossbar SCR.<br>The default is one 8-byte word for every 3 CLK periods maximum.    |

#### 14.5.8.8 GAP\_THRESH Register (offset = 1Ch) [reset = Bh]

GAP\_THRESH is shown in [Figure 14-191](#) and described in [Table 14-208](#).

CPGMAC\_SL SHORT GAP THRESHOLD

**Figure 14-191. GAP\_THRESH Register**

| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4          | 3 | 2 | 1     | 0 |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|------------|---|---|-------|---|
| Reserved |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   | GAP_THRESH |   |   |       |   |
|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |            |   |   | R/W-0 |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-208. GAP\_THRESH Register Field Descriptions**

| Bit | Field      | Type  | Reset | Description   |
|-----|------------|-------|-------|---|
| 4-0 | GAP_THRESH | R/W-0 | 0     | CPGMAC_SL Short Gap Threshold - This is the CPGMAC_SL associated FIFO transmit block usage value for triggering TX_SHORT_GAP. |

#### 14.5.8.9 TX\_START\_WDS Register (offset = 20h) [reset = 20h]

TX\_START\_WDS is shown in [Figure 14-192](#) and described in [Table 14-209](#).

TRANSMIT START WORDS

**Figure 14-192. TX\_START\_WDS Register**

| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4            | 3 | 2 | 1 | 0 |       |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|--------------|---|---|---|---|-------|
| Reserved |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   | TX_START_WDS |   |   |   |   |       |
|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |              |   |   |   |   | R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-209. TX\_START\_WDS Register Field Descriptions**

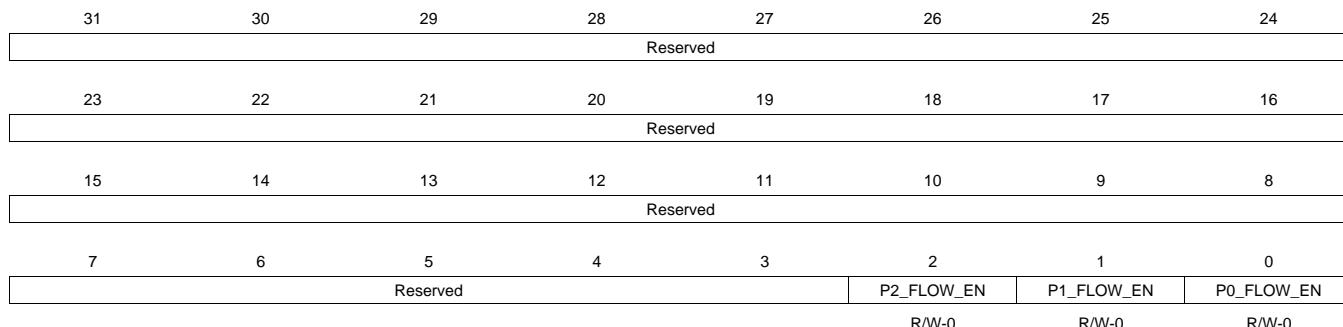

| Bit  | Field        | Type  | Reset | Description  |
|------|--------------|-------|-------|--|
| 10-0 | TX_START_WDS | R/W-0 | 0     | FIFO Packet Transmit (egress) Start Words.<br>This value is the number of required packet words in the transmit FIFO before the packet egress will begin.<br>This value is non-zero to preclude underrun.<br>Decimal 32 is the recommended value.<br>It should not be increased unnecessarily to prevent adding to the switch latency. |

#### 14.5.8.10 FLOW\_CONTROL Register (offset = 24h) [reset = 1h]

FLOW\_CONTROL is shown in [Figure 14-193](#) and described in [Table 14-210](#).

##### FLOW CONTROL

**Figure 14-193. FLOW\_CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-210. FLOW\_CONTROL Register Field Descriptions**

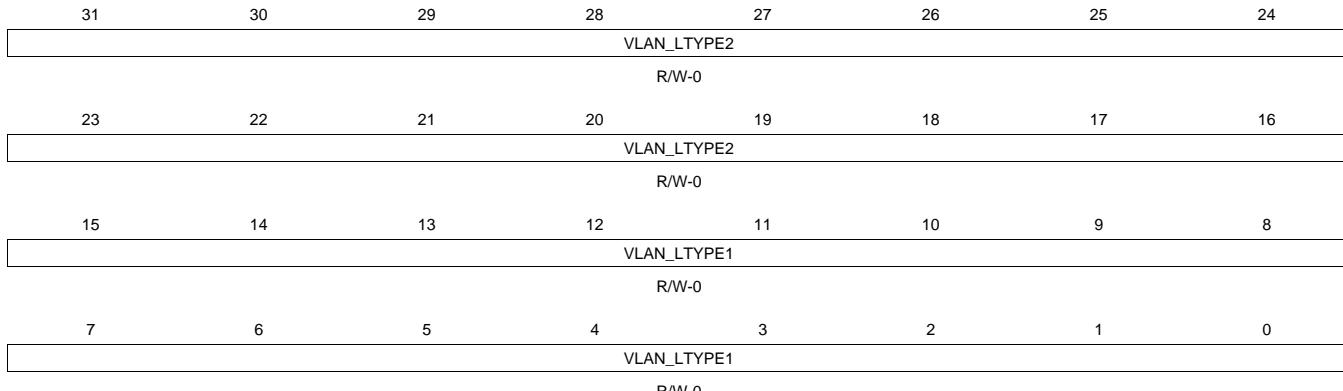

| Bit | Field      | Type  | Reset | Description                        |
|-----|------------|-------|-------|------------------------------------|
| 2   | P2_FLOW_EN | R/W-0 | 0     | Port 2 Receive flow control enable |
| 1   | P1_FLOW_EN | R/W-0 | 0     | Port 1 Receive flow control enable |
| 0   | P0_FLOW_EN | R/W-0 | 0     | Port 0 Receive flow control enable |

#### 14.5.8.11 VLAN\_LTYPE Register (offset = 28h) [reset = 81008100h]

VLAN\_LTYPE is shown in [Figure 14-194](#) and described in [Table 14-211](#).

##### LTYPE1 AND LTYPE 2 REGISTER

**Figure 14-194. VLAN\_LTYPE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-211. VLAN\_LTYPE Register Field Descriptions**

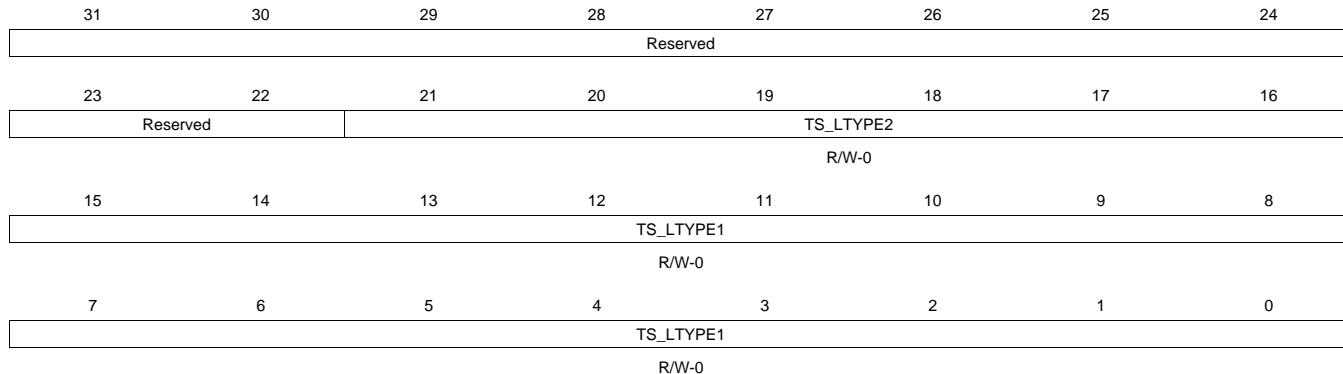

| Bit   | Field       | Type  | Reset | Description   |
|-------|-------------|-------|-------|---|
| 31-16 | VLAN_LTYPE2 | R/W-0 | 0     | Time Sync VLAN LTYPE2 This VLAN LTYPE value is used for tx and rx.<br>This is the inner VLAN if both are present. |
| 15-0  | VLAN_LTYPE1 | R/W-0 | 0     | Time Sync VLAN LTYPE1 This VLAN LTYPE value is used for tx and rx.<br>This is the outer VLAN if both are present. |

#### 14.5.8.12 TS\_LTYPE Register (offset = 2Ch) [reset = 0h]

TS\_LTYPE is shown in [Figure 14-195](#) and described in [Table 14-212](#).

VLAN\_LTYPE1 AND VLAN\_LTYPE2 REGISTER

**Figure 14-195. TS\_LTYPE Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-212. TS\_LTYPE Register Field Descriptions**

| Bit   | Field     | Type  | Reset | Description   |
|-------|-----------|-------|-------|---|
| 21-16 | TS_LTYPE2 | R/W-0 | 0     | Time Sync LTYPE2 This is an Ethertype value to match for tx and rx time sync packets. |
| 15-0  | TS_LTYPE1 | R/W-0 | 0     | Time Sync LTYPE1 This is an ethertype value to match for tx and rx time sync packets. |

#### 14.5.8.13 DLR\_LTYPE Register (offset = 30h) [reset = 80E1h]

DLR\_LTYPE is shown in [Figure 14-196](#) and described in [Table 14-213](#).

##### DLR LTYPE REGISTER

**Figure 14-196. DLR\_LTYPE Register**

|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |           |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Reserved |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | DLR_LTYPE |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| R/W-0    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |           |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-213. DLR\_LTYPE Register Field Descriptions**

| Bit  | Field     | Type  | Reset | Description |
|------|-----------|-------|-------|-------------|
| 15-0 | DLR_LTYPE | R/W-0 | 0     | DLR LTYPE   |

#### 14.5.9 CPSW\_WR Registers

[Table 14-214](#) lists the memory-mapped registers for the CPSW\_WR. All register offset addresses not listed in [Table 14-214](#) should be considered as reserved locations and the register contents should not be modified.

**Table 14-214. CPSW\_WR REGISTERS**

| Offset | Acronym           | Register Name | Section                           |
|--------|-------------------|---------------|-----------------------------------|
| 0h     | IDVER             |               | <a href="#">Section 14.5.9.1</a>  |
| 4h     | SOFT_RESET        |               | <a href="#">Section 14.5.9.2</a>  |
| 8h     | CONTROL           |               | <a href="#">Section 14.5.9.3</a>  |
| Ch     | INT_CONTROL       |               | <a href="#">Section 14.5.9.4</a>  |
| 10h    | C0_RX_THRESH_EN   |               | <a href="#">Section 14.5.9.5</a>  |
| 14h    | C0_RX_EN          |               | <a href="#">Section 14.5.9.6</a>  |
| 18h    | C0_TX_EN          |               | <a href="#">Section 14.5.9.7</a>  |
| 1Ch    | C0_MISC_EN        |               | <a href="#">Section 14.5.9.8</a>  |
| 20h    | C1_RX_THRESH_EN   |               | <a href="#">Section 14.5.9.9</a>  |
| 24h    | C1_RX_EN          |               | <a href="#">Section 14.5.9.10</a> |
| 28h    | C1_TX_EN          |               | <a href="#">Section 14.5.9.11</a> |
| 2Ch    | C1_MISC_EN        |               | <a href="#">Section 14.5.9.12</a> |
| 30h    | C2_RX_THRESH_EN   |               | <a href="#">Section 14.5.9.13</a> |
| 34h    | C2_RX_EN          |               | <a href="#">Section 14.5.9.14</a> |
| 38h    | C2_TX_EN          |               | <a href="#">Section 14.5.9.15</a> |
| 3Ch    | C2_MISC_EN        |               | <a href="#">Section 14.5.9.16</a> |
| 40h    | C0_RX_THRESH_STAT |               | <a href="#">Section 14.5.9.17</a> |
| 44h    | C0_RX_STAT        |               | <a href="#">Section 14.5.9.18</a> |
| 48h    | C0_TX_STAT        |               | <a href="#">Section 14.5.9.19</a> |
| 4Ch    | C0_MISC_STAT      |               | <a href="#">Section 14.5.9.20</a> |
| 50h    | C1_RX_THRESH_STAT |               | <a href="#">Section 14.5.9.21</a> |
| 54h    | C1_RX_STAT        |               | <a href="#">Section 14.5.9.22</a> |
| 58h    | C1_TX_STAT        |               | <a href="#">Section 14.5.9.23</a> |
| 5Ch    | C1_MISC_STAT      |               | <a href="#">Section 14.5.9.24</a> |
| 60h    | C2_RX_THRESH_STAT |               | <a href="#">Section 14.5.9.25</a> |
| 64h    | C2_RX_STAT        |               | <a href="#">Section 14.5.9.26</a> |
| 68h    | C2_TX_STAT        |               | <a href="#">Section 14.5.9.27</a> |
| 6Ch    | C2_MISC_STAT      |               | <a href="#">Section 14.5.9.28</a> |

**Table 14-214. CPSW\_WR REGISTERS (continued)**

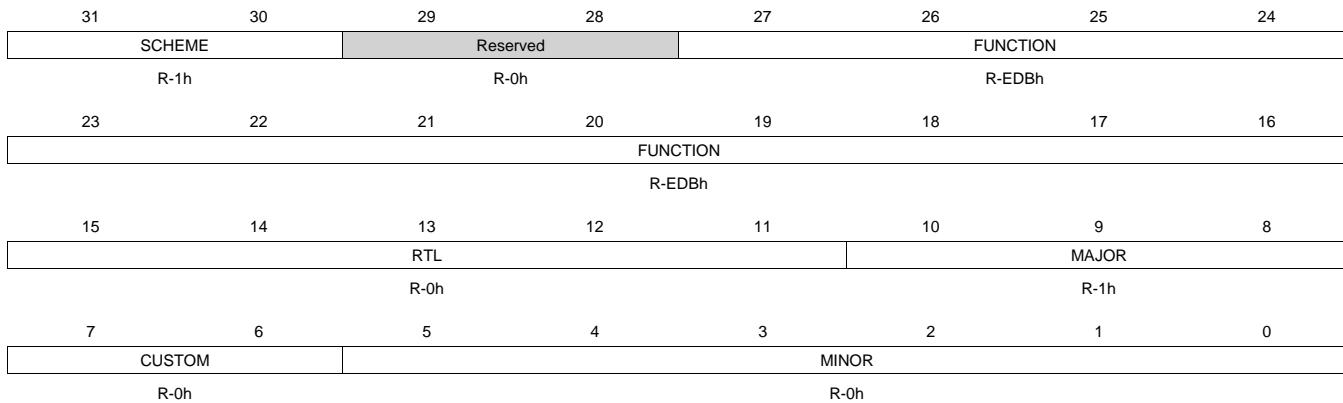

| <b>Offset</b> | <b>Acronym</b> | <b>Register Name</b> | <b>Section</b>                    |
|---------------|----------------|----------------------|-----------------------------------|
| 70h           | C0_RX_IMAX     |                      | <a href="#">Section 14.5.9.29</a> |
| 74h           | C0_TX_IMAX     |                      | <a href="#">Section 14.5.9.30</a> |
| 78h           | C1_RX_IMAX     |                      | <a href="#">Section 14.5.9.31</a> |
| 7Ch           | C1_TX_IMAX     |                      | <a href="#">Section 14.5.9.32</a> |
| 80h           | C2_RX_IMAX     |                      | <a href="#">Section 14.5.9.33</a> |
| 84h           | C2_TX_IMAX     |                      | <a href="#">Section 14.5.9.34</a> |
| 88h           | RGMII_CTL      |                      | <a href="#">Section 14.5.9.35</a> |

#### 14.5.9.1 IDVER Register (offset = 0h) [reset = 4EDB0100h]

IDVER is shown in [Figure 14-197](#) and described in [Table 14-215](#).

##### SUBSYSTEM ID VERSION REGISTER

**Figure 14-197. IDVER Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-215. IDVER Register Field Descriptions**

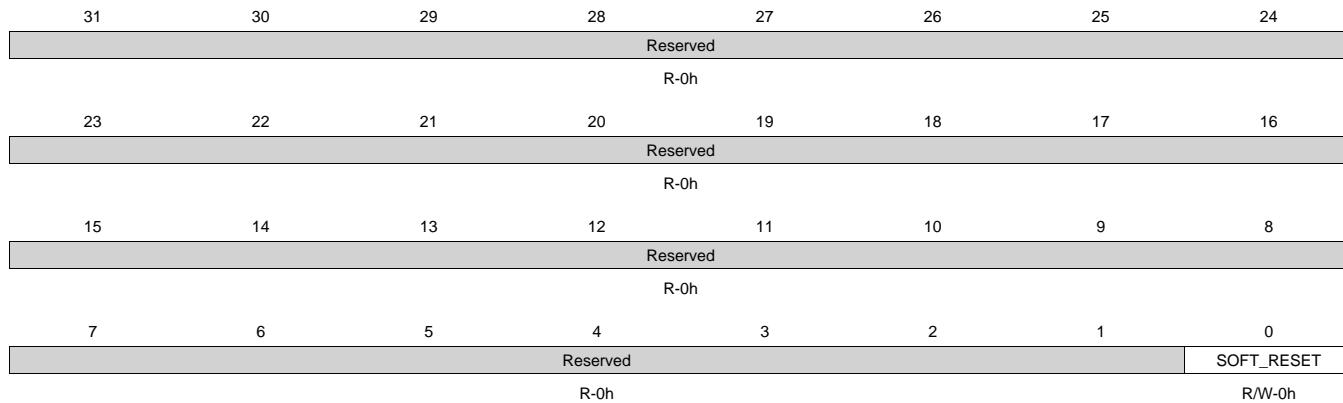

| Bit   | Field    | Type | Reset | Description    |
|-------|----------|------|-------|----------------|
| 31-30 | SCHEME   | R    | 1h    | Scheme value   |
| 29-28 | Reserved | R    | 0h    |                |
| 27-16 | FUNCTION | R    | EDBh  | function value |
| 15-11 | RTL      | R    | 0h    | rtl version    |
| 10-8  | MAJOR    | R    | 1h    | major version  |
| 7-6   | CUSTOM   | R    | 0h    | custom version |
| 5-0   | MINOR    | R    | 0h    | minor version  |

#### 14.5.9.2 SOFT\_RESET Register (offset = 4h) [reset = 0h]

SOFT\_RESET is shown in [Figure 14-198](#) and described in [Table 14-216](#).

##### SUBSYSTEM SOFT RESET REGISTER

**Figure 14-198. SOFT\_RESET Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-216. SOFT\_RESET Register Field Descriptions**

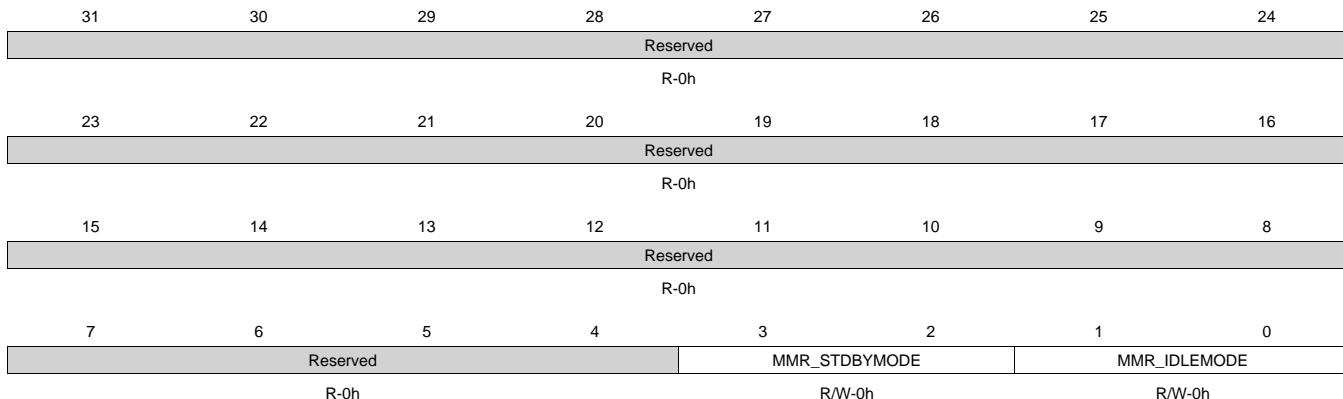

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-1 | Reserved   | R    | 0h    |   |
| 0    | SOFT_RESET | R/W  | 0h    | Software reset - Writing a one to this bit causes the CPGMACSS_R logic to be reset (INT, REGS, CPPI).<br>Software reset occurs on the clock following the register bit write. |

#### 14.5.9.3 CONTROL Register (offset = 8h) [reset = 0h]

CONTROL is shown in [Figure 14-199](#) and described in [Table 14-217](#).

##### SUBSYSTEM CONTROL REGISTER

**Figure 14-199. CONTROL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-217. CONTROL Register Field Descriptions**

| Bit  | Field         | Type | Reset | Description   |
|------|---------------|------|-------|---|
| 31-4 | Reserved      | R    | 0h    |   |
| 3-2  | MMR_STDBYMODE | R/W  | 0h    | <p>Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state.</p> <p>0x0 = Force-standby mode : Local initiator is unconditionally placed in standby state.</p> <p>0x1 = No-standby mode : Local initiator is unconditionally placed out of standby state.</p> <p>0x2 = Reserved : Reserved.</p> <p>0x3 = Reserved : Reserved.</p> |
| 1-0  | MMR_IDLEMODE  | R/W  | 0h    | <p>Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of IDLE state.</p> <p>0x0 = Force-idle mode : Local initiator is unconditionally placed in idle state.</p> <p>0x1 = No-idle mode : Local initiator is unconditionally placed out of idle state.</p> <p>0x2 = Reserved : Reserved.</p> <p>0x3 = Reserved : Reserved.</p>                |

#### 14.5.9.4 INT\_CONTROL Register (offset = Ch) [reset = 0h]

INT\_CONTROL is shown in Figure 14-200 and described in Table 14-218.

##### SUBSYSTEM INTERRUPT CONTROL

**Figure 14-200. INT\_CONTROL Register**

|          |    |    |    |              |    |    |    |
|----------|----|----|----|--------------|----|----|----|
| 31       | 30 | 29 | 28 | 27           | 26 | 25 | 24 |
| INT_TEST |    |    |    | Reserved     |    |    |    |
| R/W-0h   |    |    |    | R-0h         |    |    |    |
| 23       | 22 | 21 | 20 | 19           | 18 | 17 | 16 |
| Reserved |    |    |    | INT_PACE_EN  |    |    |    |
| R-0h     |    |    |    | R/W-0h       |    |    |    |
| 15       | 14 | 13 | 12 | 11           | 10 | 9  | 8  |
| Reserved |    |    |    | INT_PRESCALE |    |    |    |
| R-0h     |    |    |    | R-0h         |    |    |    |
| 7        | 6  | 5  | 4  | 3            | 2  | 1  | 0  |
|          |    |    |    | INT_PRESCALE |    |    |    |
|          |    |    |    | R-0h         |    |    |    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-218. INT\_CONTROL Register Field Descriptions**

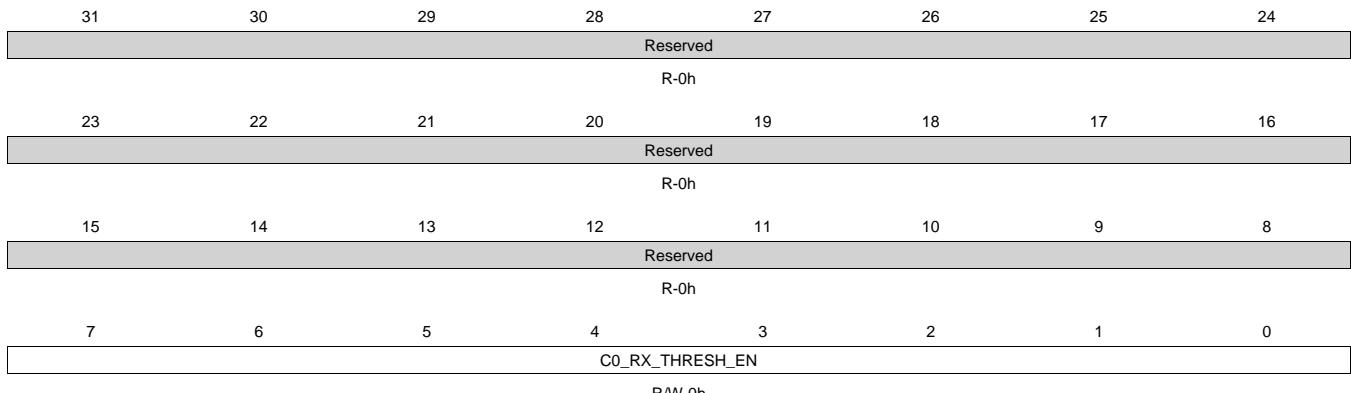

| Bit   | Field        | Type | Reset | Description   |
|-------|--------------|------|-------|---|
| 31    | INT_TEST     | R/W  | 0h    | Interrupt Test - Test bit to the interrupt pacing blocks  |
| 30-22 | Reserved     | R    | 0h    |   |
| 21-16 | INT_PACE_EN  | R/W  | 0h    | Interrupt Pacing Enable Bus int_pace_en[0] - Enables C0_Rx_Pulse Pacing (0 is pacing bypass) int_pace_en[1] - Enables C0_Tx_Pulse Pacing (0 is pacing bypass) int_pace_en[2] - Enables C1_Rx_Pulse Pacing (0 is pacing bypass) int_pace_en[3] - Enables C1_Tx_Pulse Pacing (0 is pacing bypass) int_pace_en[4] - Enables C2_Rx_Pulse Pacing (0 is pacing bypass) int_pace_en[5] - Enables C2_Tx_Pulse Pacing (0 is pacing bypass) |
| 15-12 | Reserved     | R    | 0h    |   |
| 11-0  | INT_PRESCALE | R    | 0h    | Interrupt Counter Prescaler - The number of MAIN_CLK periods in 4us.  |

#### 14.5.9.5 C0\_RX\_THRESH\_EN Register (offset = 10h) [reset = 0h]

C0\_RX\_THRESH\_EN is shown in [Figure 14-201](#) and described in [Table 14-219](#).

SUBSYSTEM CORE 0 RECEIVE THRESHOLD INT ENABLE REGISTER

**Figure 14-201. C0\_RX\_THRESH\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-219. C0\_RX\_THRESH\_EN Register Field Descriptions**

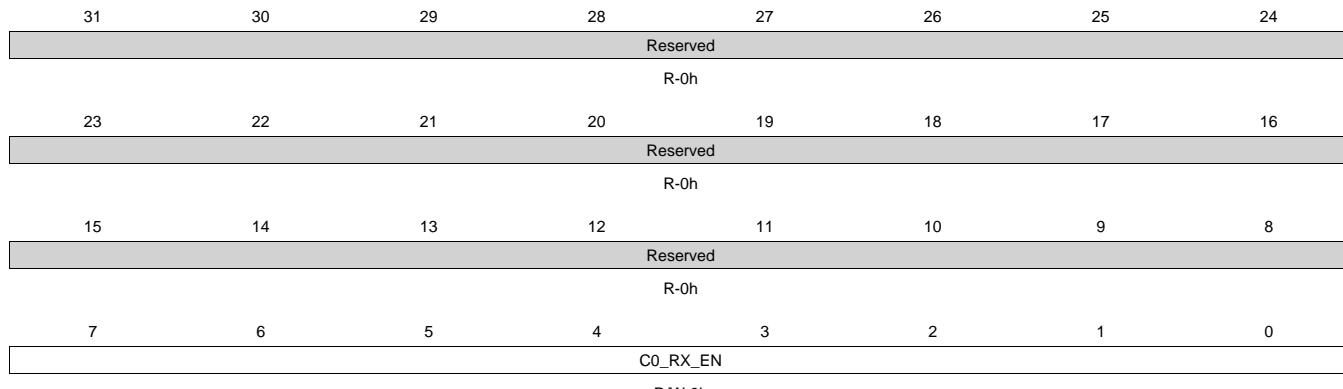

| Bit  | Field           | Type | Reset | Description   |
|------|-----------------|------|-------|---|
| 31-8 | Reserved        | R    | 0h    |   |
| 7-0  | C0_RX_THRESH_EN | R/W  | 0h    | Core 0 Receive Threshold Enable - Each bit in this register corresponds to the bit in the receive threshold interrupt that is enabled to generate an interrupt on C0_RX_THRESH_PULSE. |

#### 14.5.9.6 C0\_RX\_EN Register (offset = 14h) [reset = 0h]

C0\_RX\_EN is shown in [Figure 14-202](#) and described in [Table 14-220](#).

SUBSYSTEM CORE 0 RECEIVE INTERRUPT ENABLE REGISTER

**Figure 14-202. C0\_RX\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-220. C0\_RX\_EN Register Field Descriptions**

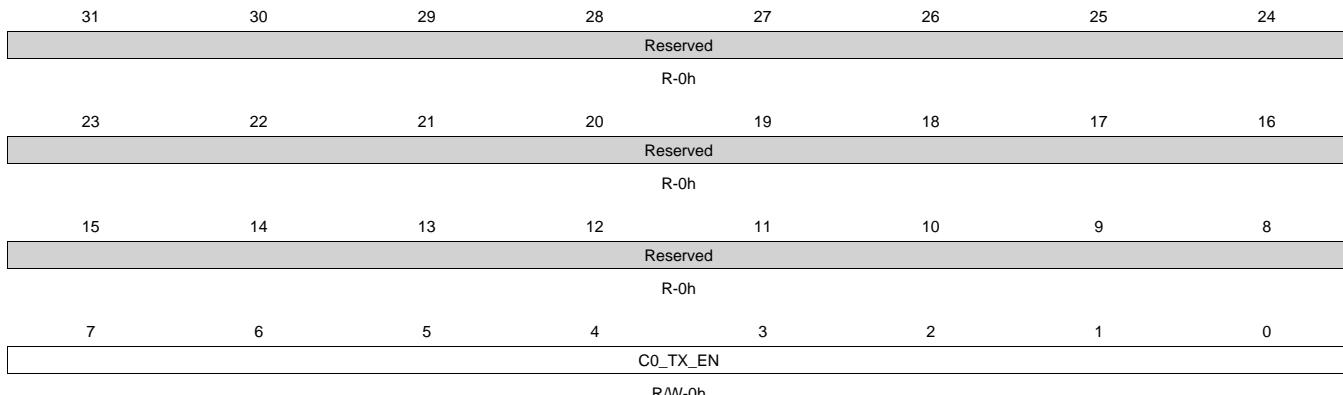

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-8 | Reserved | R    | 0h    |   |
| 7-0  | C0_RX_EN | R/W  | 0h    | Core 0 Receive Enable - Each bit in this register corresponds to the bit in the rx interrupt that is enabled to generate an interrupt on C0_RX_PULSE. |

#### 14.5.9.7 C0\_TX\_EN Register (offset = 18h) [reset = 0h]

C0\_TX\_EN is shown in [Figure 14-203](#) and described in [Table 14-221](#).

##### SUBSYSTEM CORE 0 TRANSMIT INTERRUPT ENABLE REGISTER

**Figure 14-203. C0\_TX\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-221. C0\_TX\_EN Register Field Descriptions**

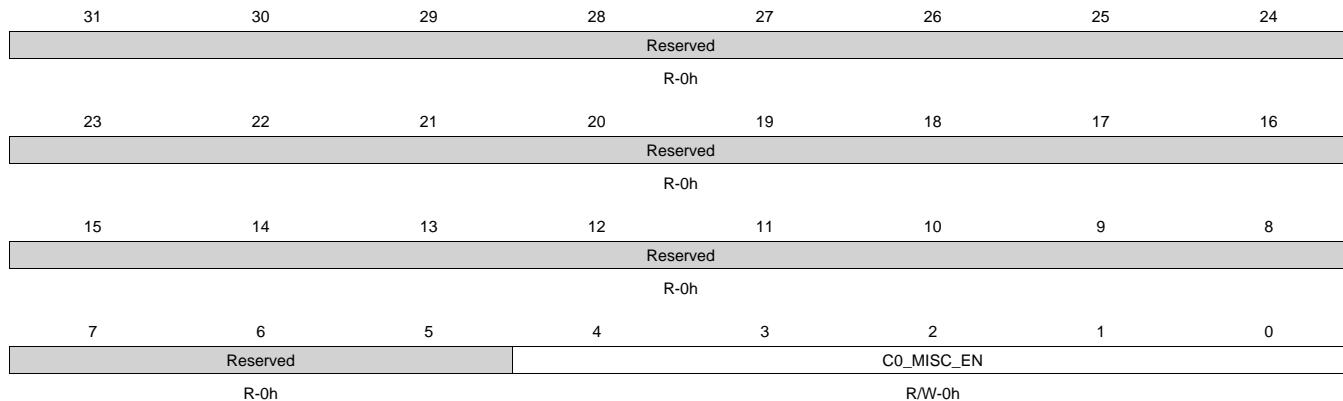

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    |  |
| 7-0  | C0_TX_EN | R/W  | 0h    | Core 0 Transmit Enable - Each bit in this register corresponds to the bit in the tx interrupt that is enabled to generate an interrupt on C0_TX_PULSE. |

#### 14.5.9.8 C0\_MISC\_EN Register (offset = 1Ch) [reset = 0h]

C0\_MISC\_EN is shown in [Figure 14-204](#) and described in [Table 14-222](#).

##### SUBSYSTEM CORE 0 MISC INTERRUPT ENABLE REGISTER

**Figure 14-204. C0\_MISC\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-222. C0\_MISC\_EN Register Field Descriptions**

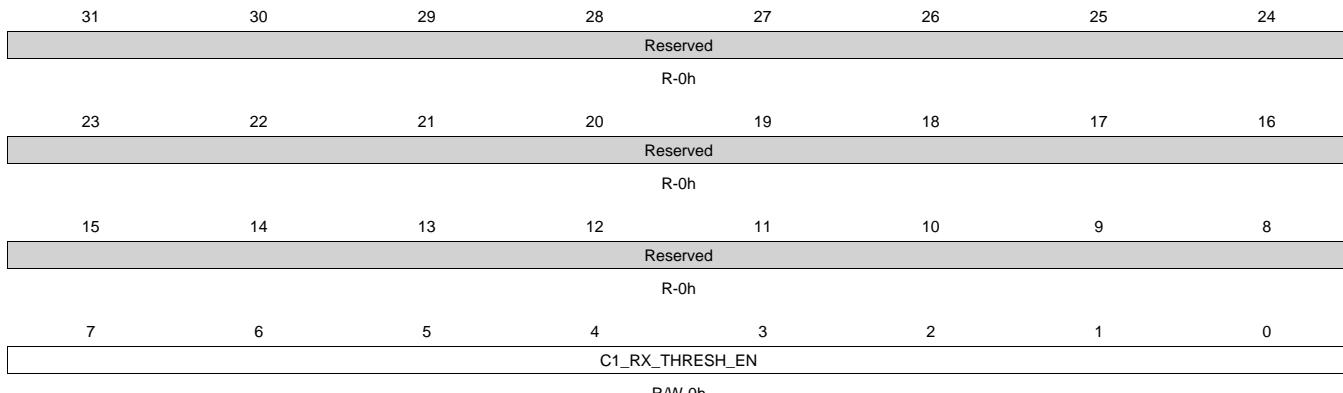

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-5 | Reserved   | R    | 0h    |  |
| 4-0  | C0_MISC_EN | R/W  | 0h    | Core 0 Misc Enable - Each bit in this register corresponds to the miscellaneous interrupt (evnt_pend, stat_pend, host_pend, mdio_linkint, mdio_userint) that is enabled to generate an interrupt on C0_Misc_PULSE. |

#### 14.5.9.9 C1\_RX\_THRESH\_EN Register (offset = 20h) [reset = 0h]

C1\_RX\_THRESH\_EN is shown in [Figure 14-205](#) and described in [Table 14-223](#).

SUBSYSTEM CORE 1 RECEIVE THRESHOLD INT ENABLE REGISTER

**Figure 14-205. C1\_RX\_THRESH\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-223. C1\_RX\_THRESH\_EN Register Field Descriptions**

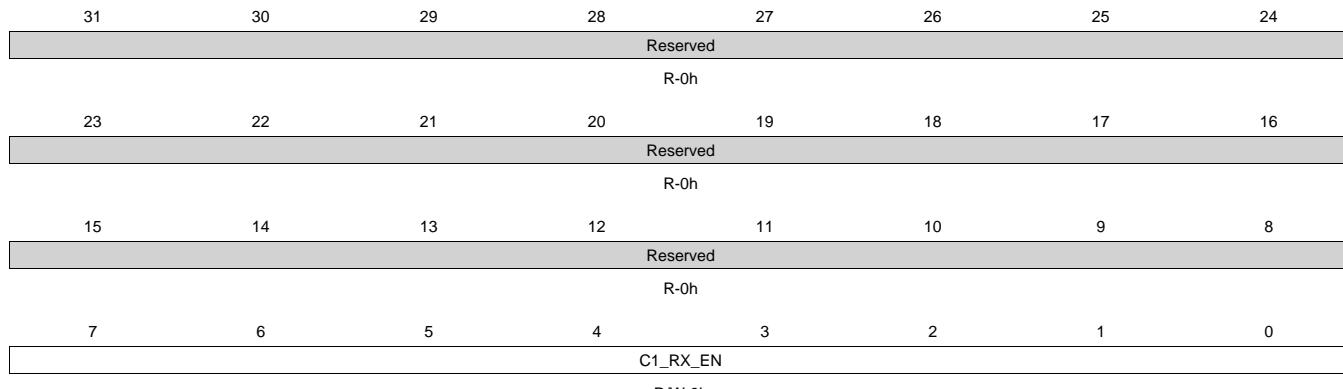

| Bit  | Field           | Type | Reset | Description   |
|------|-----------------|------|-------|---|
| 31-8 | Reserved        | R    | 0h    |   |
| 7-0  | C1_RX_THRESH_EN | R/W  | 0h    | Core 1 Receive Threshold Enable - Each bit in this register corresponds to the bit in the receive threshold interrupt that is enabled to generate an interrupt on C1_RX_THRESH_PULSE. |

#### 14.5.9.10 C1\_RX\_EN Register (offset = 24h) [reset = 0h]

C1\_RX\_EN is shown in [Figure 14-206](#) and described in [Table 14-224](#).

SUBSYSTEM CORE 1 RECEIVE INTERRUPT ENABLE REGISTER

**Figure 14-206. C1\_RX\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-224. C1\_RX\_EN Register Field Descriptions**

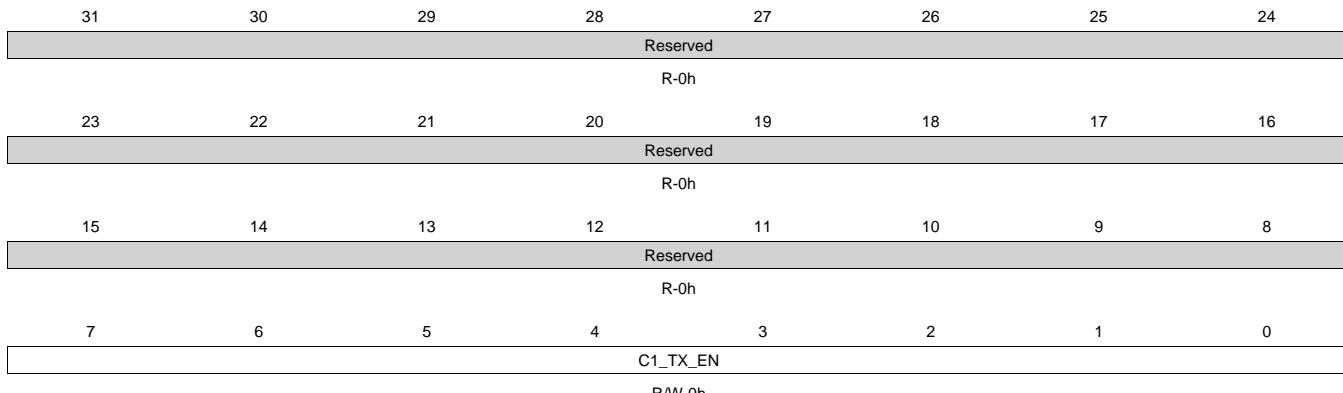

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-8 | Reserved | R    | 0h    |   |
| 7-0  | C1_RX_EN | R/W  | 0h    | Core 1 Receive Enable - Each bit in this register corresponds to the bit in the rx interrupt that is enabled to generate an interrupt on C1_RX_PULSE. |

#### 14.5.9.11 C1\_TX\_EN Register (offset = 28h) [reset = 0h]

C1\_TX\_EN is shown in [Figure 14-207](#) and described in [Table 14-225](#).

##### SUBSYSTEM CORE 1 TRANSMIT INTERRUPT ENABLE REGISTER

**Figure 14-207. C1\_TX\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-225. C1\_TX\_EN Register Field Descriptions**

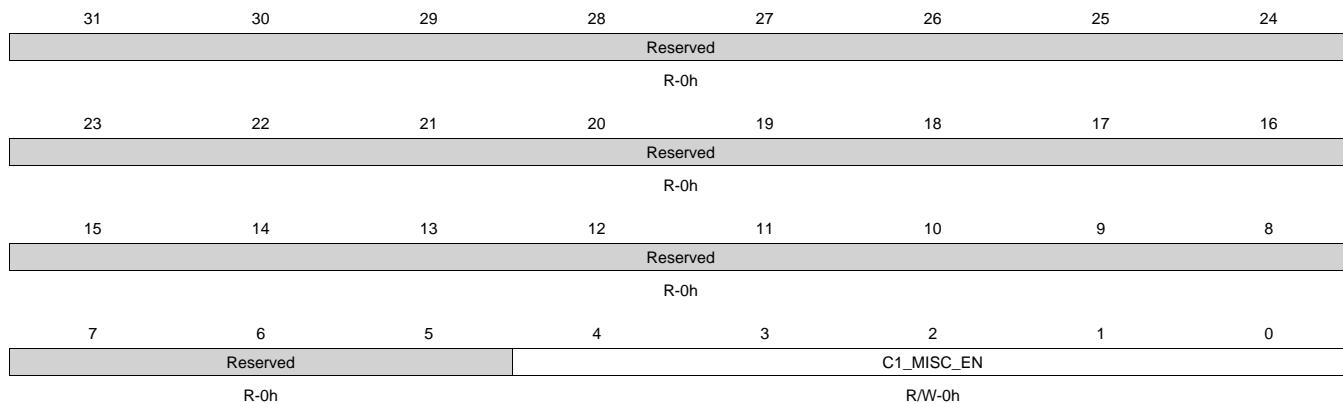

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    |  |
| 7-0  | C1_TX_EN | R/W  | 0h    | Core 1 Transmit Enable - Each bit in this register corresponds to the bit in the tx interrupt that is enabled to generate an interrupt on C1_TX_PULSE. |

#### 14.5.9.12 C1\_MISC\_EN Register (offset = 2Ch) [reset = 0h]

C1\_MISC\_EN is shown in [Figure 14-208](#) and described in [Table 14-226](#).

##### SUBSYSTEM CORE 1 MISC INTERRUPT ENABLE REGISTER

**Figure 14-208. C1\_MISC\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-226. C1\_MISC\_EN Register Field Descriptions**

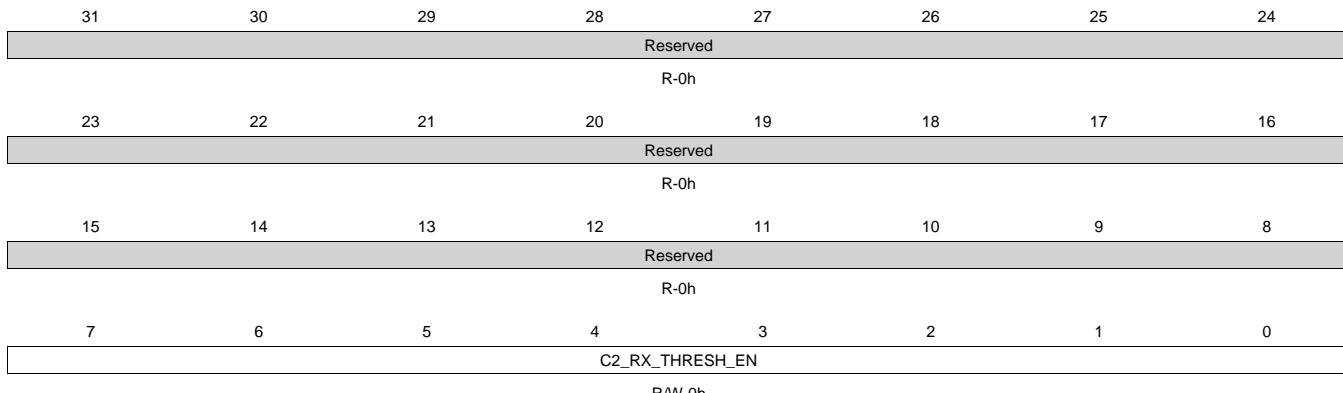

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-5 | Reserved   | R    | 0h    |  |
| 4-0  | C1_MISC_EN | R/W  | 0h    | Core 1 Misc Enable - Each bit in this register corresponds to the miscellaneous interrupt (evnt_pend, stat_pend, host_pend, mdio_linkint, mdio_userint) that is enabled to generate an interrupt on C1_Misc_PULSE. |

#### 14.5.9.13 C2\_RX\_THRESH\_EN Register (offset = 30h) [reset = 0h]

C2\_RX\_THRESH\_EN is shown in [Figure 14-209](#) and described in [Table 14-227](#).

SUBSYSTEM CORE 2 RECEIVE THRESHOLD INT ENABLE REGISTER

**Figure 14-209. C2\_RX\_THRESH\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-227. C2\_RX\_THRESH\_EN Register Field Descriptions**

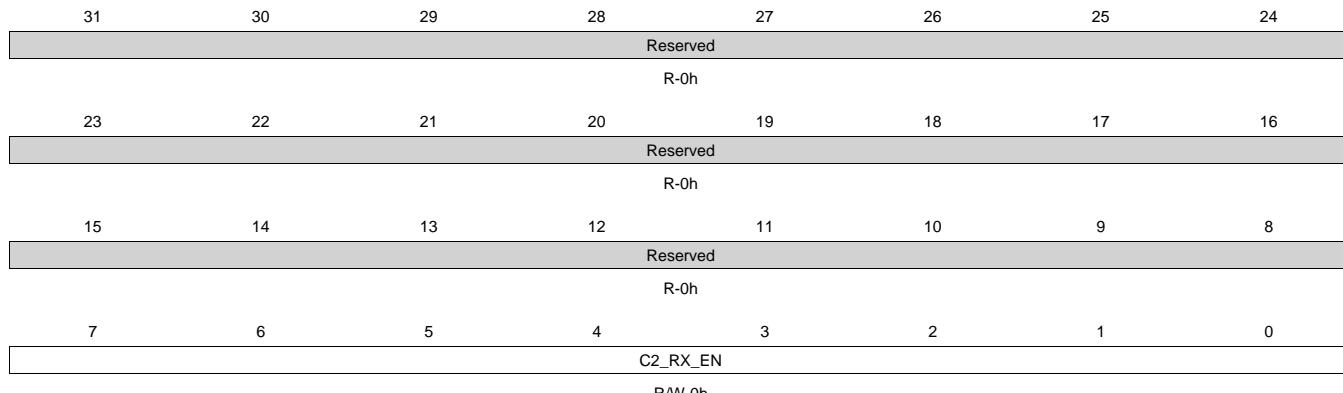

| Bit  | Field           | Type | Reset | Description   |
|------|-----------------|------|-------|---|
| 31-8 | Reserved        | R    | 0h    |   |
| 7-0  | C2_RX_THRESH_EN | R/W  | 0h    | Core 2 Receive Threshold Enable - Each bit in this register corresponds to the bit in the receive threshold interrupt that is enabled to generate an interrupt on C2_RX_THRESH_PULSE. |

#### 14.5.9.14 C2\_RX\_EN Register (offset = 34h) [reset = 0h]

C2\_RX\_EN is shown in [Figure 14-210](#) and described in [Table 14-228](#).

##### SUBSYSTEM CORE 2 RECEIVE INTERRUPT ENABLE REGISTER

**Figure 14-210. C2\_RX\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-228. C2\_RX\_EN Register Field Descriptions**

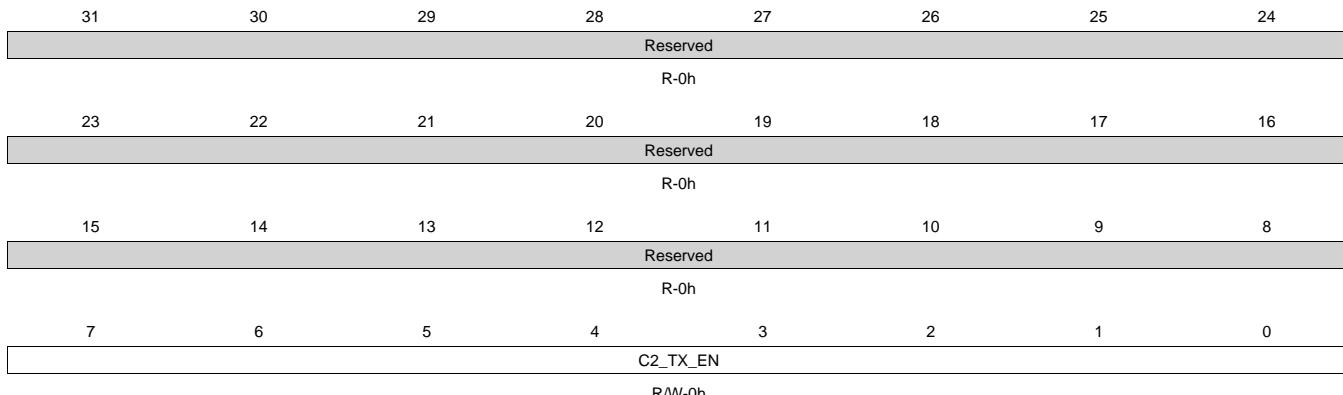

| Bit  | Field    | Type | Reset | Description   |
|------|----------|------|-------|---|
| 31-8 | Reserved | R    | 0h    |   |
| 7-0  | C2_RX_EN | R/W  | 0h    | Core 2 Receive Enable - Each bit in this register corresponds to the bit in the rx interrupt that is enabled to generate an interrupt on C2_RX_PULSE. |

#### 14.5.9.15 C2\_TX\_EN Register (offset = 38h) [reset = 0h]

C2\_TX\_EN is shown in [Figure 14-211](#) and described in [Table 14-229](#).

##### SUBSYSTEM CORE 2 TRANSMIT INTERRUPT ENABLE REGISTER

**Figure 14-211. C2\_TX\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-229. C2\_TX\_EN Register Field Descriptions**

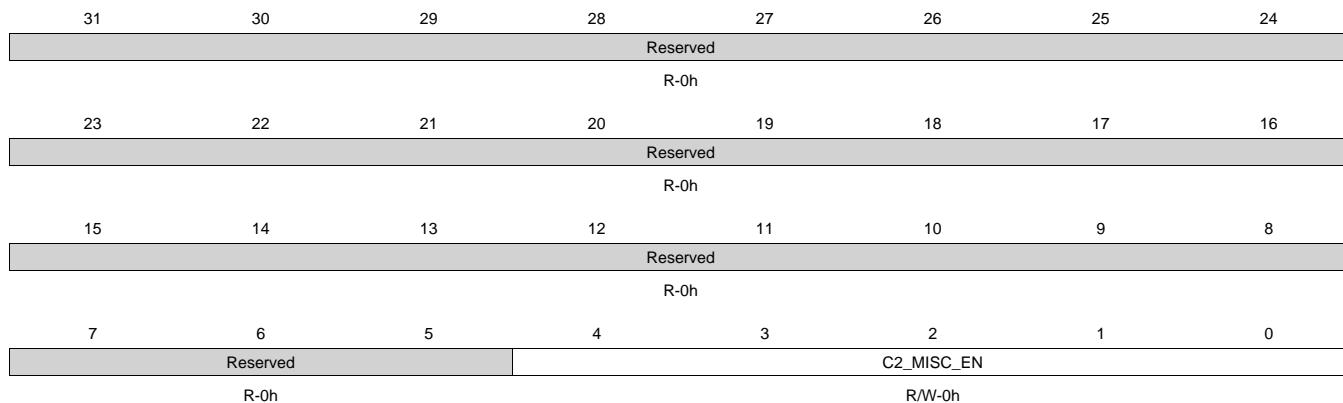

| Bit  | Field    | Type | Reset | Description  |
|------|----------|------|-------|--|
| 31-8 | Reserved | R    | 0h    |  |
| 7-0  | C2_TX_EN | R/W  | 0h    | Core 2 Transmit Enable - Each bit in this register corresponds to the bit in the tx interrupt that is enabled to generate an interrupt on C2_TX_PULSE. |

#### 14.5.9.16 C2\_MISC\_EN Register (offset = 3Ch) [reset = 0h]

C2\_MISC\_EN is shown in [Figure 14-212](#) and described in [Table 14-230](#).

##### SUBSYSTEM CORE 2 MISC INTERRUPT ENABLE REGISTER

**Figure 14-212. C2\_MISC\_EN Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-230. C2\_MISC\_EN Register Field Descriptions**

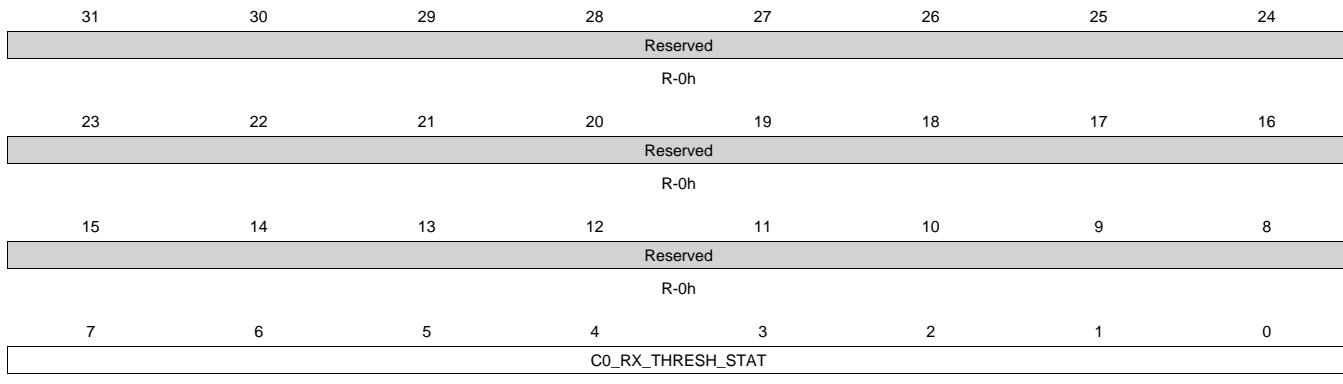

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-5 | Reserved   | R    | 0h    |  |
| 4-0  | C2_MISC_EN | R/W  | 0h    | Core 2 Misc Enable - Each bit in this register corresponds to the miscellaneous interrupt (evnt_pend, stat_pend, host_pend, mdio_linkint, mdio_userint) that is enabled to generate an interrupt on C2_Misc_PULSE. |

#### 14.5.9.17 C0\_RX\_THRESH\_STAT Register (offset = 40h) [reset = 0h]

C0\_RX\_THRESH\_STAT is shown in [Figure 14-213](#) and described in [Table 14-231](#).

##### SUBSYSTEM CORE 0 RX THRESHOLD MASKED INT STATUS REGISTER

**Figure 14-213. C0\_RX\_THRESH\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-231. C0\_RX\_THRESH\_STAT Register Field Descriptions**

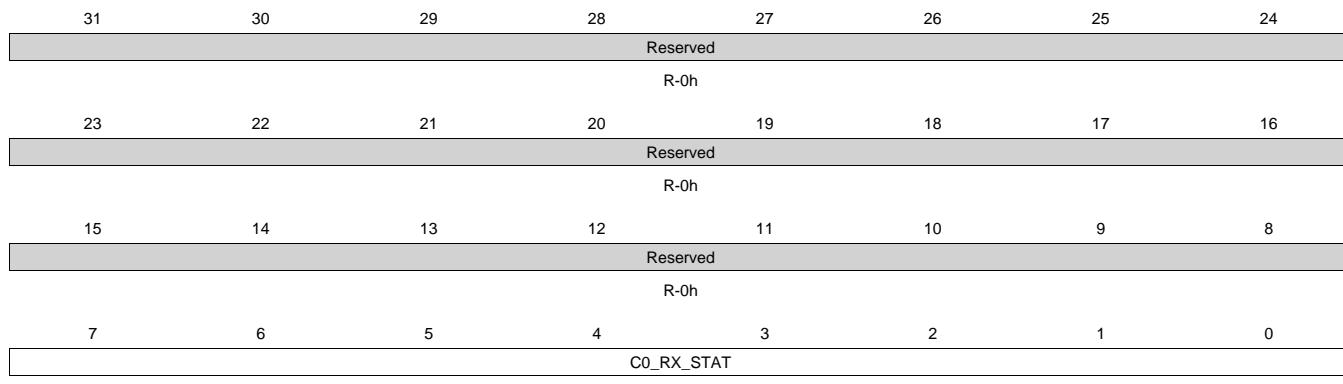

| Bit  | Field             | Type | Reset | Description   |
|------|-------------------|------|-------|---|
| 31-8 | Reserved          | R    | 0h    |   |
| 7-0  | C0_RX_THRESH_STAT | R    | 0h    | Core 0 Receive Threshold Masked Interrupt Status - Each bit in this read only register corresponds to the bit in the receive threshold interrupt that is enabled and generating an interrupt on C0_RX_THRESH_PULSE. |

#### 14.5.9.18 C0\_RX\_STAT Register (offset = 44h) [reset = 0h]

C0\_RX\_STAT is shown in [Figure 14-214](#) and described in [Table 14-232](#).

SUBSYSTEM CORE 0 RX INTERRUPT MASKED INT STATUS REGISTER

**Figure 14-214. C0\_RX\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-232. C0\_RX\_STAT Register Field Descriptions**

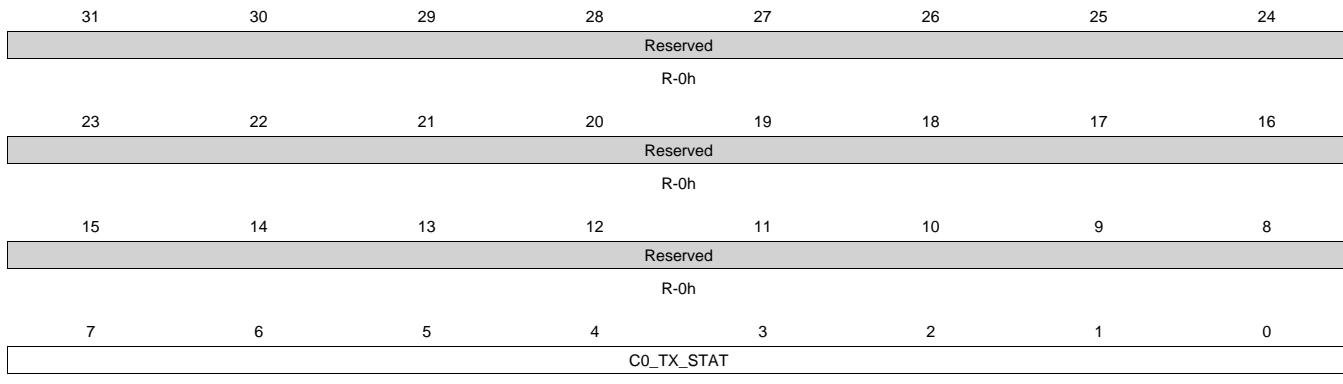

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-8 | Reserved   | R    | 0h    |   |
| 7-0  | C0_RX_STAT | R    | 0h    | Core 0 Receive Masked Interrupt Status - Each bit in this read only register corresponds to the bit in the Rx interrupt that is enabled and generating an interrupt on C0_RX_PULSE. |

#### 14.5.9.19 C0\_TX\_STAT Register (offset = 48h) [reset = 0h]

C0\_TX\_STAT is shown in [Figure 14-215](#) and described in [Table 14-233](#).

SUBSYSTEM CORE 0 TX INTERRUPT MASKED INT STATUS REGISTER

**Figure 14-215. C0\_TX\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-233. C0\_TX\_STAT Register Field Descriptions**

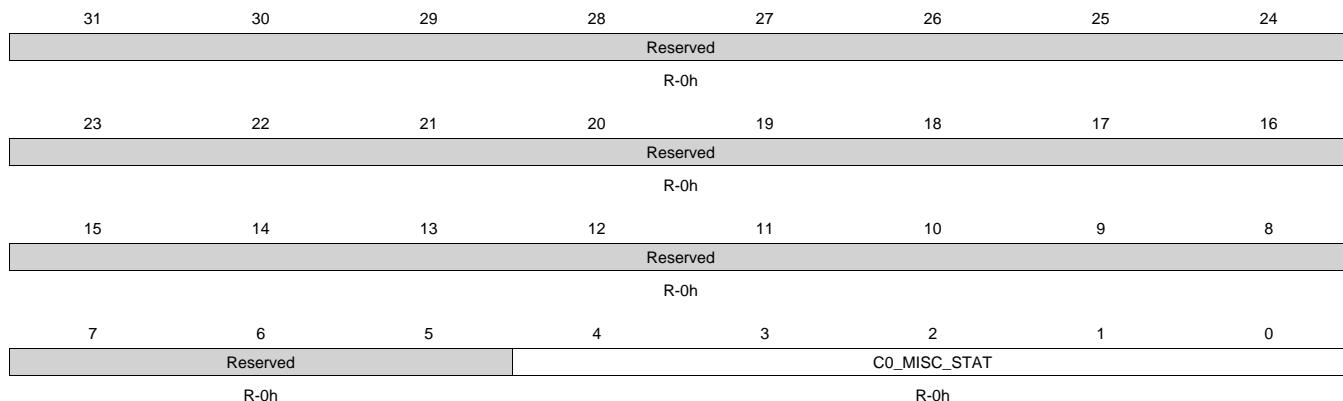

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-8 | Reserved   | R    | 0h    |   |
| 7-0  | C0_TX_STAT | R    | 0h    | Core 0 Transmit Masked Interrupt Status - Each bit in this read only register corresponds to the bit in the Tx interrupt that is enabled and generating an interrupt on C0_TX_PULSE . |

#### 14.5.9.20 C0\_MISC\_STAT Register (offset = 4Ch) [reset = 0h]

C0\_MISC\_STAT is shown in [Figure 14-216](#) and described in [Table 14-234](#).

SUBSYSTEM CORE 0 MISC INTERRUPT MASKED INT STATUS REGISTER

**Figure 14-216. C0\_MISC\_STAT Register**

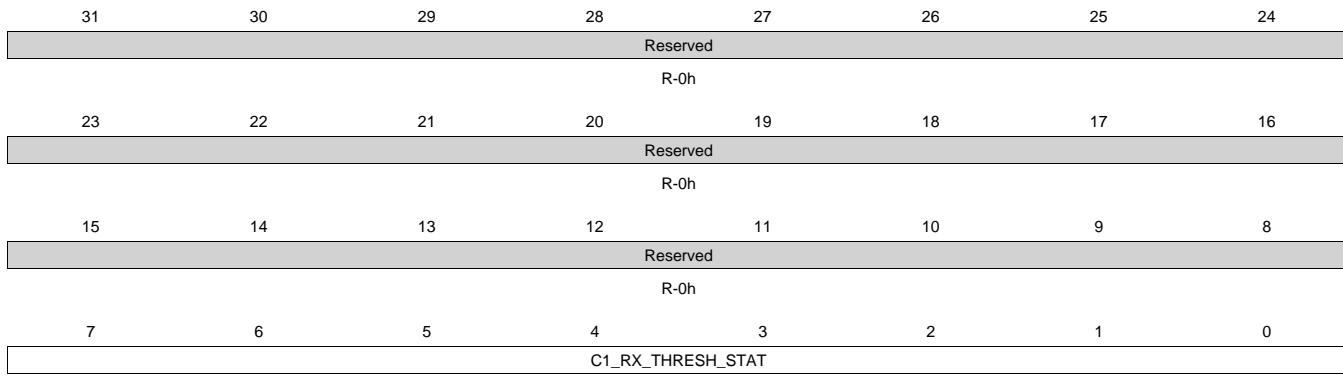

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-234. C0\_MISC\_STAT Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-5 | Reserved     | R    | 0h    |   |
| 4-0  | C0_MISC_STAT | R    | 0h    | Core 0 Misc Masked Interrupt Status - Each bit in this register corresponds to the miscellaneous interrupt (evnt_pend, stat_pend, host_pend, mdio_linkint, mdio_userint) that is enabled and generating an interrupt on C0_MISC_PULSE . |

**14.5.9.21 C1\_RX\_THRESH\_STAT Register (offset = 50h) [reset = 0h]**

C1\_RX\_THRESH\_STAT is shown in [Figure 14-217](#) and described in [Table 14-235](#).

**SUBSYSTEM CORE 1 RX THRESHOLD MASKED INT STATUS REGISTER**
**Figure 14-217. C1\_RX\_THRESH\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-235. C1\_RX\_THRESH\_STAT Register Field Descriptions**

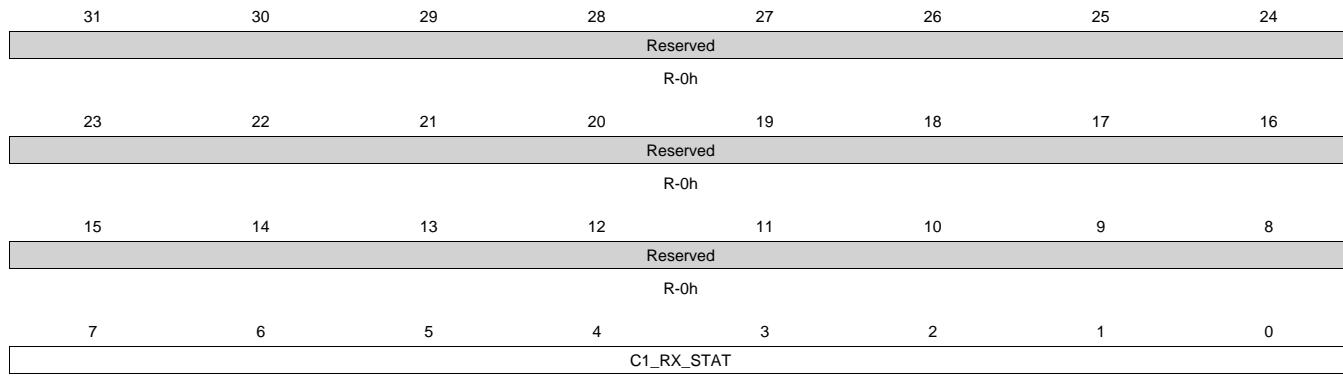

| Bit  | Field             | Type | Reset | Description   |
|------|-------------------|------|-------|---|
| 31-8 | Reserved          | R    | 0h    |   |
| 7-0  | C1_RX_THRESH_STAT | R    | 0h    | Core 1 Receive Threshold Masked Interrupt Status - Each bit in this register corresponds to the bit in the receive threshold interrupt that is enabled and generating an interrupt on C1_RX_THRESH_PULSE. |

#### 14.5.9.22 C1\_RX\_STAT Register (offset = 54h) [reset = 0h]

C1\_RX\_STAT is shown in [Figure 14-218](#) and described in [Table 14-236](#).

SUBSYSTEM CORE 1 RECEIVE MASKED INTERRUPT STATUS REGISTER

**Figure 14-218. C1\_RX\_STAT Register**

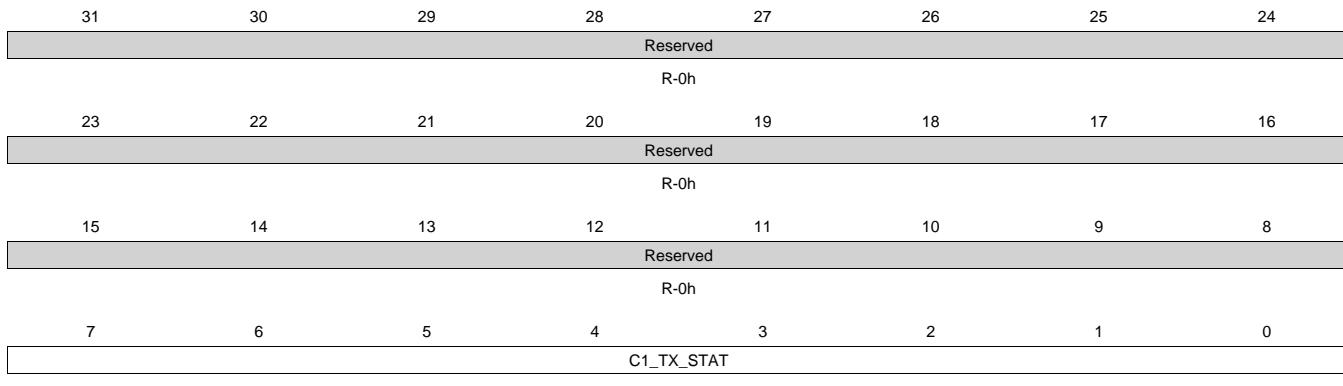

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-236. C1\_RX\_STAT Register Field Descriptions**

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-8 | Reserved   | R    | 0h    |   |
| 7-0  | C1_RX_STAT | R    | 0h    | Core 1 Receive Masked Interrupt Status - Each bit in this register corresponds to the bit in the Rx interrupt that is enabled and generating an interrupt on C1_RX_PULSE. |

**14.5.9.23 C1\_TX\_STAT Register (offset = 58h) [reset = 0h]**

C1\_TX\_STAT is shown in [Figure 14-219](#) and described in [Table 14-237](#).

**SUBSYSTEM CORE 1 TRANSMIT MASKED INTERRUPT STATUS REGISTER**
**Figure 14-219. C1\_TX\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-237. C1\_TX\_STAT Register Field Descriptions**

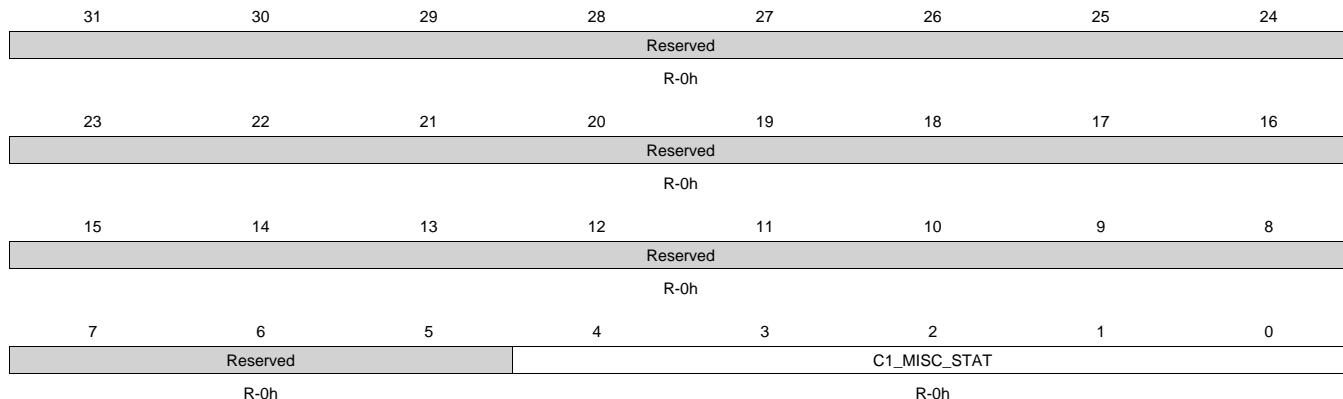

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-8 | Reserved   | R    | 0h    |  |
| 7-0  | C1_TX_STAT | R    | 0h    | Core 1 Transmit Masked Interrupt Status - Each bit in this register corresponds to the bit in the Tx interrupt that is enabled and generating an interrupt on C1_TX_PULSE. |

#### 14.5.9.24 C1\_MISC\_STAT Register (offset = 5Ch) [reset = 0h]

C1\_MISC\_STAT is shown in [Figure 14-220](#) and described in [Table 14-238](#).

##### SUBSYSTEM CORE 1 MISC MASKED INTERRUPT STATUS REGISTER

**Figure 14-220. C1\_MISC\_STAT Register**

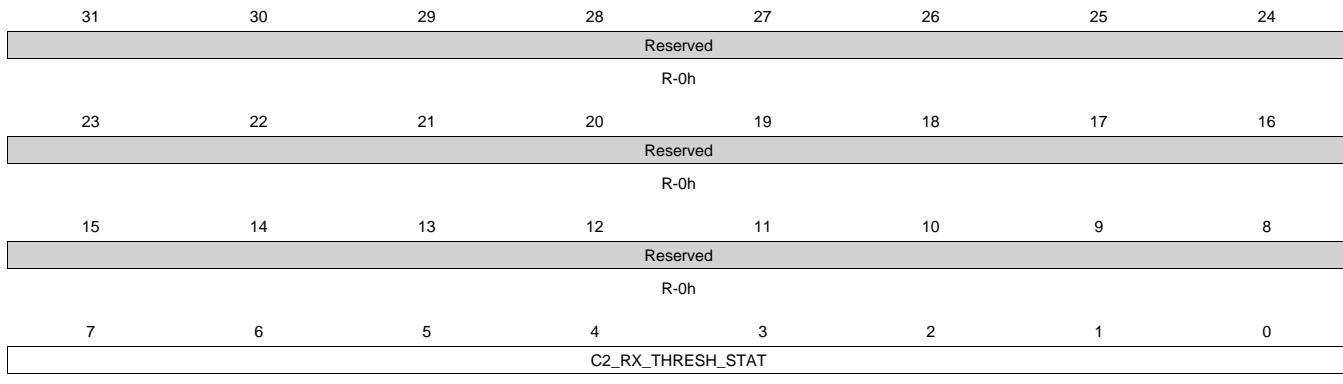

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-238. C1\_MISC\_STAT Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-5 | Reserved     | R    | 0h    |   |
| 4-0  | C1_MISC_STAT | R    | 0h    | Core 1 Misc Masked Interrupt Status - Each bit in this register corresponds to the miscellaneous interrupt (evnt_pend, stat_pend, host_pend, mdio_linkint, mdio_userint) that is enabled and generating an interrupt on C1_MISC_PULSE . |

**14.5.9.25 C2\_RX\_THRESH\_STAT Register (offset = 60h) [reset = 0h]**

C2\_RX\_THRESH\_STAT is shown in [Figure 14-221](#) and described in [Table 14-239](#).

**SUBSYSTEM CORE 2 RX THRESHOLD MASKED INT STATUS REGISTER**
**Figure 14-221. C2\_RX\_THRESH\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-239. C2\_RX\_THRESH\_STAT Register Field Descriptions**

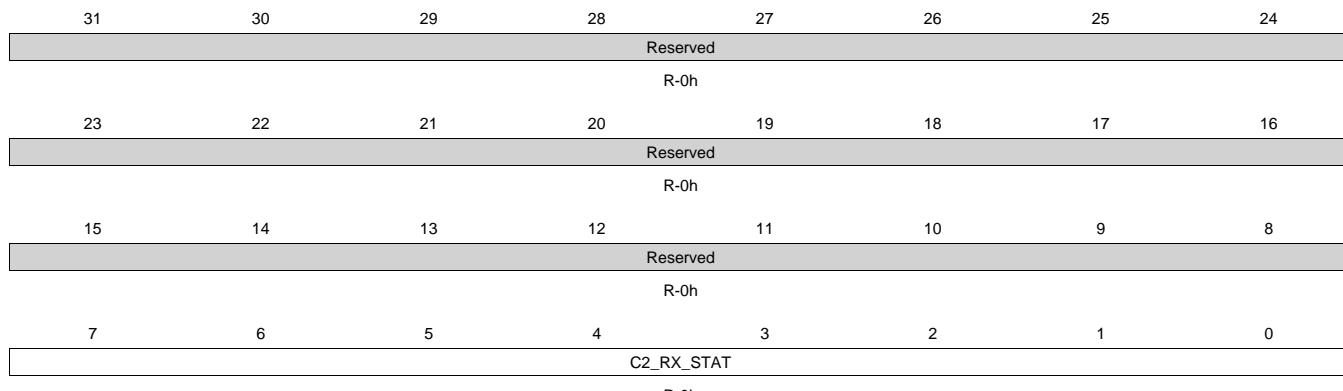

| Bit  | Field             | Type | Reset | Description   |
|------|-------------------|------|-------|---|
| 31-8 | Reserved          | R    | 0h    |   |
| 7-0  | C2_RX_THRESH_STAT | R    | 0h    | Core 2 Receive Threshold Masked Interrupt Status - Each bit in this register corresponds to the bit in the receive threshold interrupt that is enabled and generating an interrupt on C2_RX_THRESH_PULSE. |

#### 14.5.9.26 C2\_RX\_STAT Register (offset = 64h) [reset = 0h]

C2\_RX\_STAT is shown in [Figure 14-222](#) and described in [Table 14-240](#).

SUBSYSTEM CORE 2 RECEIVE MASKED INTERRUPT STATUS REGISTER

**Figure 14-222. C2\_RX\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-240. C2\_RX\_STAT Register Field Descriptions**

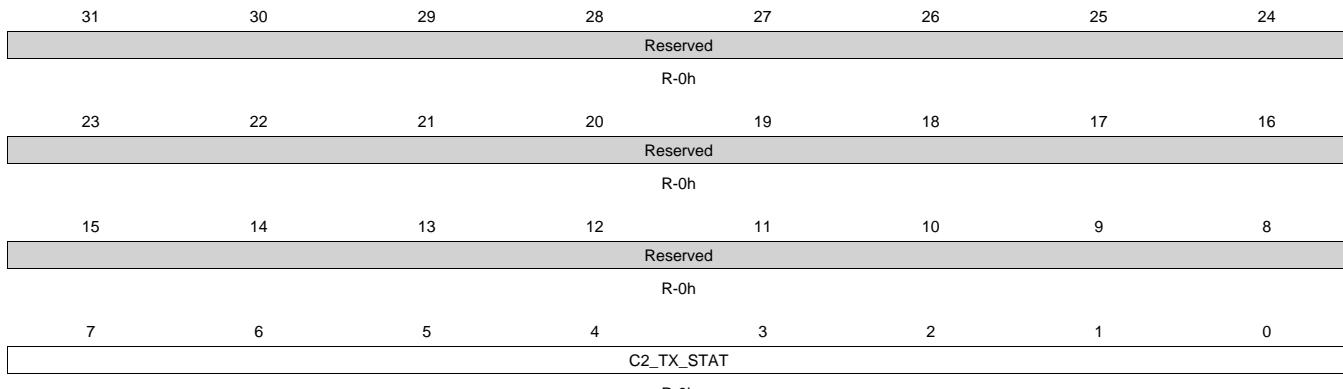

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-8 | Reserved   | R    | 0h    |   |
| 7-0  | C2_RX_STAT | R    | 0h    | Core 2 Receive Masked Interrupt Status - Each bit in this register corresponds to the bit in the Rx interrupt that is enabled and generating an interrupt on C2_RX_PULSE. |

#### 14.5.9.27 C2\_TX\_STAT Register (offset = 68h) [reset = 0h]

C2\_TX\_STAT is shown in [Figure 14-223](#) and described in [Table 14-241](#).

##### SUBSYSTEM CORE 2 TRANSMIT MASKED INTERRUPT STATUS REGISTER

**Figure 14-223. C2\_TX\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-241. C2\_TX\_STAT Register Field Descriptions**

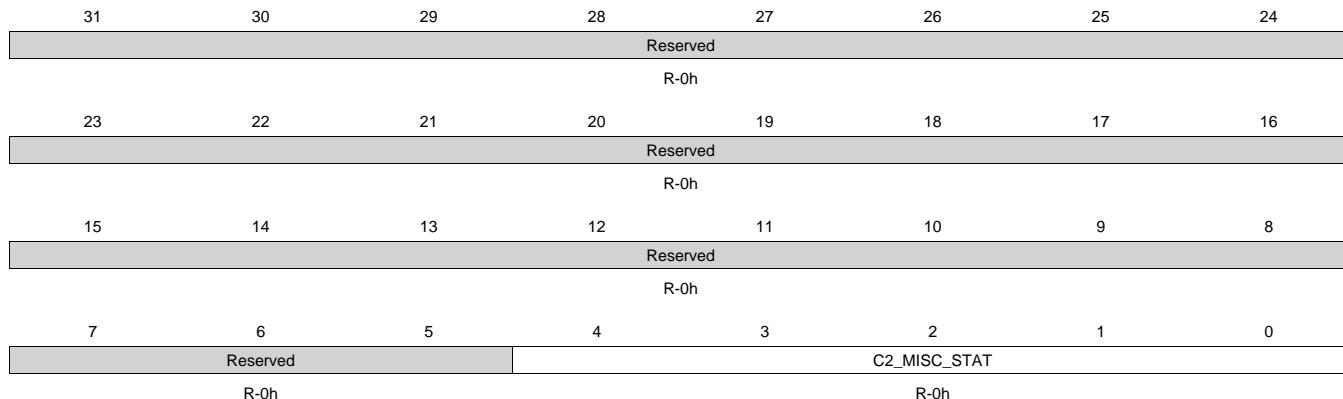

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-8 | Reserved   | R    | 0h    |  |
| 7-0  | C2_TX_STAT | R    | 0h    | Core 2 Transmit Masked Interrupt Status - Each bit in this register corresponds to the bit in the Tx interrupt that is enabled and generating an interrupt on C2_TX_PULSE. |

#### 14.5.9.28 C2\_MISC\_STAT Register (offset = 6Ch) [reset = 0h]

C2\_MISC\_STAT is shown in [Figure 14-224](#) and described in [Table 14-242](#).

##### SUBSYSTEM CORE 2 MISC MASKED INTERRUPT STATUS REGISTER

**Figure 14-224. C2\_MISC\_STAT Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-242. C2\_MISC\_STAT Register Field Descriptions**

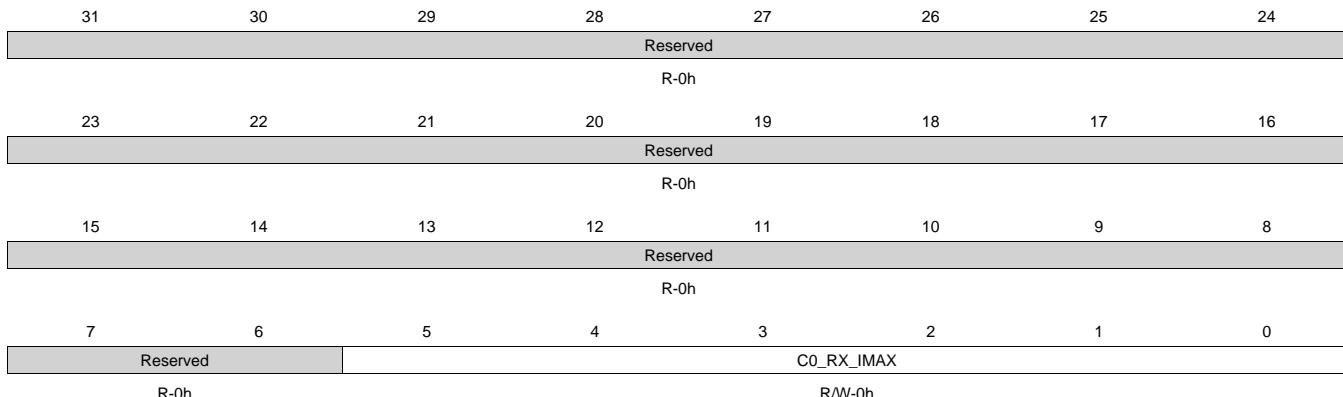

| Bit  | Field        | Type | Reset | Description   |
|------|--------------|------|-------|---|
| 31-5 | Reserved     | R    | 0h    |   |
| 4-0  | C2_MISC_STAT | R    | 0h    | Core 2 Misc Masked Interrupt Status - Each bit in this register corresponds to the miscellaneous interrupt (evnt_pend, stat_pend, host_pend, mdio_linkint, mdio_userint) that is enabled and generating an interrupt on C2_MISC_PULSE . |

#### 14.5.9.29 C0\_RX\_IMAX Register (offset = 70h) [reset = 0h]

C0\_RX\_IMAX is shown in [Figure 14-225](#) and described in [Table 14-243](#).

SUBSYSTEM CORE 0 RECEIVE INTERRUPTS PER MILLISECOND

**Figure 14-225. C0\_RX\_IMAX Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-243. C0\_RX\_IMAX Register Field Descriptions**

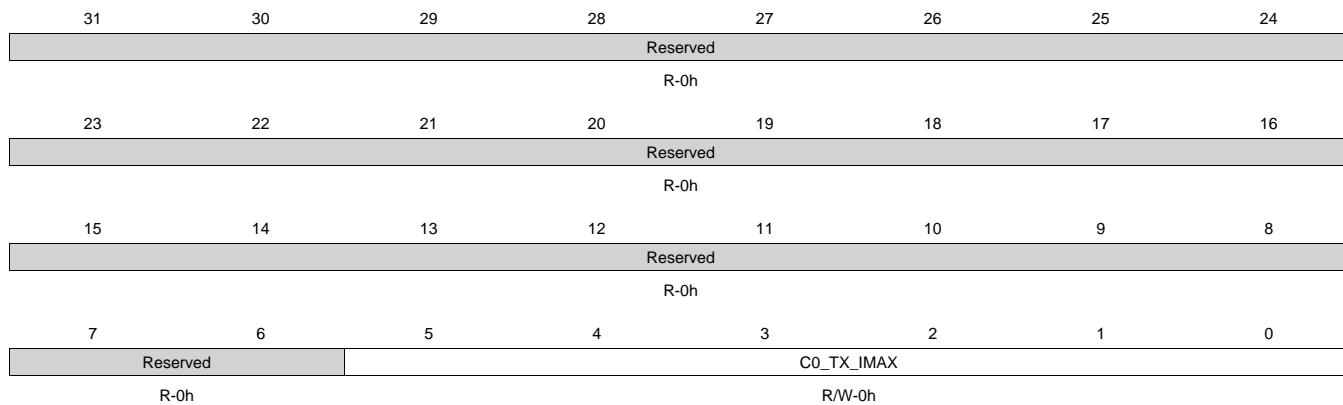

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-6 | Reserved   | R    | 0h    |  |
| 5-0  | C0_RX_IMAX | R/W  | 0h    | Core 0 Receive Interrupts per Millisecond - The maximum number of interrupts per millisecond generated on C0_RX_PULSE if pacing is enabled for this interrupt. |

#### 14.5.9.30 C0\_TX\_IMAX Register (offset = 74h) [reset = 0h]

C0\_TX\_IMAX is shown in [Figure 14-226](#) and described in [Table 14-244](#).

SUBSYSTEM CORE 0 TRANSMIT INTERRUPTS PER MILLISECOND

**Figure 14-226. C0\_TX\_IMAX Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-244. C0\_TX\_IMAX Register Field Descriptions**

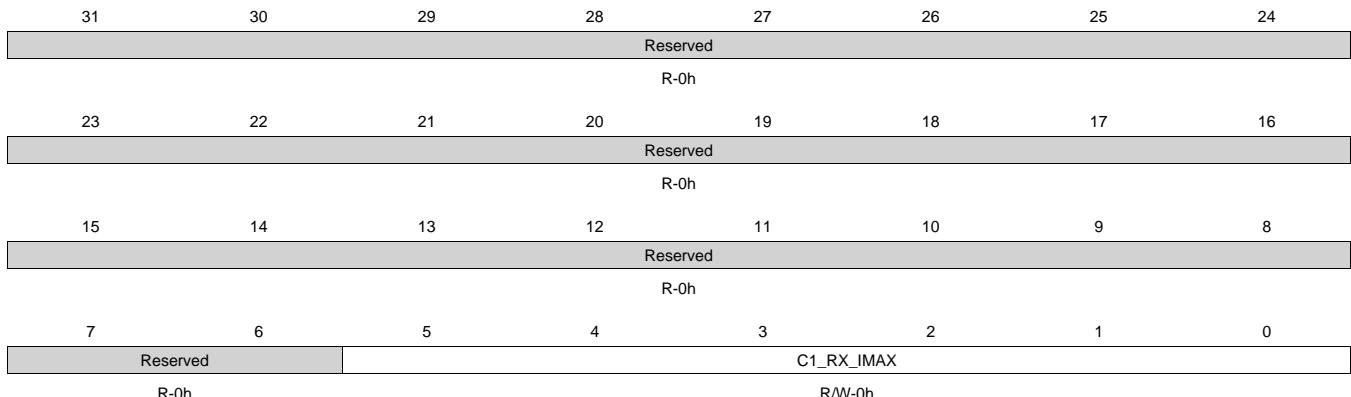

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-6 | Reserved   | R    | 0h    |   |
| 5-0  | C0_TX_IMAX | R/W  | 0h    | Core 0 Transmit Interrupts per Millisecond - The maximum number of interrupts per millisecond generated on C0_TX_PULSE if pacing is enabled for this interrupt. |

**14.5.9.31 C1\_RX\_IMAX Register (offset = 78h) [reset = 0h]**

C1\_RX\_IMAX is shown in [Figure 14-227](#) and described in [Table 14-245](#).

SUBSYSTEM CORE 1 RECEIVE INTERRUPTS PER MILLISECOND

**Figure 14-227. C1\_RX\_IMAX Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-245. C1\_RX\_IMAX Register Field Descriptions**

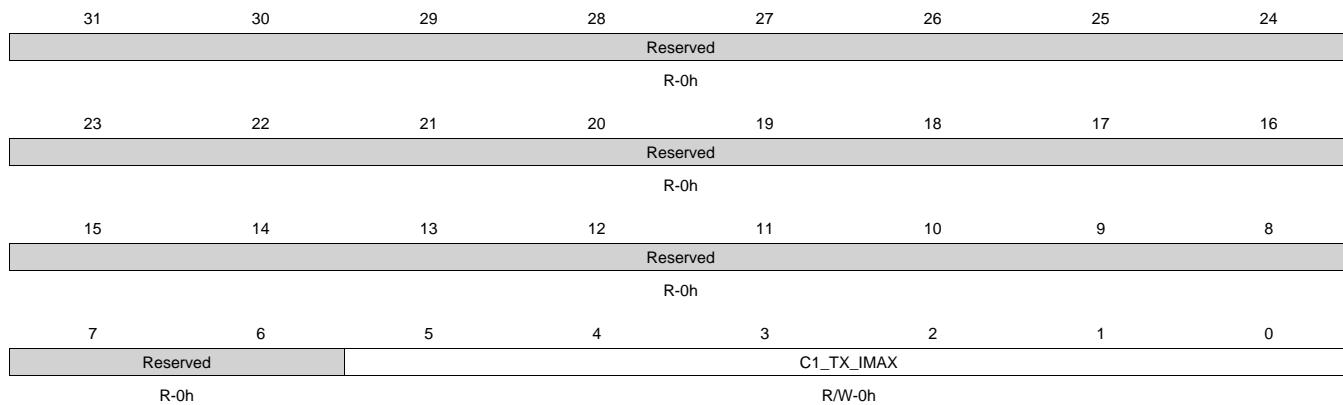

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-6 | Reserved   | R    | 0h    |  |
| 5-0  | C1_RX_IMAX | R/W  | 0h    | Core 1 Receive Interrupts per Millisecond - The maximum number of interrupts per millisecond generated on C1_RX_PULSE if pacing is enabled for this interrupt. |

#### 14.5.9.32 C1\_TX\_IMAX Register (offset = 7Ch) [reset = 0h]

C1\_TX\_IMAX is shown in [Figure 14-228](#) and described in [Table 14-246](#).

SUBSYSTEM CORE 1 TRANSMIT INTERRUPTS PER MILLISECOND

**Figure 14-228. C1\_TX\_IMAX Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-246. C1\_TX\_IMAX Register Field Descriptions**

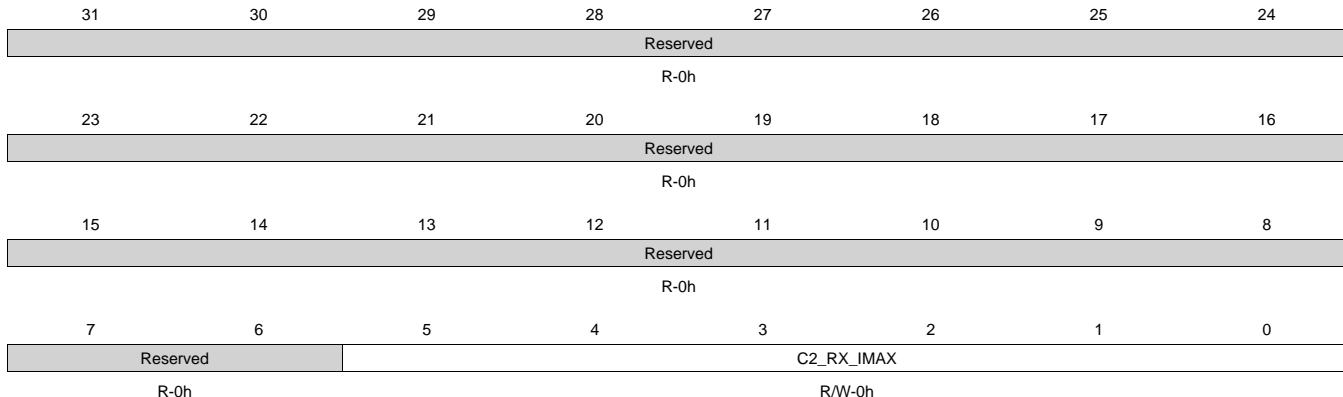

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-6 | Reserved   | R    | 0h    |   |
| 5-0  | C1_TX_IMAX | R/W  | 0h    | Core 1 Transmit Interrupts per Millisecond - The maximum number of interrupts per millisecond generated on C1_TX_PULSE if pacing is enabled for this interrupt. |

#### 14.5.9.33 C2\_RX\_IMAX Register (offset = 80h) [reset = 0h]

C2\_RX\_IMAX is shown in [Figure 14-229](#) and described in [Table 14-247](#).

SUBSYSTEM CORE 2 RECEIVE INTERRUPTS PER MILLISECOND

**Figure 14-229. C2\_RX\_IMAX Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-247. C2\_RX\_IMAX Register Field Descriptions**

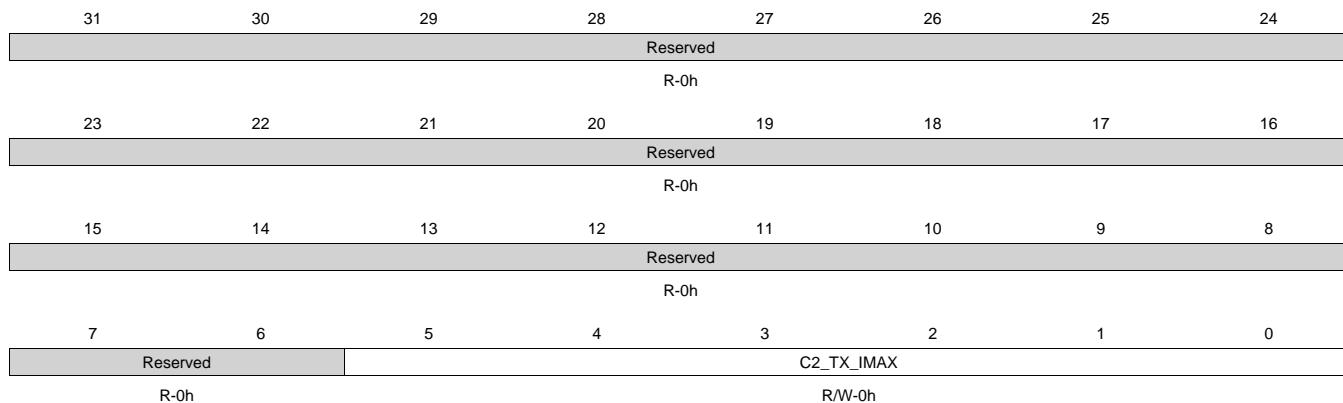

| Bit  | Field      | Type | Reset | Description  |
|------|------------|------|-------|--|
| 31-6 | Reserved   | R    | 0h    |  |
| 5-0  | C2_RX_IMAX | R/W  | 0h    | Core 2 Receive Interrupts per Millisecond - The maximum number of interrupts per millisecond generated on C2_RX_PULSE if pacing is enabled for this interrupt. |

#### 14.5.9.34 C2\_TX\_IMAX Register (offset = 84h) [reset = 0h]

C2\_TX\_IMAX is shown in [Figure 14-230](#) and described in [Table 14-248](#).

SUBSYSTEM CORE 2 TRANSMIT INTERRUPTS PER MILLISECOND

**Figure 14-230. C2\_TX\_IMAX Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-248. C2\_TX\_IMAX Register Field Descriptions**

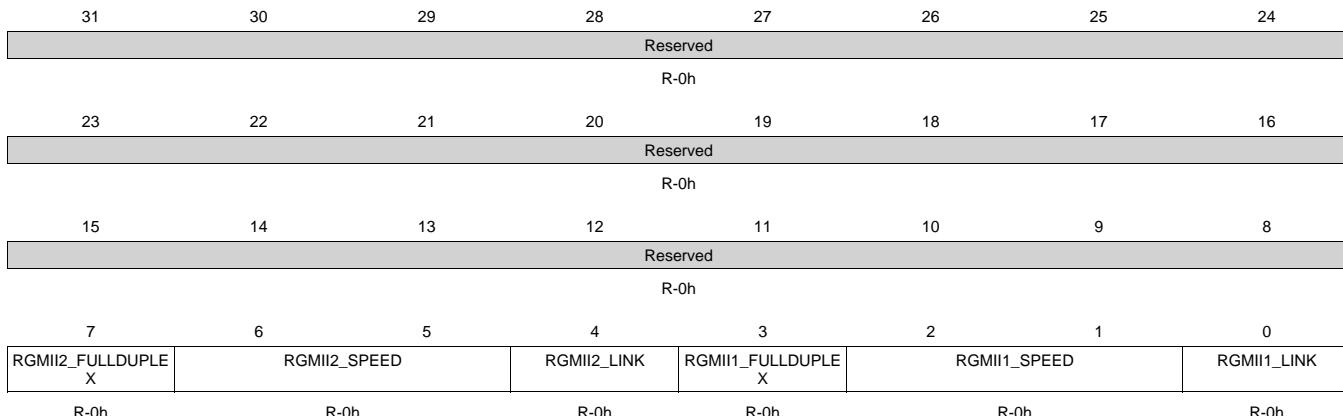

| Bit  | Field      | Type | Reset | Description   |
|------|------------|------|-------|---|
| 31-6 | Reserved   | R    | 0h    |   |
| 5-0  | C2_TX_IMAX | R/W  | 0h    | Core 2 Transmit Interrupts per Millisecond - The maximum number of interrupts per millisecond generated on C2_TX_PULSE if pacing is enabled for this interrupt. |

#### 14.5.9.35 RGMII\_CTL Register (offset = 88h) [reset = 0h]

RGMII\_CTL is shown in [Figure 14-231](#) and described in [Table 14-249](#).

##### RGMII CONTROL SIGNAL REGISTER

**Figure 14-231. RGMII\_CTL Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 14-249. RGMII\_CTL Register Field Descriptions**

| Bit  | Field             | Type | Reset | Description  |
|------|-------------------|------|-------|--|
| 31-8 | Reserved          | R    | 0h    |  |
| 7    | RGMII2_FULLDUPLEX | R    | 0h    | RGMII 2 Fullduplex - This is the CPRGMII fullduplex output signal.<br>0 - Half-duplex mode<br>1 - Fullduplex mode                            |

| 2-1  | RGMII1_SPEED      | R    | 0h    | RGMII1 Speed - This is the CPRGMII speed output signal<br>00 - 10Mbps mode<br>01 - 100Mbps mode<br>10 - 1000Mbps (gig) mode<br>11 - reserved |
| 0    | RGMII1_LINK       | R    | 0h    | RGMII1 Link Indicator - This is the CPRGMII link output signal<br>0 - RGMII1 link is down  |

#### 14.5.10 Management Data Input/Output (MDIO) Registers

This section describes the memory-mapped registers for the Management Data Input/Output (MDIO).

[Table 14-250](#) lists the memory-mapped registers for the Management Data Input/Output (MDIO).

**Table 14-250. Management Data Input/Output (MDIO) Registers**

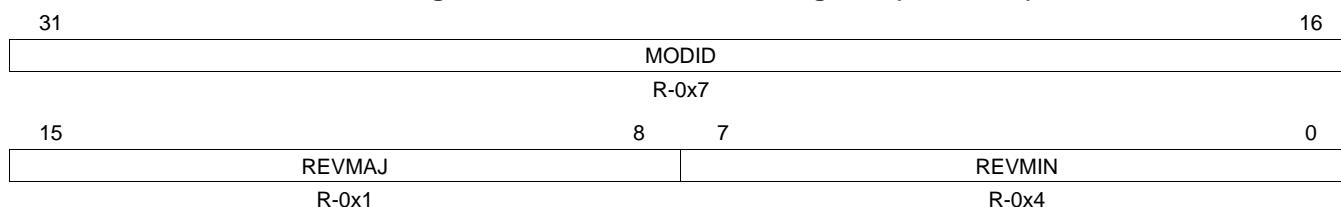

| Offset | Acronym | Register Description  | Section                           |
|--------|---------|-----------------------|-----------------------------------|
| 0      | MDIOVER | MDIO Version Register | <a href="#">Section 14.5.10.1</a> |

**Table 14-250. Management Data Input/Output (MDIO) Registers (continued)**

| Offset | Acronym            | Register Description   | Section            |
|--------|--------------------|--|--------------------|
| 4h     | MDIOCONTROL        | MDIO Control Register  | Section 14.5.10.2  |
| 8h     | MDIOALIVE          | PHY Alive Status Register                                    | Section 14.5.10.3  |
| Ch     | MDIOLINK           | PHY Link Status Register                                     | Section 14.5.10.4  |
| 10h    | MDIOLINKINTRAW     | MDIO Link Status Change Interrupt Register                   | Section 14.5.10.5  |
| 14h    | MDIOLINKINTMASKED  | MDIO Link Status Change Interrupt Register (Masked Value)    | Section 14.5.10.6  |
| 20h    | MDIOUSERINTRAW     | MDIO User Command Complete Interrupt Register (Raw Value)    | Section 14.5.10.7  |
| 24h    | MDIOUSERINTMASKED  | MDIO User Command Complete Interrupt Register (Masked Value) | Section 14.5.10.8  |
| 28h    | MDIOUSERINTMASKSET | MDIO User Command Complete Interrupt Mask Set Register       | Section 14.5.10.9  |
| 2Ch    | MDIOUSERINTMASKCLR | MDIO User Interrupt Mask Clear Register                      | Section 14.5.10.10 |
| 80h    | MDIOUSERACCESS0    | MDIO User Access Register 0                                  | Section 14.5.10.11 |
| 84h    | MDIOUSERPHYSEL0    | MDIO User PHY Select Register 0                              | Section 14.5.10.12 |
| 88h    | MDIOUSERACCESS1    | MDIO User Access Register 1                                  | Section 14.5.10.13 |
| 8Ch    | MDIOUSERPHYSEL1    | MDIO User PHY Select Register 1                              | Section 14.5.10.14 |

#### 14.5.10.1 MDIO Version Register (MDIOVER)

The MDIO version register (MDIOVER) is shown in [Figure 14-232](#) and described in [Table 14-251](#).

**Figure 14-232. MDIO Version Register (MDIOVER)**

LEGEND: R = Read only; -n = value after reset

**Table 14-251. MDIO Version Register (MDIOVER) Field Descriptions**

| Bit   | Field  | Value   | Description                                       |
|-------|--------|---------|---|
| 31-16 | MODID  | 0-FFFFh | Identifies type of peripheral.                    |
| 15-8  | REVMAJ | 0-FFh   | Management interface module major revision value. |
| 7-0   | REVMIN | 0-FFh   | Management interface module minor revision value. |

#### 14.5.10.2 MDIO Control Register (MDIOCONTROL)

The MDIO control register (MDIOCONTROL) is shown in [Figure 14-233](#) and described in [Table 14-252](#).

**Figure 14-233. MDIO Control Register (MDIOCONTROL)**

| 31    | 30      | 29       | 28                   | 24       | 23       | 21        | 20       | 19         | 18       | 17      | 16    |
|-------|---------|----------|----------------------|----------|----------|-----------|----------|------------|----------|---------|-------|
| IDLE  | ENABLE  | Reserved | HIGHEST_USER_CHANNEL | Reserved | PREAMBLE | FAULT     | FAULTENB | INTTESTENB | Reserved |         |       |
| R-0x1 | R/W-0x0 | R-0x0    | R-0x1                | R-0x0    | R/W-0x0  | RWC-0x0   | R/W-0x0  | R/W-0x0    | R/W-0x0  | R/W-0x0 | R-0x0 |
| 15    |         |          |                      |          |          |           |          |            |          |         | 0     |
|       |         |          |                      |          | CLKDIV   |           |          |            |          |         |       |
|       |         |          |                      |          |          | R/W-0x255 |          |            |          |         |       |

LEGEND: R/W = Read/Write; RWC = Read/Write/Clear; R = Read only; -n = value after reset

**Table 14-252. MDIO Control Register (MDIOCONTROL) Field Descriptions**

| Bit   | Field                | Value   | Description   |
|-------|----------------------|---------|---|
| 31    | IDLE                 | 0       | MDIO state machine IDLE. Set to 1 when the state machine is in the idle state.  |
|       |                      | 1       | State machine is not in idle state.   |
| 30    | ENABLE               | 0       | Enable control. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register. |
|       |                      | 1       | Disables the MDIO state machine.<br>Enable the MDIO state machine.  |
| 29    | Reserved             | 0       | Reserved.   |
| 28-24 | HIGHEST_USER_CHANNEL | 0-1Fh   | Highest user channel. This field specifies the highest user access channel that is available in the module and is currently set to 1. This implies that the MDIouseraccess1 register is the highest available user access channel.                    |
| 23-21 | Reserved             | 0       | Reserved.   |
| 20    | PREAMBLE             | 0       | Preamble disable.   |
|       |                      | 1       | Standard MDIO preamble is used.<br>Disables this device from sending MDIO frame pREAMBLES.  |
| 19    | FAULT                | 0       | Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.                        |
|       |                      | 1       | No failure.<br>Physical layer fault; the MDIO state machine is reset.   |
| 18    | FAULTENB             | 0       | Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.  |
|       |                      | 1       | Disables the physical layer fault detection.<br>Enables the physical layer fault detection.   |
| 17    | INTTESTENB           | 0       | Interrupt test enable. This bit can be set to 1 to enable the host to set the USERINT and LINKINT bits for test purposes.   |
|       |                      | 1       | Interrupt bits are not set.<br>Enables the host to set the USERINT and LINKINT bits for test purposes.  |
| 16    | Reserved             | 0       | Reserved.   |
| 15-0  | CLKDIV               | 0-FFFFh | Clock divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0. MDCLK frequency = clk frequency/(clkdiv+1).   |

#### 14.5.10.3 PHY Acknowledge Status Register (MDIOALIVE)

The PHY acknowledge status register (MDIOALIVE) is shown in [Figure 14-234](#) and described in [Table 14-253](#).

**Figure 14-234. PHY Acknowledge Status Register (MDIOALIVE)**

|         |   |
|---------|---|
| 31      | 0 |
| ALIVE   |   |
| RWC-0x0 |   |

LEGEND: RWC = Read/Write/Clear

**Table 14-253. PHY Acknowledge Status Register (MDIOALIVE) Field Descriptions**

| Bit  | Field | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | ALIVE | 0xFFFF FFFFh | MDIO alive. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are only meant to be used to give an indication of the presence or not of a PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect. |

#### 14.5.10.4 PHY Link Status Register (MDIOLINK)

The PHY link status register (MDIOLINK) is shown in [Figure 14-235](#) and described in [Table 14-254](#).

**Figure 14-235. PHY Link Status Register (MDIOLINK)**

|       |   |
|-------|---|
| 31    | 0 |
| LINK  |   |
| R-0x0 |   |

LEGEND: R = Read only; -n = value after reset

**Table 14-254. PHY Link Status Register (MDIOLINK) Field Descriptions**

| Bit  | Field | Value        | Description   |
|------|-------|--------------|---|
| 31-0 | LINK  | 0xFFFF FFFFh | MDIO link state. This register is updated after a read of the Generic Status Register of a PHY. The bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is reset if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, the status of the two PHYs specified in the MDIOUSERPHYSEL $n$ registers can be determined using the MLINK input pins. This is determined by the LINKSEL bit in the MDIOUSERPHYSEL $n$ register. |

#### 14.5.10.5 MDIO Link Status Change Interrupt Register (MDIOLINKINTRAW)

The MDIO link status change interrupt register (MDIOLINKINTRAW) is shown in [Figure 14-236](#) and described in [Table 14-255](#).

**Figure 14-236. MDIO Link Status Change Interrupt Register (MDIOLINKINTRAW)**

|    |          |                       |
|----|----------|-----------------------|
| 31 | Reserved | 16                    |
|    | R-0x0    |                       |
| 15 | Reserved | 2      1      0       |
|    | R-0x0    | LINKINTRAW<br>RWC-0x0 |

LEGEND: RWC = Read/Write/Clear; R = Read only; -n = value after reset

**Table 14-255. MDIO Link Status Change Interrupt Register (MDIOLINKINTRAW) Field Descriptions**

| Bit  | Field      | Value | Description   |
|------|------------|-------|---|
| 31-2 | Reserved   | 0     | Reserved.   |
| 1-0  | LINKINTRAW | 0-3h  | MDIO link change event, raw value. When asserted 1, a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLINK register) corresponding to the PHY address in the MDIOUSERPHYSEL $n$ register. LINKINTRAW[0] and LINKINTRAW[1] correspond to MDIOUSERPHYSEL0 and MDIOUSERPHYSEL1, respectively. Writing a 1 will clear the event and writing 0 has no effect. If the INTTESTENB bit in the MDIOCONTROL register is set, the host may set the LINKINTRAW bits to a 1. This mode may be used for test purposes. |

#### 14.5.10.6 MDIO Link Status Change Interrupt Register (Masked Value) (MDIOLINKINTMASKED)

The MDIO link status change interrupt register (Masked Value) (MDIOLINKINTMASKED) is shown in [Figure 14-237](#) and described in [Table 14-256](#).

**Figure 14-237. MDIO Link Status Change Interrupt Register (Masked Value) (MDIOLINKINTMASKED)**

|    |          |                          |
|----|----------|--------------------------|
| 31 | Reserved | 16                       |
|    | R-0x0    |                          |
| 15 | Reserved | 2      1      0          |
|    | R-0x0    | LINKINTMASKED<br>RWC-0x0 |

LEGEND: RWC = Read/Write/Clear; R = Read only; -n = value after reset

**Table 14-256. MDIO Link Status Change Interrupt Register (Masked Value) (MDIOLINKINTMASKED) Field Descriptions**

| Bit  | Field         | Value | Description   |
|------|---------------|-------|---|
| 31-2 | Reserved      | 0     | Reserved.   |
| 1-0  | LINKINTMASKED | 0-3h  | MDIO link change interrupt, masked value. When asserted 1, a bit indicates that there was an MDIO link change event (i.e. change in the MDIO Link register) corresponding to the PHY address in the MDIOUSERPHYSEL $n$ register and the corresponding LINKINTENB bit was set. LINKINTMASKED[0] and LINKINTMASKED[1] correspond to MDIOUSERPHYSEL0 and MDIOUSERPHYSEL1, respectively. Writing a 1 will clear the interrupt and writing 0 has no effect. If the INTTESTENB bit in the MDIOCONTROL register is set, the host may set the LINKINT bits to a 1. This mode may be used for test purposes. |

#### 14.5.10.7 MDIO User Command Complete Interrupt Register (Raw Value) (MDIOUSERINTRAW)

The MDIO user command complete interrupt register (Raw Value) (MDIOUSERINTRAW) is shown in Figure 14-238 and described in Table 14-257.

**Figure 14-238. MDIO User Command Complete Interrupt Register (Raw Value) (MDIOUSERINTRAW)**

|    |          |         |
|----|----------|---------|

|    | R-0x0    |         |
| 15 | Reserved | 2       |
|    | R-0x0    | 1       |
|    |          | 0       |
|    |          | RWC-0x0 |

LEGEND: RWC = Read/Write/Clear; R = Read only; -n = value after reset

**Table 14-257. MDIO User Command Complete Interrupt Register (Raw Value) (MDIOUSERINTRAW) Field Descriptions**

| Bit  | Field      | Value | Description   |
|------|------------|-------|---|
| 31-2 | Reserved   | 0     | Reserved.   |
| 1-0  | USERINTRAW | 0-3h  | Raw value of MDIO user command complete event for the MDIOUSERACCESS1 register through the MDIOUSERACCESS0 register, respectively. When asserted 1, a bit indicates that the previously scheduled PHY read or write command using that particular MDIOUSERACCESSn register has completed. Writing a 1 will clear the event and writing 0 has no effect. If the INTTESTENB bit in the MDIOCONTROL register is set, the host may set the USERINTRAW bits to a 1. This mode may be used for test purposes. |

#### 14.5.10.8 MDIO User Command Complete Interrupt Register (Masked Value) (MDIOUSERINTMASKED)

The MDIO user command complete interrupt register (Masked Value) (MDIOUSERINTMASKED) is shown in Figure 14-239 and described in Table 14-258.

**Figure 14-239. MDIO User Command Complete Interrupt Register (Masked Value) (MDIOUSERINTMASKED)**

|    |          |         |
|----|----------|---------|
| 31 | Reserved | 16      |
|    | R-0x0    |         |
| 15 | Reserved | 2       |
|    | R-0x0    | 1       |
|    |          | 0       |
|    |          | RWC-0x0 |

LEGEND: RWC = Read/Write/Clear; R = Read only; -n = value after reset

**Table 14-258. MDIO User Command Complete Interrupt Register (Masked Value) (MDIOUSERINTMASKED) Field Descriptions**

| Bit  | Field         | Value | Description  |
|------|---------------|-------|--|
| 31-2 | Reserved      | 0     | Reserved.  |
| 1-0  | USERINTMASKED | 0-3h  | Masked value of MDIO user command complete interrupt for the MDIOUSERACCESS1 register through the MDIOUSERACCESS0 register, respectively. When asserted 1, a bit indicates that the previously scheduled PHY read or write command using that particular MDIOUSERACCESSn register has completed and the corresponding USERINTMASKSET bit is set to 1. Writing a 1 will clear the interrupt and writing 0 has no effect. If the INTTESTENB bit in the MDIOCONTROL register is set, the host may set the USERINTMASKED bits to a 1. This mode may be used for test purposes. |

#### 14.5.10.9 MDIO User Command Complete Interrupt Mask Set Register (MDIOUSERINTMASKSET)

The MDIO user command complete interrupt mask set register (MDIOUSERINTMASKSET) is shown in Figure 14-240 and described in Table 14-259.

**Figure 14-240. MDIO User Command Complete Interrupt Mask Set Register (MDIOUSERINTMASKSET)**

|    |          |   |   |                |
|----|----------|---|---|----------------|
| 31 | Reserved |   |   | 16             |
|    | R-0x0    |   |   |                |
| 15 | 2        | 1 | 0 |                |
|    | Reserved |   |   | USERINTMASKSET |
|    | R-0x0    |   |   | RWC-0x0        |

LEGEND: RWC = Read/Write/Clear; R = Read only; -n = value after reset

**Table 14-259. MDIO User Command Complete Interrupt Mask Set Register (MDIOUSERINTMASKSET) Field Descriptions**

| Bit  | Field          | Value | Description   |
|------|----------------|-------|---|
| 31-2 | Reserved       | 0     | Reserved.   |
| 1-0  | USERINTMASKSET | 0-3h  | MDIO user interrupt mask set for USERINTMASKED, respectively. Writing a bit to 1 will enable MDIO user command complete interrupts for that particular MDIOUSERACCESS $n$ register. MDIO user interrupt for a particular MDIOUSERACCESS $n$ register is disabled if the corresponding bit is 0. Writing a 0 to this register has no effect. |

#### 14.5.10.10 MDIO User Command Complete Interrupt Mask Clear Register (MDIOUSERINTMASKCLR)

The MDIO user interrupt mask clear register (MDIOUSERINTMASKCLR) is shown in Figure 14-241 and described in Table 14-260.

**Figure 14-241. MDIO User Command Complete Interrupt Mask Clear Register (MDIOUSERINTMASKCLR)**

|    |          |   |   |                  |
|----|----------|---|---|------------------|
| 31 | Reserved |   |   | 16               |
|    | R-0x0    |   |   |                  |
| 15 | 2        | 1 | 0 |                  |
|    | Reserved |   |   | USERINTMASKCLEAR |
|    | R-0x0    |   |   | RWC-0x0          |

LEGEND: RWC = Read/Write/Clear; R = Read only; -n = value after reset

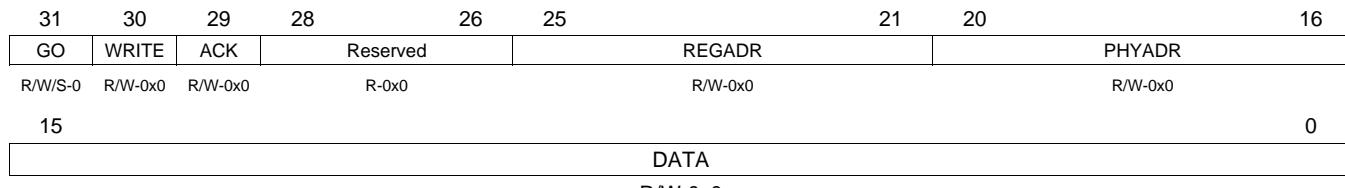

**Table 14-260. MDIO User Command Complete Interrupt Mask Clear Register (MDIOUSERINTMASKCLR) Field Descriptions**

| Bit  | Field            | Value | Description  |
|------|------------------|-------|--|
| 31-2 | Reserved         | 0     | Reserved.  |
| 1-0  | USERINTMASKCLEAR | 0-3h  | MDIO user command complete interrupt mask clear for USERINTMASKED, respectively. Writing a bit to 1 will disable further user command complete interrupts for that particular MDIOUSERACCESS $n$ register. Writing a 0 to this register has no effect. |

#### 14.5.10.11 MDIO User Access Register 0 (MDIouserAccess0)

The MDIO user access register 0 (MDIouserAccess0) is shown in [Figure 14-242](#) and described in [Table 14-261](#).

**Figure 14-242. MDIO User Access Register 0 (MDIouserAccess0)**

LEGEND: R/W = Read/Write; R = Read only; S = Status; -n = value after reset

**Table 14-261. MDIO User Access Register 0 (MDIouserAccess0) Field Descriptions**

| Bit   | Field    | Value   | Description  |
|-------|----------|---------|--|
| 31    | GO       | 0-1     | Go. Writing a 1 to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0 to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIouserAccess0 register are blocked when the GO bit is 1. If byte access is being used, the GO bit should be written last. |
| 30    | WRITE    | 0-1     | Write enable. Setting this bit to a 1 causes the MDIO transaction to be a register write, otherwise it is a register read.   |
| 29    | ACK      | 0-1     | Acknowledge. This bit is set if the PHY acknowledged the read transaction.   |
| 28-26 | Reserved | 0       | Reserved.  |
| 25-21 | REGADR   | 0-1Fh   | Register address. Specifies the PHY register to be accessed for this transaction.  |
| 20-16 | PHYADR   | 0-1Fh   | PHY address. Specifies the PHY to be accessed for this transaction.  |
| 15-0  | DATA     | 0-FFFFh | User data. The data value read from or to be written to the specified PHY register.  |

#### 14.5.10.12 MDIO User PHY Select Register 0 (MDIouserPHYSEL0)

The MDIO user PHY select register 0 (MDIouserPHYSEL0) is shown in [Figure 14-243](#) and described in [Table 14-262](#).

**Figure 14-243. MDIO User PHY Select Register 0 (MDIouserPHYSEL0)**

|       |          |   |         |         |       |   |         |    |  |  |  |  |  |  |  |
|-------|----------|---|---------|---------|-------|---|---------|----|--|--|--|--|--|--|--|
| 31    | Reserved |   |         |         |       |   |         | 16 |  |  |  |  |  |  |  |
| R-0x0 |          |   |         |         |       |   |         |    |  |  |  |  |  |  |  |
|       |          |   |         |         |       |   |         |    |  |  |  |  |  |  |  |
| 15    | Reserved | 8 | 7       | 6       | 5     | 4 | 0       |    |  |  |  |  |  |  |  |
|       | R-0x0    |   | R/W-0x0 | R/W-0x0 | R-0x0 |   | R/W-0x0 |    |  |  |  |  |  |  |  |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

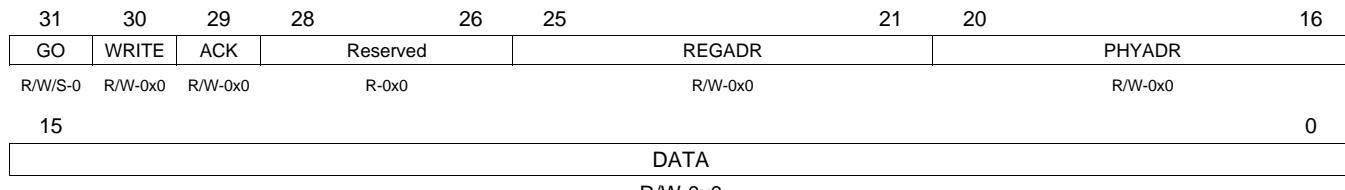

**Table 14-262. MDIO User PHY Select Register 0 (MDIouserPHYSEL0) Field Descriptions**

| Bit  | Field      | Value | Description   |
|------|------------|-------|---|
| 31-8 | Reserved   | 0     | Reserved.   |
| 7    | LINKSEL    | 0-1   | Link status determination select. Set to 1 to determine link status using the MLINK pin. Default value is 0 which implies that the link status is determined by the MDIO state machine.   |
| 6    | LINKINTENB |       | Link change interrupt enable. Set to 1 to enable link change status interrupts for PHY address specified in PHYADDRMON. Link change interrupts are disabled if this bit is set to 0.<br><br>0 Link change interrupts are disabled.<br><br>1 Link change status interrupts for PHY address specified in PHYADDRMON bits are enabled. |
| 5    | Reserved   | 0     | Reserved.   |
| 4-0  | PHYADDRMON | 0-1Fh | PHY address whose link status is to be monitored.   |

#### 14.5.10.13 MDIO User Access Register 1 (MDIOUSERACCESS1)

The MDIO user access register 1 (MDIOUSERACCESS1) is shown in [Figure 14-244](#) and described in [Table 14-263](#).

**Figure 14-244. MDIO User Access Register 1 (MDIOUSERACCESS1)**

LEGEND: R/W = Read/Write; R = Read only; S = Status; -n = value after reset

**Table 14-263. MDIO User Access Register 1 (MDIOUSERACCESS1) Field Descriptions**

| Bit   | Field    | Value   | Description  |
|-------|----------|---------|--|
| 31    | GO       | 0-1     | Writing a 1 to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0 to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUSERACCESS0 register are blocked when the GO bit is 1. If byte access is being used, the GO bit should be written last. |
| 30    | WRITE    | 0-1     | Write enable. Setting this bit to a 1 causes the MDIO transaction to be a register write, otherwise it is a register read.   |
| 29    | ACK      | 0-1     | Acknowledge. This bit is set if the PHY acknowledged the read transaction.   |
| 28-26 | Reserved | 0       | Reserved.  |
| 25-21 | REGADR   | 0-1Fh   | Register address; specifies the PHY register to be accessed for this transaction.  |
| 20-16 | PHYADR   | 0-1Fh   | PHY address; specifies the PHY to be accessed for this transaction.  |
| 15-0  | DATA     | 0-FFFFh | User data. The data value read from or to be written to the specified PHY register.  |

#### 14.5.10.14 MDIO User PHY Select Register 1 (MDIouserphySel1)

The MDIO user PHY select register 1 (MDIOUSERPHYSEL1) is shown in [Figure 14-245](#) and described in [Table 14-264](#).

**Figure 14-245. MDIO User PHY Select Register 1 (MDIOUSERPHYSEL1)**

|    |          |   |         |            |          |            |   |    |
|----|----------|---|---------|------------|----------|------------|---|----|
| 31 | Reserved |   |         |            |          |            |   | 16 |
|    | R-0x0    |   |         |            |          |            |   |    |
| 15 |          | 8 | 7       | 6          | 5        | 4          | 0 |    |

**Table 14-264. MDIO User PHY Select Register 1 (MDIouserPhySel1) Field Descriptions**

| Bit  | Field      | Value | Description   |
|------|------------|-------|---|
| 31-8 | Reserved   | 0     | Reserved.   |
| 7    | LINKSEL    | 0-1   | Link status determination select. Set to 1 to determine link status using the MLINK pin. Default value is 0 which implies that the link status is determined by the MDIO state machine.   |
| 6    | LINKINTENB |       | <p>Link change interrupt enable. Set to 1 to enable link change status interrupts for PHY address specified in PHYADDRMON. Link change interrupts are disabled if this bit is cleared to 0.</p> <p>0 Link change interrupts are disabled</p> <p>1 Link change status interrupts for PHY address specified in PHYADDRMON bits are enabled.</p> |
| 5    | Reserved   | 0     | Reserved.   |
| 4-0  | PHYADDRMON | 0-1Fh | PHY address whose link status is to be monitored.   |

## Pulse-Width Modulation Subsystem (PWMSS)

This chapter describes the PWMSS of the device.

| Topic  | Page |
|--|------|
| 15.1 Pulse-Width Modulation Subsystem (PWMSS) .....        | 1478 |
| 15.2 Enhanced PWM (ePWM) Module .....                      | 1486 |
| 15.3 Enhanced Capture (eCAP) Module .....                  | 1599 |
| 15.4 Enhanced Quadrature Encoder Pulse (eQEP) Module ..... | 1638 |

## 15.1 Pulse-Width Modulation Subsystem (PWMSS)

### 15.1.1 Introduction

#### 15.1.1.1 Features

The general features of the PWMSS are:

##### eHRPWM

- Dedicated 16 bit time-base with Period / Frequency control
- Can support 2 independent PWM outputs with Single edge operation
- Can support 2 independent PWM outputs with Dual edge symmetric operation
- Can support 1 independent PWM output with Dual edge asymmetric operation
- Supports Dead-band generation with independent Rising and Falling edge delay control
- Provides asynchronous over-ride control of PWM signals during fault conditions
- Supports “trip zone” allocation of both latched and un-latched fault conditions
- Allows events to trigger both CPU interrupts and start of ADC conversions
- Support PWM chopping by high frequency carrier signal, used for pulse transformer gate drives.
- High-resolution module with programmable delay line.
  - Programmable on a per PWM period basis.
  - Can be inserted either on the rising edge or falling edge of the PWM pulse or both or not at all.

##### eCAP

- Dedicated input Capture pin
- 32 bit Time Base (counter)
- 4 x 32 bit Time-stamp Capture registers (CAP1-CAP4)
- 4 stage sequencer (Mod4 counter) which is synchronized to external events (ECAPx pin edges)
- Independent Edge polarity (Rising / Falling edge) selection for all 4 events
- Input Capture signal pre-scaling (from 1 to 16)
- One-shot compare register (2 bits) to freeze captures after 1 to 4 Time-stamp events
- Control for continuous Time-stamp captures using a 4 deep circular buffer (CAP1-CAP4) scheme
- Interrupt capabilities on any of the 4 capture events

##### eQEP

- Input Synchronization
- Three Stage/Six Stage Digital Noise Filter
- Quadrature Decoder Unit
- Position Counter and Control unit for position measurement
- Quadrature Edge Capture unit for low speed measurement
- Unit Time base for speed/frequency measurement
- Watchdog Timer for detecting stalls

### 15.1.1.2 Unsupported Features

The PWMSS module features not supported are shown in [Table 15-1](#).

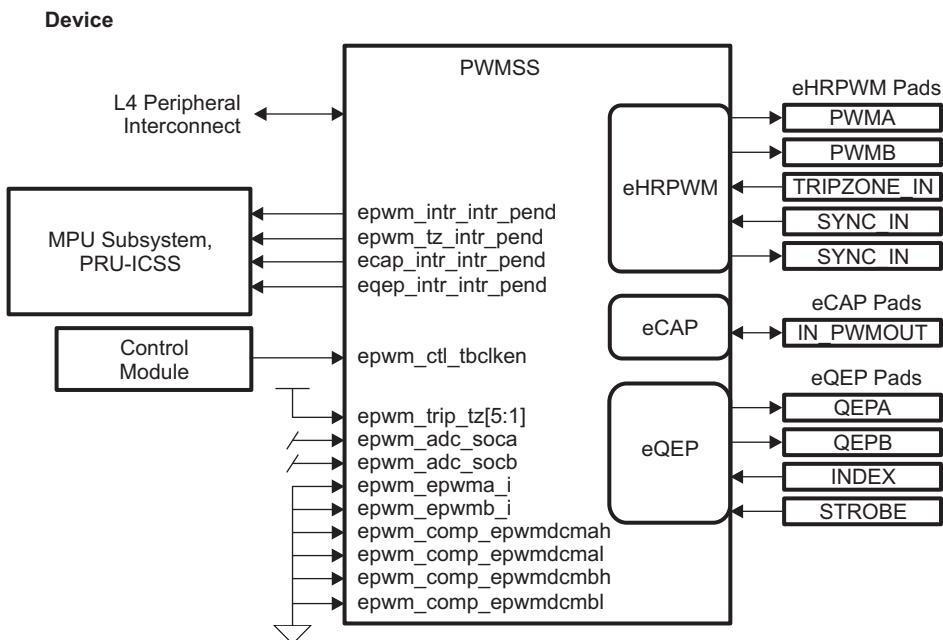

**Table 15-1. Unsupported Features**

| Feature                  | Reason                           |
|--------------------------|----------------------------------|
| ePWM inputs              | Not pinned out                   |
| ePWM tripzone 1-5 inputs | Only Tripzone0 is pinned out     |
| ePWM digital comparators | Inputs not connected             |
| eQEP quadrature outputs  | Only input signals are connected |

### 15.1.2 Integration

The Pulse Width Modulation Subsystem (PWMSS) includes a single instance of the Enhanced High Resolution Pulse Width Modulator (eHRPWM), Enhanced Capture (eCAP), and Enhanced Quadrature Encoded Pulse (eQEP) modules. This includes three instantiations of the PWMSS.

**Figure 15-1. PWMSS Integration**

#### 15.1.2.1 PWMSS Connectivity Attributes

The general connectivity attributes for the PWMSS module are shown in [Table 15-2](#).

**Table 15-2. PWMSS Connectivity Attributes**

| Attributes          | Type  |
|---------------------|---|
| Power Domain        | Peripheral Domain   |
| Clock Domain        | PD_PER_L4LS_GCLK  |
| Reset Signals       | PER_DOM_RST_N   |
| Idle/Wakeup Signals | Smart Idle  |
| Interrupt Requests  | 2 ePWM interrupts per instance<br>epwm_intr_intr - Event interrupt, ePWMxINT for ARM subsystem, epwm_intr_intr_pend for PRU-ICSS<br>epwm_tz_intr - Tripzone interrupt, ePWMx_TZINT for ARM subsystem, pwm_trip_zone for PRU-ICSS (only 1 for all 3 instances)<br>1 eCAP interrupt per instance<br>ecap_intr - Capture/PWM event interrupt, eCAPxINT for ARM subsystem, ecap_intr_intr_pend for PRU-ICSS<br>1 eQEP Interrupt per instance<br>eqep_intr_intr - Event interrupt, eQEPxINT for ARM subsystem, eqep_intr_intr_pend for PRU-ICSS (only for eQEP0) |
| DMA Requests        | Interrupt requests are redirected as DMA requests:<br><ul style="list-style-type: none"> <li>• 1 DMA request from ePWM per instance (ePMEVTx)</li> <li>• 1 DMA request from eCAP per instance (eCAPEVTx)</li> <li>• 1 DMA request from eQEP per instance (eQEPEVTx)</li> </ul>  |
| Physical Address    | L4 Peripheral slave port  |

### 15.1.2.2 PWMSS Clock and Reset Management

The PWMSS controllers have separate bus interface and functional clocks.

**Table 15-3. PWMSS Clock Signals**

| Clock Signal                                  | Max Freq | Reference / Source | Comments                      |
|---|----------|--------------------|-------------------------------|
| PWMSS_ocp_clk<br>Interface / Functional clock | 100 MHz  | CORE_CLKOUTM4 / 2  | pd_per_I4ls_gclk<br>from PRCM |

### 15.1.2.3 PWMSS Pin list

The external signals for the PWMSS module are shown in the following table.

**Table 15-4. PWMSS Pin List**

| Pin                | Type* | Description                     |
|--------------------|-------|---------------------------------|
| EPWMxA             | O     | PWM output A                    |
| EPWMxB             | O     | PWM output B                    |
| EPWM_SYNCIN        | I     | PWM Sync input                  |
| EPWM_SYNCOUT       | O     | PWM Sync output                 |
| EPWM_TRIPZONE[5:0] | I     | PWM Tripzone inputs             |
| ECAP_CAPIN_APWMOUT | I/O   | eCAP Capture input / PWM output |
| EQEP_A             | I/O   | eQEP Quadrature input/output    |
| EQEP_B             | I/O   | eQEP Quadrature input/output    |
| EQEP_INDEX         | I/O   | eQEP Index input/output         |
| EQEP_STROBE        | I/O   | eQEP Strobe input/output        |

### 15.1.3 PWMSS Registers

Table 15-5 lists the memory-mapped registers for the PWMSS. All register offset addresses not listed in Table 15-5 should be considered as reserved locations and the register contents should not be modified.

**Table 15-5. PWMSS REGISTERS**

| Offset | Acronym   | Register Name                 | Section          |
|--------|-----------|-------------------------------|------------------|
| 0h     | IDVER     | IP Revision Register          | Section 15.1.3.1 |
| 4h     | SYSCONFIG | System Configuration Register | Section 15.1.3.2 |
| 8h     | CLKCONFIG | Clock Configuration Register  | Section 15.1.3.3 |
| Ch     | CLKSTATUS | Clock Status Register         | Section 15.1.3.4 |

### 15.1.3.1 IDVER Register (offset = 0h) [reset = 40000000h]

IDVER is shown in Figure 15-2 and described in Table 15-6.

The IP revision register is used by software to track features, bugs, and compatibility.

**Figure 15-2. IDVER Register**

| 31     | 30 | 29       | 28 | 27 | 26      | 25 | 24 |
|--------|----|----------|----|----|---------|----|----|

| 7      | 6  | 5        | 4  | 3  | 2       | 1  | 0  |
| CUSTOM |    | Y_MINOR  |    |    | R-0h    |    |    |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 15-6. IDVER Register Field Descriptions**

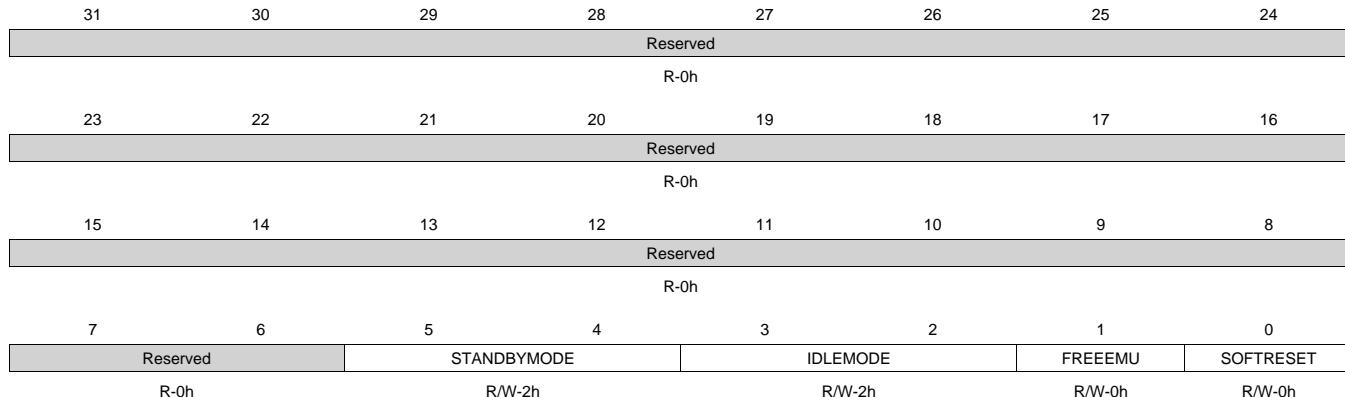

| Bit   | Field    | Type | Reset | Description   |
|-------|----------|------|-------|---|
| 31-30 | SCHEME   | R    | 1h    | Used to distinguish between the old scheme and current. |
| 29-28 | Reserved | R    | 0h    |   |
| 27-16 | FUNC     | R    | 0h    | FUNC  |
| 15-11 | R RTL    | R    | 0h    | RTL version (R), maintained by IP design owner.         |
| 10-8  | X_MAJOR  | R    | 0h    | Major revision (X)                                      |
| 7-6   | CUSTOM   | R    | 0h    | CUSTOM  |
| 5-0   | Y_MINOR  | R    | 0h    | Minor revision (Y)                                      |

### 15.1.3.2 SYSCONFIG Register (offset = 4h) [reset = 28h]

SYSCONFIG is shown in [Figure 15-3](#) and described in [Table 15-7](#).

The system configuration register is used for clock management configuration.

**Figure 15-3. SYSCONFIG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 15-7. SYSCONFIG Register Field Descriptions**

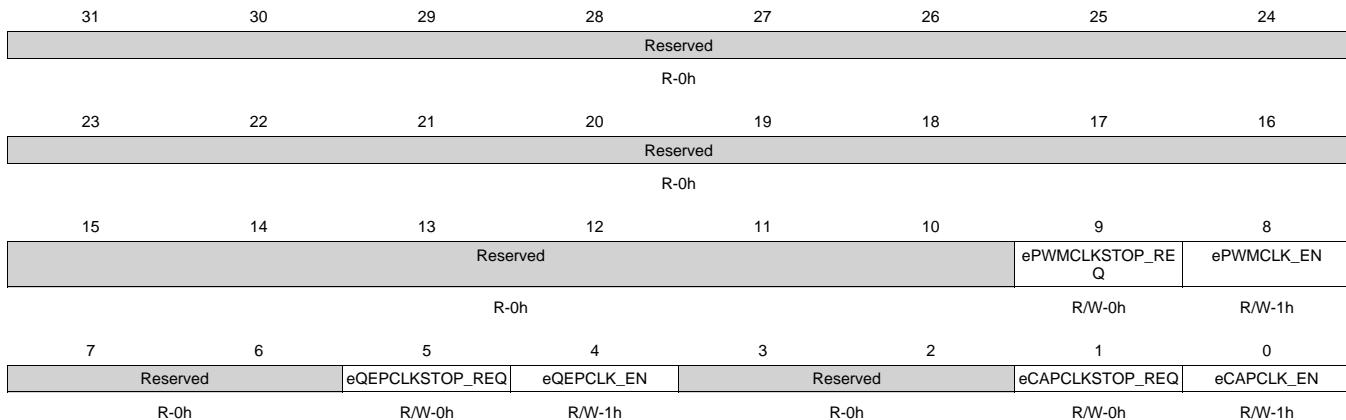

| Bit  | Field       | Type | Reset | Description  |
|------|-------------|------|-------|--|
| 31-6 | Reserved    | R    | 0h    |  |
| 5-4  | STANDBYMODE | R/W  | 2h    | Configuration of the local initiator state management mode.<br>By definition, initiator may generate read/write transaction as long as it is out of STANDBY state.<br>0x0 = Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only.<br>0x1 = No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only.<br>0x2 = Smart-standby mode: local initiator standby status depends on local conditions, i.e., the module's functional requirement from the initiator. IP module should not generate (initiator-related) wakeup events.<br>0x3 = Reserved.   |
| 3-2  | IDLEMODE    | R/W  | 2h    | Configuration of the local target state management mode.<br>By definition, target can handle read/write transaction as long as it is out of IDLE state.<br>0x0 = Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only.<br>0x1 = No-idle mode: local target never enters idle state. Backup mode, for debug only.<br>0x2 = Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events.<br>0x3 = Reserved. |
| 1    | FREEEMU     | R/W  | 0h    | Sensitivity to emulation (debug) suspend input signal.<br>0x0 = IP module is sensitive to emulation suspend.<br>0x1 = IP module is not sensitive to emulation suspend.   |
| 0    | SOFTRESET   | R/W  | 0h    | Software reset (optional)  |

### 15.1.3.3 CLKCONFIG Register (offset = 8h) [reset = 111h]

CLKCONFIG is shown in [Figure 15-4](#) and described in [Table 15-8](#).

The clock configuration register is used in the PWMSS submodule for clkstop req and clk\_en control.

**Figure 15-4. CLKCONFIG Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 15-8. CLKCONFIG Register Field Descriptions**

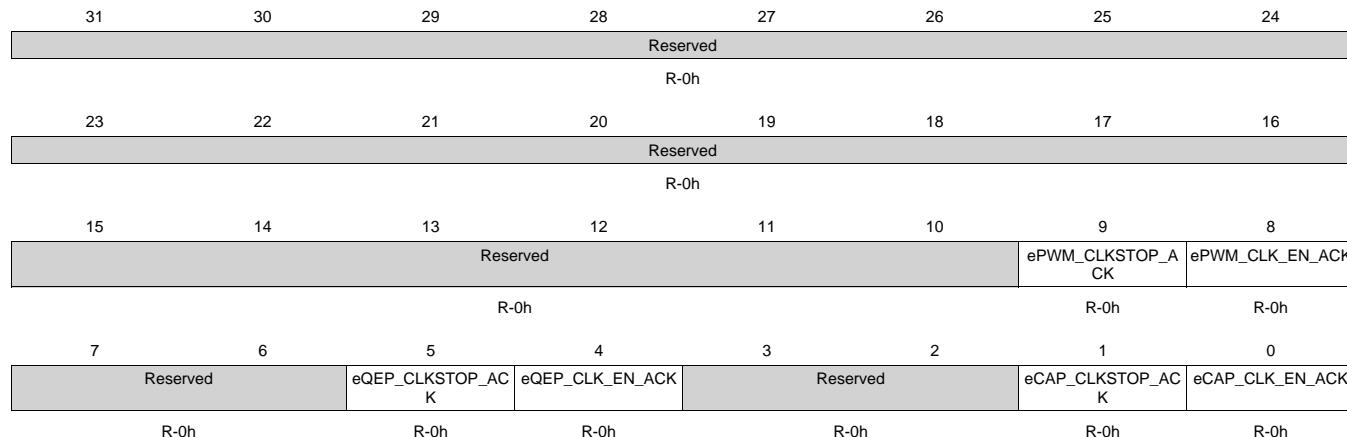

| Bit   | Field           | Type | Reset | Description   |
|-------|-----------------|------|-------|---|
| 31-10 | Reserved        | R    | 0h    |   |
| 9     | ePWMCLKSTOP_REQ | R/W  | 0h    | This bit controls the clkstop_req input to the ePWM module. |
| 8     | ePWMCLK_EN      | R/W  | 1h    | This bit controls the clk_en input to the ePWM module.      |
| 7-6   | Reserved        | R    | 0h    |   |
| 5     | eQEPCLKSTOP_REQ | R/W  | 0h    | This bit controls the clkstop_req input to the eQEP module  |
| 4     | eQEPCLK_EN      | R/W  | 1h    | This bit controls the clk_en input to the eQEP module.      |
| 3-2   | Reserved        | R    | 0h    |   |
| 1     | eCAPCLKSTOP_REQ | R/W  | 0h    | This bit controls the clkstop_req input to the eCAP module. |
| 0     | eCAPCLK_EN      | R/W  | 1h    | This bit controls the clk_en input to the eCAP module.      |

#### 15.1.3.4 CLKSTATUS Register (offset = Ch) [reset = 0h]

CLKSTATUS is shown in [Figure 15-5](#) and described in [Table 15-9](#).

The clock status register is used in the PWMSS submodule for clkstop ack and clk\_en ack status.

**Figure 15-5. CLKSTATUS Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 15-9. CLKSTATUS Register Field Descriptions**

| Bit   | Field            | Type | Reset | Description   |
|-------|------------------|------|-------|---|
| 31-10 | Reserved         | R    | 0h    |   |
| 9     | ePWM_CLKSTOP_ACK | R    | 0h    | This bit is the clkstop_req_ack status output of the ePWM module. |
| 8     | ePWM_CLK_EN_ACK  | R    | 0h    | This bit is the clk_en status output of the ePWM module.          |
| 7-6   | Reserved         | R    | 0h    |   |
| 5     | eQEP_CLKSTOP_ACK | R    | 0h    | This bit is the clkstop_req_ack status output of the eQEP module. |
| 4     | eQEP_CLK_EN_ACK  | R    | 0h    | This bit is the clk_en status output of the eQEP module.          |
| 3-2   | Reserved         | R    | 0h    |   |
| 1     | eCAP_CLKSTOP_ACK | R    | 0h    | This bit is the clkstop_req_ack status output of the eCAP module. |
| 0     | eCAP_CLK_EN_ACK  | R    | 0h    | This bit is the clk_en status output of the eCAP module.          |

## 15.2 Enhanced PWM (ePWM) Module

### 15.2.1 Introduction

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel modules with separate resources and that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

In this chapter, the letter x within a signal or module name is used to indicate a generic ePWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the ePWMx instance. Thus, EPWM1A and EPWM1B belong to ePWM1 and, likewise, EPWM4A and EPWM4B belong to ePWM4.

#### 15.2.1.1 Submodule Overview

The ePWM module represents one complete PWM channel composed of two PWM outputs: EPWMxA and EPWMxB. Multiple ePWM modules are instanced within a device as shown in [Figure 15-6](#). Each ePWM instance is identical with one exception. Some instances include a hardware extension that allows more precise control of the PWM outputs. This extension is the high-resolution pulse width modulator (HRPWM) and is described in [Section 15.2.2.10](#). See [Section 15.1.2](#) to determine which ePWM instances include this feature. Each ePWM module is indicated by a numerical value starting with 1. For example ePWM0 is the first instance and ePWM2 is the third instance in the system and ePWMx indicates any instance.

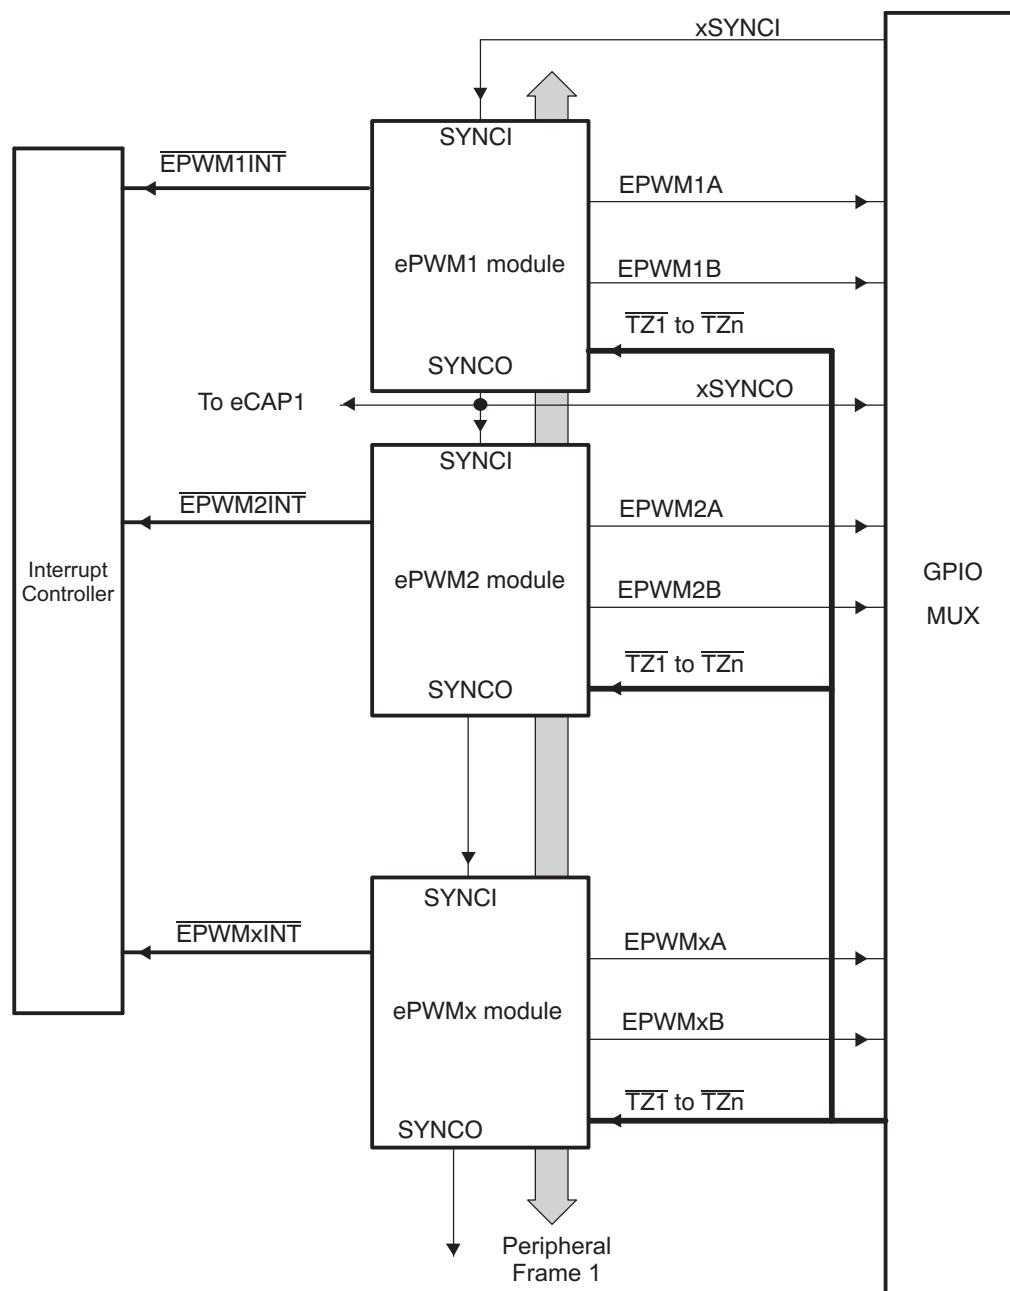

The ePWM modules are chained together via a clock synchronization scheme that allows them to operate as a single system when required. Additionally, this synchronization scheme can be extended to the capture peripheral modules (eCAP). The number of modules is device-dependent and based on target application needs. Modules can also operate stand-alone.

Each ePWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Two PWM outputs (EPWMxA and EPWMxB) that can be used in the following configurations:
  - Two independent PWM outputs with single-edge operation
  - Two independent PWM outputs with dual-edge symmetric operation
  - One independent PWM output with dual-edge asymmetric operation
- Asynchronous override control of PWM signals through software.
- Programmable phase-control support for lag or lead operation relative to other ePWM modules.
- Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.
- Dead-band generation with independent rising and falling edge delay control.
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.
- Programmable event prescaling minimizes CPU overhead on interrupts.
- PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.

Each ePWM module is connected to the input/output signals shown in [Figure 15-6](#). The signals are described in detail in subsequent sections.

The order in which the ePWM modules are connected may differ from what is shown in [Figure 15-6](#). See [Section 15.2.2.3.3.2](#) for the synchronization scheme for a particular device. Each ePWM module consists of seven submodules and is connected within a system via the signals shown in [Figure 15-7](#).

**Figure 15-6. Multiple ePWM Modules**

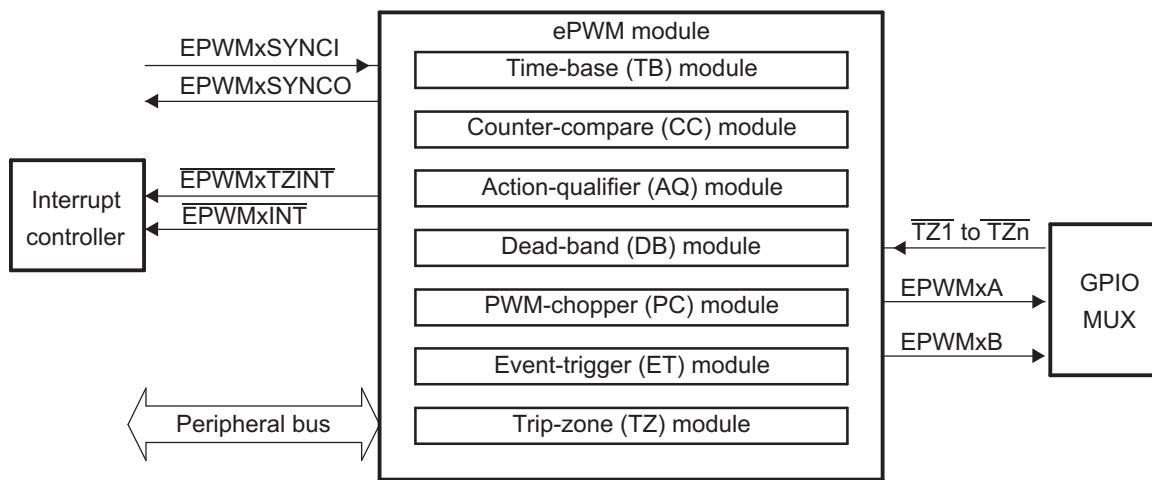

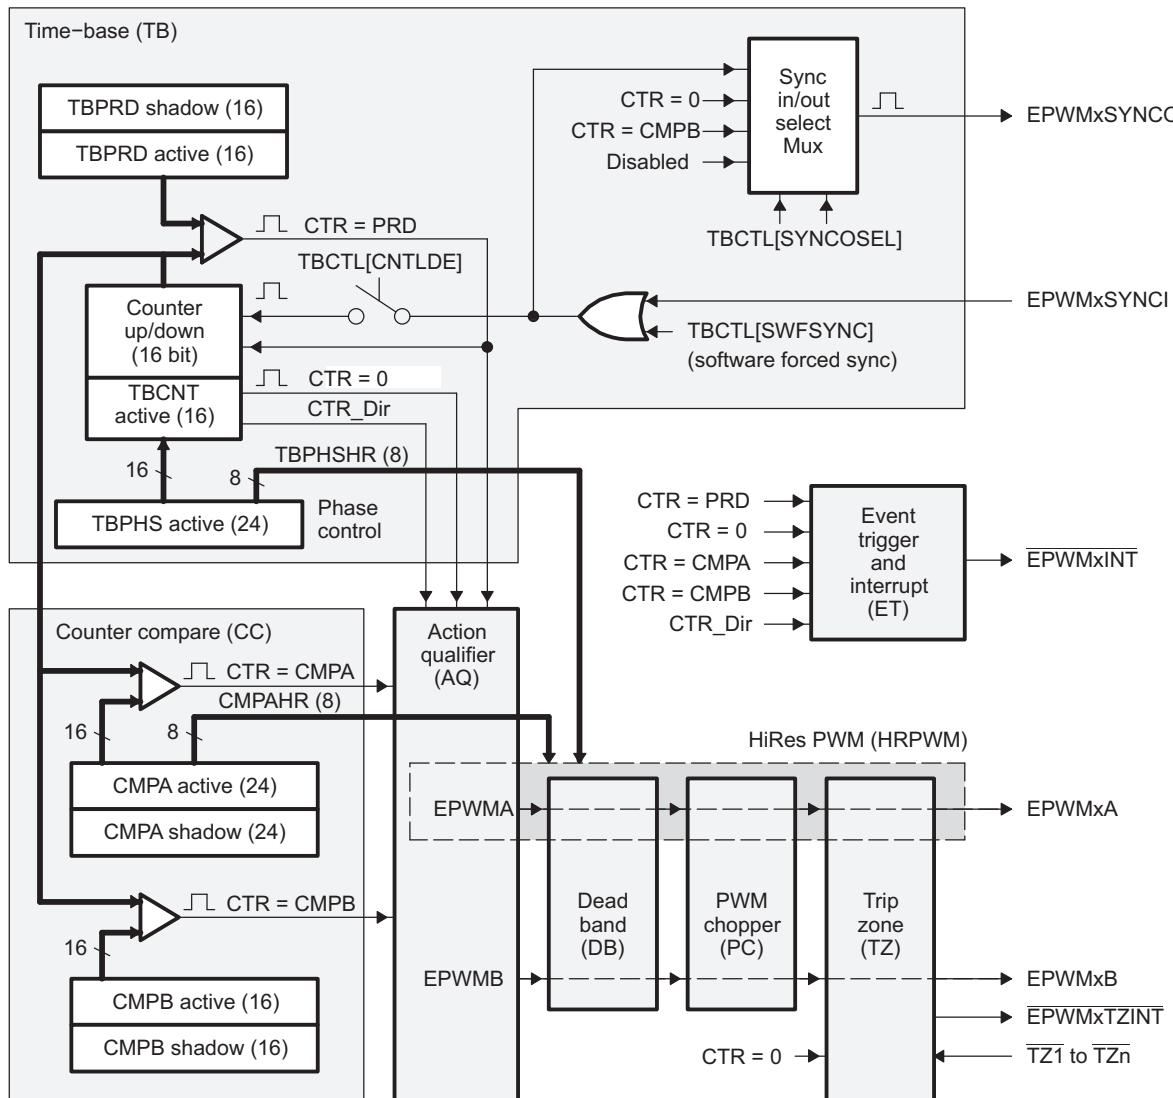

**Figure 15-7. Submodules and Signal Connections for an ePWM Module**

Figure 15-8 shows more internal details of a single ePWM module. The main signals used by the ePWM module are:

- PWM output signals (EPWMxA and EPWMxB).** The PWM output signals are made available external to the device through the GPIO peripheral described in the system control and interrupts guide for your device.
- Trip-zone signals (TZ1 to TZn).** These input signals alert the ePWM module of an external fault condition. Each module on a device can be configured to either use or ignore any of the trip-zone signals. The trip-zone signal can be configured as an asynchronous input through the GPIO peripheral. See [Section 15.1.2](#) to determine how many trip-zone pins are available in the device.
- Time-base synchronization input (EPWMxSYNCI) and output (EPWMxSYNCO) signals.** The synchronization signals daisy chain the ePWM modules together. Each module can be configured to either use or ignore its synchronization input. The clock synchronization input and output signal are brought out to pins only for ePWM1 (ePWM module #1). The synchronization output for ePWM1 (EPWM1SYNCO) is also connected to the SYNCI of the first enhanced capture module (eCAP1).
- Peripheral Bus.** The peripheral bus is 32-bits wide and allows both 16-bit and 32-bit writes to the ePWM register file.

Figure 15-8 also shows the key internal submodule interconnect signals. Each submodule is described in [Section 15.2.2](#).

**Figure 15-8. ePWM Submodules and Critical Internal Signal Interconnects**

## 15.2.2 Functional Description

Seven submodules are included in every ePWM peripheral. There are some instances that include a high-resolution submodule that allows more precise control of the PWM outputs. Each of these submodules performs specific tasks that can be configured by software.

### 15.2.2.1 Overview

[Table 15-10](#) lists the eight key submodules together with a list of their main configuration parameters. For example, if you need to adjust or control the duty cycle of a PWM waveform, then you should see the counter-compare submodule in [Section 15.2.2.4](#) for relevant details.

**Table 15-10. Submodule Configuration Parameters**

| Submodule             | Configuration Parameter or Option  |
|-----------------------|--|
| Time-base (TB)        | <ul style="list-style-type: none"> <li>• Scale the time-base clock (TBCLK) relative to the system clock (SYSCLKOUT).</li> <li>• Configure the PWM time-base counter (TBCNT) frequency or period.</li> <li>• Set the mode for the time-base counter:           <ul style="list-style-type: none"> <li>– count-up mode: used for asymmetric PWM</li> <li>– count-down mode: used for asymmetric PWM</li> <li>– count-up-and-down mode: used for symmetric PWM</li> </ul> </li> <li>• Configure the time-base phase relative to another ePWM module.</li> <li>• Synchronize the time-base counter between modules through hardware or software.</li> <li>• Configure the direction (up or down) of the time-base counter after a synchronization event.</li> <li>• Configure how the time-base counter will behave when the device is halted by an emulator.</li> <li>• Specify the source for the synchronization output of the ePWM module:           <ul style="list-style-type: none"> <li>– Synchronization input signal</li> <li>– Time-base counter equal to zero</li> <li>– Time-base counter equal to counter-compare B (CMPB)</li> <li>– No output synchronization signal generated.</li> </ul> </li> </ul> |
| Counter-compare (CC)  | <ul style="list-style-type: none"> <li>• Specify the PWM duty cycle for output EPWMxA and/or output EPWMxB</li> <li>• Specify the time at which switching events occur on the EPWMxA or EPWMxB output</li> </ul>   |
| Action-qualifier (AQ) | <ul style="list-style-type: none"> <li>• Specify the type of action taken when a time-base or counter-compare submodule event occurs:           <ul style="list-style-type: none"> <li>– No action taken</li> <li>– Output EPWMxA and/or EPWMxB switched high</li> <li>– Output EPWMxA and/or EPWMxB switched low</li> <li>– Output EPWMxA and/or EPWMxB toggled</li> </ul> </li> <li>• Force the PWM output state through software control</li> <li>• Configure and control the PWM dead-band through software</li> </ul>   |
| Dead-band (DB)        | <ul style="list-style-type: none"> <li>• Control of traditional complementary dead-band relationship between upper and lower switches</li> <li>• Specify the output rising-edge-delay value</li> <li>• Specify the output falling-edge delay value</li> <li>• Bypass the dead-band module entirely. In this case the PWM waveform is passed through without modification.</li> </ul>   |
| PWM-chopper (PC)      | <ul style="list-style-type: none"> <li>• Create a chopping (carrier) frequency.</li> <li>• Pulse width of the first pulse in the chopped pulse train.</li> <li>• Duty cycle of the second and subsequent pulses.</li> <li>• Bypass the PWM-chopper module entirely. In this case the PWM waveform is passed through without modification.</li> </ul>   |

**Table 15-10. Submodule Configuration Parameters (continued)**

| Submodule                   | Configuration Parameter or Option  |
|-----------------------------|--|
| Trip-zone (TZ)              | <ul style="list-style-type: none"> <li>• Configure the ePWM module to react to one, all, or none of the trip-zone pins.</li> <li>• Specify the tripping action taken when a fault occurs: <ul style="list-style-type: none"> <li>– Force EPWMxA and/or EPWMxB high</li> <li>– Force EPWMxA and/or EPWMxB low</li> <li>– Force EPWMxA and/or EPWMxB to a high-impedance state</li> <li>– Configure EPWMxA and/or EPWMxB to ignore any trip condition.</li> </ul> </li> <li>• Configure how often the ePWM will react to each trip-zone pin: <ul style="list-style-type: none"> <li>– One-shot</li> <li>– Cycle-by-cycle</li> </ul> </li> <li>• Enable the trip-zone to initiate an interrupt.</li> <li>• Bypass the trip-zone module entirely.</li> </ul> |
| Event-trigger (ET)          | <ul style="list-style-type: none"> <li>• Enable the ePWM events that will trigger an interrupt.</li> <li>• Specify the rate at which events cause triggers (every occurrence or every second or third occurrence)</li> <li>• Poll, set, or clear event flags</li> </ul>  |
| High-Resolution PWM (HRPWM) | <ul style="list-style-type: none"> <li>• Enable extended time resolution capabilities</li> <li>• Configure finer time granularity control or edge positioning</li> </ul>   |

Code examples are provided in the remainder of this chapter that show how to implement various ePWM module configurations. These examples use the constant definitions shown in [Example 15-1](#).

### **Example 15-1. Constant Definitions Used in the Code Examples**

```
// TBCTL (Time-Base Control)
// =====

**15.2.2.2 Proper Interrupt Initialization Procedure**

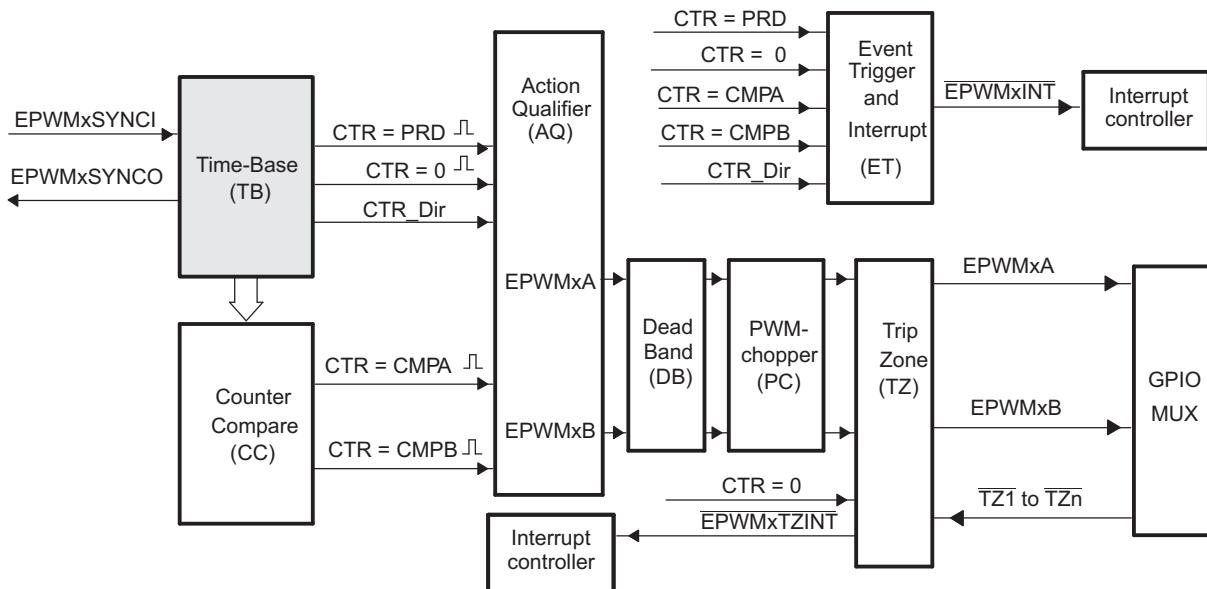

When the ePWM peripheral clock is enabled it may be possible that interrupt flags may be set due to spurious events due to the ePWM registers not being properly initialized. The proper procedure for initializing the ePWM peripheral is:

1. Disable global interrupts (CPU INTM flag)
2. Disable ePWM interrupts
3. Initialize peripheral registers
4. Clear any spurious ePWM flags
5. Enable ePWM interrupts
6. Enable global interrupts

**15.2.2.3 Time-Base (TB) Submodule**

Each ePWM module has its own time-base submodule that determines all of the event timing for the ePWM module. Built-in synchronization logic allows the time-base of multiple ePWM modules to work together as a single system. [Figure 15-9](#) illustrates the time-base module's place within the ePWM.

**Figure 15-9. Time-Base Submodule Block Diagram**

### 15.2.2.3.1 Purpose of the Time-Base Submodule

You can configure the time-base submodule for the following:

- Specify the ePWM time-base counter (TBCNT) frequency or period to control how often events occur.
- Manage time-base synchronization with other ePWM modules.
- Maintain a phase relationship with other ePWM modules.
- Set the time-base counter to count-up, count-down, or count-up-and-down mode.
- Generate the following events:
  - CTR = PRD: Time-base counter equal to the specified period (TBCNT = TBPRD) .
  - CTR = 0: Time-base counter equal to zero (TBCNT = 0000h).
- Configure the rate of the time-base clock; a prescaled version of the CPU system clock (SYSCLKOUT). This allows the time-base counter to increment/decrement at a slower rate.

### 15.2.2.3.2 Controlling and Monitoring the Time-Base Submodule

Table 15-11 lists the registers used to control and monitor the time-base submodule.

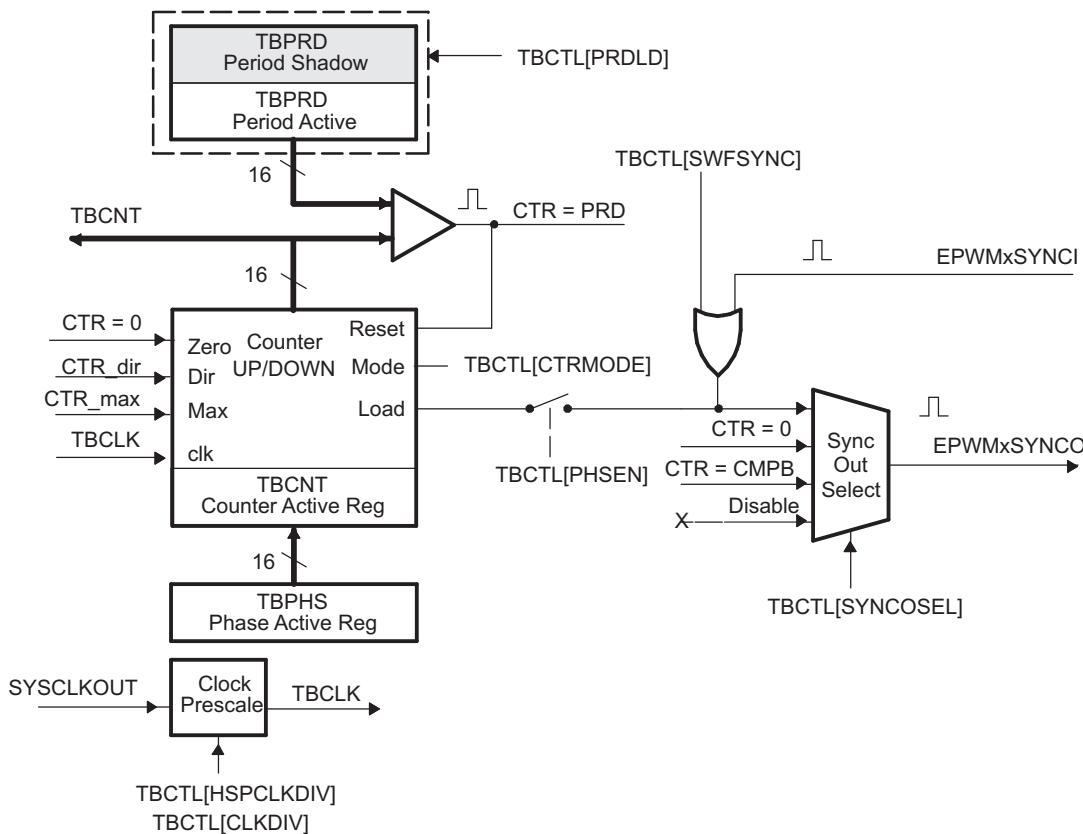

**Table 15-11. Time-Base Submodule Registers**

| Acronym | Register Description                          | Address Offset | Shadowed |
|---------|---|----------------|----------|
| TBCTL   | Time-Base Control Register                    | 0h             | No       |
| TBSTS   | Time-Base Status Register                     | 2h             | No       |
| TBPHSR  | HRPWM extension Phase Register <sup>(1)</sup> | 4h             | No       |
| TBPHS   | Time-Base Phase Register                      | 6h             | No       |
| TBCNT   | Time-Base Counter Register                    | 8h             | No       |
| TBPRD   | Time-Base Period Register                     | Ah             | Yes      |

<sup>(1)</sup> This register is available only on ePWM instances that include the high-resolution extension (HRPWM). On ePWM modules that do not include the HRPWM, this location is reserved. See [Section 15.1.2](#) to determine which ePWM instances include this feature.

Figure 15-10 shows the critical signals and registers of the time-base submodule. Table 15-12 provides descriptions of the key signals associated with the time-base submodule.

**Figure 15-10. Time-Base Submodule Signals and Registers**

**Table 15-12. Key Time-Base Signals**

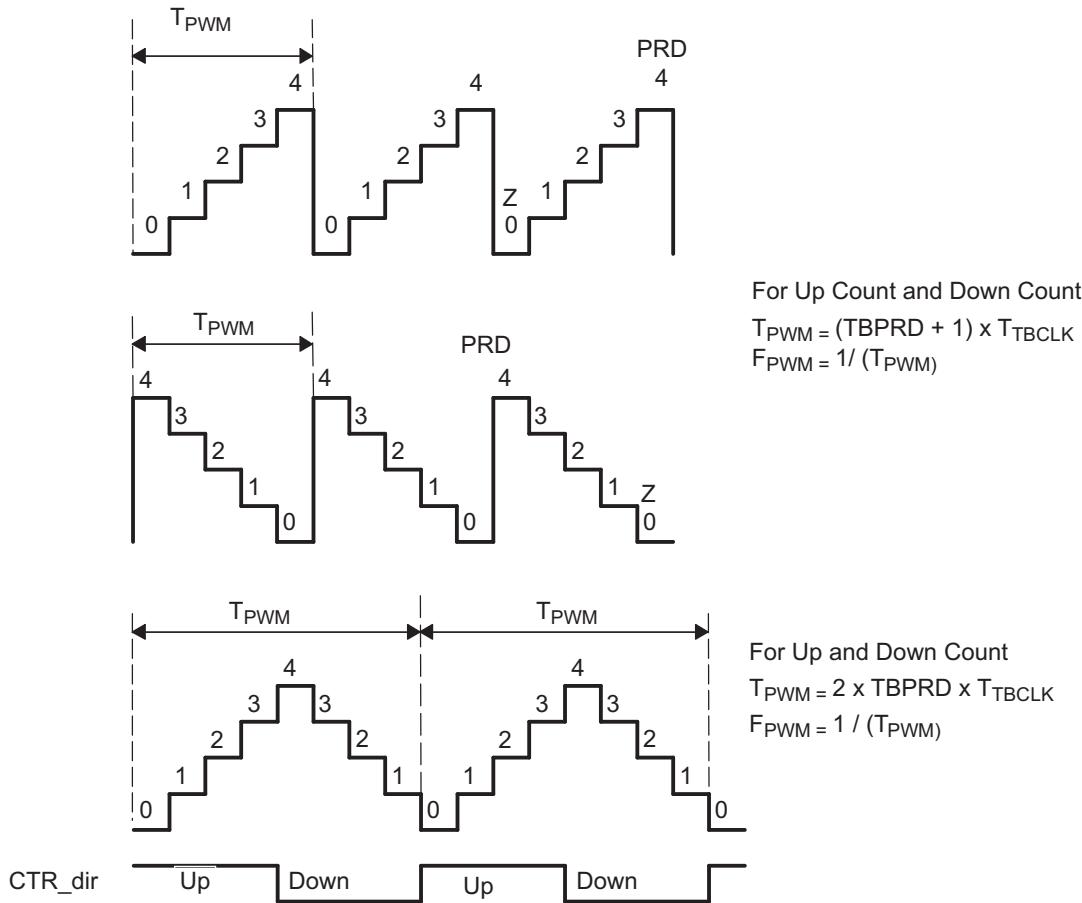

| Signal     | Description  |
|------------|--|
| EPWMxSYNCI | Time-base synchronization input.<br><br>Input pulse used to synchronize the time-base counter with the counter of ePWM module earlier in the synchronization chain. An ePWM peripheral can be configured to use or ignore this signal. For the first ePWM module (EPWM1) this signal comes from a device pin. For subsequent ePWM modules this signal is passed from another ePWM peripheral. For example, EPWM2SYNCI is generated by the ePWM1 peripheral, EPWM3SYNCI is generated by ePWM2 and so forth. See <a href="#">Section 15.2.2.3.3.2</a> for information on the synchronization order of a particular device. |
| EPWMxSYNCO | Time-base synchronization output.<br><br>This output pulse is used to synchronize the counter of an ePWM module later in the synchronization chain. The ePWM module generates this signal from one of three event sources:<br>1. EPWMxSYNCI (Synchronization input pulse)<br>2. CTR = 0: The time-base counter equal to zero (TBCNT = 0000h).<br>3. CTR = CMPB: The time-base counter equal to the counter-compare B (TBCNT = CMPB) register.  |
| CTR = PRD  | Time-base counter equal to the specified period.<br><br>This signal is generated whenever the counter value is equal to the active period register value. That is when TBCNT = TBPRD.  |
| CTR = 0    | Time-base counter equal to zero.<br><br>This signal is generated whenever the counter value is zero. That is when TBCNT equals 0000h.  |
| CTR = CMPB | Time-base counter equal to active counter-compare B register (TBCNT = CMPB).<br><br>This event is generated by the counter-compare submodule and used by the synchronization out logic.  |
| CTR_dir    | Time-base counter direction.<br><br>Indicates the current direction of the ePWM's time-base counter. This signal is high when the counter is increasing and low when it is decreasing.   |
| CTR_max    | Time-base counter equal max value. (TBCNT = FFFFh)<br><br>Generated event when the TBCNT value reaches its maximum value. This signal is only used only as a status bit.   |
| TBCLK      | Time-base clock.<br><br>This is a prescaled version of the system clock (SYSCLKOUT) and is used by all submodules within the ePWM. This clock determines the rate at which time-base counter increments or decrements.   |

### 15.2.2.3.3 Calculating PWM Period and Frequency

The frequency of PWM events is controlled by the time-base period (TBPRD) register and the mode of the time-base counter. [Figure 15-11](#) shows the period ( $T_{\text{pwm}}$ ) and frequency ( $F_{\text{pwm}}$ ) relationships for the up-count, down-count, and up-down-count time-base counter modes when the period is set to 4 (TBPRD = 4). The time increment for each step is defined by the time-base clock (TBCLK) which is a prescaled version of the system clock (SYSCLKOUT).

The time-base counter has three modes of operation selected by the time-base control register (TBCTL):

- **Up-Down-Count Mode:** In up-down-count mode, the time-base counter starts from zero and increments until the period (TBPRD) value is reached. When the period value is reached, the time-base counter then decrements until it reaches zero. At this point the counter repeats the pattern and begins to increment.
- **Up-Count Mode:** In this mode, the time-base counter starts from zero and increments until it reaches the value in the period register (TBPRD). When the period value is reached, the time-base counter resets to zero and begins to increment once again.
- **Down-Count Mode:** In down-count mode, the time-base counter starts from the period (TBPRD) value and decrements until it reaches zero. When it reaches zero, the time-base counter is reset to the period value and it begins to decrement once again.

**Figure 15-11. Time-Base Frequency and Period**

#### 15.2.2.3.3.1 Time-Base Period Shadow Register

The time-base period register (TBPRD) has a shadow register. Shadowing allows the register update to be synchronized with the hardware. The following definitions are used to describe all shadow registers in the ePWM module:

- **Active Register:** The active register controls the hardware and is responsible for actions that the hardware causes or invokes.
- **Shadow Register:** The shadow register buffers or provides a temporary holding location for the active register. It has no direct effect on any control hardware. At a strategic point in time the shadow register's content is transferred to the active register. This prevents corruption or spurious operation due to the register being asynchronously modified by software.

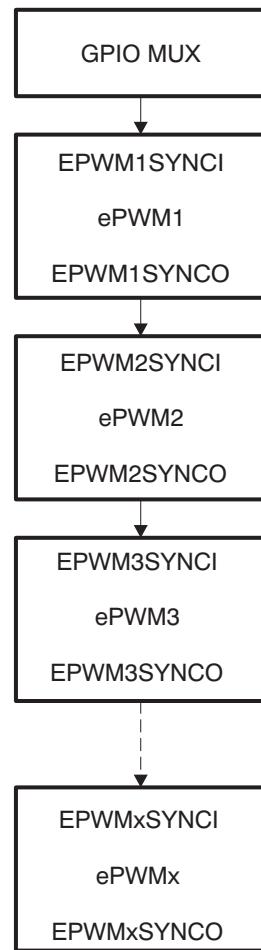

The memory address of the shadow period register is the same as the active register. Which register is written to or read from is determined by the TBCTL[PRDLD] bit. This bit enables and disables the TBPRD shadow register as follows:

- **Time-Base Period Shadow Mode:** The TBPRD shadow register is enabled when TBCTL[PRDLD] = 0. Reads from and writes to the TBPRD memory address go to the shadow register. The shadow register contents are transferred to the active register (TBPRD (Active)  $\leftarrow$  TBPRD (shadow)) when the time-base counter equals zero (TBCNT = 0000h). By default the TBPRD shadow register is enabled.
- **Time-Base Period Immediate Load Mode:** If immediate load mode is selected (TBCTL[PRDLD] = 1), then a read from or a write to the TBPRD memory address goes directly to the active register.

### 15.2.2.3.3.2 Time-Base Counter Synchronization

A time-base synchronization scheme connects all of the ePWM modules on a device. Each ePWM module has a synchronization input (EPWMxSYNCI) and a synchronization output (EPWMxSYNCO). The input synchronization for the first instance (ePWM1) comes from an external pin. The possible synchronization connections for the remaining ePWM modules is shown in [Figure 15-12](#).

**Figure 15-12. Time-Base Counter Synchronization Scheme 1**

Each ePWM module can be configured to use or ignore the synchronization input. If the TBCTL[PHSEN] bit is set, then the time-base counter (TBCNT) of the ePWM module will be automatically loaded with the phase register (TBPHS) contents when one of the following conditions occur:

- **EPWMxSYNCI: Synchronization Input Pulse:** The value of the phase register is loaded into the counter register when an input synchronization pulse is detected (TBPHS → TBCNT). This operation occurs on the next valid time-base clock (TBCLK) edge.
- **Software Forced Synchronization Pulse:** Writing a 1 to the TBCTL[SWFSYNC] control bit invokes a software forced synchronization. This pulse is ORed with the synchronization input signal, and therefore has the same effect as a pulse on EPWMxSYNCI.

This feature enables the ePWM module to be automatically synchronized to the time base of another ePWM module. Lead or lag phase control can be added to the waveforms generated by different ePWM modules to synchronize them. In up-down-count mode, the TBCTL[PSHDIR] bit configures the direction of the time-base counter immediately after a synchronization event. The new direction is independent of the direction prior to the synchronization event. The TBPHS bit is ignored in count-up or count-down modes. See [Figure 15-13](#) through [Figure 15-16](#) for examples.

Clearing the TBCTL[PHSEN] bit configures the ePWM to ignore the synchronization input pulse. The synchronization pulse can still be allowed to flow-through to the EPWMxSYNCO and be used to synchronize other ePWM modules. In this way, you can set up a master time-base (for example, ePWM1) and downstream modules (ePWM2 - ePWMx) may elect to run in synchronization with the master.

#### **15.2.2.3.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules**

The TBCLKEN bit in the PWMSS\_CTRL register in the Control Module can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. The TBCLKEN bit is part of the chip configuration registers and is described in [Chapter 9](#). When TBCLKEN = 0, the time-base clock of all ePWM modules is stopped (default). When TBCLKEN = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

1. Enable the ePWM module clocks.
2. Set TBCLKEN = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure the prescaler values and desired ePWM modes.
4. Set TBCLKEN = 1.

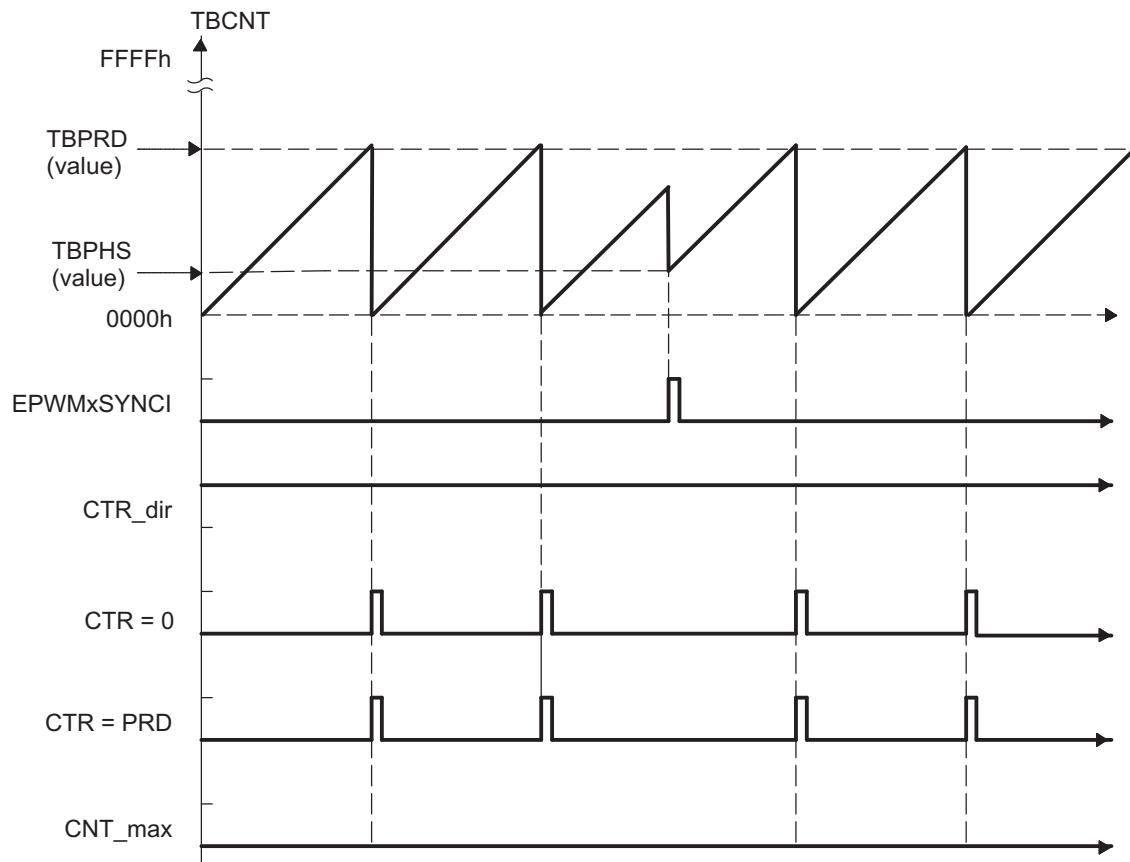

#### **15.2.2.3.5 Time-Base Counter Modes and Timing Waveforms**

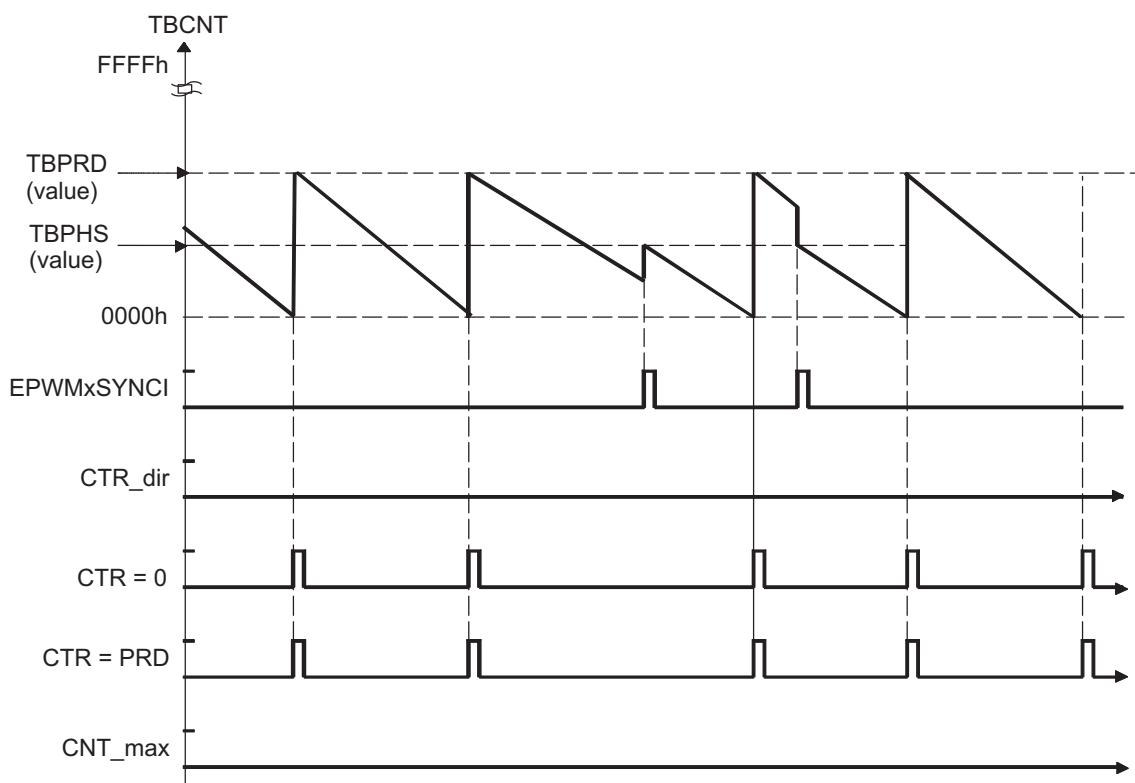

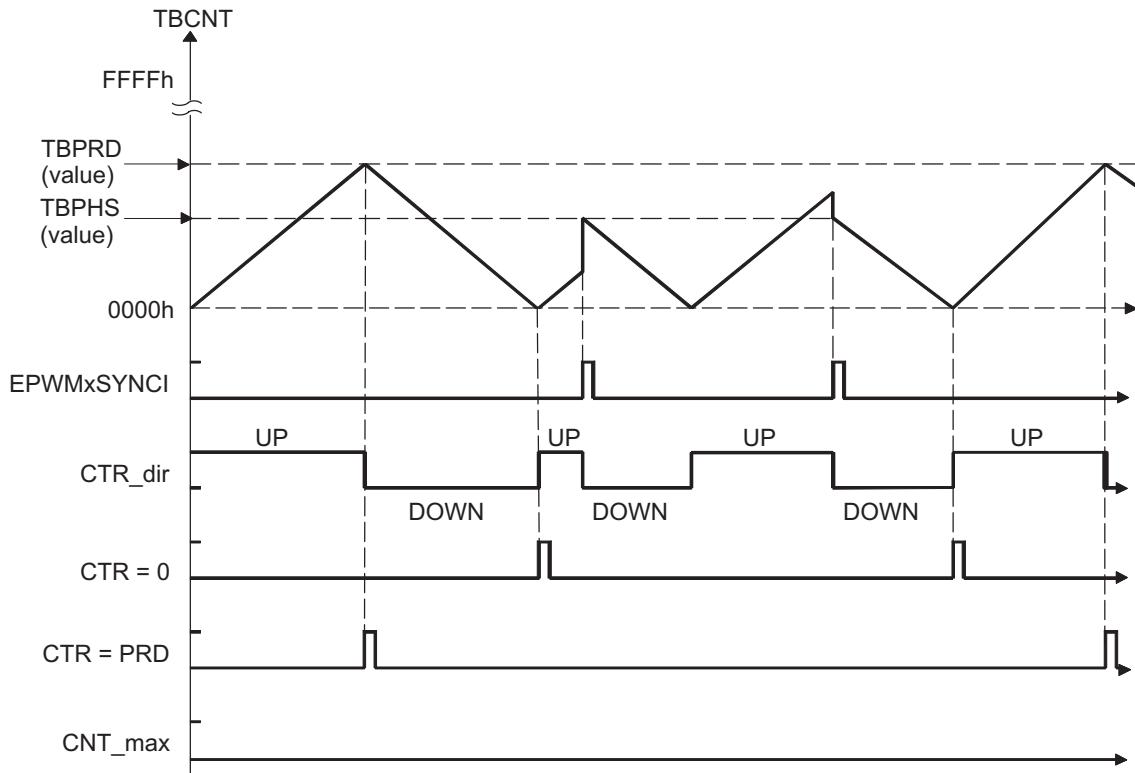

The time-base counter operates in one of four modes:

- Up-count mode which is asymmetrical.
- Down-count mode which is asymmetrical.
- Up-down-count which is symmetrical.
- Frozen where the time-base counter is held constant at the current value.

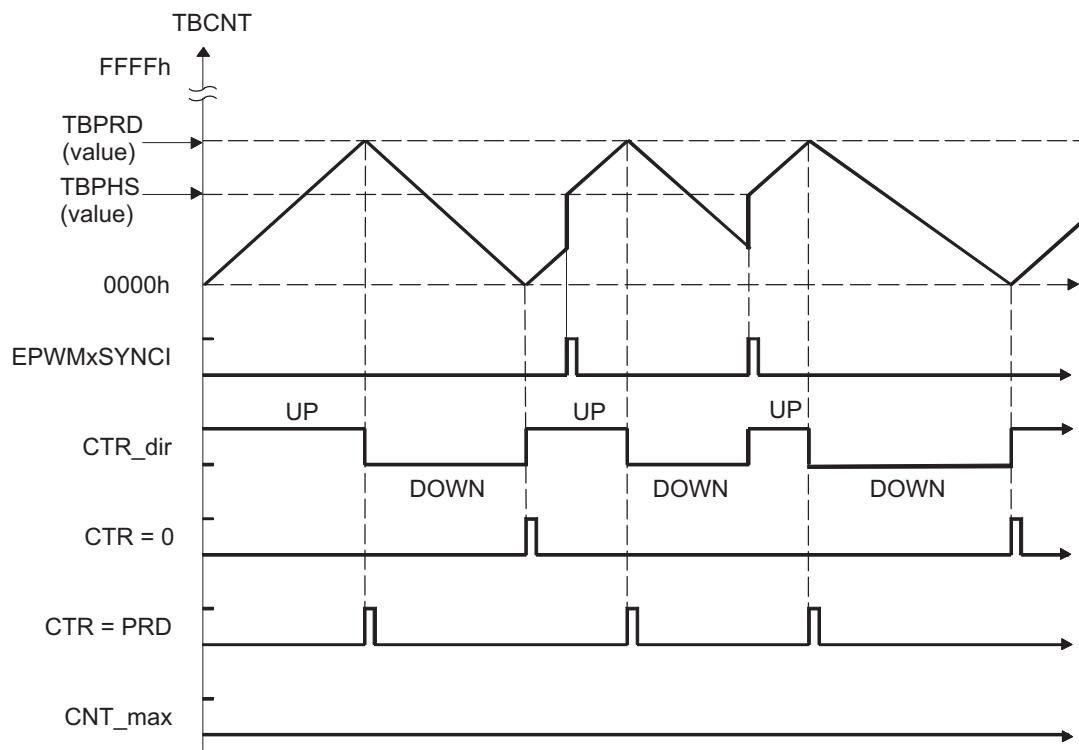

To illustrate the operation of the first three modes, [Figure 15-13](#) to [Figure 15-16](#) show when events are generated and how the time-base responds to an EPWMxSYNCI signal.

Figure 15-13. Time-Base Up-Count Mode Waveforms

**Figure 15-14. Time-Base Down-Count Mode Waveforms**

**Figure 15-15. Time-Base Up-Down-Count Waveforms, TBCTL[PHSDIR = 0] Count Down on Synchronization Event**

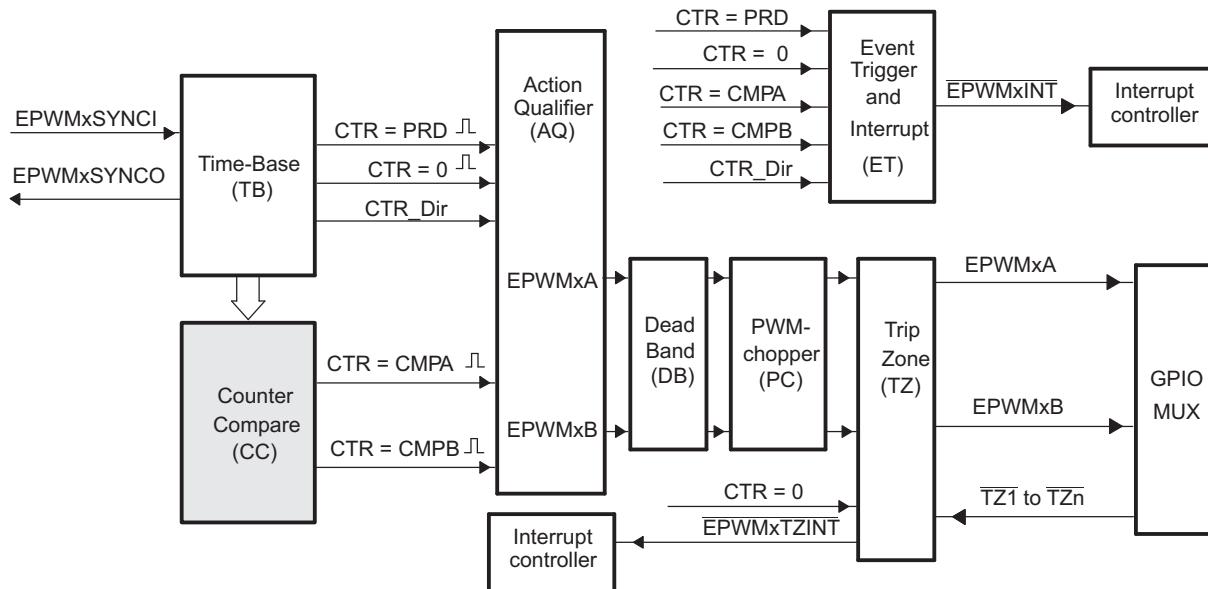

**Figure 15-16. Time-Base Up-Down Count Waveforms, TBCTL[PHSDIR = 1] Count Up on Synchronization Event**

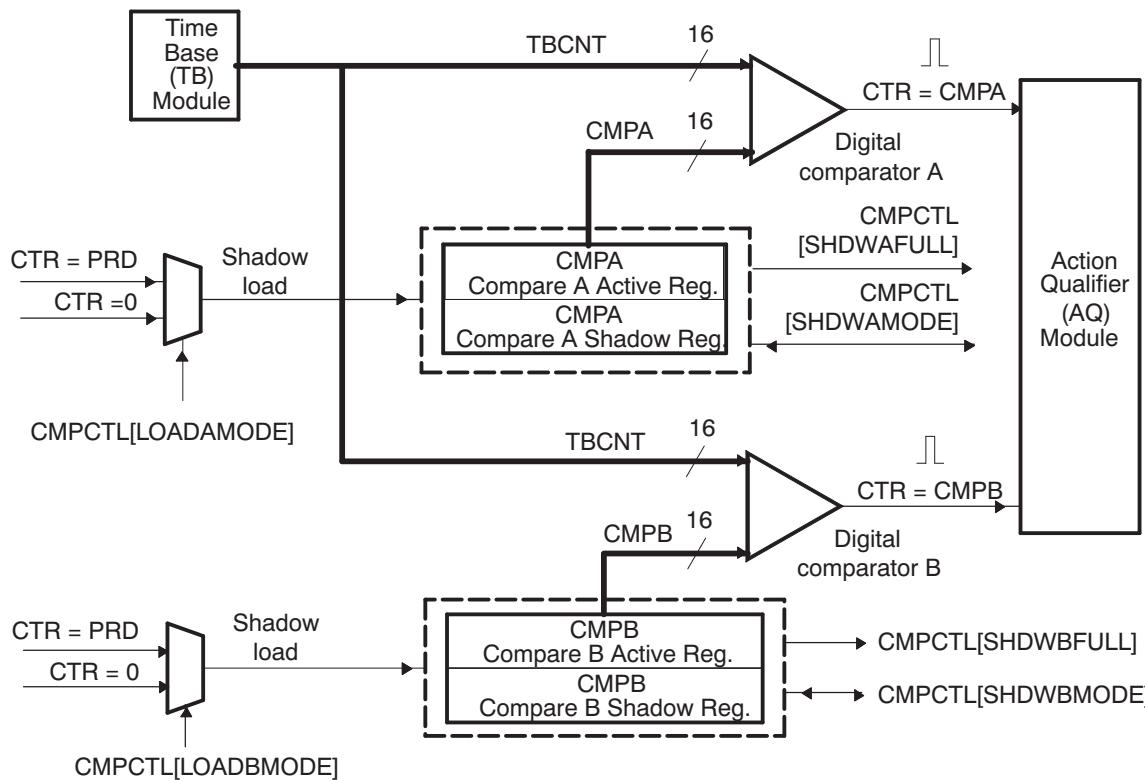

#### 15.2.2.4 Counter-Compare (CC) Submodule

Figure 15-17 illustrates the counter-compare submodule within the ePWM. Figure 15-18 shows the basic structure of the counter-compare submodule.

**Figure 15-17. Counter-Compare Submodule**

**Figure 15-18. Counter-Compare Submodule Signals and Registers**

#### 15.2.2.4.1 Purpose of the Counter-Compare Submodule

The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (CMPA) and counter-compare B (CMPB) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare submodule:

- Generates events based on programmable time stamps using the CMPA and CMPB registers
  - CTR = CMPA: Time-base counter equals counter-compare A register (TBCNT = CMPA).
  - CTR = CMPB: Time-base counter equals counter-compare B register (TBCNT = CMPB)
- Controls the PWM duty cycle if the action-qualifier submodule is configured appropriately
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

#### 15.2.2.4.2 Controlling and Monitoring the Counter-Compare Submodule

[Table 15-13](#) lists the registers used to control and monitor the counter-compare submodule. [Table 15-14](#) lists the key signals associated with the counter-compare submodule.

**Table 15-13. Counter-Compare Submodule Registers**

| Acronym | Register Description                                      | Address Offset | Shadowed |
|---------|---|----------------|----------|
| CMPCTL  | Counter-Compare Control Register.                         | Eh             | No       |
| CMPAHR  | HRPWM Counter-Compare A Extension Register <sup>(1)</sup> | 10h            | Yes      |
| CMPA    | Counter-Compare A Register                                | 12h            | Yes      |
| CMPB    | Counter-Compare B Register                                | 14h            | Yes      |

<sup>(1)</sup> This register is available only on ePWM modules with the high-resolution extension (HRPWM). On ePWM modules that do not include the HRPWM, this location is reserved. See [Section 15.1.2](#) to determine which ePWM instances include this feature.

**Table 15-14. Counter-Compare Submodule Key Signals**

| Signal     | Description of Event  | Registers Compared |
|------------|---|--------------------|
| CTR = CMPA | Time-base counter equal to the active counter-compare A value   | TBCNT = CMPA       |
| CTR = CMPB | Time-base counter equal to the active counter-compare B value   | TBCNT = CMPB       |
| CTR = PRD  | Time-base counter equal to the active period.<br>Used to load active counter-compare A and B registers from the shadow register | TBCNT = TBPRD      |
| CTR = 0    | Time-base counter equal to zero.<br>Used to load active counter-compare A and B registers from the shadow register              | TBCNT = 0000h      |

#### **15.2.2.4.3 Operational Highlights for the Counter-Compare Submodule**

The counter-compare submodule is responsible for generating two independent compare events based on two compare registers:

1. CTR = CMPA: Time-base counter equal to counter-compare A register (TBCNT = CMPA).
2. CTR = CMPB: Time-base counter equal to counter-compare B register (TBCNT = CMPB).

For up-count or down-count mode, each event occurs only once per cycle. For up-down-count mode each event occurs twice per cycle, if the compare value is between 0000h and TBPRD; and occurs once per cycle, if the compare value is equal to 0000h or equal to TBPRD. These events are fed into the action-qualifier submodule where they are qualified by the counter direction and converted into actions if enabled. Refer to [Section 15.2.2.5.1](#) for more details.

The counter-compare registers CMPA and CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occurs at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. Which register is written to or read from is determined by the CMPCTL[SHDWAMODE] and CMPCTL[SHDWBMODE] bits. These bits enable and disable the CMPA shadow register and CMPB shadow register respectively. The behavior of the two load modes is described below:

- **Shadow Mode:** The shadow mode for the CMPA is enabled by clearing the CMPCTL[SHDWAMODE] bit and the shadow register for CMPB is enabled by clearing the CMPCTL[SHDWBMODE] bit. Shadow mode is enabled by default for both CMPA and CMPB.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events:

- CTR = PRD: Time-base counter equal to the period (TBCNT = TBPRD).
- CTR = 0: Time-base counter equal to zero (TBCNT = 0000h)
- Both CTR = PRD and CTR = 0

Which of these three events is specified by the CMPCTL[LOADAMODE] and CMPCTL[LOADBMODE] register bits. Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

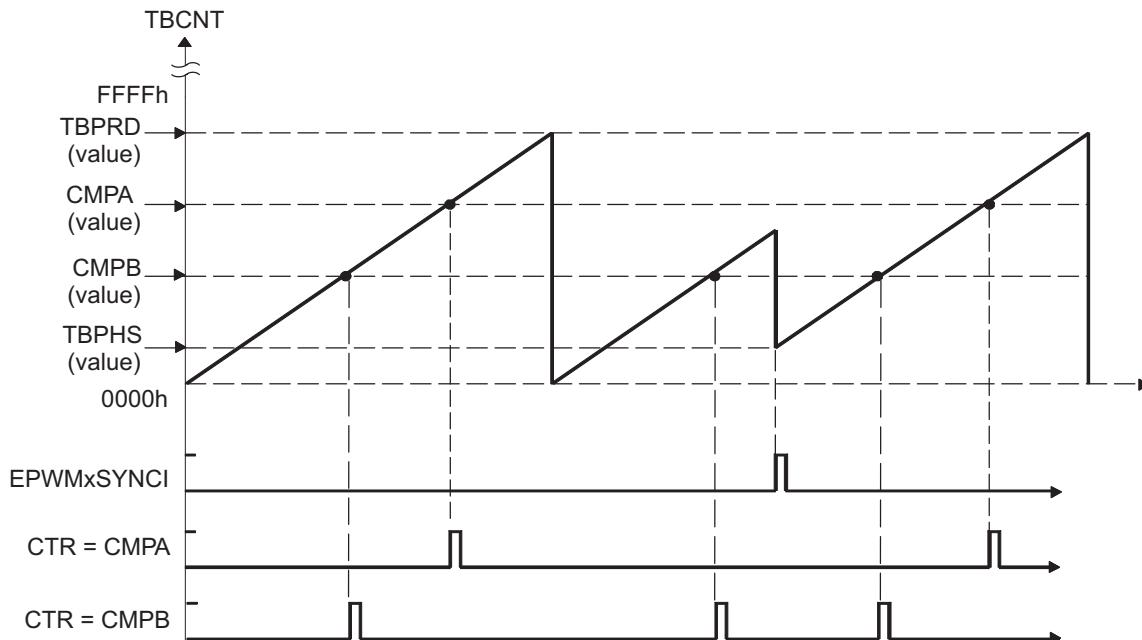

- **Immediate Load Mode:** If immediate load mode is selected (TBCTL[SHADWAMODE] = 1 or TBCTL[SHADWBMODE] = 1), then a read from or a write to the register will go directly to the active register.

#### **15.2.2.4.4 Count Mode Timing Waveforms**

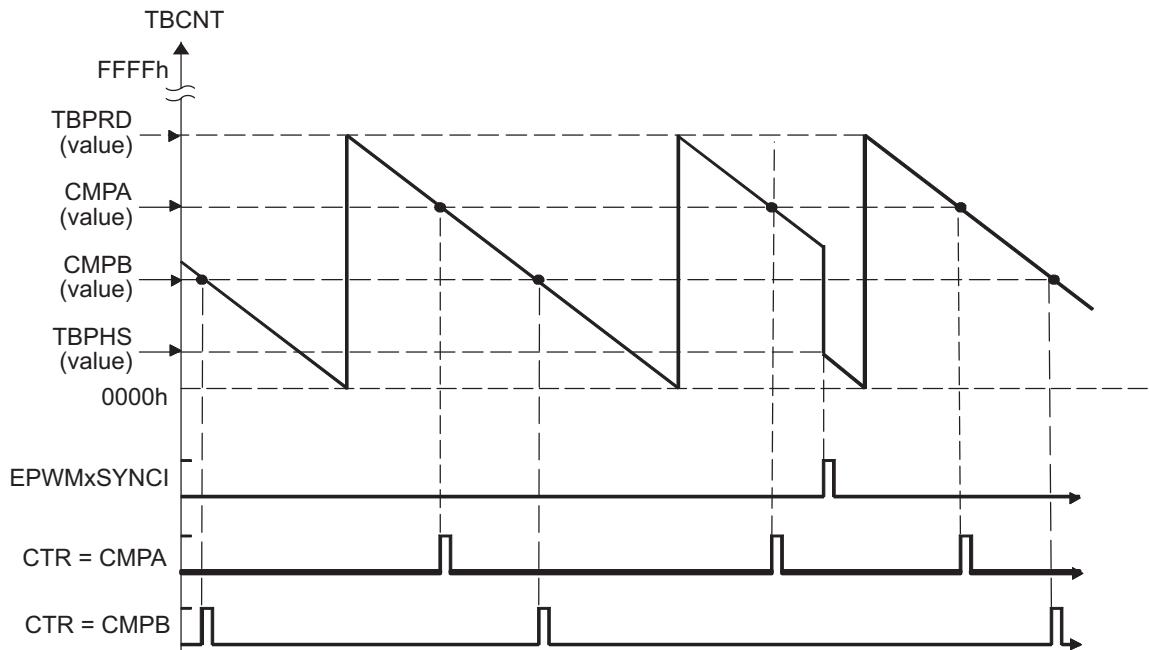

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

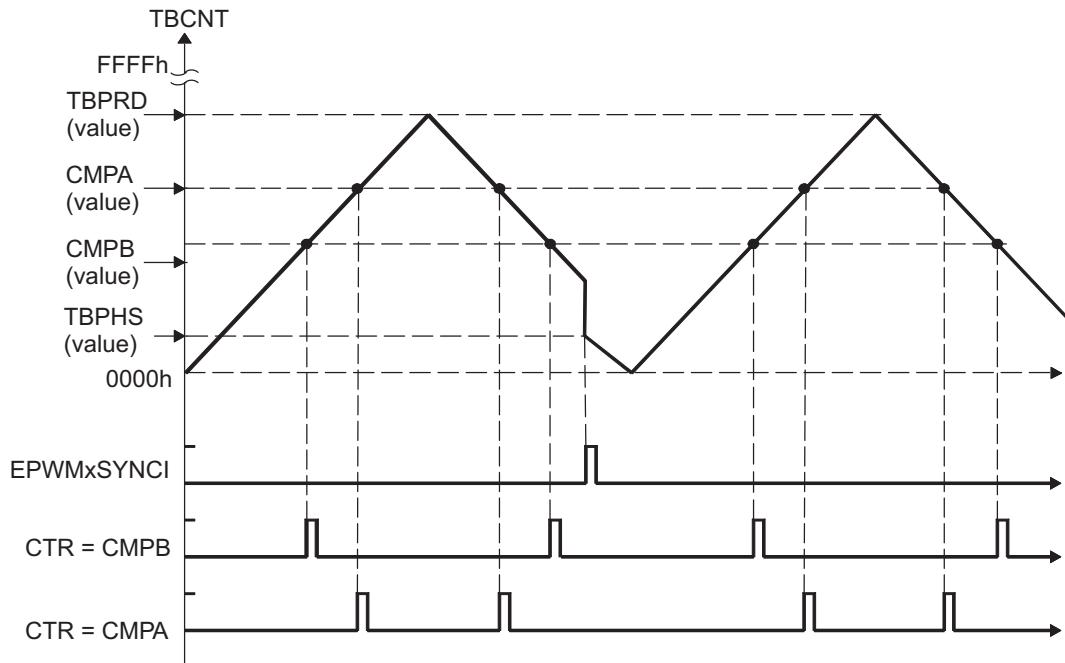

To best illustrate the operation of the first three modes, the timing diagrams in [Figure 15-19](#) to [Figure 15-22](#) show when events are generated and how the EPWMxSYNCI signal interacts.

**Figure 15-19. Counter-Compare Event Waveforms in Up-Count Mode**

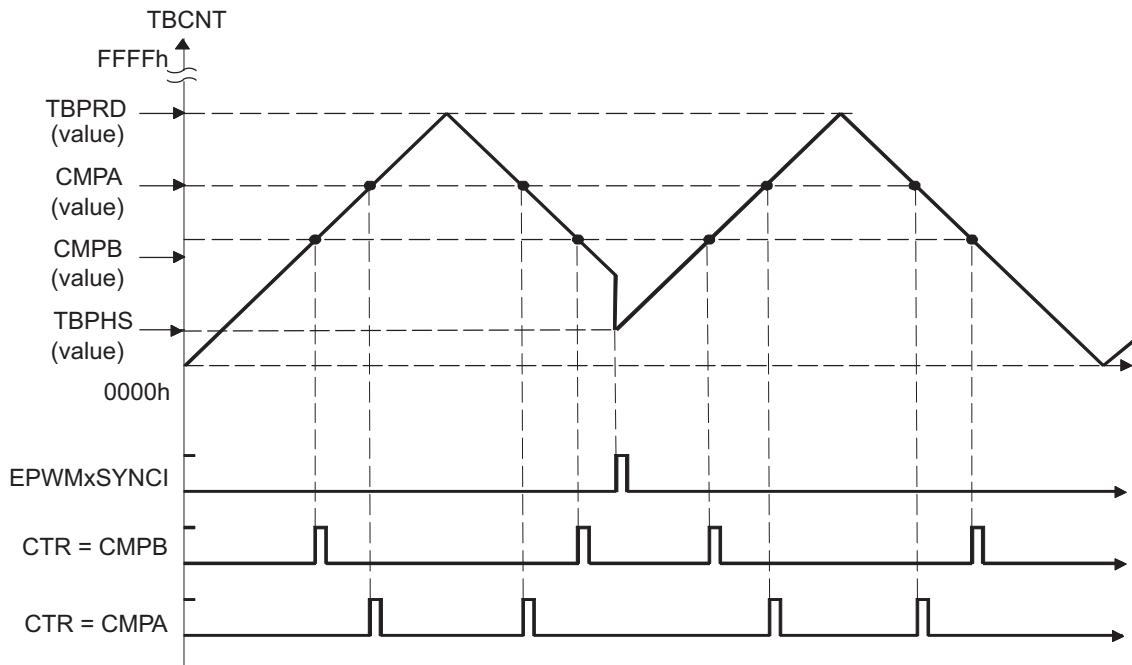

NOTE: An EPWMxSYNCI external synchronization event can cause a discontinuity in the TBCNT count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

**Figure 15-20. Counter-Compare Events in Down-Count Mode**

**Figure 15-21. Counter-Compare Events in Up-Down-Count Mode, TBCTL[PHSDIR = 0] Count Down on Synchronization Event**

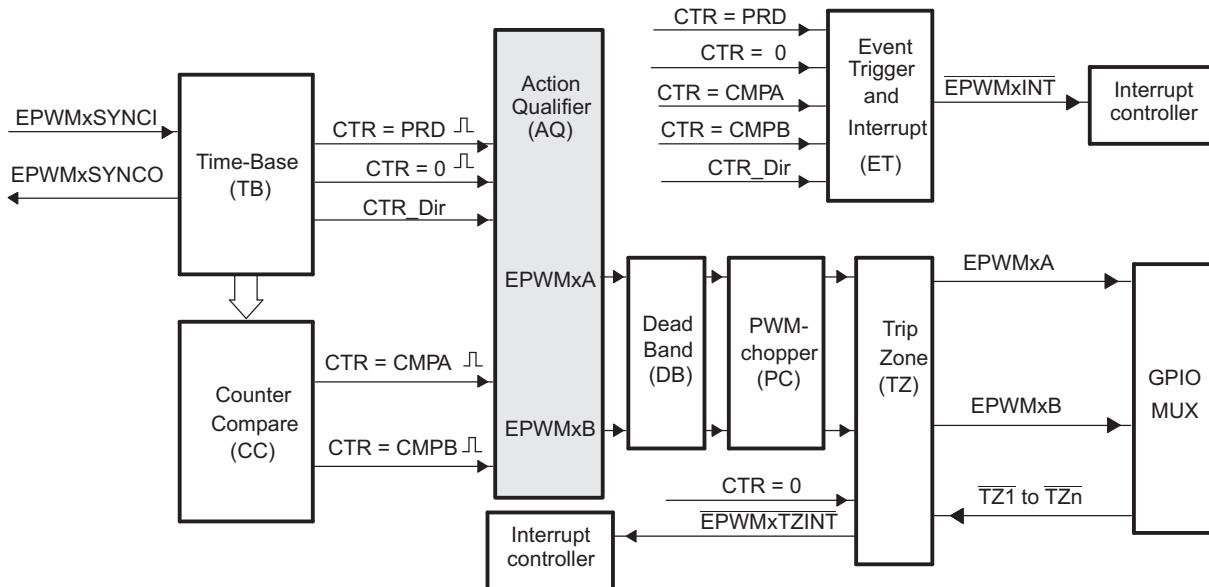

**Figure 15-22. Counter-Compare Events in Up-Down-Count Mode, TBCTL[PHSDIR = 1] Count Up on Synchronization Event**

### 15.2.2.5 Action-Qualifier (AQ) Submodule

Figure 15-23 shows the action-qualifier (AQ) submodule (see shaded block) in the ePWM system. The action-qualifier submodule has the most important role in waveform construction and PWM generation. It decides which events are converted into various action types, thereby producing the required switched waveforms at the EPWMxA and EPWMxB outputs.

**Figure 15-23. Action-Qualifier Submodule**

#### 15.2.2.5.1 Purpose of the Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
  - CTR = PRD: Time-base counter equal to the period ( $TBCNT = TBPRD$ )
  - CTR = 0: Time-base counter equal to zero ( $TBCNT = 0000h$ )
  - CTR = CMPA: Time-base counter equal to the counter-compare A register ( $TBCNT = CMPA$ )
  - CTR = CMPB: Time-base counter equal to the counter-compare B register ( $TBCNT = CMPB$ )
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when it is decreasing.

#### 15.2.2.5.2 Controlling and Monitoring the Action-Qualifier Submodule

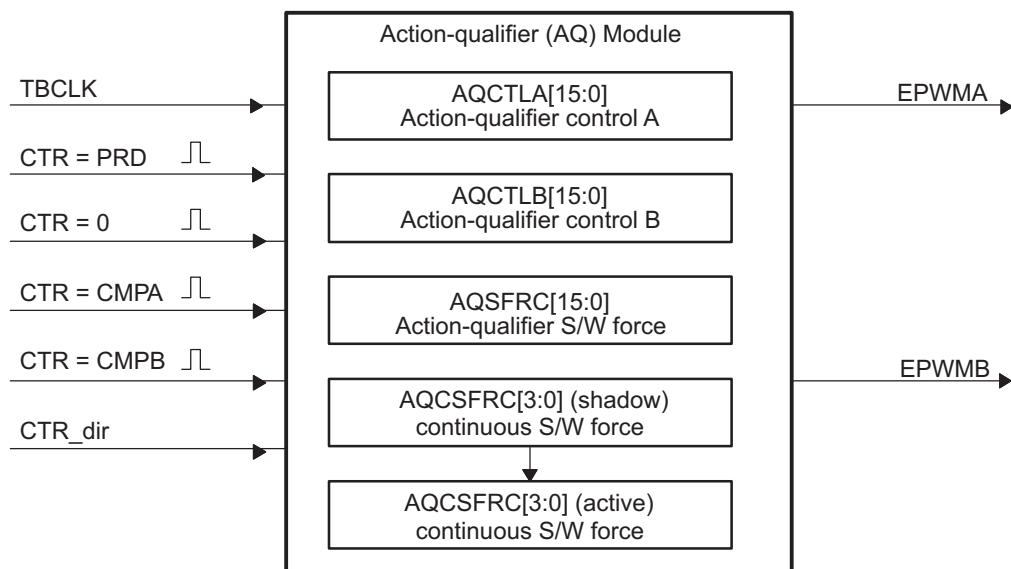

Table 15-15 lists the registers used to control and monitor the action-qualifier submodule.

**Table 15-15. Action-Qualifier Submodule Registers**

| Acronym | Register Description                                    | Address Offset | Shadowed |
|---------|---|----------------|----------|
| AQCTLA  | Action-Qualifier Control Register For Output A (EPWMxA) | 16h            | No       |
| AQCTLB  | Action-Qualifier Control Register For Output B (EPWMxB) | 18h            | No       |
| AQSFR   | Action-Qualifier Software Force Register                | 1Ah            | No       |
| AQCSFR  | Action-Qualifier Continuous Software Force              | 1Ch            | Yes      |

The action-qualifier submodule is based on event-driven logic. It can be thought of as a programmable cross switch with events at the input and actions at the output, all of which are software controlled via the set of registers shown in [Figure 15-24](#). The possible input events are summarized again in [Table 15-16](#).

**Figure 15-24. Action-Qualifier Submodule Inputs and Outputs**

**Table 15-16. Action-Qualifier Submodule Possible Input Events**

| Signal                | Description                                      | Registers Compared |
|-----------------------|--|--------------------|
| CTR = PRD             | Time-base counter equal to the period value      | TBCNT = TBPRD      |
| CTR = 0               | Time-base counter equal to zero                  | TBCNT = 0000h      |
| CTR = CMPA            | Time-base counter equal to the counter-compare A | TBCNT = CMPA       |
| CTR = CMPB            | Time-base counter equal to the counter-compare B | TBCNT = CMPB       |
| Software forced event | Asynchronous event initiated by software         |                    |

The software forced action is a useful asynchronous event. This control is handled by registers AQSFRC and AQCSFRC.

The action-qualifier submodule controls how the two outputs EPWMxA and EPWMxB behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:** Set output EPWMxA or EPWMxB to a high level.
- **Clear Low:** Set output EPWMxA or EPWMxB to a low level.
- **Toggle:** If EPWMxA or EPWMxB is currently pulled high, then pull the output low. If EPWMxA or EPWMxB is currently pulled low, then pull the output high.
- **Do Nothing:** Keep outputs EPWMxA and EPWMxB at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMxA and EPWMxB outputs, this event can still trigger interrupts. See the event-trigger submodule description in [Section 15.2.2.9](#) for details.

Actions are specified independently for either output (EPWMxA or EPWMxB). Any or all events can be configured to generate actions on a given output. For example, both CTR = CMPA and CTR = CMPB can operate on output EPWMxA. All qualifier actions are configured via the control registers found at the end of this section.

For clarity, the drawings in this chapter use a set of symbolic actions. These symbols are summarized in [Figure 15-25](#). Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and their time positions are programmed via the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"; it is the default at reset.

**Figure 15-25. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs**

| S/W force | TB Counter equals: |        |        |        | Actions    |
|-----------|--------------------|--------|--------|--------|------------|
|           | Zero               | Comp A | Comp B | Period |            |
|           |                    |        |        |        | Do Nothing |
|           |                    |        |        |        | Clear Low  |
|           |                    |        |        |        | Set High   |
|           |                    |        |        |        | Toggle     |

### 15.2.2.5.3 Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down-count mode are shown in [Table 15-17](#). A priority level of 1 is the highest priority and level 7 is the lowest. The priority changes slightly depending on the direction of TBCNT.

**Table 15-17. Action-Qualifier Event Priority for Up-Down-Count Mode**

| Priority Level | Event if TBCNT is Incrementing<br>TBCNT = 0 up to TBCNT = TBPRD | Event if TBCNT is Decrementing<br>TBCNT = TBPRD down to TBCNT = 1 |
|----------------|---|---|
| 1 (Highest)    | Software forced event   | Software forced event   |
| 2              | Counter equals CMPB on up-count (CBU)                           | Counter equals CMPB on down-count (CBD)                           |
| 3              | Counter equals CMPA on up-count (CAU)                           | Counter equals CMPA on down-count (CAD)                           |
| 4              | Counter equals zero   | Counter equals period (TBPRD)                                     |
| 5              | Counter equals CMPB on down-count (CBD) <sup>(1)</sup>          | Counter equals CMPB on up-count (CBU) <sup>(1)</sup>              |
| 6 (Lowest)     | Counter equals CMPA on down-count (CAD) <sup>(1)</sup>          | Counter equals CMPA on up-count (CBU) <sup>(1)</sup>              |

<sup>(1)</sup> To maintain symmetry for up-down-count mode, both up-events (CAU/CBU) and down-events (CAD/CBD) can be generated for TBPRD. Otherwise, up-events can occur only when the counter is incrementing and down-events can occur only when the counter is decrementing.

[Table 15-18](#) shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up and thus down-count events will never be taken.

**Table 15-18. Action-Qualifier Event Priority for Up-Count Mode**

| Priority Level | Event                                   |
|----------------|---|
| 1 (Highest)    | Software forced event                   |
| 2              | Counter equal to period (TBPRD)         |
| 3              | Counter equal to CMPB on up-count (CBU) |
| 4              | Counter equal to CMPA on up-count (CAU) |
| 5 (Lowest)     | Counter equal to Zero                   |

[Table 15-19](#) shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down and thus up-count events will never be taken.

**Table 15-19. Action-Qualifier Event Priority for Down-Count Mode**

| Priority Level | Event                                     |
|----------------|---|
| 1 (Highest)    | Software forced event                     |
| 2              | Counter equal to Zero                     |
| 3              | Counter equal to CMPB on down-count (CBD) |
| 4              | Counter equal to CMPA on down-count (CAD) |
| 5 (Lowest)     | Counter equal to period (TBPRD)           |

It is possible to set the compare value greater than the period. In this case the action will take place as shown in Table 15-20.

**Table 15-20. Behavior if CMPA/CMPB is Greater than the Period**

| Counter Mode       | Compare on Up-Count Event CAU/CBU   | Compare on Down-Count Event CAU/CBU   |
|--------------------|---|---|
| Up-Count Mode      | If $\text{CMPA}/\text{CMPB} \leq \text{TBPRD}$ period, then the event occurs on a compare match ( $\text{TBCNT} = \text{CMPA}$ or $\text{CMPB}$ ).<br><br>If $\text{CMPA}/\text{CMPB} > \text{TBPRD}$ , then the event will not occur.  | Never occurs.   |
|                    |   |   |
| Down-Count Mode    | Never occurs.   | If $\text{CMPA}/\text{CMPB} < \text{TBPRD}$ , the event will occur on a compare match ( $\text{TBCNT} = \text{CMPA}$ or $\text{CMPB}$ ).<br><br>If $\text{CMPA}/\text{CMPB} \geq \text{TBPRD}$ , the event will occur on a period match ( $\text{TBCNT} = \text{TBPRD}$ ).                        |
|                    |   |   |
| Up-Down-Count Mode | If $\text{CMPA}/\text{CMPB} < \text{TBPRD}$ and the counter is incrementing, the event occurs on a compare match ( $\text{TBCNT} = \text{CMPA}$ or $\text{CMPB}$ ).<br><br>If $\text{CMPA}/\text{CMPB} \geq \text{TBPRD}$ , the event will occur on a period match ( $\text{TBCNT} = \text{TBPRD}$ ). | If $\text{CMPA}/\text{CMPB} < \text{TBPRD}$ and the counter is decrementing, the event occurs on a compare match ( $\text{TBCNT} = \text{CMPA}$ or $\text{CMPB}$ ).<br><br>If $\text{CMPA}/\text{CMPB} \geq \text{TBPRD}$ , the event occurs on a period match ( $\text{TBCNT} = \text{TBPRD}$ ). |
|                    |   |   |

#### 15.2.2.5.4 Waveforms for Common Configurations

**NOTE:** The waveforms in this chapter show the ePWMs behavior for a static compare register value. In a running system, the active compare registers (CMPA and CMPB) are typically updated from their respective shadow registers once every period. The user specifies when the update will take place; either when the time-base counter reaches zero or when the time-base counter reaches period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

**Use up-down-count mode to generate a symmetric PWM:**

- If you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1.
- If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD - 1.

This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

**Use up-down-count mode to generate an asymmetric PWM:**

- To achieve 50%-0% asymmetric PWM use the following configuration: Load CMPA/CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

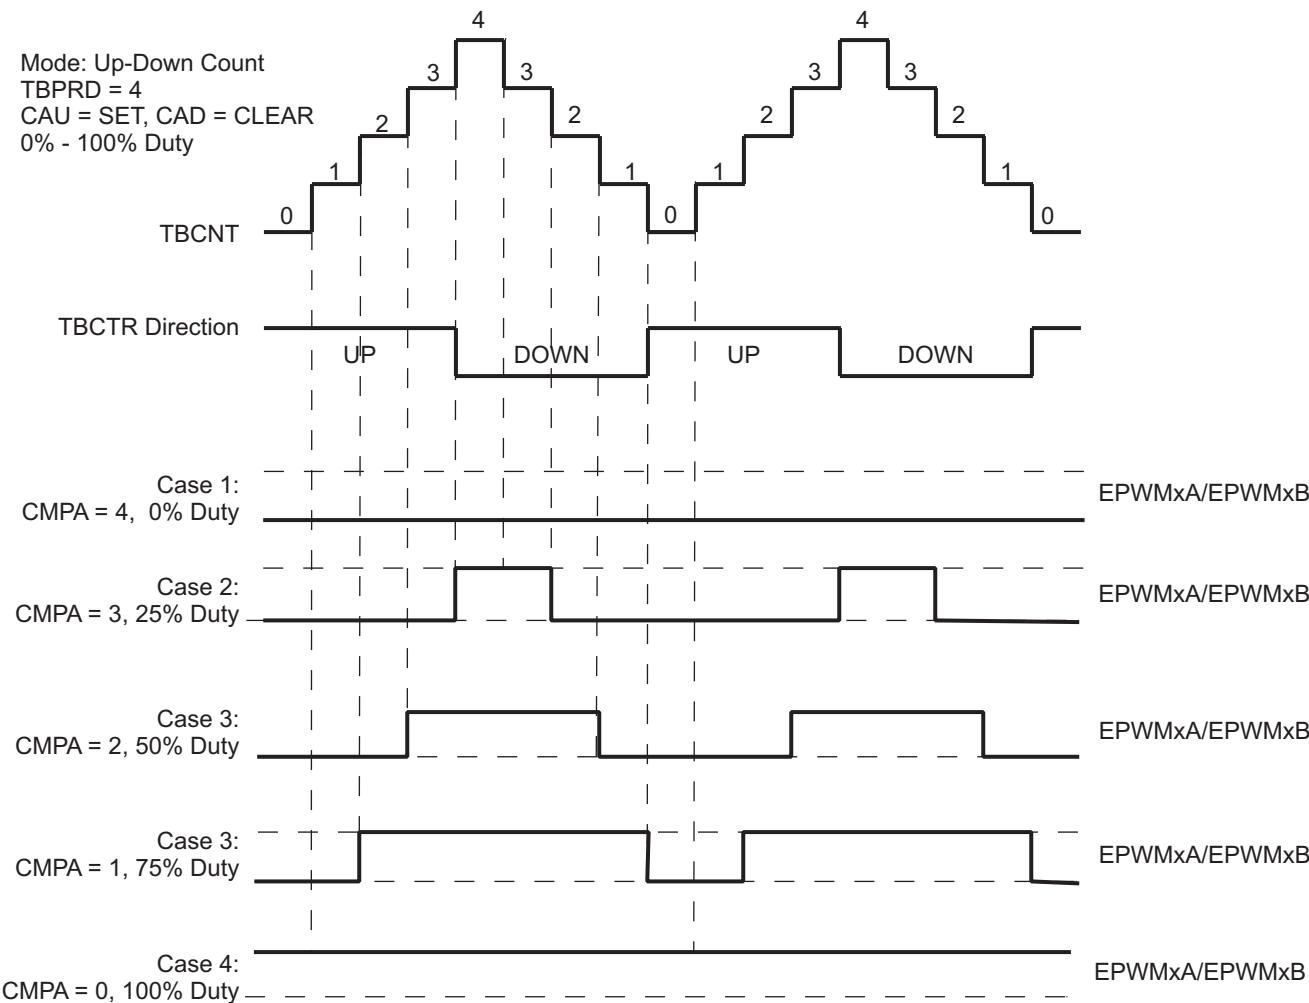

**When using up-count mode to generate an asymmetric PWM:**

- To achieve 0-100% asymmetric PWM use the following configuration: Load CMPA/CMPB on TBPRD. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to TBPRD+1 to achieve 0-100% PWM duty.

**Figure 15-26** shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCNT. In this mode 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing the CMPA match will pull the PWM output high. Likewise, when the counter is decrementing the compare match will pull the PWM signal low. When  $CMPA = 0$ , the PWM signal is low for the entire period giving the 0% duty waveform. When  $CMPA = TBPRD$ , the PWM signal is high achieving 100% duty.

When using this configuration in practice, if you load  $CMPA/CMPB$  on zero, then use  $CMPA/CMPB$  values greater than or equal to 1. If you load  $CMPA/CMPB$  on period, then use  $CMPA/CMPB$  values less than or equal to  $TBPRD-1$ . This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

**Figure 15-26. Up-Down-Count Mode Symmetrical Waveform**

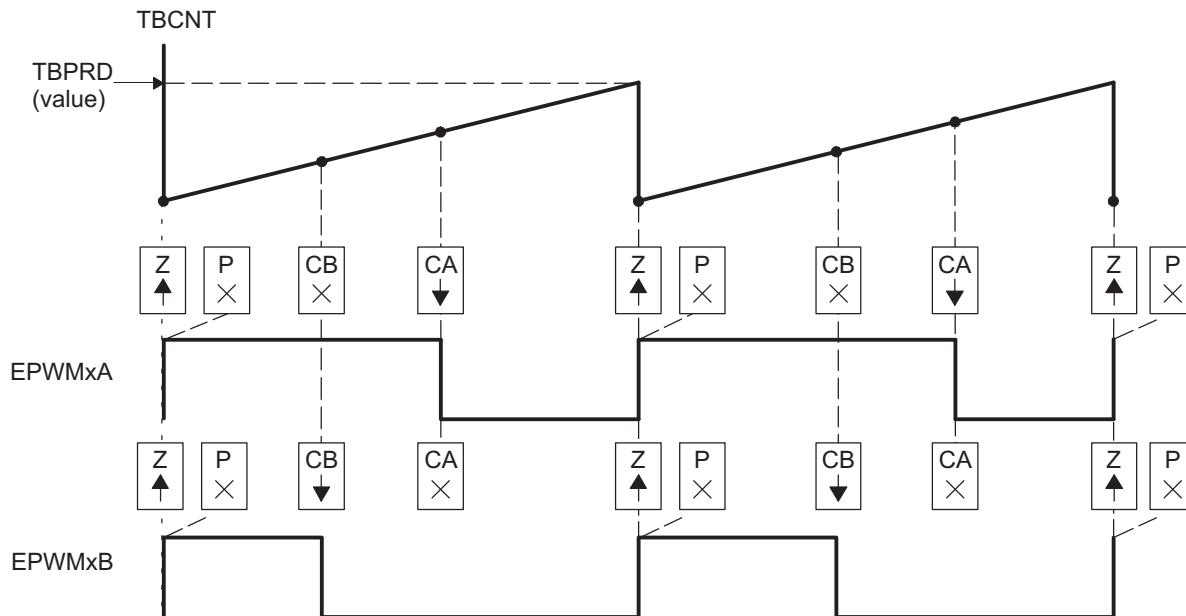

The PWM waveforms in [Figure 15-27](#) through [Figure 15-32](#) show some common action-qualifier configurations. Some conventions used in the figures are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in their respective registers. The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB.
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means Count-up-and-down mode, Up means up-count mode and Dwn means down-count mode
- Sym = Symmetric, Asym = Asymmetric

[Table 15-21](#) and [Table 15-22](#) contains initialization and runtime register configurations for the waveforms in [Figure 15-27](#).

**Figure 15-27. Up, Single Edge Asymmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB—Active High**

- (1) PWM period =  $(TBPRD + 1) \times T_{TBCLK}$
- (2) Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).
- (3) Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).
- (4) The "Do Nothing" actions ( X ) are shown for completeness, but will not be shown on subsequent diagrams.
- (5) Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCNT wraps from period to 0000h.

**Table 15-21. EPWMx Initialization for Figure 15-27**

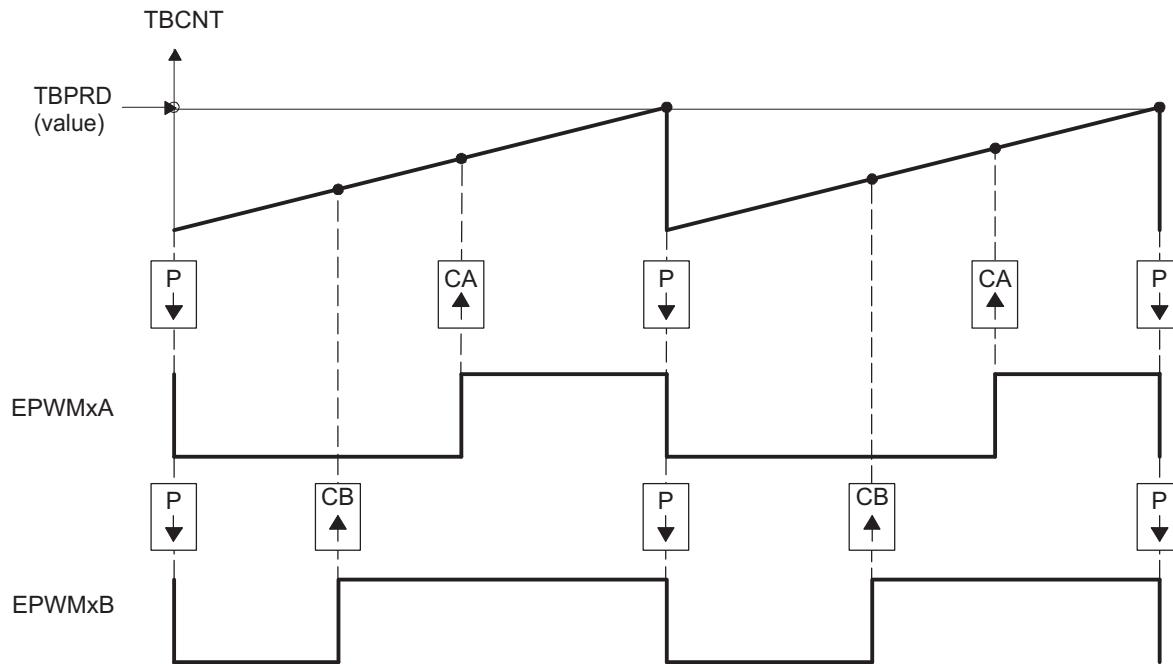

| <b>Register</b> | <b>Bit</b> | <b>Value</b>    | <b>Comments</b>              |
|-----------------|------------|-----------------|------------------------------|
| TBPRD           | TBPRD      | 600 (258h)      | Period = 601 TBCLK counts    |
| TBPHS           | TBPHS      | 0               | Clear Phase Register to 0    |
| TBCNT           | TBCNT      | 0               | Clear TB counter             |
| TBCTL           | CTRMODE    | TB_UP           |                              |
|                 | PHSEN      | TB_DISABLE      | Phase loading disabled       |
|                 | PRDLD      | TB_SHADOW       |                              |

|                 | CAD        | AQ_CLEAR        |                              |
| AQCTLB          | CBU        | AQ_CLEAR        |                              |
|                 | CBD        | AQ_SET          |                              |

**Table 15-30. EPWMx Run Time Changes for Figure 15-31**

| <b>Register</b> | <b>Bit</b> | <b>Value</b> | <b>Comments</b>               |
|-----------------|------------|--------------|-------------------------------|
| CMPA            | CMPA       | Duty1A       | Adjust duty for output EPWM1A |
| CMPB            | CMPB       | Duty1B       | Adjust duty for output EPWM1B |

Table 15-31 and Table 15-32 contains initialization and runtime register configurations for the waveforms in Figure 15-32. Use the code in Example 15-1 to define the headers.

**Figure 15-32. Up-Down-Count, Dual Edge Asymmetric Waveform, With Independent Modulation on EPWMxA—Active Low**

- (1) PWM period =  $2 \times \text{TBPRD} \times \text{TBCLK}$
- (2) Rising edge and falling edge can be asymmetrically positioned within a PWM cycle. This allows for pulse placement techniques.
- (3) Duty modulation for EPWMxA is set by CMPA and CMPB.
- (4) Low time duty for EPWMxA is proportional to  $(\text{CMPA} + \text{CMPB})$ .
- (5) To change this example to active high, CMPA and CMPB actions need to be inverted (i.e., Set ! Clear and Clear Set).
- (6) Duty modulation for EPWMxB is fixed at 50% (utilizes spare action resources for EPWMxB)

**Table 15-31. EPWMx Initialization for Figure 15-32**

| Register | Bit       | Value           | Comments                     |
|----------|-----------|-----------------|------------------------------|

### 15.2.2.6 Dead-Band Generator (DB) Submodule

Figure 15-33 illustrates the dead-band generator submodule within the ePWM module.

**Figure 15-33. Dead-Band Generator Submodule**

#### 15.2.2.6.1 Purpose of the Dead-Band Submodule

The "Action-qualifier (AQ) Module" section discussed how it is possible to generate the required dead-band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical edge delay-based dead-band with polarity control is required, then the dead-band generator submodule should be used.

The key functions of the dead-band generator submodule are:

- Generating appropriate signal pairs (EPWMxA and EPWMxB) with dead-band relationship from a single EPWMxA input
- Programming signal pairs for:
  - Active high (AH)
  - Active low (AL)
  - Active high complementary (AHC)
  - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

#### 15.2.2.6.2 Controlling and Monitoring the Dead-Band Submodule

The dead-band generator submodule operation is controlled and monitored via the following registers:

**Table 15-33. Dead-Band Generator Submodule Registers**

| Acronym | Register Description                        | Address Offset | Shadowed |
|---------|---|----------------|----------|
| DBCTL   | Dead-Band Control Register                  | 1Eh            | No       |
| DBRED   | Dead-Band Rising Edge Delay Count Register  | 20h            | No       |
| DBFED   | Dead-Band Falling Edge Delay Count Register | 22h            | No       |

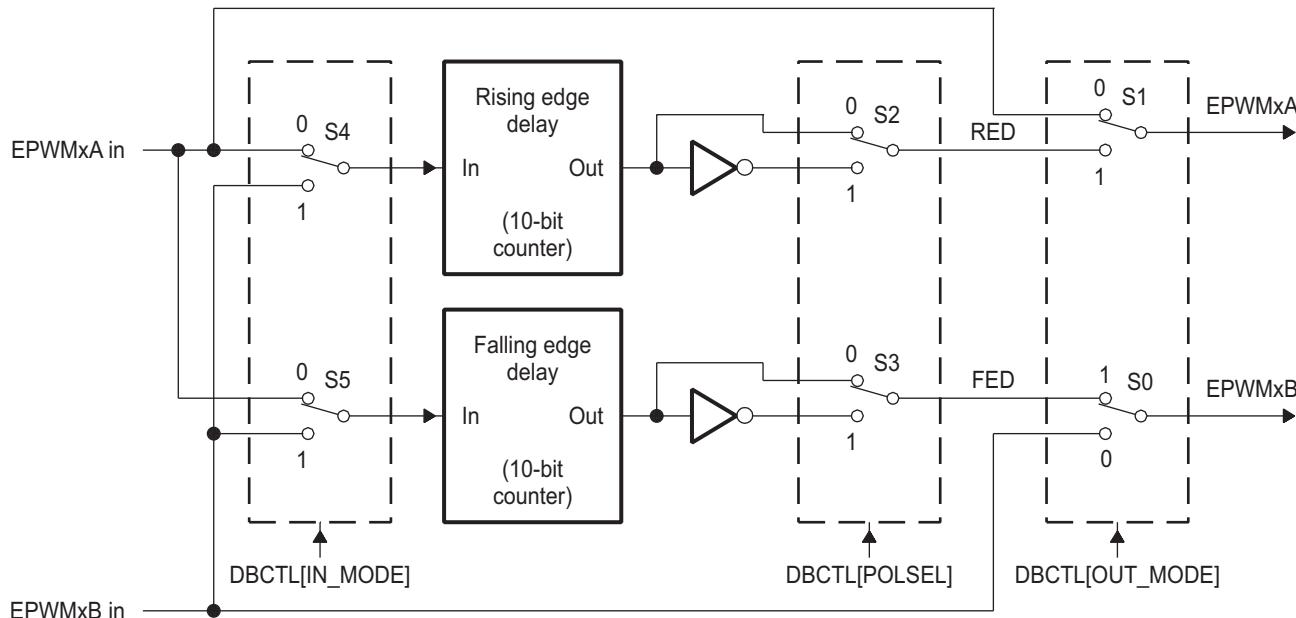

### 15.2.2.6.3 Operational Highlights for the Dead-Band Generator Submodule

The following sections provide the operational highlights.

The dead-band submodule has two groups of independent selection options as shown in [Figure 15-34](#).

- **Input Source Selection:** The input signals to the dead-band module are the EPWMxA and EPWMxB output signals from the action-qualifier. In this section they will be referred to as EPWMxA In and EPWMxB In. Using the DBCTL[IN\_MODE] control bits, the signal source for each delay, falling-edge or rising-edge, can be selected:
  - EPWMxA In is the source for both falling-edge and rising-edge delay. This is the default mode.
  - EPWMxA In is the source for falling-edge delay, EPWMxB In is the source for rising-edge delay.
  - EPWMxA In is the source for rising edge delay, EPWMxB In is the source for falling-edge delay.
  - EPWMxB In is the source for both falling-edge and rising-edge delay.
- **Output Mode Control:** The output mode is configured by way of the DBCTL[OUT\_MODE] bits. These bits determine if the falling-edge delay, rising-edge delay, neither, or both are applied to the input signals.
- **Polarity Control:** The polarity control (DBCTL[POLSEL]) allows you to specify whether the rising-edge delayed signal and/or the falling-edge delayed signal is to be inverted before being sent out of the dead-band submodule.

**Figure 15-34. Configuration Options for the Dead-Band Generator Submodule**

Although all combinations are supported, not all are typical usage modes. [Table 15-34](#) lists some classical dead-band configurations. These modes assume that the DBCTL[IN\_MODE] is configured such that EPWMxA In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in [Table 15-34](#) fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED)** Allows you to fully disable the dead-band submodule from the PWM signal path.
- **Mode 2-5: Classical Dead-Band Polarity Settings** These represent typical polarity configurations that should address all the active high/low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in [Figure 15-35](#). Note that to generate equivalent waveforms to [Figure 15-35](#), configure the action-qualifier submodule to generate the signal as shown for EPWMxA.
- **Mode 6: Bypass rising-edge-delay and Mode 7: Bypass falling-edge-delay** Finally the last two entries in [Table 15-34](#) show combinations where either the falling-edge-delay (FED) or rising-edge-delay (RED) blocks are bypassed.

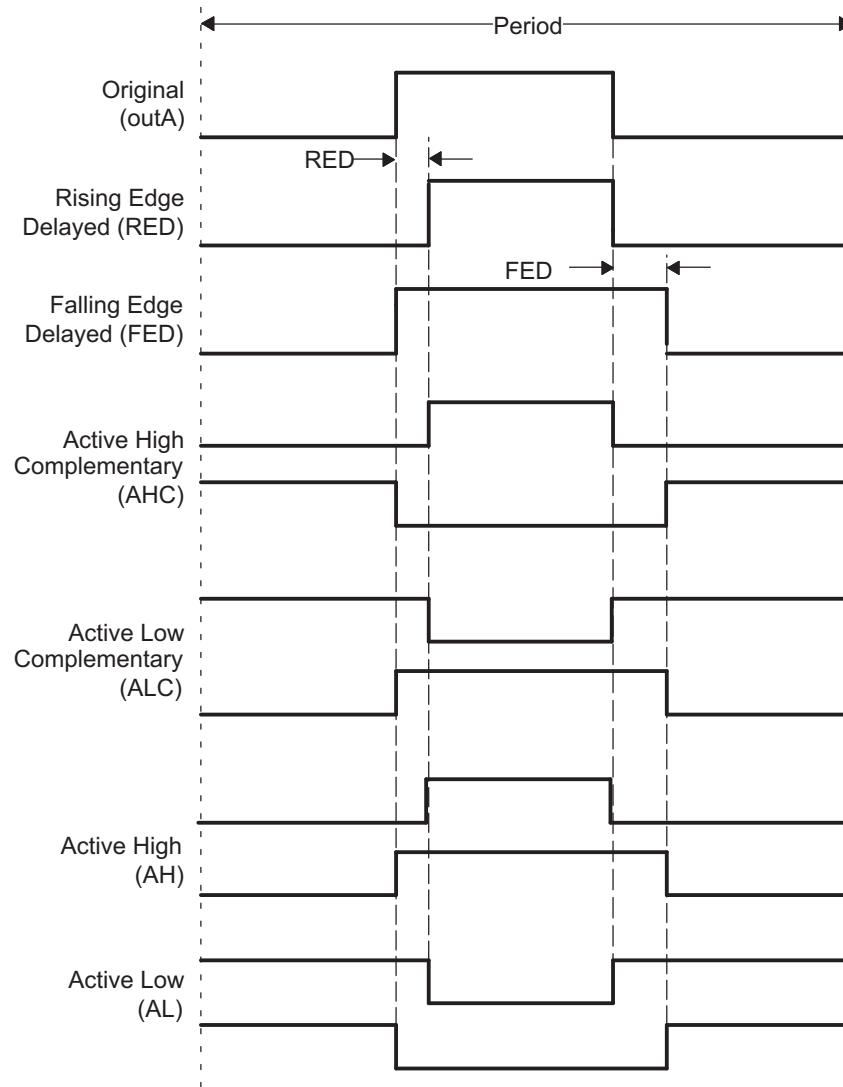

**Table 15-34. Classical Dead-Band Operating Modes**

| Mode | Mode Description <sup>(1)</sup>   | DBCTL[POLSEL] |        | DBCTL[OUT_MODE] |    |
|------|---|---------------|--------|-----------------|----|
|      |   | S3            | S2     | S1              | S0 |
| 1    | EPWMxA and EPWMxB Passed Through (No Delay)   | x             | x      | 0               | 0  |
| 2    | Active High Complementary (AHC)   | 1             | 0      | 1               | 1  |
| 3    | Active Low Complementary (ALC)  | 0             | 1      | 1               | 1  |
| 4    | Active High (AH)  | 0             | 0      | 1               | 1  |
| 5    | Active Low (AL)   | 1             | 1      | 1               | 1  |
| 6    | EPWMxA Out = EPWMxA In (No Delay)<br>EPWMxB Out = EPWMxA In with Falling Edge Delay   | 0 or 1        | 0 or 1 | 0               | 1  |
| 7    | EPWMxA Out = EPWMxA In with Rising Edge Delay<br>EPWMxB Out = EPWMxB In with No Delay | 0 or 1        | 0 or 1 | 1               | 0  |

<sup>(1)</sup> These are classical dead-band modes and assume that DBCTL[IN\_MODE] = 0,0. That is, EPWMxA in is the source for both the falling-edge and rising-edge delays. Enhanced, non-traditional modes can be achieved by changing the IN\_MODE configuration.

Figure 15-35 shows waveforms for typical cases where  $0\% < \text{duty} < 100\%$ .

**Figure 15-35. Dead-Band Waveforms for Typical Cases ( $0\% < \text{Duty} < 100\%$ )**

The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the DBRED and DBFED registers. These are 10-bit registers and their value represents the number of time-base clock, TBCLK, periods a signal edge is delayed by. For example, the formula to calculate falling-edge-delay and rising-edge-delay are:

$$\text{FED} = \text{DBFED} \times T_{\text{TBCLK}}$$

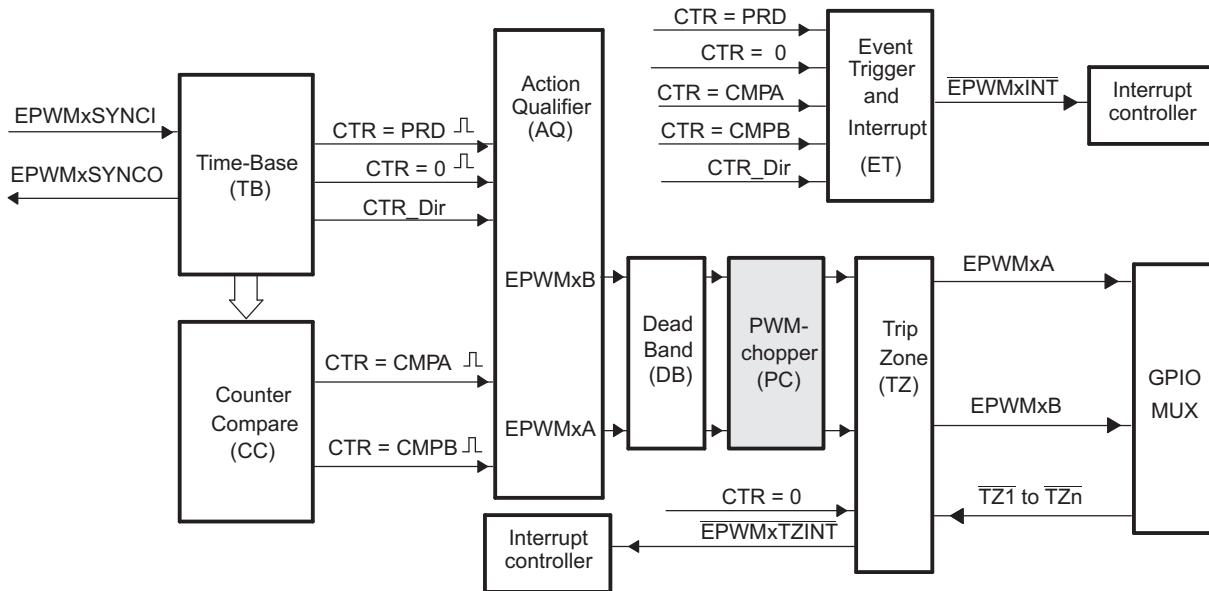

$$\text{RED} = \text{DBRED} \times T_{\text{TBCLK}}$$

Where  $T_{\text{TBCLK}}$  is the period of TBCLK, the prescaled version of SYSCLKOUT.

### 15.2.2.7 PWM-Chopper (PC) Submodule

**Figure 15-36** illustrates the PWM-chopper (PC) submodule within the ePWM module. The PWM-chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if you need pulse transformer-based gate drivers to control the power switching elements.

**Figure 15-36. PWM-Chopper Submodule**

#### 15.2.2.7.1 Purpose of the PWM-Chopper Submodule

The key functions of the PWM-chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

#### 15.2.2.7.2 Controlling the PWM-Chopper Submodule

The PWM-chopper submodule operation is controlled via the register in [Table 15-35](#).

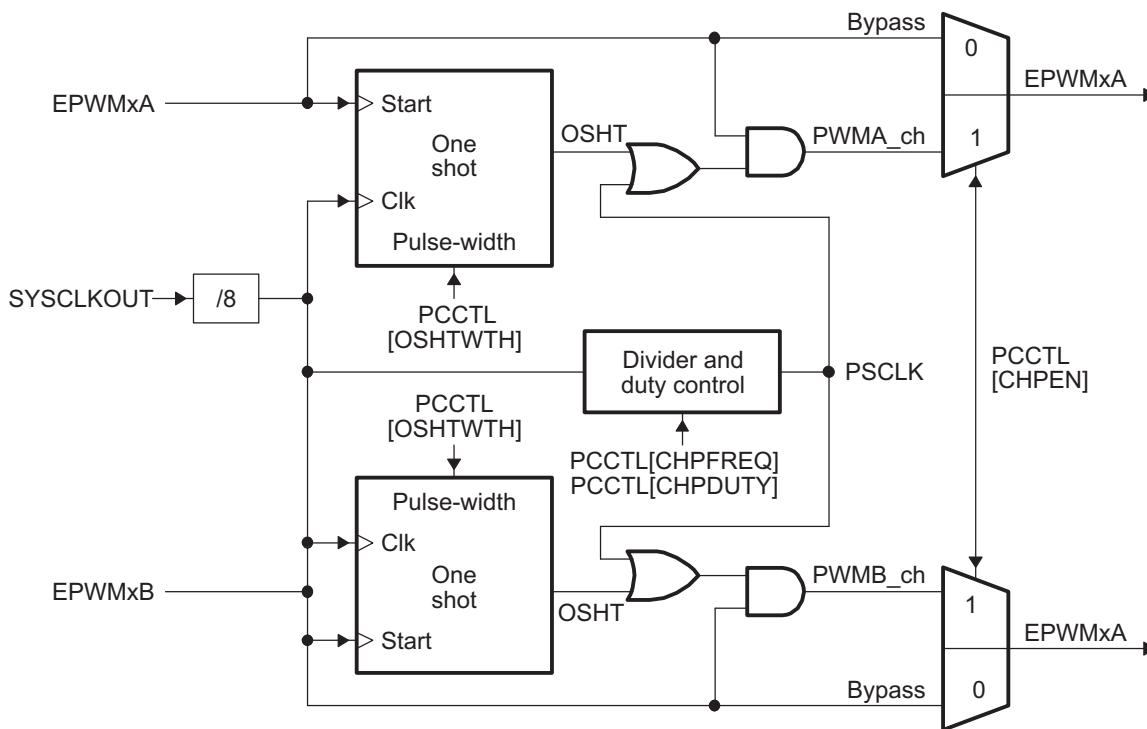

**Table 15-35. PWM-Chopper Submodule Registers**

| Acronym | Register Description         | Address Offset | Shadowed |
|---------|------------------------------|----------------|----------|
| PCCTL   | PWM-chopper Control Register | 3Ch            | No       |

### 15.2.2.7.3 Operational Highlights for the PWM-Chopper Submodule

Figure 15-37 shows the operational details of the PWM-chopper submodule. The carrier clock is derived from SYSCLKOUT. Its frequency and duty cycle are controlled via the CHPFREQ and CHPDUTY bits in the PCCTL register. The one-shot block is a feature that provides a high energy first pulse to ensure hard and fast power switch turn on, while the subsequent pulses sustain pulses, ensuring the power switch remains on. The one-shot width is programmed via the OSHTWTH bits. The PWM-chopper submodule can be fully disabled (bypassed) via the CHPEN bit.

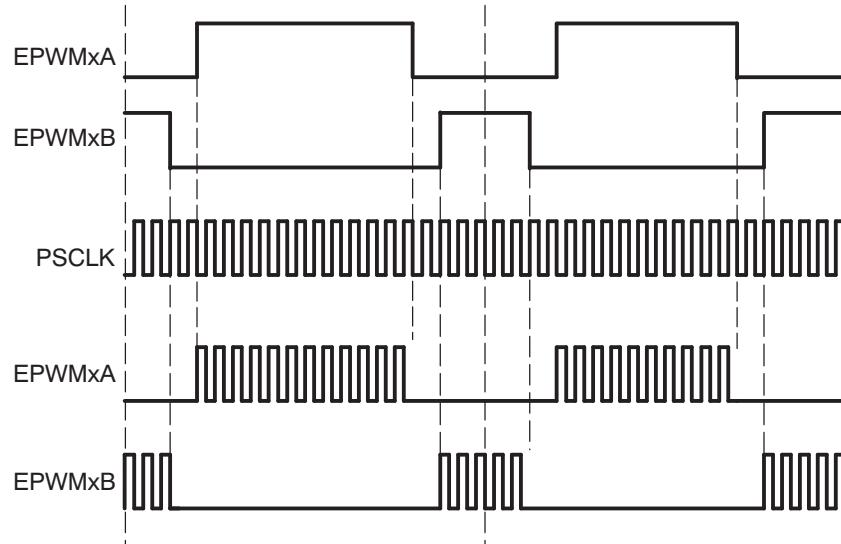

**Figure 15-37. PWM-Chopper Submodule Signals and Registers**

#### 15.2.2.7.4 Waveforms

Figure 15-38 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

**Figure 15-38. Simple PWM-Chopper Submodule Waveforms Showing Chopping Action Only**

##### 15.2.2.7.4.1 One-Shot Pulse

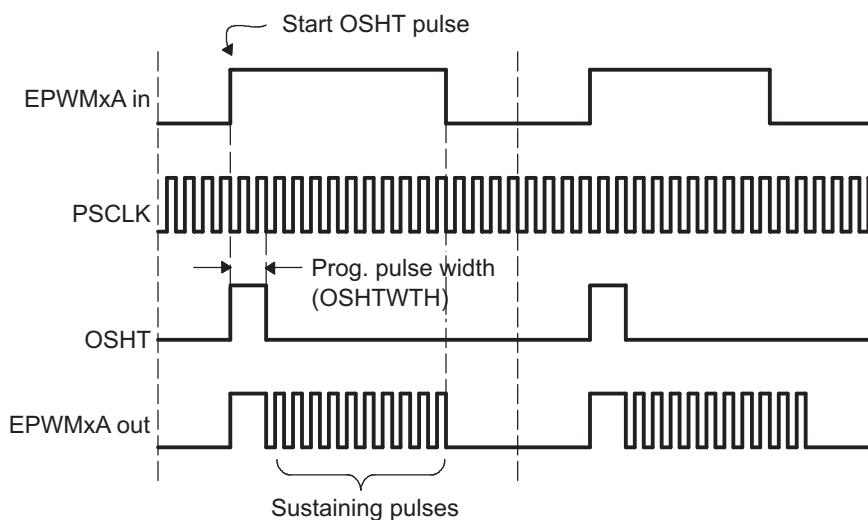

The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$$T_{1\text{st} \text{pulse}} = T_{\text{SYSCLKOUT}} \times 8 \times \text{OSHTWTH}$$

Where  $T_{\text{SYSCLKOUT}}$  is the period of the system clock (SYSCLKOUT) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 15-39 shows the first and subsequent sustaining pulses.

**Figure 15-39. PWM-Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses**

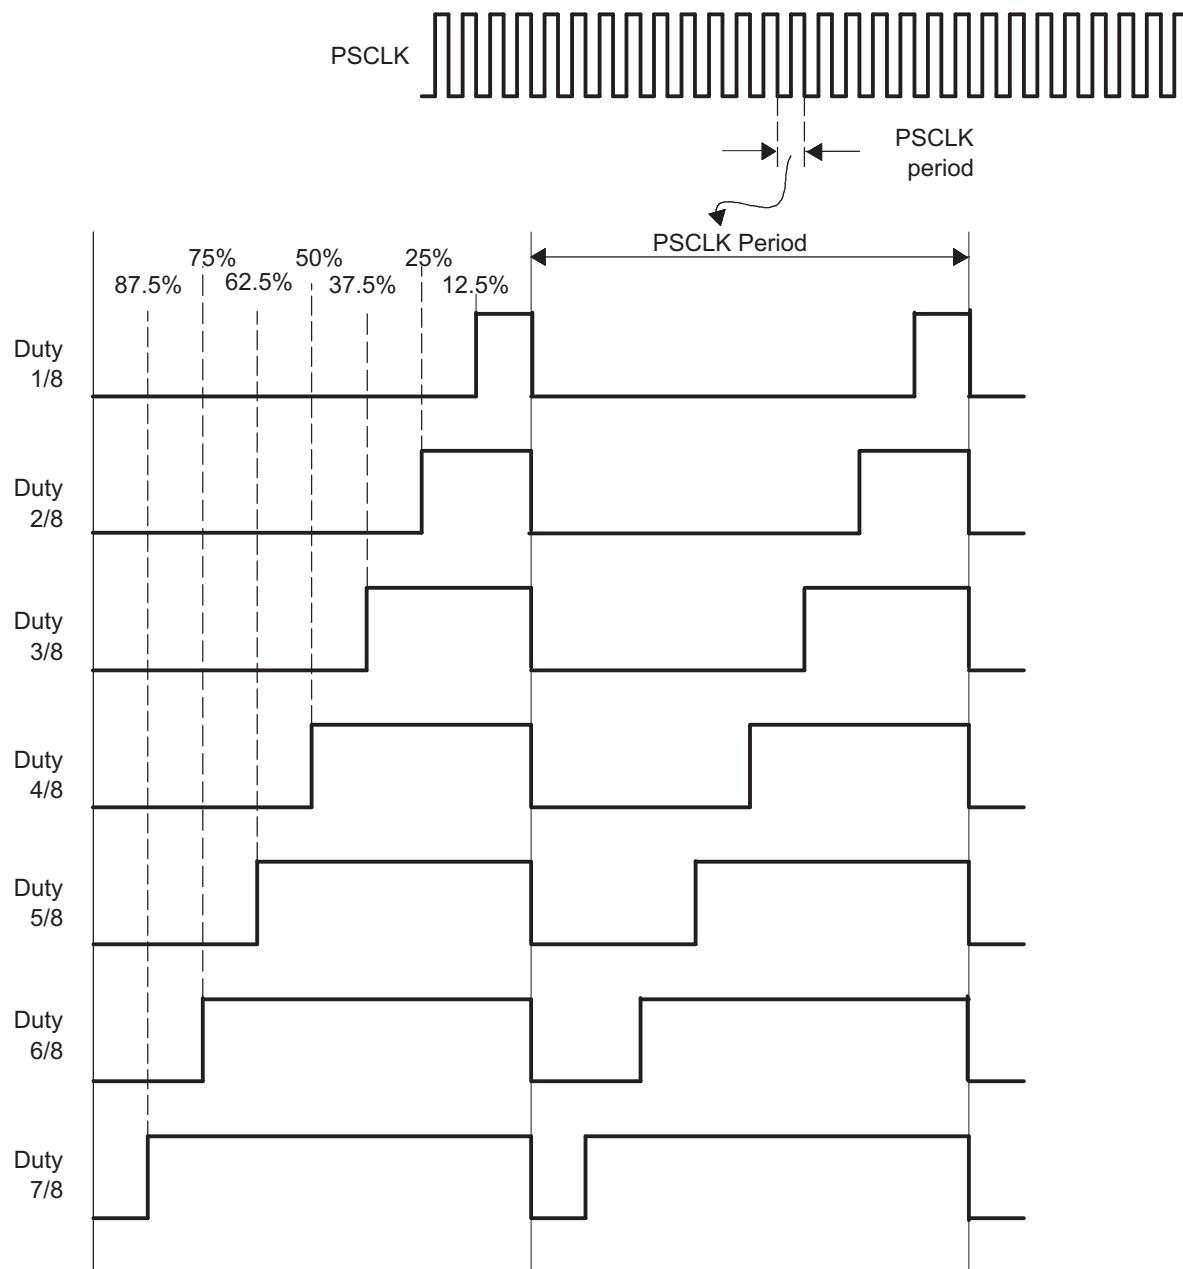

#### 15.2.2.7.4.2 Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses ensure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized via software control.

[Figure 15-40](#) shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

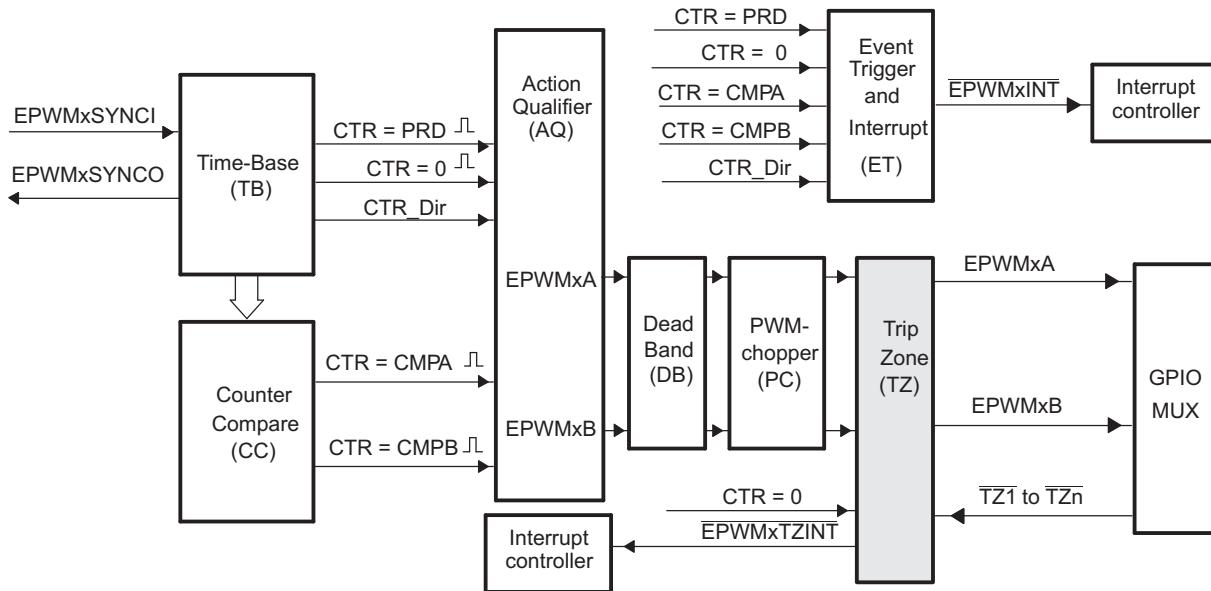

**Figure 15-40. PWM-Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses**

### 15.2.2.8 Trip-Zone (TZ) Submodule

Figure 15-41 shows how the trip-zone (TZ) submodule fits within the ePWM module. Each ePWM module is connected to every  $\overline{TZ}$  signal that are sourced from the GPIO MUX. These signals indicates external fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur. See Section 15.1.2 to determine the number of trip-zone pins available for the device.

**Figure 15-41. Trip-Zone Submodule**

#### 15.2.2.8.1 Purpose of the Trip-Zone Submodule

The key functions of the trip-zone submodule are:

- Trip inputs  $\overline{TZ1}$  to  $\overline{TZn}$  can be flexibly mapped to any ePWM module.
- Upon a fault condition, outputs EPWMxA and EPWMxB can be forced to one of the following:
  - High
  - Low
  - High-impedance
  - No action taken
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Each trip-zone input pin can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone pin.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if it is not required.

### 15.2.2.8.2 Controlling and Monitoring the Trip-Zone Submodule

The trip-zone submodule operation is controlled and monitored through the following registers:

**Table 15-36. Trip-Zone Submodule Registers**

| Acronym | Register Description                | Address Offset | Shadowed |
|---------|-------------------------------------|----------------|----------|
| TZSEL   | Trip-Zone Select Register           | 24h            | No       |
| TZCTL   | Trip-Zone Control Register          | 28h            | No       |
| TZEINT  | Trip-Zone Enable Interrupt Register | 2Ah            | No       |
| TZFLG   | Trip-Zone Flag Register             | 2Ch            | No       |
| TZCLR   | Trip-Zone Clear Register            | 2Eh            | No       |
| TZFCR   | Trip-Zone Force Register            | 30h            | No       |

### 15.2.2.8.3 Operational Highlights for the Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals at pin  $\overline{TZ1}$  to  $\overline{TZn}$  is an active-low input signal. When the pin goes low, it indicates that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone pins. Which trip-zone pins are used by a particular ePWM module is determined by the TZSEL register for that specific ePWM module. The trip-zone signal may or may not be synchronized to the system clock (SYSCLKOUT). A minimum of 1 SYSCLKOUT low pulse on the  $\overline{TZ_n}$  inputs is sufficient to trigger a fault condition in the ePWM module. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on the  $\overline{TZn}$  inputs.

The  $\overline{TZ_n}$  input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for a ePWM module. The configuration is determined by the TZSEL[CBCn] and TZSEL[OSHTn] bits (where n corresponds to the trip pin) respectively.

- **Cycle-by-Cycle (CBC):** When a cycle-by-cycle trip event occurs, the action specified in the TZCTL register is carried out immediately on the EPWMxA and/or EPWMxB output. [Table 15-37](#) lists the possible actions. In addition, the cycle-by-cycle trip event flag (TZFLG[CBC]) is set and a EPWMxTZINT interrupt is generated if it is enabled in the TZEINT register.

The specified condition on the pins is automatically cleared when the ePWM time-base counter reaches zero (TBCNT = 0000h) if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The TZFLG[CBC] flag bit will remain set until it is manually cleared by writing to the TZCLR[CBC] bit. If the cycle-by-cycle trip event is still present when the TZFLG[CBC] bit is cleared, then it will again be immediately set.

- **One-Shot (OSHT):** When a one-shot trip event occurs, the action specified in the TZCTL register is carried out immediately on the EPWMxA and/or EPWMxB output. [Table 15-37](#) lists the possible actions. In addition, the one-shot trip event flag (TZFLG[OST]) is set and a EPWMxTZINT interrupt is generated if it is enabled in the TZEINT register. The one-shot trip condition must be cleared manually by writing to the TZCLR[OST] bit.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the TZCTL[TZA] and TZCTL[TZB] register bits. One of four possible actions, shown in [Table 15-37](#), can be taken on a trip event.

**Table 15-37. Possible Actions On a Trip Event**

| TZCTL[TZA]<br>and/or<br>TZCTL[TZB] | EPWMx <sub>A</sub><br>and/or<br>EPWMx <sub>B</sub> | Comment                                      |
|------------------------------------|--|--|
| 0                                  | High-Impedance                                     | Tripped                                      |
| 1h                                 | Force to High State                                | Tripped                                      |
| 2h                                 | Force to Low State                                 | Tripped                                      |
| 3h                                 | No Change  | Do Nothing. No change is made to the output. |

**Example 15-2. Trip-Zone Configurations****Scenario A:**

A one-shot trip event on  $\overline{\text{TZ1}}$  pulls both EPWM1A, EPWM1B low and also forces EPWM2A and EPWM2B high.

- Configure the ePWM1 registers as follows:
  - TZSEL[OSHT1] = 1: enables  $\overline{\text{TZ}}$  as a one-shot event source for ePWM1
  - TZCTL[TZA] = 2: EPWM1A will be forced low on a trip event.
  - TZCTL[TZB] = 2: EPWM1B will be forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables  $\overline{\text{TZ}}$  as a one-shot event source for ePWM2
  - TZCTL[TZA] = 1: EPWM2A will be forced high on a trip event.
  - TZCTL[TZB] = 1: EPWM2B will be forced high on a trip event.

**Scenario B:**

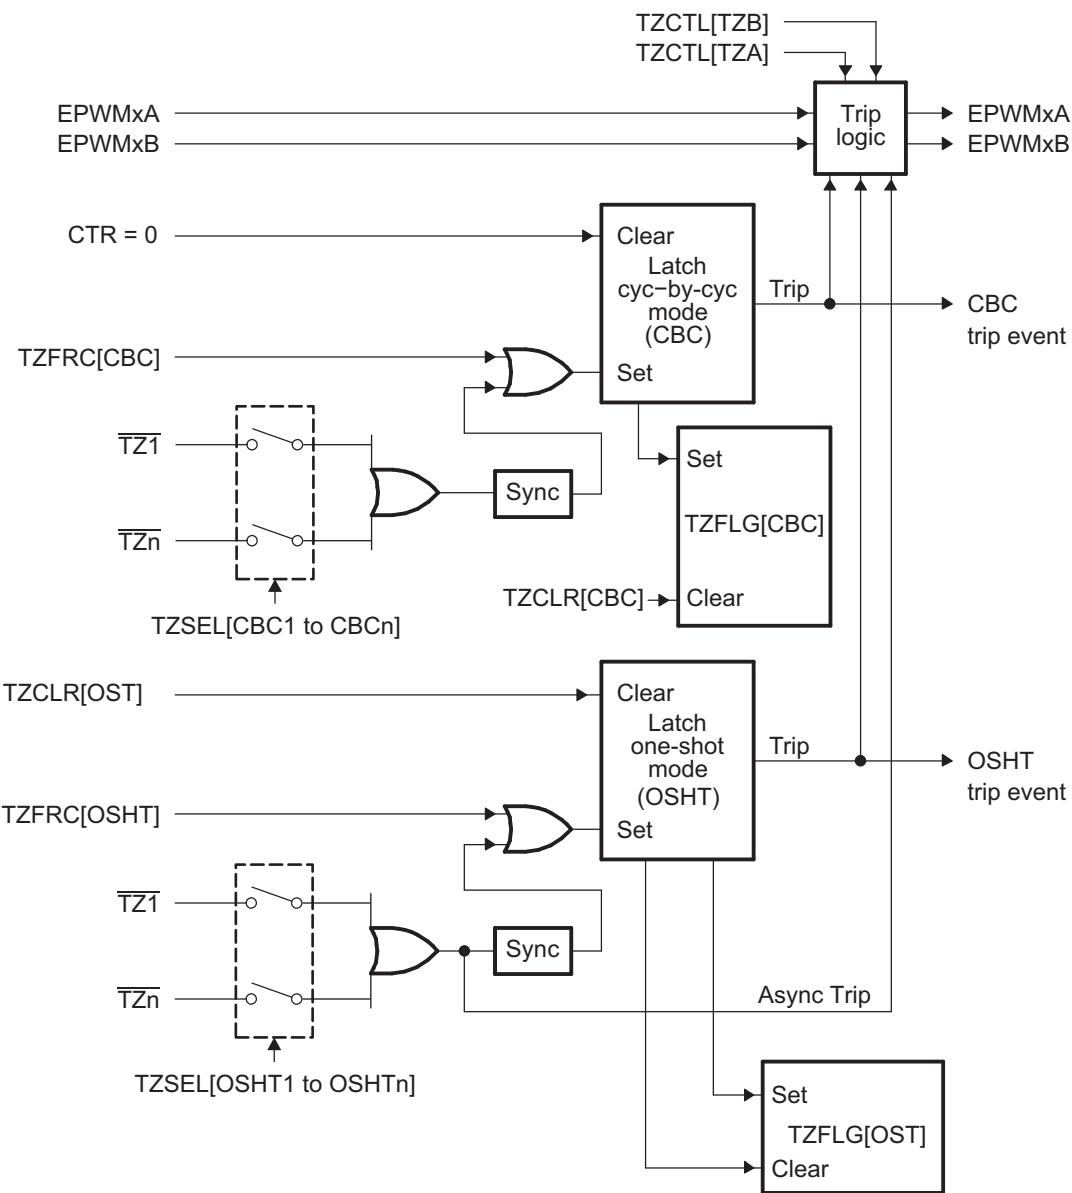

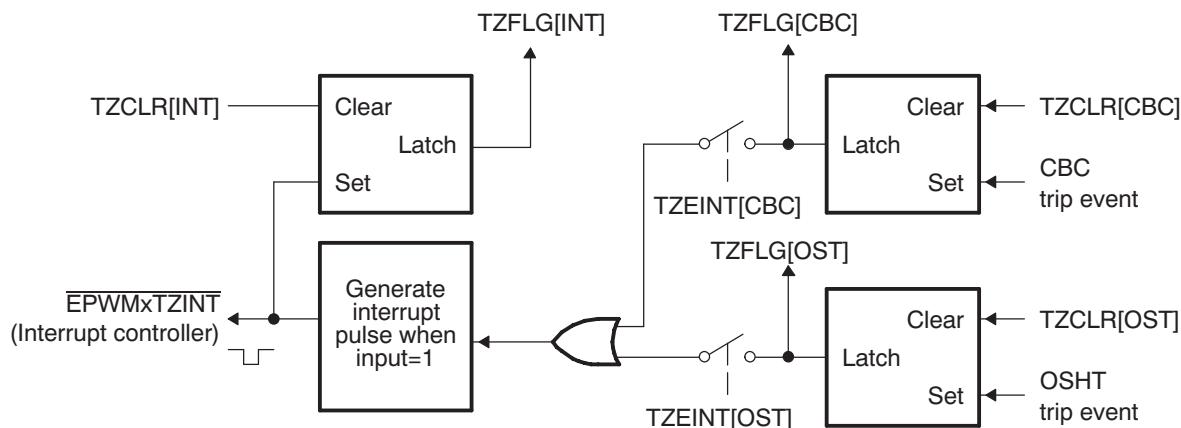

A cycle-by-cycle event on  $\overline{\text{TZ5}}$  pulls both EPWM1A, EPWM1B low.

A one-shot event on  $\overline{\text{TZ1}}$  or  $\overline{\text{TZ6}}$  puts EPWM2A into a high impedance state.

- Configure the ePWM1 registers as follows:
  - TZSEL[CBC5] = 1: enables  $\overline{\text{TZ5}}$  as a one-shot event source for ePWM1
  - TZCTL[TZA] = 2: EPWM1A will be forced low on a trip event.
  - TZCTL[TZB] = 2: EPWM1B will be forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables  $\overline{\text{TZ1}}$  as a one-shot event source for ePWM2
  - TZSEL[OSHT6] = 1: enables  $\overline{\text{TZ6}}$  as a one-shot event source for ePWM1
  - TZCTL[TZA] = 0: EPWM1A will be put into a high-impedance state on a trip event.
  - TZCTL[TZB] = 3: EPWM1B will ignore the trip event.

**15.2.2.8.4 Generating Trip Event Interrupts**

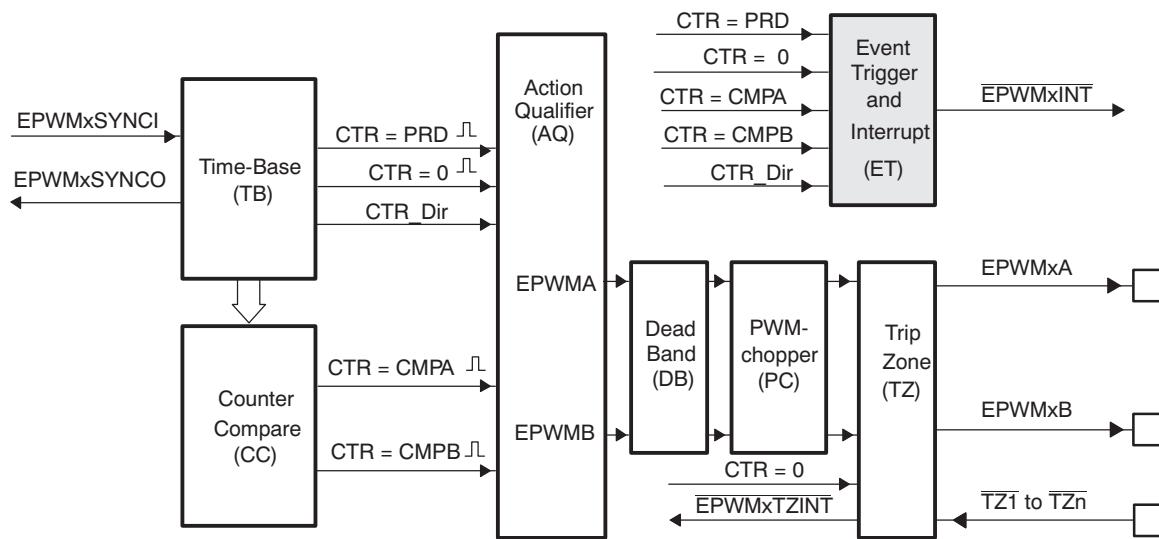

Figure 15-42 and Figure 15-43 illustrate the trip-zone submodule control and interrupt logic, respectively.

**Figure 15-42. Trip-Zone Submodule Mode Control Logic**

**Figure 15-43. Trip-Zone Submodule Interrupt Logic**

### 15.2.2.9 Event-Trigger (ET) Submodule

Figure 15-44 shows the event-trigger (ET) submodule in the ePWM system. The event-trigger submodule manages the events generated by the time-base submodule and the counter-compare submodule to generate an interrupt to the CPU.

**Figure 15-44. Event-Trigger Submodule**

#### 15.2.2.9.1 Purpose of the Event-Trigger Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base and counter-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests at:
  - Every event
  - Every second event
  - Every third event
- Provides full visibility of event generation via event counters and flags

#### 15.2.2.9.2 Controlling and Monitoring the Event-Trigger Submodule

The key registers used to configure the event-trigger submodule are shown in Table 15-38:

**Table 15-38. Event-Trigger Submodule Registers**

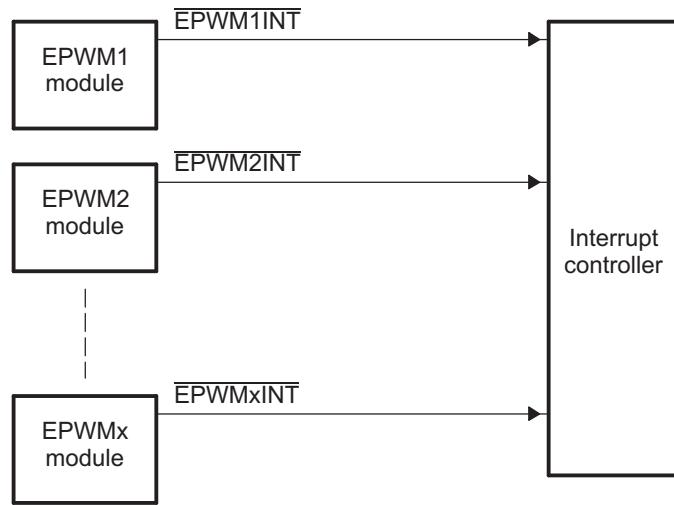

| Acronym | Register Description             | Address Offset | Shadowed |
|---------|----------------------------------|----------------|----------|
| ETSEL   | Event-Trigger Selection Register | 32h            | No       |
| ETPS    | Event-Trigger Prescale Register  | 34h            | No       |
| ETFLG   | Event-Trigger Flag Register      | 36h            | No       |
| ETCLR   | Event-Trigger Clear Register     | 38h            | No       |
| ETFRC   | Event-Trigger Force Register     | 3Ah            | No       |

### 15.2.2.9.3 Operational Overview of the Event-Trigger Submodule

The following sections describe the event-trigger submodule's operational highlights.

Each ePWM module has one interrupt request line connected to the interrupt controller as shown in Figure 15-45.

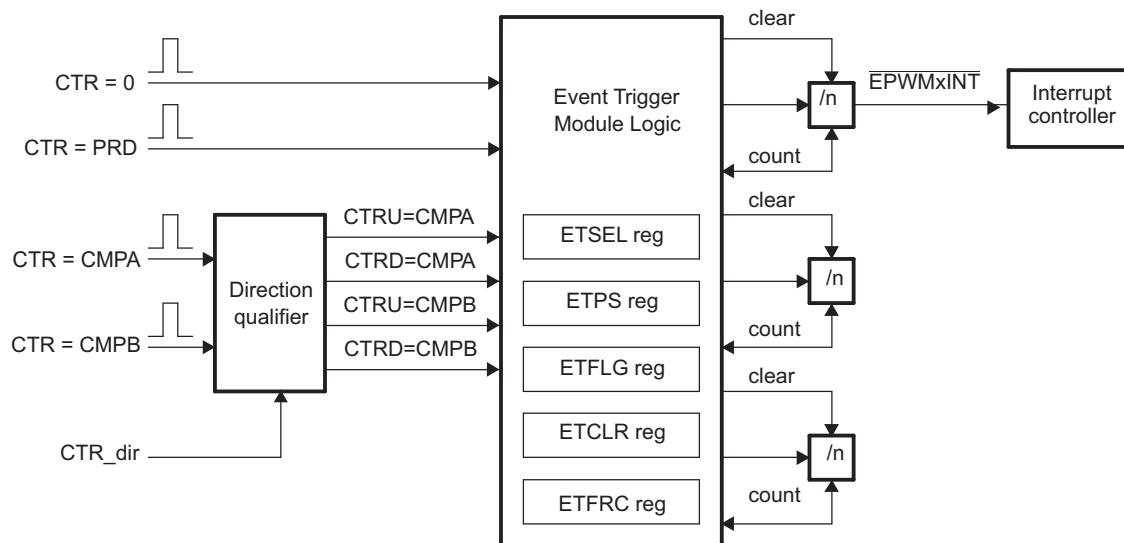

**Figure 15-45. Event-Trigger Submodule Inter-Connectivity to Interrupt Controller**

The event-trigger submodule monitors various event conditions (the left side inputs to event-trigger submodule shown in Figure 15-46) and can be configured to prescale these events before issuing an interrupt request. The event-trigger prescaling logic can issue interrupt requests at:

- Every event
- Every second event
- Every third event

**Figure 15-46. Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs**

- ETSEL—This selects which of the possible events will trigger an interrupt.
- ETPS—This programs the event prescaling options previously mentioned.
- ETFLG—These are flag bits indicating status of the selected and prescaled events.
- ETCLR—These bits allow you to clear the flag bits in the ETFLG register via software.
- ETFRC—These bits allow software forcing of an event. Useful for debugging or software intervention.

A more detailed look at how the various register bits interact with the Interrupt is shown in [Figure 15-47](#).

[Figure 15-47](#) shows the event-trigger's interrupt generation logic. The interrupt-period (ETPS[INTPRD]) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt
- Generate an interrupt on every event
- Generate an interrupt on every second event
- Generate an interrupt on every third event

An interrupt cannot be generated on every fourth or more events.

Which event can cause an interrupt is configured by the interrupt selection (ETSEL[INTSEL]) bits. The event can be one of the following:

- Time-base counter equal to zero (TBCNT = 0000h).
- Time-base counter equal to period (TBCNT = TBPRD).
- Time-base counter equal to the compare A register (CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (CMPA) when the timer is decrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is decrementing.

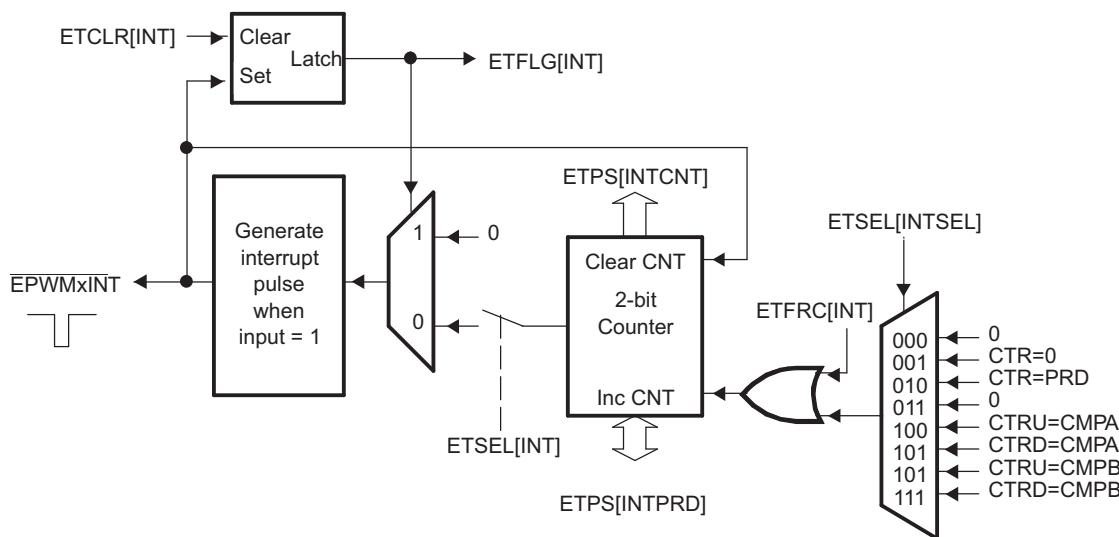

The number of events that have occurred can be read from the interrupt event counter (ETPS[INTCNT]) register bits. That is, when the specified event occurs the ETPS[INTCNT] bits are incremented until they reach the value specified by ETPS[INTPRD]. When ETPS[INTCNT] = ETPS[INTPRD] the counter stops counting and its output is set. The counter is only cleared when an interrupt is sent to the interrupt controller.

When ETPS[INTCNT] reaches ETPS[INTPRD], one of the following behaviors will occur:

- If interrupts are enabled, ETSEL[INTEN] = 1 and the interrupt flag is clear, ETFLG[INT] = 0, then an interrupt pulse is generated and the interrupt flag is set, ETFLG[INT] = 1, and the event counter is cleared ETPS[INTCNT] = 0. The counter will begin counting events again.
- If interrupts are disabled, ETSEL[INTEN] = 0, or the interrupt flag is set, ETFLG[INT] = 1, the counter stops counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].
- If interrupts are enabled, but the interrupt flag is already set, then the counter will hold its output high until the ENTFLG[INT] flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing to the INTPRD bits will automatically clear the counter INTCTN = 0 and the counter output will be reset (so no interrupts are generated). Writing a 1 to the ETFRC[INT] bit will increment the event counter INTCNT. The counter will behave as described above when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events will be detected and the ETFRC[INT] bit is also ignored.

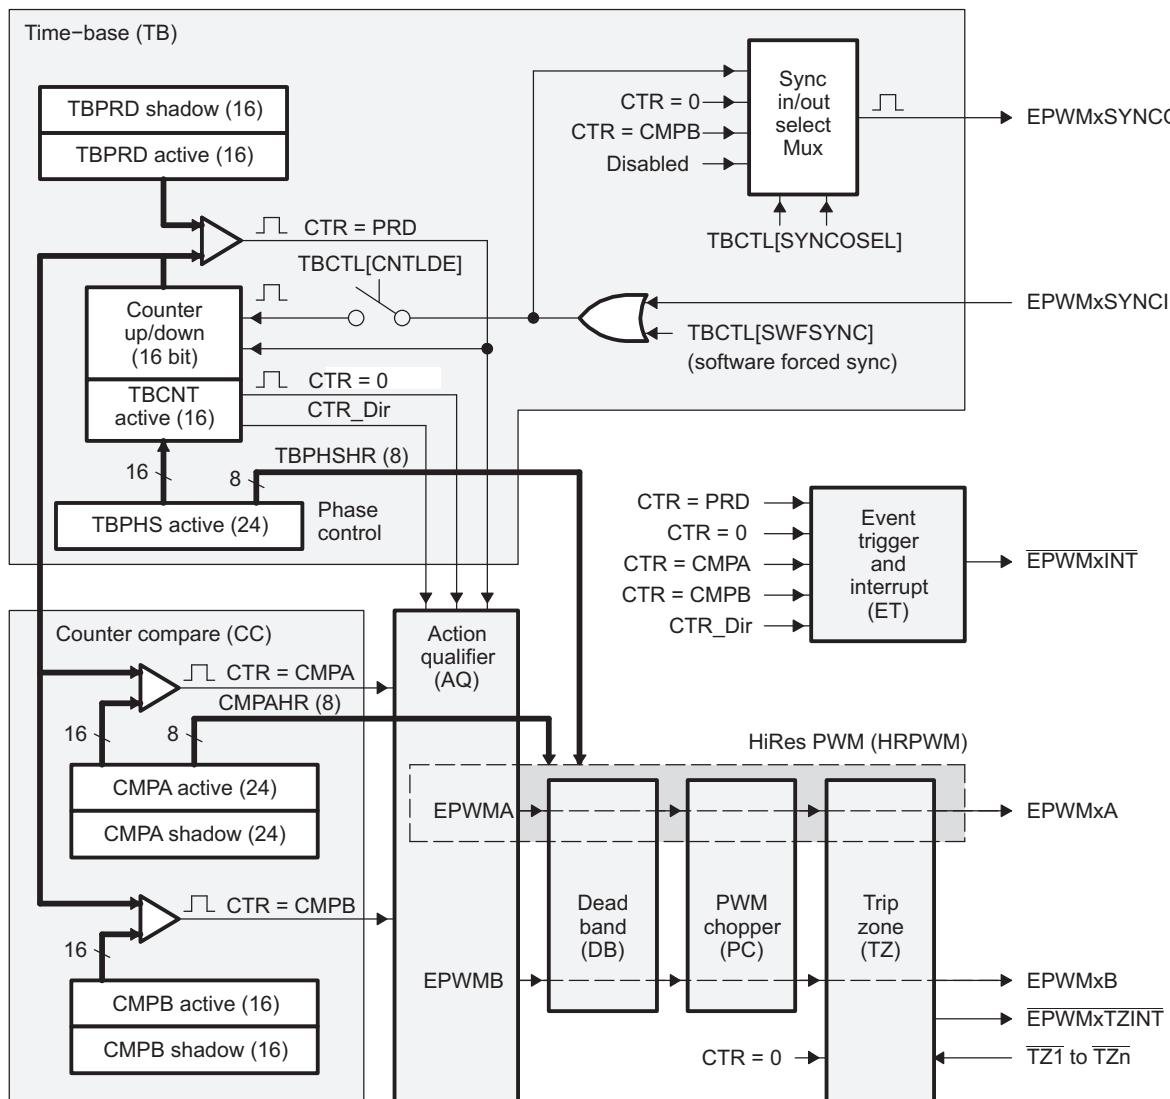

**Figure 15-47. Event-Trigger Interrupt Generator**

### 15.2.2.10 High-Resolution PWM (HRPWM) Submodule

Figure 15-48 shows the high-resolution PWM (HRPWM) submodule in the ePWM system. Some devices include the high-resolution PWM submodule, see [Section 15.1.2](#) to determine which ePWM instances include this feature.

**Figure 15-48. HRPWM System Interface**

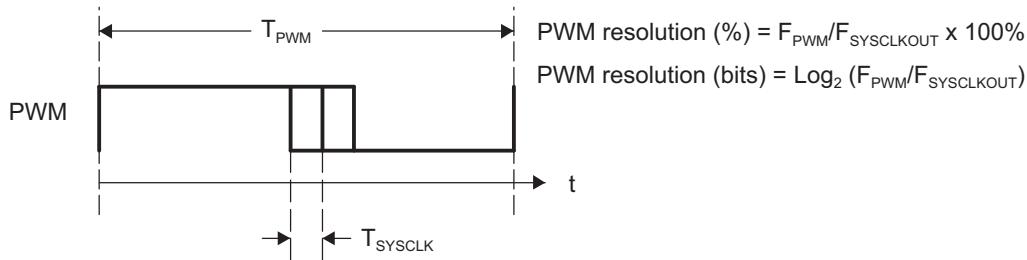

### 15.2.2.10.1 Purpose of the High-Resolution PWM Submodule

The enhanced high-resolution pulse-width modulator (eHRPWM) extends the time resolution capabilities of the conventionally derived digital pulse-width modulator (PWM). HRPWM is typically used when PWM resolution falls below ~9-10 bits. The key features of HRPWM are:

- Extended time resolution capability
- Used in both duty cycle and phase-shift control methods
- Finer time granularity control or edge positioning using extensions to the Compare A and Phase registers
- Implemented using the A signal path of PWM, that is, on the EPWMxA output. EPWMxB output has conventional PWM capabilities

The ePWM peripheral is used to perform a function that is mathematically equivalent to a digital-to-analog converter (DAC). As shown in [Figure 15-49](#), the effective resolution for conventionally generated PWM is a function of PWM frequency (or period) and system clock frequency.

**Figure 15-49. Resolution Calculations for Conventionally Generated PWM**

If the required PWM operating frequency does not offer sufficient resolution in PWM mode, you may want to consider HRPWM. As an example of improved performance offered by HRPWM, [Table 15-39](#) shows resolution in bits for various PWM frequencies. [Table 15-39](#) values assume a MEP step size of 180 ps. See your device-specific data manual for typical and maximum performance specifications for the MEP.

**Table 15-39. Resolution for PWM and HRPWM**

| PWM Frequency (kHz) | Regular Resolution (PWM) |     | High Resolution (HRPWM) |       |
|---------------------|--------------------------|-----|-------------------------|-------|
|                     | Bits                     | %   | Bits                    | %     |
| 20                  | 12.3                     | 0.0 | 18.1                    | 0.000 |
| 50                  | 11.0                     | 0.0 | 16.8                    | 0.001 |
| 100                 | 10.0                     | 0.1 | 15.8                    | 0.002 |
| 150                 | 9.4                      | 0.2 | 15.2                    | 0.003 |
| 200                 | 9.0                      | 0.2 | 14.8                    | 0.004 |
| 250                 | 8.6                      | 0.3 | 14.4                    | 0.005 |
| 500                 | 7.6                      | 0.5 | 13.8                    | 0.007 |
| 1000                | 6.6                      | 1.0 | 12.4                    | 0.018 |
| 1500                | 6.1                      | 1.5 | 11.9                    | 0.027 |
| 2000                | 5.6                      | 2.0 | 11.4                    | 0.036 |

Although each application may differ, typical low-frequency PWM operation (below 250 kHz) may not require HRPWM. HRPWM capability is most useful for high-frequency PWM requirements of power conversion topologies such as:

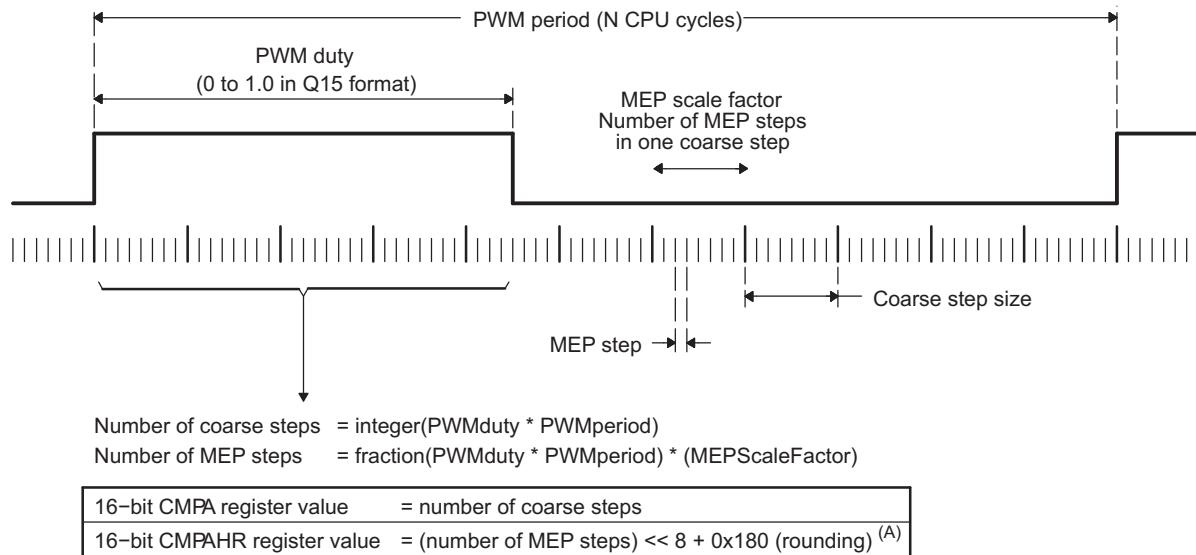

- Single-phase buck, boost, and flyback
- Multi-phase buck, boost, and flyback
- Phase-shifted full bridge
- Direct modulation of D-Class power amplifiers

### 15.2.2.10.2 Architecture of the High-Resolution PWM Submodule

The HRPWM is based on micro edge positioner (MEP) technology. MEP logic is capable of positioning an edge very finely by sub-dividing one coarse system clock of a conventional PWM generator. The time step accuracy is on the order of 150 ps. The HRPWM also has a self-check software diagnostics mode to check if the MEP logic is running optimally, under all operating conditions.

[Figure 15-50](#) shows the relationship between one coarse system clock and edge position in terms of MEP steps, which are controlled via an 8-bit field in the Compare A extension register (CMPAHR).

**Figure 15-50. Operating Logic Using MEP**

A For MEP range and rounding adjustment.

To generate an HRPWM waveform, configure the TBM, CCM, and AQM registers as you would to generate a conventional PWM of a given frequency and polarity. The HRPWM works together with the TBM, CCM, and AQM registers to extend edge resolution, and should be configured accordingly. Although many programming combinations are possible, only a few are needed and practical.

### 15.2.2.10.3 Controlling and Monitoring the High-Resolution PWM Submodule

The MEP of the HRPWM is controlled by two extension registers, each 8-bits wide. These two HRPWM registers are concatenated with the 16-bit TBPHS and CMPA registers used to control PWM operation.

- TBPHSHR - Time-Base Phase High-Resolution Register
- CMPAHR - Counter-Compare A High-Resolution Register

[Table 15-40](#) lists the registers used to control and monitor the high-resolution PWM submodule.

**Table 15-40. HRPWM Submodule Registers**

| Acronym | Register Description               | Address Offset | Shadowed |
|---------|------------------------------------|----------------|----------|
| TBPHSHR | Extension Register for HRPWM Phase | 4h             | No       |
| CMPAHR  | Extension Register for HRPWM Duty  | 10h            | Yes      |
| HRCNFG  | HRPWM Configuration Register       | 1040h          | No       |

#### 15.2.2.10.4 Configuring the High-Resolution PWM Submodule

Once the ePWM has been configured to provide conventional PWM of a given frequency and polarity, the HRPWM is configured by programming the HRCNFG register located at offset address 1040h. This register provides configuration options for the following key operating modes:

- **Edge Mode:** The MEP can be programmed to provide precise position control on the rising edge (RE), falling edge (FE), or both edges (BE) at the same time. FE and RE are used for power topologies requiring duty cycle control, while BE is used for topologies requiring phase shifting, for example, phase shifted full bridge.
- **Control Mode:** The MEP is programmed to be controlled either from the CMPAHR register (duty cycle control) or the TBPHSHR register (phase control). RE or FE control mode should be used with CMPAHR register. BE control mode should be used with TBPHSHR register.
- **Shadow Mode:** This mode provides the same shadowing (double buffering) option as in regular PWM mode. This option is valid only when operating from the CMPAHR register and should be chosen to be the same as the regular load option for the CMPA register. If TBPHSHR is used, then this option has no effect.

#### 15.2.2.10.5 Operational Highlights for the High-Resolution PWM Submodule

The MEP logic is capable of placing an edge in one of 255 (8 bits) discrete time steps, each of which has a time resolution on the order of 150 ps. The MEP works with the TBM and CCM registers to be certain that time steps are optimally applied and that edge placement accuracy is maintained over a wide range of PWM frequencies, system clock frequencies and other operating conditions. [Table 15-41](#) shows the typical range of operating frequencies supported by the HRPWM.

**Table 15-41. Relationship Between MEP Steps, PWM Frequency and Resolution**

| System (MHz) | MEP Steps Per SYSCLKOUT <sup>(1)</sup> <sup>(2)</sup> <sup>(3)</sup> | PWM Minimum (Hz) <sup>(4)</sup> | PWM Maximum (MHz) | Resolution at Maximum (Bits) <sup>(5)</sup> |
|--------------|--|---------------------------------|-------------------|---|
| 50.0         | 111  | 763                             | 2.50              | 11.1  |
| 60.0         | 93   | 916                             | 3.00              | 10.9  |
| 70.0         | 79   | 1068                            | 3.50              | 10.6  |
| 80.0         | 69   | 1221                            | 4.00              | 10.4  |
| 90.0         | 62   | 1373                            | 4.50              | 10.3  |
| 100.0        | 56   | 1526                            | 5.00              | 10.1  |

<sup>(1)</sup> System frequency = SYSCLKOUT, that is, CPU clock. TBCLK = SYSCLKOUT

<sup>(2)</sup> Table data based on a MEP time resolution of 180 ps (this is an example value)

<sup>(3)</sup> MEP steps applied =  $T_{SYSCLKOUT}/180$  ps in this example.

<sup>(4)</sup> PWM minimum frequency is based on a maximum period value, TBPRD = 65 535. PWM mode is asymmetrical up-count.

<sup>(5)</sup> Resolution in bits is given for the maximum PWM frequency stated.

### 15.2.2.10.5.1 Edge Positioning

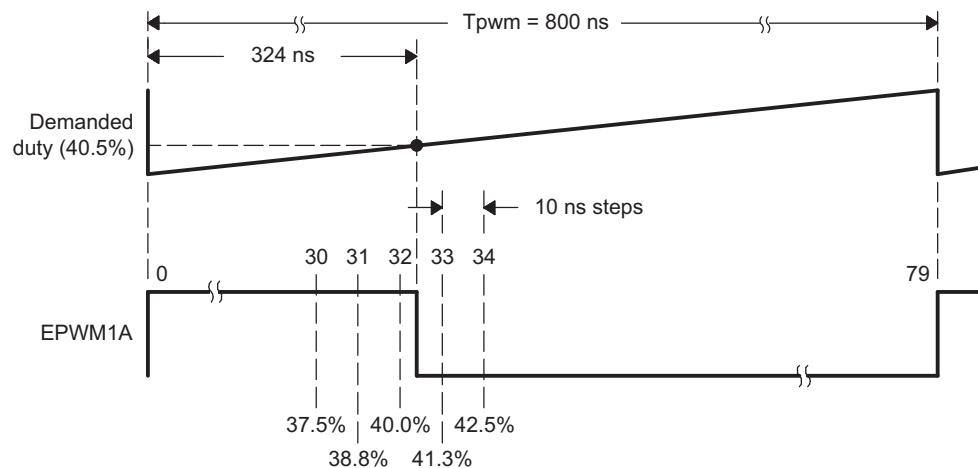

In a typical power control loop (switch modes, digital motor control (DMC), uninterruptible power supply (UPS)), a digital controller (PID, 2pole/2zero, lag/lead, etc.) issues a duty command, usually expressed in per unit or percentage terms.

In the following example, assume that for a particular operating point, the demanded duty cycle is 0.405 or 40.5% on-time and the required converter PWM frequency is 1.25 MHz. In conventional PWM generation with a system clock of 100 MHz, the duty cycle choices are in the vicinity of 40.5%. In [Figure 15-51](#), a compare value of 32 counts (duty = 40%) is the closest to 40.5% that you can attain. This is equivalent to an edge position of 320 ns instead of the desired 324 ns. This data is shown in [Table 15-42](#).

By utilizing the MEP, you can achieve an edge position much closer to the desired point of 324 ns.

[Table 15-42](#) shows that in addition to the CMPA value, 22 steps of the MEP (CMPAHR register) will position the edge at 323.96 ns, resulting in almost zero error. In this example, it is assumed that the MEP has a step resolution of 180 ns.

**Figure 15-51. Required PWM Waveform for a Requested Duty = 40.5%**

**Table 15-42. CMPA vs Duty (left), and [CMPA:CMPAHR] vs Duty (right)**

| CMPA<br>(count)<br><small>(1) (2) (3)</small> | DUTY<br>(%) | High Time<br>(ns) | CMPA<br>(count) | CMPAHR<br>(count) | Duty<br>(%) | High Time<br>(ns) |
|---|-------------|-------------------|-----------------|-------------------|-------------|-------------------|
| 28  | 35.0        | 280               | 32              | 18                | 40.405      | 323.24            |
| 29  | 36.3        | 290               | 32              | 19                | 40.428      | 323.42            |
| 30  | 37.5        | 300               | 32              | 20                | 40.450      | 323.60            |
| 31  | 38.8        | 310               | 32              | 21                | 40.473      | 323.78            |
| 32  | 40.0        | 320               | 32              | 22                | 40.495      | 323.96            |
| 33  | 41.3        | 330               | 32              | 23                | 40.518      | 324.14            |
| 34  | 42.5        | 340               | 32              | 24                | 40.540      | 324.32            |
|   |             |                   | 32              | 25                | 40.563      | 324.50            |
| Required                                      |             |                   | 32              | 26                | 40.585      | 324.68            |
| 32.40   | 40.5        | 324               | 32              | 27                | 40.608      | 324.86            |

<sup>(1)</sup> System clock, SYSCLKOUT and TBCLK = 100 MHz, 10 ns

<sup>(2)</sup> For a PWM Period register value of 80 counts, PWM Period =  $80 \times 10 \text{ ns} = 800 \text{ ns}$ , PWM frequency =  $1/800 \text{ ns} = 1.25 \text{ MHz}$

<sup>(3)</sup> Assumed MEP step size for the above example = 180 ps

### 15.2.2.10.5.2 Scaling Considerations

The mechanics of how to position an edge precisely in time has been demonstrated using the resources of the standard (CMPA) and MEP (CMPAHR) registers. In a practical application, however, it is necessary to seamlessly provide the CPU a mapping function from a per-unit (fractional) duty cycle to a final integer (non-fractional) representation that is written to the [CMPA:CMPAHR] register combination.

To do this, first examine the scaling or mapping steps involved. It is common in control software to express duty cycle in a per-unit or percentage basis. This has the advantage of performing all needed math calculations without concern for the final absolute duty cycle, expressed in clock counts or high time in ns. Furthermore, it makes the code more transportable across multiple converter types running different PWM frequencies.

To implement the mapping scheme, a two-step scaling procedure is required.

Assumptions for this example:

|   |                       |
|---|-----------------------|
| System clock, SYSCLKOUT   | = 10 ns (100 MHz)     |
| PWM frequency   | = 1.25 MHz (1/800 ns) |
| Required PWM duty cycle, <b>PWMDuty</b>   | = 0.405 (40.5%)       |
| PWM period in terms of coarse steps,<br><b>PWMperiod</b> (800 ns/10 ns)                               | = 80                  |
| Number of MEP steps per coarse step at<br>180 ps (10 ns/180 ps), <b>MEP_SF</b>                        | = 55                  |
| Value to keep CMPAHR within the range<br>of 1-255 and fractional rounding constant<br>(default value) | = 180h                |

#### Step 1: Percentage Integer Duty value conversion for CMPA register

|                     |  |
|---------------------|--|
| CMPA register value | = int( <b>PWMDuty</b> × <b>PWMperiod</b> ); int means integer part |
|                     | = int(0.405 × 80)  |
|                     | = int(32.4)  |
| CMPA register value | = 32 (20h)   |

#### Step 2: Fractional value conversion for CMPAHR register

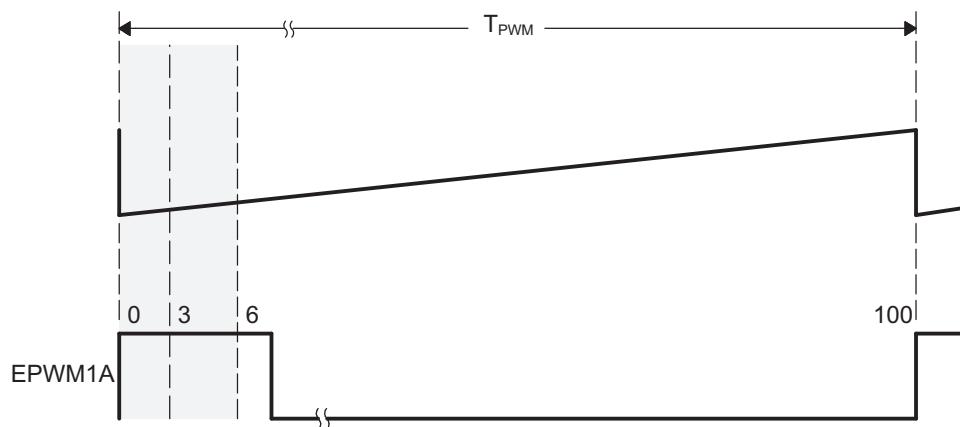

|                       |   |
|-----------------------|---|
| CMPAHR register value | = (frac( <b>PWMDuty</b> × <b>PWMperiod</b> ) × <b>MEP_SF</b> ) << 8 +<br>180h; frac means fractional part |
|                       | = (frac(32.4) × 55 <<8) + 180h; Shift is to move the<br>value as CMPAHR high byte                         |
|                       | = ((0.4 × 55) <<8) + 180h   |
|                       | = (22 <<8) + 180h   |
|                       | = 22 × 256 + 180h ; Shifting left by 8 is the same<br>multiplying by 256.                                 |
|                       | = 5632 + 180h   |
|                       | = 1600h + 180h  |
| CMPAHR value          | = 1780h; CMPAHR value = 1700h, lower 8 bits will be<br>ignored by hardware.                               |

### 15.2.2.10.5.3 Duty Cycle Range Limitation

In high resolution mode, the MEP is not active for 100% of the PWM period. It becomes operational 3 SYSCLK cycles after the period starts.

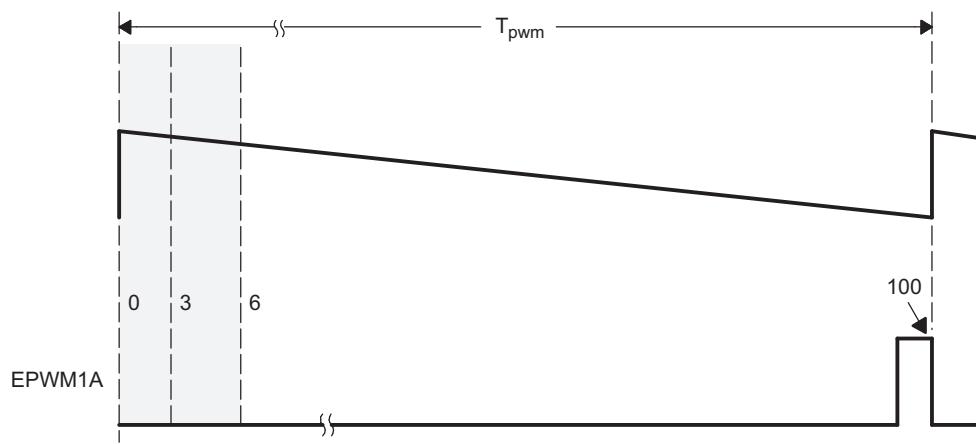

Duty cycle range limitations are illustrated in [Figure 15-52](#). This limitation imposes a lower duty cycle limit on the MEP. For example, precision edge control is not available all the way down to 0% duty cycle. Although for the first 3 or 6 cycles, the HRPWM capabilities are not available, regular PWM duty control is still fully operational down to 0% duty. In most applications this should not be an issue as the controller regulation point is usually not designed to be close to 0% duty cycle.

**Figure 15-52. Low % Duty Cycle Range Limitation Example When PWM Frequency = 1 MHz**

If the application demands HRPWM operation in the low percent duty cycle region, then the HRPWM can be configured to operate in count-down mode with the rising edge position (REP) controlled by the MEP. This is illustrated in [Figure 15-53](#). In this case low percent duty limitation is no longer an issue.

**Figure 15-53. High % Duty Cycle Range Limitation Example when PWM Frequency = 1 MHz**

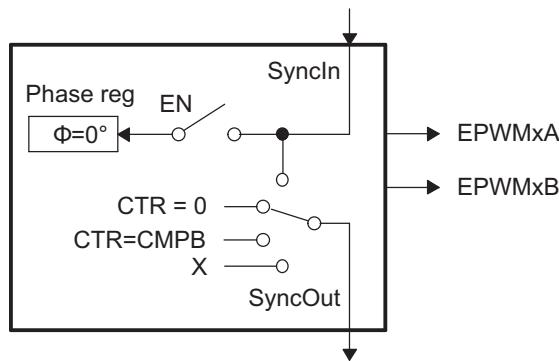

### 15.2.3 Use Cases

An ePWM module has all the local resources necessary to operate completely as a standalone module or to operate in synchronization with other identical ePWM modules.

#### 15.2.3.1 Overview of Multiple Modules

Previously in this user's guide, all discussions have described the operation of a single module. To facilitate the understanding of multiple modules working together in a system, the ePWM module described in reference is represented by the more simplified block diagram shown in [Figure 15-54](#). This simplified ePWM block shows only the key resources needed to explain how a multiswitch power topology is controlled with multiple ePWM modules working together.

**Figure 15-54. Simplified ePWM Module**

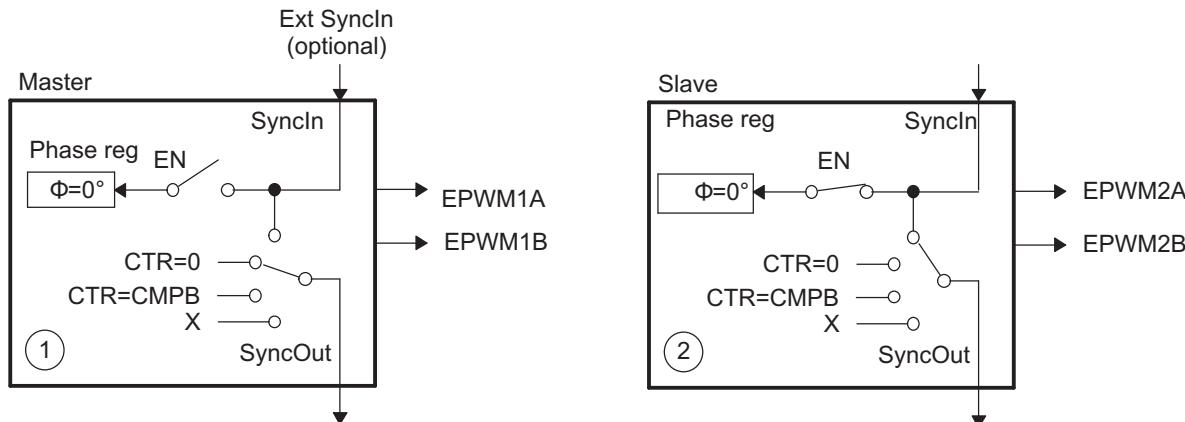

### 15.2.3.2 Key Configuration Capabilities

The key configuration choices available to each module are as follows:

- Options for SyncIn
  - Load own counter with phase register on an incoming sync strobe—enable (EN) switch closed
  - Do nothing or ignore incoming sync strobe—enable switch open
  - Sync flow-through - SyncOut connected to SyncIn
  - Master mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Master mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)
- Options for SyncOut
  - Sync flow-through - SyncOut connected to SyncIn
  - Master mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Master mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)

For each choice of SyncOut, a module may also choose to load its own counter with a new phase value on a SyncIn strobe input or choose to ignore it, i.e., via the enable switch. Although various combinations are possible, the two most common—master module and slave module modes—are shown in [Figure 15-55](#).

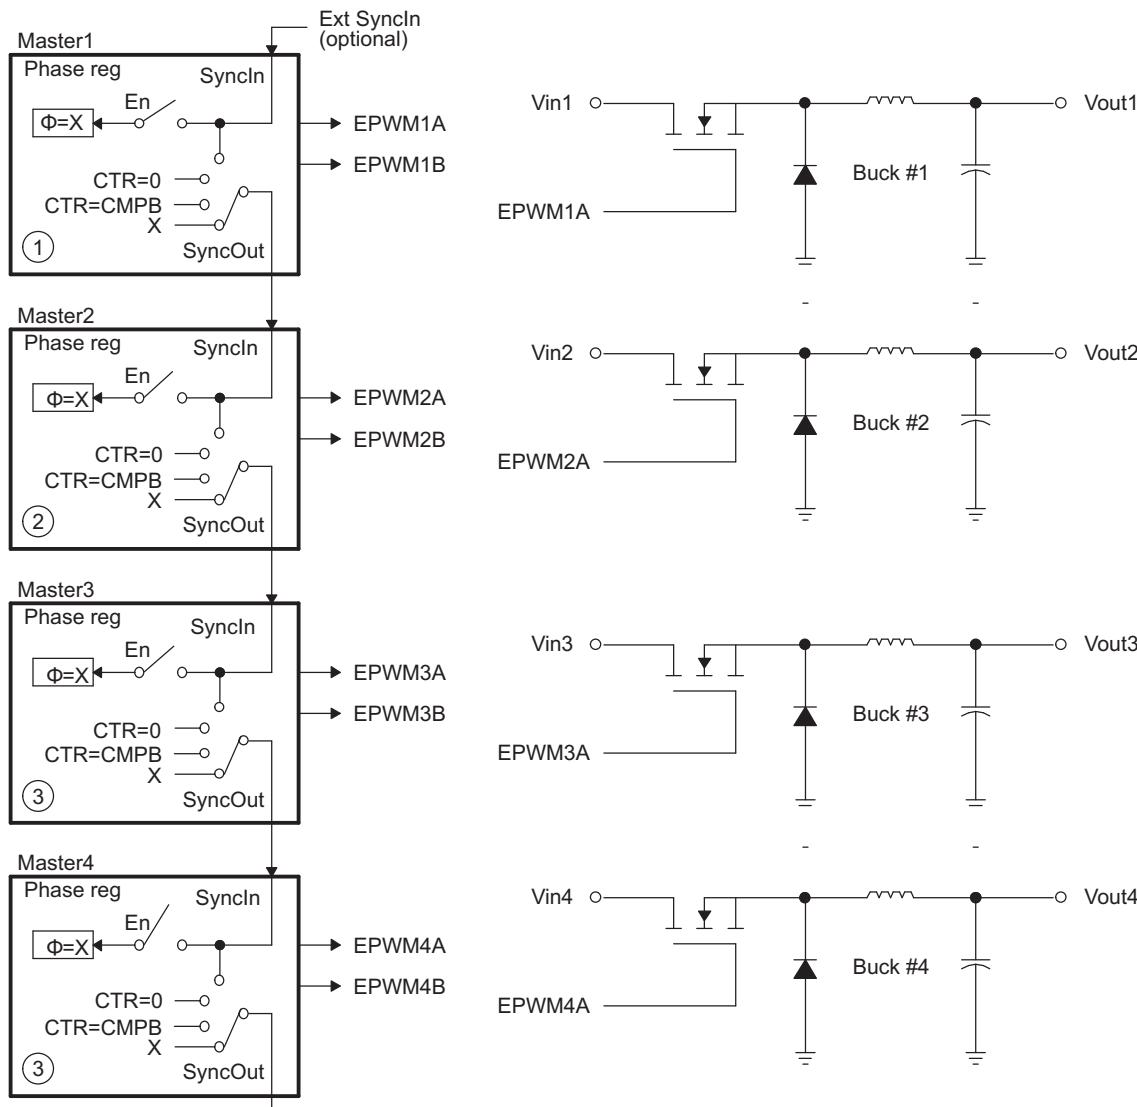

**Figure 15-55. EPWM1 Configured as a Typical Master, EPWM2 Configured as a Slave**

### 15.2.3.3 Controlling Multiple Buck Converters With Independent Frequencies

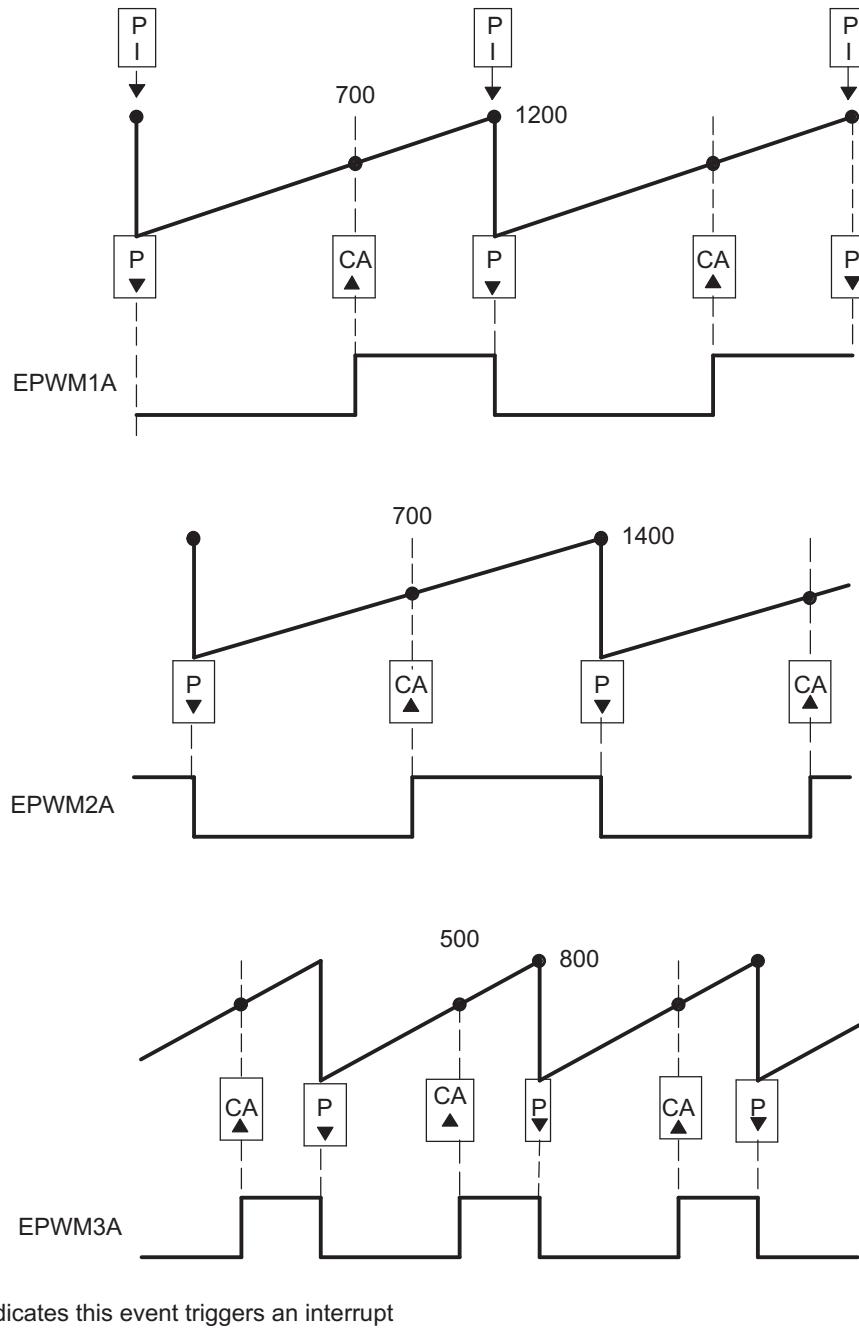

One of the simplest power converter topologies is the buck. A single ePWM module configured as a master can control two buck stages with the same PWM frequency. If independent frequency control is required for each buck converter, then one ePWM module must be allocated for each converter stage. [Figure 15-56](#) shows four buck stages, each running at independent frequencies. In this case, all four ePWM modules are configured as Masters and no synchronization is used. [Figure 15-57](#) shows the waveforms generated by the setup shown in [Figure 15-56](#); note that only three waveforms are shown, although there are four stages.

**Figure 15-56. Control of Four Buck Stages. Here  $F_{\text{PWM}1} \neq F_{\text{PWM}2} \neq F_{\text{PWM}3} \neq F_{\text{PWM}4}$**

NOTE:  $\Theta = X$  indicates value in phase register is a "don't care"

**Figure 15-57. Buck Waveforms for Figure 15-56 (Note: Only three bucks shown here)**

**Table 15-43. EPWM1 Initialization for Figure 15-57**

| Register | Bit       | Value           | Comments                   |
|----------|-----------|-----------------|----------------------------|
| TBPRD    | TBPRD     | 1200 (4B0h)     | Period = 1201 TBCLK counts |

| CMPCTL   | SHDWAMODE | CC_SHADOW       |                           |
|          | SHDWBMODE | CC_SHADOW       |                           |
|          | LOADAMODE | CC_CTR_ZERO     | Load on CTR = 0           |
|          | LOADBMODE | CC_CTR_ZERO     | Load on CTR = 0           |
| AQCTLA   | PRD       | AQ_CLEAR        |                           |
|          | CAU       | AQ_SET          |                           |

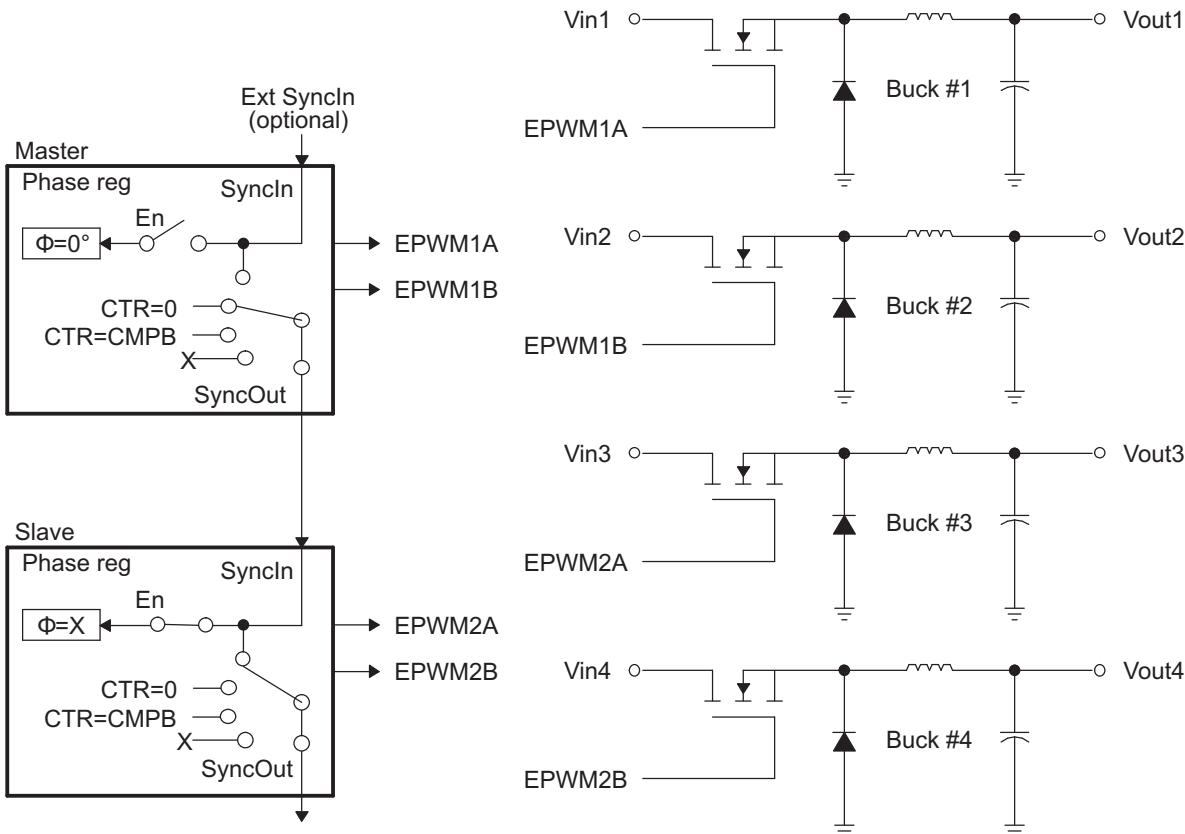

**Example 15-3. Configuration for Example in Figure 15-57**

```
// Run Time (Note: Example execution of one run-time instance)
//=====
EPwm1Regs.CMPA.half.CMPA = 700;           // adjust duty for output EPWM1A
EPwm2Regs.CMPA.half.CMPA = 700;           // adjust duty for output EPWM2A
EPwm3Regs.CMPA.half.CMPA = 500;           // adjust duty for output EPWM3A
```

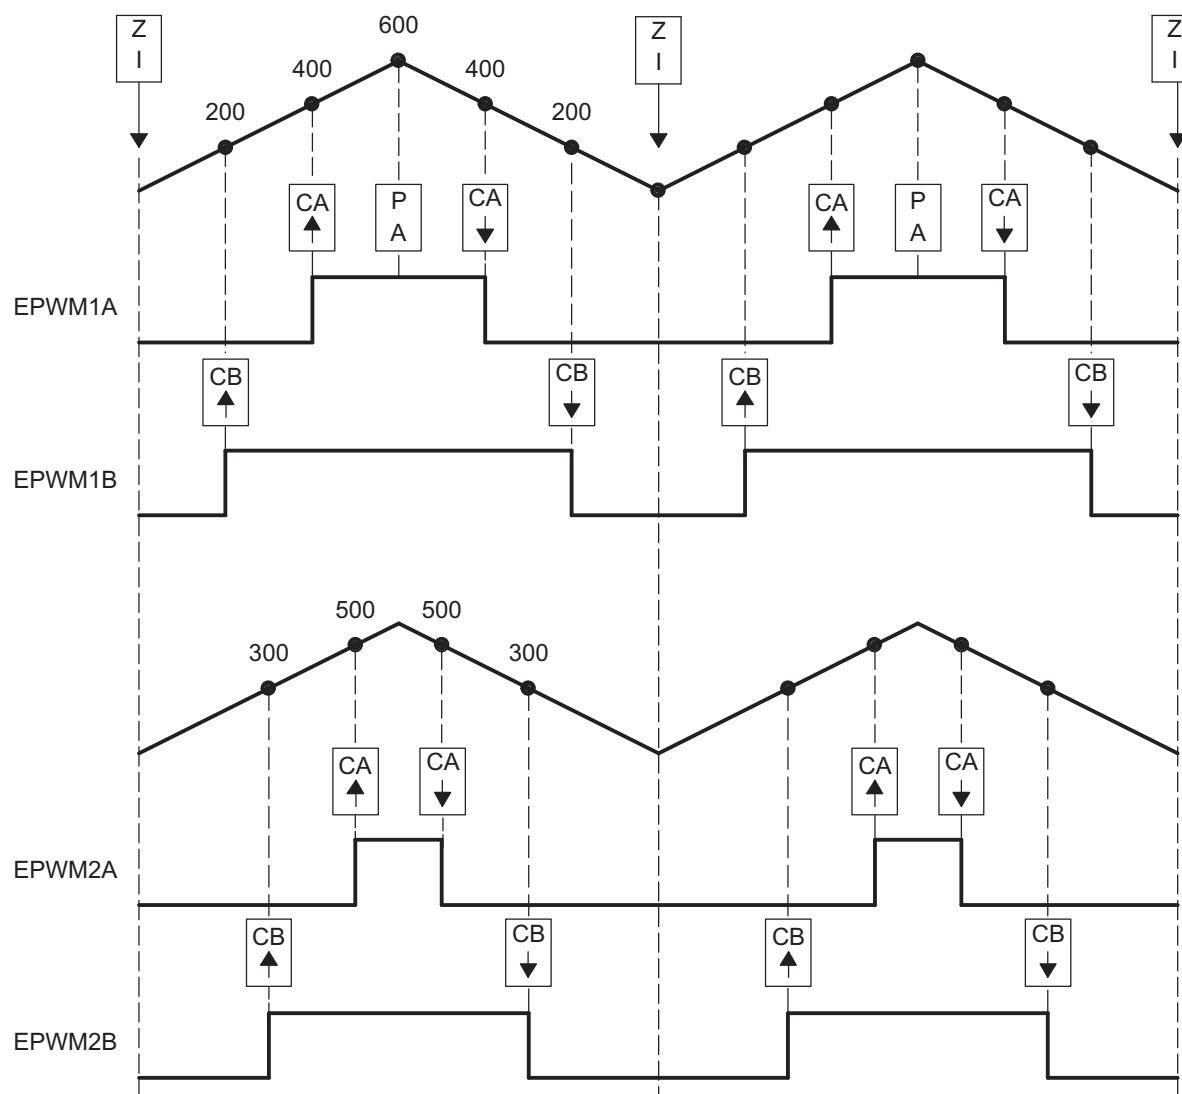

**15.2.3.4 Controlling Multiple Buck Converters With Same Frequencies**

If synchronization is a requirement, ePWM module 2 can be configured as a slave and can operate at integer multiple (N) frequencies of module 1. The sync signal from master to slave ensures these modules remain locked. [Figure 15-58](#) shows such a configuration; [Figure 15-59](#) shows the waveforms generated by the configuration.

**Figure 15-58. Control of Four Buck Stages. (Note:  $F_{\text{PWM2}} = N \times F_{\text{PWM1}}$ )**

**Figure 15-59. Buck Waveforms for Figure 15-58 (Note:  $F_{\text{PWM}2} = F_{\text{PWM}1}$ )**

**Table 15-46. EPWM1 Initialization for Figure 15-58**

| Register | Bit       | Value       | Comments                   |

**Example 15-4. Code Snippet for Configuration in Figure 15-58**

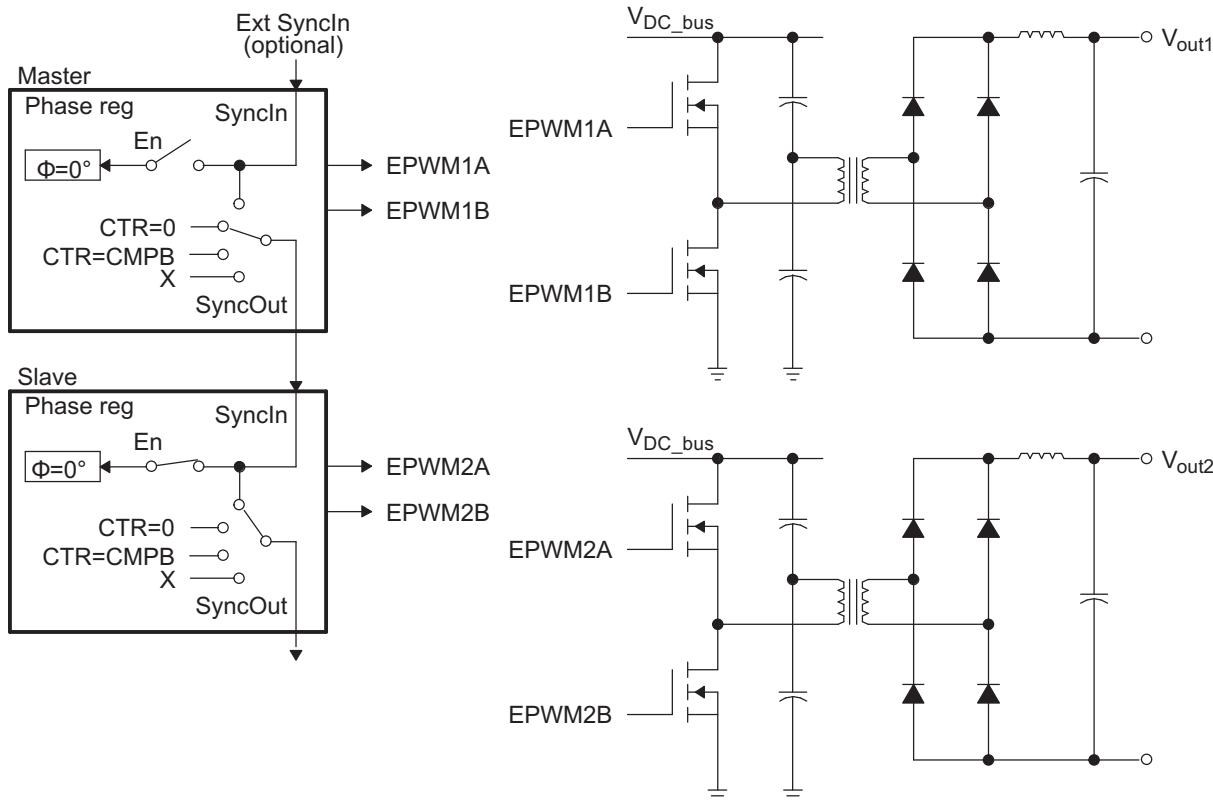

```
// Run Time (Note: Example execution of one run-time instance)
//=====
EPwm1Regs.CMPA.half.CMPA = 400;           // adjust duty for output EPWM1A
EPwm1Regs.CMPB = 200;                     // adjust duty for output EPWM1B
EPwm2Regs.CMPA.half.CMPA = 500;           // adjust duty for output EPWM2A
EPwm2Regs.CMPB = 300;                     // adjust duty for output EPWM2B
```

### 15.2.3.5 Controlling Multiple Half H-Bridge (HHB) Converters

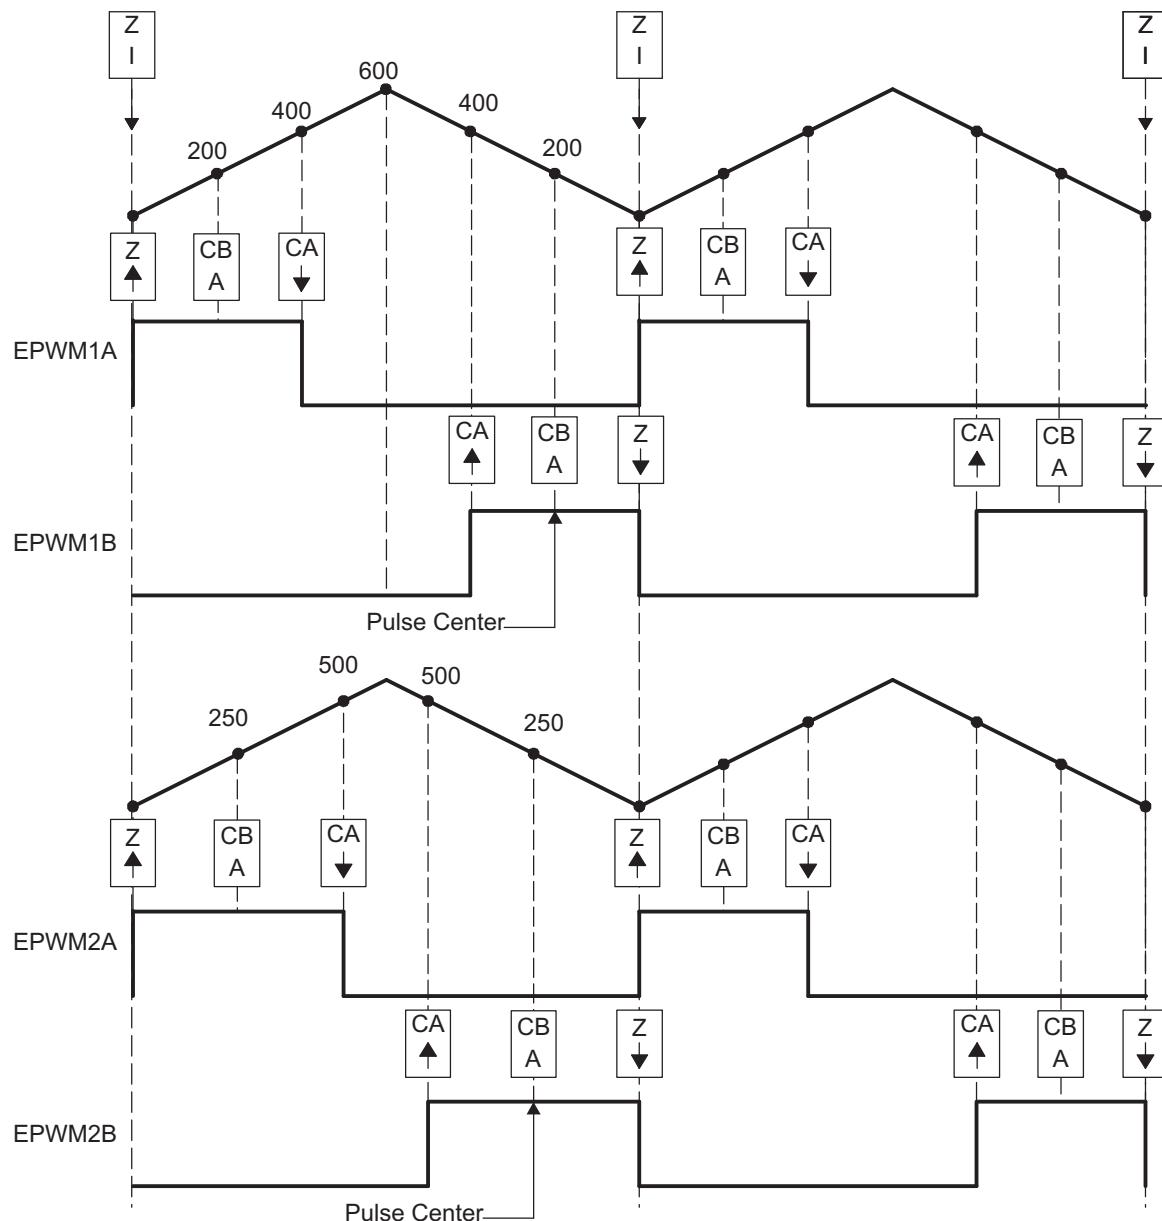

Topologies that require control of multiple switching elements can also be addressed with these same ePWM modules. It is possible to control a Half-H bridge stage with a single ePWM module. This control can be extended to multiple stages. Figure 15-60 shows control of two synchronized Half-H bridge stages where stage 2 can operate at integer multiple (N) frequencies of stage 1. Figure 15-61 shows the waveforms generated by the configuration shown in Figure 15-60.

Module 2 (slave) is configured for Sync flow-through; if required, this configuration allows for a third Half-H bridge to be controlled by PWM module 3 and also, most importantly, to remain in synchronization with master module 1.

**Figure 15-60. Control of Two Half-H Bridge Stages ( $F_{\text{PWM}2} = N \times F_{\text{PWM}1}$ )**

**Figure 15-61. Half-H Bridge Waveforms for Figure 15-60 (Note: Here  $F_{\text{PWM}2} = F_{\text{PWM}1}$ )**

**Table 15-48. EPWM1 Initialization for Figure 15-60**

| Register | Bit       | Value       | Comments                   |

EPwm2Regs.CMPB = 250;           // adjust duty for output EPWM2B
```

### 15.2.3.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM)

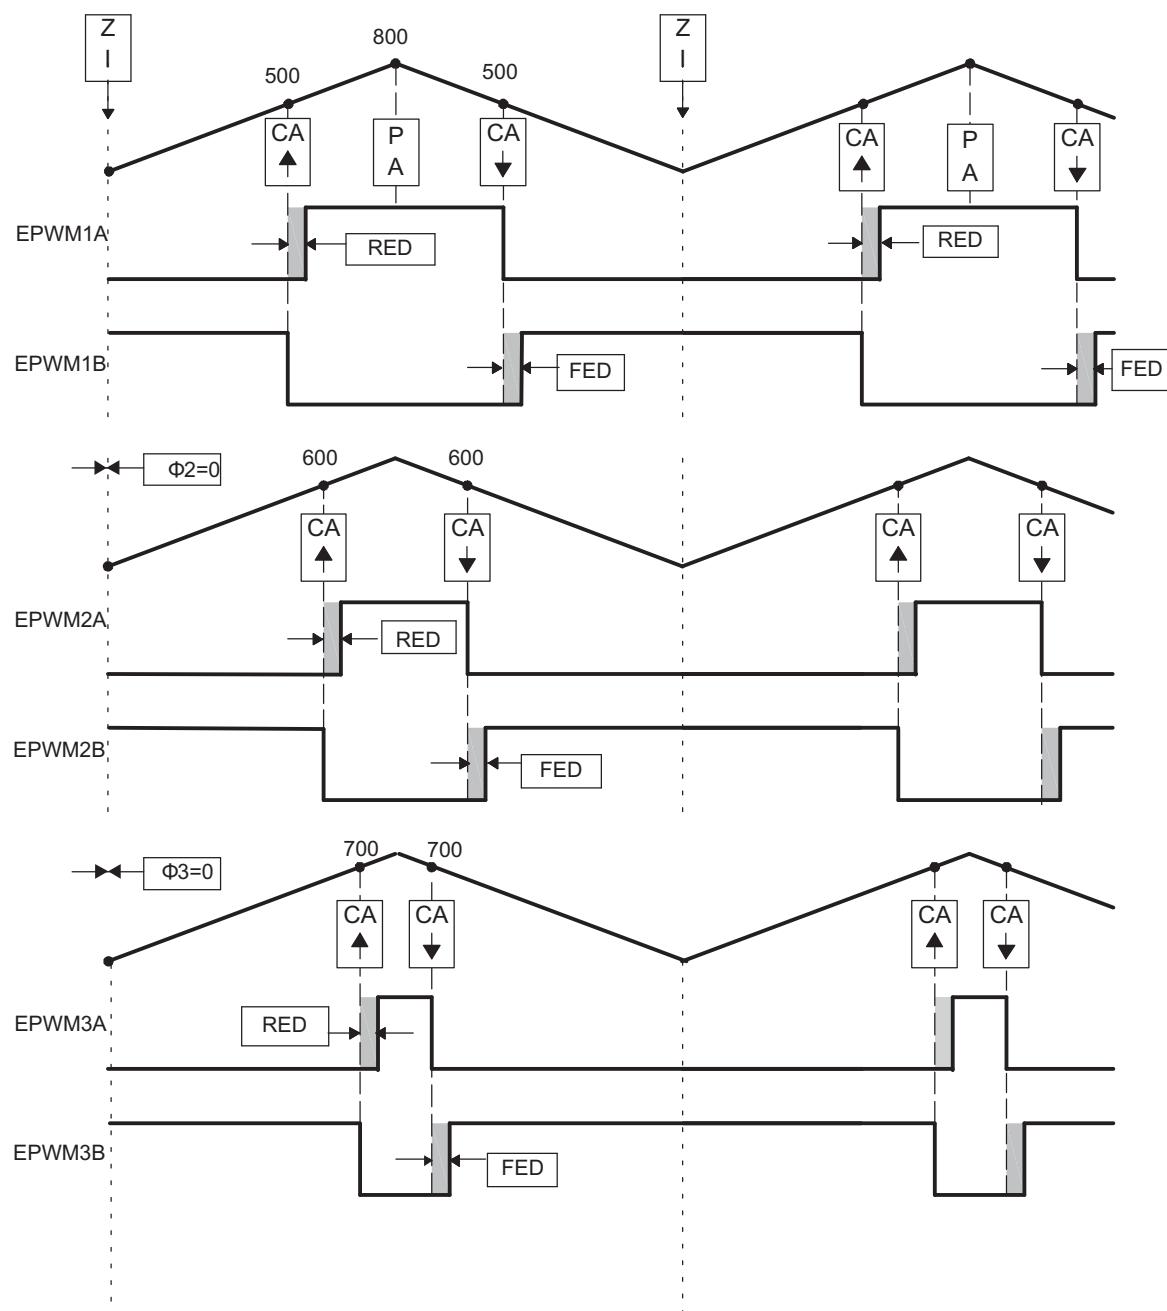

The idea of multiple modules controlling a single power stage can be extended to the 3-phase Inverter case. In such a case, six switching elements can be controlled using three PWM modules, one for each leg of the inverter. Each leg must switch at the same frequency and all legs must be synchronized. A master + two slaves configuration can easily address this requirement. [Figure 15-62](#) shows how six PWM modules can control two independent 3-phase Inverters; each running a motor.

As in the cases shown in the previous sections, we have a choice of running each inverter at a different frequency (module 1 and module 4 are masters as in [Figure 15-62](#)), or both inverters can be synchronized by using one master (module 1) and five slaves. In this case, the frequency of modules 4, 5, and 6 (all equal) can be integer multiples of the frequency for modules 1, 2, 3 (also all equal).

**Figure 15-62. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control**

EPwm3Regs.CMPA.half.CMPA = 700; // adjust duty for output EPWM3A
```

### 15.2.3.7 Practical Applications Using Phase Control Between PWM Modules

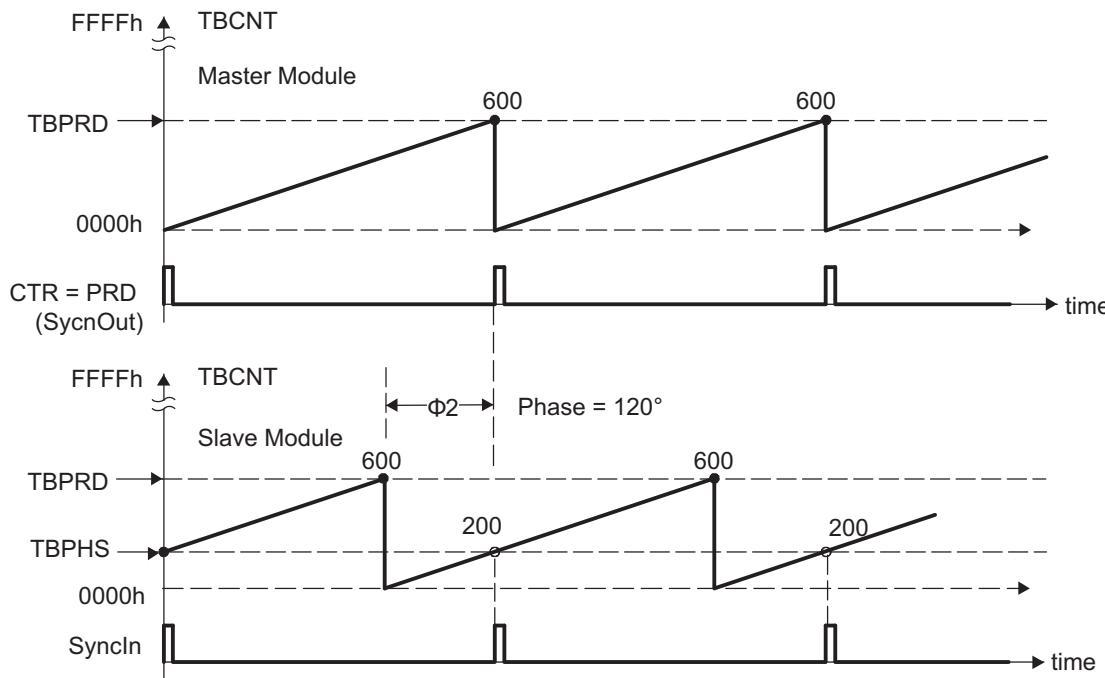

So far, none of the examples have made use of the phase register (TBPHS). It has either been set to zero or its value has been a don't care. However, by programming appropriate values into TBPHS, multiple PWM modules can address another class of power topologies that rely on phase relationship between legs (or stages) for correct operation. As described in the TB module section, a PWM module can be configured to allow a SyncIn pulse to cause the TBPHS register to be loaded into the TBCNT register. To illustrate this concept, [Figure 15-64](#) shows a master and slave module with a phase relationship of 120°, that is, the slave leads the master.

**Figure 15-64. Configuring Two PWM Modules for Phase Control**

[Figure 15-65](#) shows the associated timing waveforms for this configuration. Here, TBPRD = 600 for both master and slave. For the slave, TBPHS = 200 ( $200/600 \times 360^\circ = 120^\circ$ ). Whenever the master generates a SyncIn pulse (CTR = PRD), the value of TBPHS = 200 is loaded into the slave TBCNT register so the slave time-base is always leading the master's time-base by 120°.

**Figure 15-65. Timing Waveforms Associated With Phase Control Between 2 Modules**

#### 15.2.3.8 Controlling a 3-Phase Interleaved DC/DC Converter

A popular power topology that makes use of phase-offset between modules is shown in [Figure 15-66](#). This system uses three PWM modules, with module 1 configured as the master. To work, the phase relationship between adjacent modules must be  $F = 120^\circ$ . This is achieved by setting the slave TBPHS registers 2 and 3 with values of 1/3 and 2/3 of the period value, respectively. For example, if the period register is loaded with a value of 600 counts, then TBPHS (slave 2) = 200 and TBPHS (slave 3) = 400. Both slave modules are synchronized to the master 1 module.

This concept can be extended to four or more phases, by setting the TBPHS values appropriately. The following formula gives the TBPHS values for N phases:

$$\text{TBPHS}(N,M) = (\text{TBPRD}/N) \times (M - 1)$$

Where:

N = number of phases

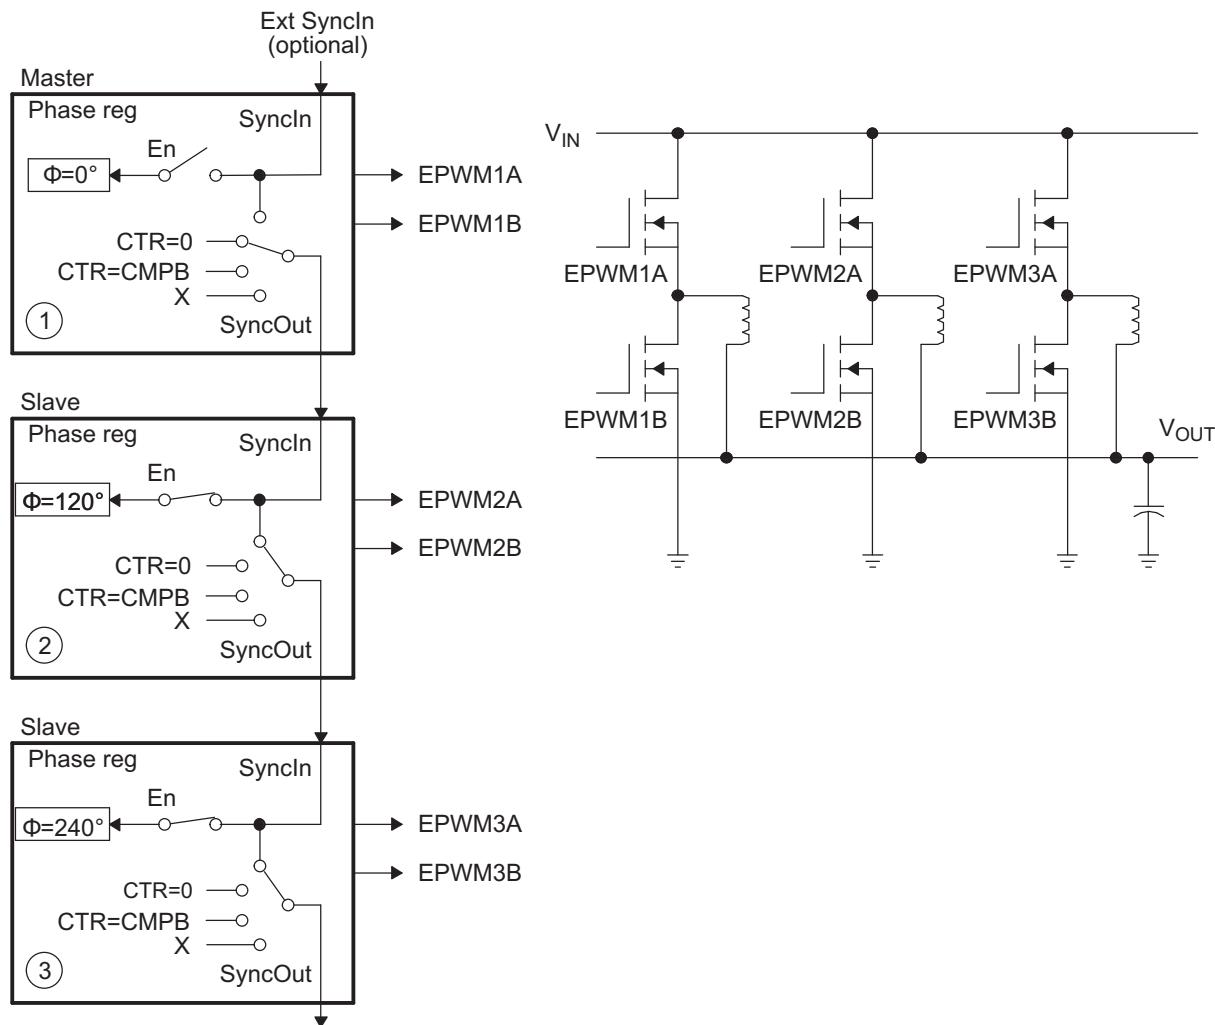

M = PWM module number

For example, for the 3-phase case ( $N = 3$ ),  $\text{TBPRD} = 600$ ,

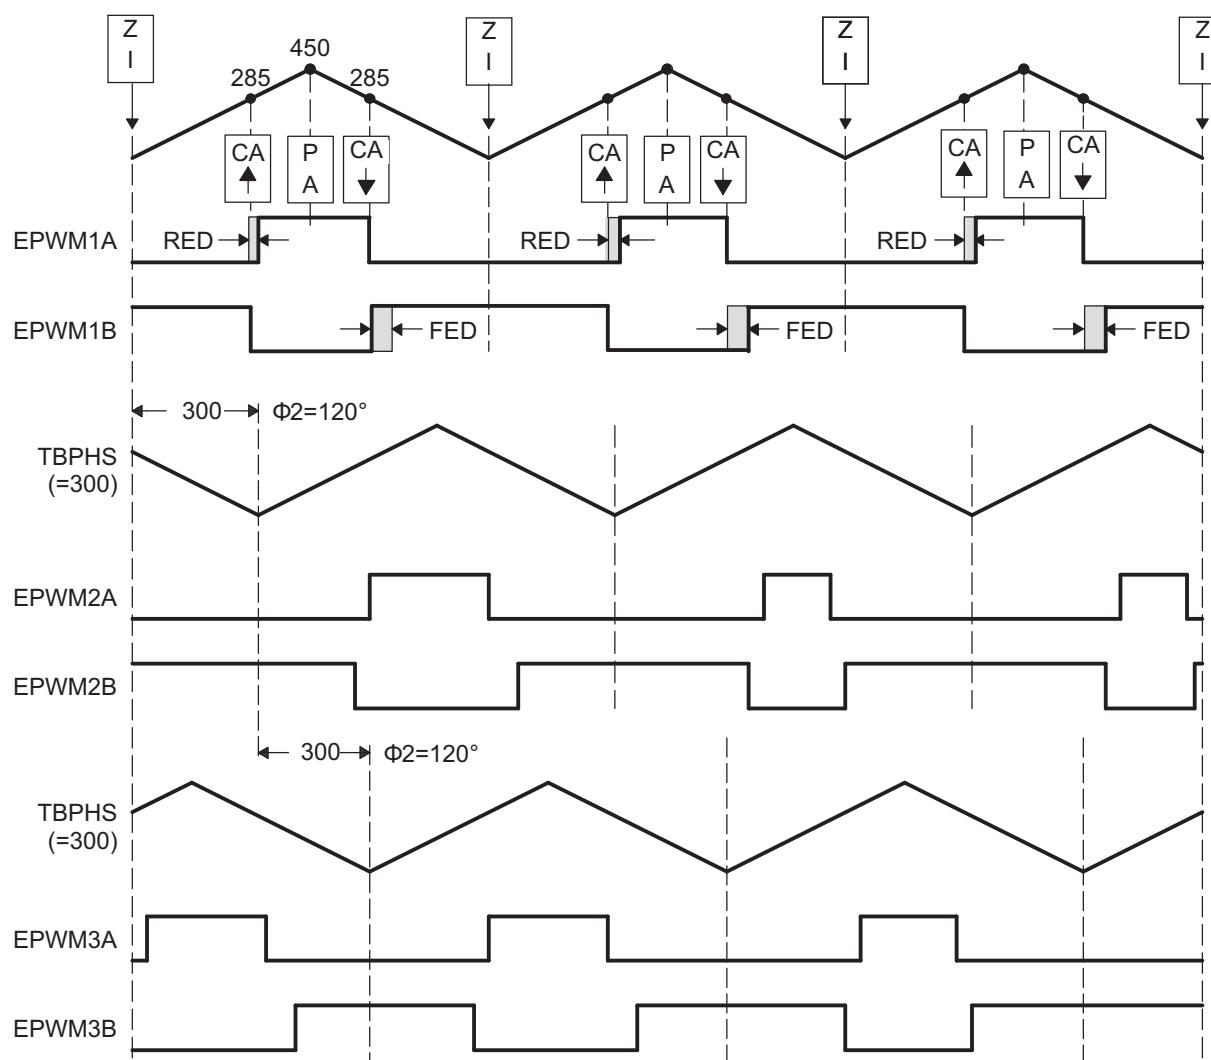

$$\text{TBPHS}(3,2) = (600/3) \times (2 - 1) = 200 \times 1 = 200 \text{ (Phase value for Slave module 2)}$$

$$\text{TBPHS}(3,3) = (600/3) \times (3 - 1) = 200 \times 2 = 400 \text{ (Phase value for Slave module 3)}$$

[Figure 15-67](#) shows the waveforms for the configuration in [Figure 15-66](#).

EPwm3Regs.CMPA.half.CMPA = 285;           // adjust duty for output EPWM3A
```

### 15.2.3.9 Controlling Zero Voltage Switched Full Bridge (ZVSFB) Converter

The example given in [Figure 15-68](#) assumes a static or constant phase relationship between legs (modules). In such a case, control is achieved by modulating the duty cycle. It is also possible to dynamically change the phase value on a cycle-by-cycle basis. This feature lends itself to controlling a class of power topologies known as *phase-shifted full bridge*, or *zero voltage switched full bridge*. Here the controlled parameter is not duty cycle (this is kept constant at approximately 50 percent); instead it is the phase relationship between legs. Such a system can be implemented by allocating the resources of two PWM modules to control a single power stage, which in turn requires control of four switching elements. [Figure 15-69](#) shows a master/slave module combination synchronized together to control a full H-bridge. In this case, both master and slave modules are required to switch at the same PWM frequency. The phase is controlled by using the slave's phase register (TBPHS). The master's phase register is not used and therefore can be initialized to zero.

**Figure 15-68. Controlling a Full-H Bridge Stage ( $F_{\text{PWM}2} = F_{\text{PWM}1}$ )**

**Figure 15-69. ZVS Full-H Bridge Waveforms**

**Table 15-56. EPWM1 Initialization for Figure 15-68**

| Register | Bit       | Value          | Comments                   |
|----------|-----------|----------------|----------------------------|
| TBPRD    | TBPRD     | 1200 (4B0h)    | Period = 1201 TBCLK counts |
| TBPHS    | TBPHS     | 0              | Clear Phase Register to 0  |
| TBCTL    | CTRMODE   | TB_UP          |                            |
|          | PHSEN     | TB_DISABLE     | Phase loading disabled     |
|          | PRDLDD    | TB_SHADOW      |                            |
|          | SYNCOSEL  | TB_CTR_ZERO    | Sync down-stream module    |
| CMPA     | CMPA      | 600 (258h)     | Set 50% duty for EPWM1A    |
| CMPCTL   | SHDWAMODE | CC_SHADOW      |                            |
|          | SHDWBMODE | CC_SHADOW      |                            |
|          | LOADAMODE | CC_CTR_ZERO    | Load on CTR = 0            |
|          | LOADBMODE | CC_CTR_ZERO    | Load on CTR = 0            |
| AQCTLA   | ZRO       | AQ_SET         | Set actions for EPWM1A     |
|          | CAU       | AQ_CLEAR       |                            |
| DBCTL    | MODE      | DB_FULL_ENABLE | Enable Dead-band module    |
|          | POLSEL    | DB_ACTV_HIC    | Active Hi complementary    |
| DBFED    | DBFED     | 50             | FED = 50 TBCLKs            |
|          | DBRED     | 70             | RED = 70 TBCLKs            |

**Table 15-57. EPWM2 Initialization for Figure 15-68**

| Register | Bit       | Value          | Comments                   |
|----------|-----------|----------------|----------------------------|
| TBPRD    | TBPRD     | 1200 (4B0h)    | Period = 1201 TBCLK counts |
| TBPHS    | TBPHS     | 0              | Clear Phase Register to 0  |
| TBCTL    | CTRMODE   | TB_UP          |                            |
|          | PHSEN     | TB_ENABLE      | Slave module               |
|          | PRDLDD    | TB_SHADOW      |                            |
|          | SYNCOSEL  | TB_SYNC_IN     | Sync flow-through          |
| CMPA     | CMPA      | 600 (258h)     | Set 50% duty for EPWM2A    |
| CMPCTL   | SHDWAMODE | CC_SHADOW      |                            |
|          | SHDWBMODE | CC_SHADOW      |                            |
|          | LOADAMODE | CC_CTR_ZERO    | Load on CTR = 0            |
|          | LOADBMODE | CC_CTR_ZERO    | Load on CTR = 0            |
| AQCTLA   | ZRO       | AQ_SET         | Set actions for EPWM2A     |
|          | CAU       | AQ_CLEAR       |                            |
| DBCTL    | MODE      | DB_FULL_ENABLE | Enable Dead-band module    |
|          | POLSEL    | DB_ACTV_HIC    | Active Hi complementary    |
| DBFED    | DBFED     | 30             | FED = 30 TBCLKs            |
|          | DBRED     | 40             | RED = 40 TBCLKs            |

**Example 15-8. Code Snippet for Configuration in Figure 15-68**

```
// Run Time (Note: Example execution of one run-time instance)
//=====
EPwm2Regs.TBPHS = 1200-300; // Set Phase reg to 300/1200 * 360 = 90 deg
EPwm1Regs.DBFED = FED1_NewValue; // Update ZVS transition interval
EPwm1Regs.DBRED = RED1_NewValue; // Update ZVS transition interval
EPwm2Regs.DBFED = FED2_NewValue; // Update ZVS transition interval
EPwm2Regs.DBRED = RED2_NewValue; // Update ZVS transition interval
```

## 15.2.4 Registers

**Table 15-58. ePWM Module Control and Status Registers Grouped by Submodule**

| Acronym   | Offset <sup>(1)</sup> | Size<br>(x16) | Shadow | Register Description  |
|---|-----------------------|---------------|--------|---|
| <b>Time-Base Submodule Registers (Section 15.2.4.1)</b>                   |                       |               |        |   |
| TBCTL   | 0h                    | 1             | No     | Time-Base Control Register                                    |
| TBSTS   | 2h                    | 1             | No     | Time-Base Status Register                                     |
| TBPHSHR   | 4h                    | 1             | No     | Extension for HRPWM Phase Register <sup>(2)</sup>             |
| TBPHS   | 6h                    | 1             | No     | Time-Base Phase Register                                      |
| TBCNT   | 8h                    | 1             | No     | Time-Base Counter Register                                    |
| TBPRD   | Ah                    | 1             | Yes    | Time-Base Period Register                                     |
| <b>Counter-Compare Submodule Registers (Section 15.2.4.2)</b>             |                       |               |        |   |
| CMPCTL  | Eh                    | 1             | No     | Counter-Compare Control Register                              |
| CMPAHR  | 10h                   | 1             | No     | Extension for HRPWM Counter-Compare A Register <sup>(2)</sup> |
| CMPA  | 12h                   | 1             | Yes    | Counter-Compare A Register                                    |
| CMPB  | 14h                   | 1             | Yes    | Counter-Compare B Register                                    |
| <b>Action-Qualifier Submodule Registers (Section 15.2.4.3)</b>            |                       |               |        |   |
| AQCTLA  | 16h                   | 1             | No     | Action-Qualifier Control Register for Output A (EPWMxA)       |
| AQCTLB  | 18h                   | 1             | No     | Action-Qualifier Control Register for Output B (EPWMxB)       |
| AQSFR   | 1Ah                   | 1             | No     | Action-Qualifier Software Force Register                      |
| AQCSFR  | 1Ch                   | 1             | Yes    | Action-Qualifier Continuous S/W Force Register Set            |
| <b>Dead-Band Generator Submodule Registers (Section 15.2.4.4)</b>         |                       |               |        |   |
| DBCTL   | 1Eh                   | 1             | No     | Dead-Band Generator Control Register                          |
| DBRED   | 20h                   | 1             | No     | Dead-Band Generator Rising Edge Delay Count Register          |
| DBFED   | 22h                   | 1             | No     | Dead-Band Generator Falling Edge Delay Count Register         |
| <b>Trip-Zone Submodule Registers (Section 15.2.4.5)</b>                   |                       |               |        |   |
| TZSEL   | 24h                   | 1             | No     | Trip-Zone Select Register                                     |
| TZCTL   | 28h                   | 1             | No     | Trip-Zone Control Register                                    |
| TZEINT  | 2Ah                   | 1             | No     | Trip-Zone Enable Interrupt Register                           |
| TZFLG   | 2Ch                   | 1             | No     | Trip-Zone Flag Register                                       |
| TZCLR   | 2Eh                   | 1             | No     | Trip-Zone Clear Register                                      |
| TZFRC   | 30h                   | 1             | No     | Trip-Zone Force Register                                      |
| <b>Event-Trigger Submodule Registers (Section 15.2.4.6)</b>               |                       |               |        |   |
| ETSEL   | 32h                   | 1             | No     | Event-Trigger Selection Register                              |
| ETPS  | 34h                   | 1             | No     | Event-Trigger Pre-Scale Register                              |
| ETFLG   | 36h                   | 1             | No     | Event-Trigger Flag Register                                   |
| ETCLR   | 38h                   | 1             | No     | Event-Trigger Clear Register                                  |
| ETFRC   | 3Ah                   | 1             | No     | Event-Trigger Force Register                                  |
| <b>PWM-Chopper Submodule Registers (Section 15.2.4.7)</b>                 |                       |               |        |   |
| PCCTL   | 3Ch                   | 1             | No     | PWM-Chopper Control Register                                  |
| <b>High-Resolution PWM (HRPWM) Submodule Registers (Section 15.2.4.8)</b> |                       |               |        |   |
| HRCTL   | 40h                   | 1             | No     | HRPWM Control Register <sup>(2)</sup>                         |

<sup>(1)</sup> Locations not shown are reserved.

<sup>(2)</sup> These registers are only available on ePWM instances that include the high-resolution PWM (HRPWM) extension; otherwise, these locations are reserved. See [Section 15.1.2](#) to determine which instances include the HRPWM.

### 15.2.4.1 Time-Base Submodule Registers

**Table 15-59** lists the memory-mapped registers for the time-base submodule. All other register offset addresses not listed in **Table 15-59** should be considered as reserved locations and the register contents should not be modified.

**Table 15-59. Time-Base Submodule Registers**

| Offset | Acronym | Register Description                                    | Section            |
|--------|---------|---|--------------------|
| 0h     | TBCTL   | Time-Base Control Register                              | Section 15.2.4.1.1 |
| 2h     | TBSTS   | Time-Base Status Register                               | Section 15.2.4.1.2 |
| 4h     | TBPHSR  | Time-Base Phase High-Resolution Register <sup>(1)</sup> | Section 15.2.4.8.1 |
| 6h     | TBPHS   | Time-Base Phase Register                                | Section 15.2.4.1.3 |
| 8h     | TBCNT   | Time-Base Counter Register                              | Section 15.2.4.1.4 |
| Ah     | TBPRD   | Time-Base Period Register                               | Section 15.2.4.1.5 |

<sup>(1)</sup> This register is only available on ePWM instances that include the high-resolution PWM (HRPWM) extension; otherwise, this location is reserved.

#### 15.2.4.1.1 Time-Base Control Register (TBCTL)

The time-base control register (TBCTL) is shown in **Figure 15-70** and described in **Table 15-60**.

**Figure 15-70. Time-Base Control Register (TBCTL)**

| 15         | 14      | 13      | 12     | 10    | 9         | 8      |
|------------|---------|---------|--------|-------|-----------|--------|
| FREE, SOFT | PHSDIR  |         | CLKDIV |       | HSPCLKDIV |        |
| R/W-0      | R/W-0   |         | R/W-0  |       | R/W-0     |        |
| 7          | 6       | 5       | 4      | 3     | 2         | 1      |
| HSPCLKDIV  | SWFSYNC | SYNCSEL | PRDL   | PHSEN | CTRMODE   |        |
| R/W-1      | R/W-0   | R/W-0   | R/W-0  | R/W-0 | R/W-0     | R/W-3h |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-60. Time-Base Control Register (TBCTL) Field Descriptions**

| Bit   | Field      | Value | Description   |
|-------|------------|-------|---|
| 15-14 | FREE, SOFT | 0-3h  | Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events:<br><br>0 Stop after the next time-base counter increment or decrement<br>1h Stop when counter completes a whole cycle: <ul style="list-style-type: none"><li>• Up-count mode: stop when the time-base counter = period (TBCNT = TBPRD)</li><li>• Down-count mode: stop when the time-base counter = 0000 (TBCNT = 0000h)</li><li>• Up-down-count mode: stop when the time-base counter = 0000 (TBCNT = 0000h)</li></ul><br>2h-3h Free run          |
| 13    | PHSDIR     |       | Phase Direction Bit. This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCNT) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event..<br><br>In the up-count and down-count modes this bit is ignored.<br>0 Count down after the synchronization event.<br>1 Count up after the synchronization event. |

**Table 15-60. Time-Base Control Register (TBCTL) Field Descriptions (continued)**

| Bit   | Field     | Value | Description  |
|-------|-----------|-------|--|
| 12:10 | CLKDIV    | 0-7h  | Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value.<br>$TBCLK = SYSCLKOUT/(HSPCLKDIV \times CLKDIV)$   |
|       |           | 0     | /1 (default on reset)  |
|       |           | 1h    | /2   |
|       |           | 2h    | /4   |
|       |           | 3h    | /8   |
|       |           | 4h    | /16  |
|       |           | 5h    | /32  |
|       |           | 6h    | /64  |
|       |           | 7h    | /128   |
| 9-7   | HSPCLKDIV | 0-7h  | High-Speed Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value.<br>$TBCLK = SYSCLKOUT/(HSPCLKDIV \times CLKDIV)$<br>This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager (EV) peripheral.  |
|       |           | 0     | /1   |
|       |           | 1h    | /2 (default on reset)  |
|       |           | 2h    | /4   |
|       |           | 3h    | /6   |
|       |           | 4h    | /8   |
|       |           | 5h    | /10  |
|       |           | 6h    | /12  |
|       |           | 7h    | /14  |
| 6     | SWFSYNC   | 0     | Software Forced Synchronization Pulse<br>Writing a 0 has no effect and reads always return a 0.  |
|       |           | 1     | Writing a 1 forces a one-time synchronization pulse to be generated.<br>This event is ORed with the EPWMxSYNCI input of the ePWM module.<br>SWFSYNC is valid (operates) only when EPWMxSYNCI is selected by SYNCSEL = 00.  |
| 5-4   | SYNCSEL   | 0-3h  | Synchronization Output Select. These bits select the source of the EPWMxSYNCO signal.<br>EPWMxSYNC:<br>CTR = 0: Time-base counter equal to zero (TBCNT = 0000h)<br>CTR = CMPB : Time-base counter equal to counter-compare B (TBCNT = CMPB)<br>Disable EPWMxSYNCO signal |
| 3     | PRDLD     | 0     | Active Period Register Load From Shadow Register Select<br>The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCNT, is equal to zero.<br>A write or read to the TBPRD register accesses the shadow register.                    |
|       |           | 1     | Load the TBPRD register immediately without using a shadow register.<br>A write or read to the TBPRD register directly accesses the active register.   |
| 2     | PHSEN     | 0     | Counter Register Load From Phase Register Enable<br>Do not load the time-base counter (TBCNT) from the time-base phase register (TBPHS)  |
|       |           | 1     | Load the time-base counter with the phase register when an EPWMxSYNCI input signal occurs or when a software synchronization is forced by the SWFSYNC bit.   |

**Table 15-60. Time-Base Control Register (TBCTL) Field Descriptions (continued)**

| Bit | Field   | Value | Description  |
|-----|---------|-------|--|
| 1-0 | CTRMODE | 0-3h  | <p>Counter Mode. The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change.</p> <p>These bits set the time-base counter mode of operation as follows:</p> <ul style="list-style-type: none"> <li>0 Up-count mode</li> <li>1h Down-count mode</li> <li>2h Up-down-count mode</li> <li>3h Stop-freeze counter operation (default on reset)</li> </ul> |

**15.2.4.1.2 Time-Base Status Register (TBSTS)**

The time-base status register (TBSTS) is shown in [Figure 15-71](#) and described in [Table 15-61](#).

**Figure 15-71. Time-Base Status Register (TBSTS)**

|    |          |   |         |         |     |
|----|----------|---|---------|---------|-----|
| 15 | Reserved | 3 | 2       | 1       | 0   |
|    | R-0      |   | R/W1C-0 | R/W1C-0 | R-1 |

LEGEND: R/W = Read/Write; R/W1C = Read/Write 1 to clear; -n = value after reset

**Table 15-61. Time-Base Status Register (TBSTS) Field Descriptions**

| Bit  | Field    | Value | Description  |
|------|----------|-------|--|
| 15-3 | Reserved | 0     | Reserved   |
| 2    | CTRMAX   | 0     | Time-Base Counter Max Latched Status Bit   |
|      |          | 1     | Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect.  |
|      |          | 1     | Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event.   |
| 1    | SYNCI    | 0     | Input Synchronization Latched Status Bit   |
|      |          | 1     | Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. Reading a 1 on this bit indicates that an external synchronization event has occurred (EPWMxSYNCI). Writing a 1 to this bit will clear the latched event. |
| 0    | CTRDIR   | 0     | Time-Base Counter Direction Status Bit. At reset, the counter is frozen; therefore, this bit has no meaning. To make this bit meaningful, you must first set the appropriate mode via TBCTL[CTRMODE].  |
|      |          | 1     | Time-Base Counter is currently counting down.  |
|      |          | 1     | Time-Base Counter is currently counting up.  |

**15.2.4.1.3 Time-Base Phase Register (TBPHS)**

The time-base phase register (TBPHS) is shown in [Figure 15-72](#) and described in [Table 15-62](#).

**Figure 15-72. Time-Base Phase Register (TBPHS)**

|    |       |   |
|----|-------|---|
| 15 | TBPHS | 0 |
|    | R/W-0 |   |

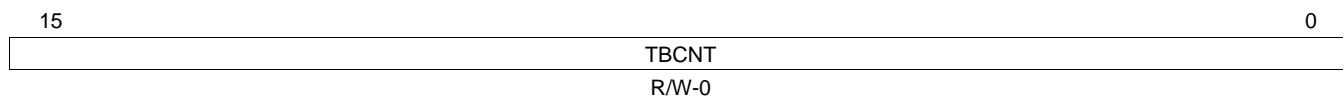

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-62. Time-Base Phase Register (TBPHS) Field Descriptions**

| Bits | Name  | Value   | Description  |
|------|-------|---------|--|
| 15-0 | TBPHS | 0xFFFFh | <p>These bits set time-base counter phase of the selected ePWM relative to the time-base that is supplying the synchronization input signal.</p> <ul style="list-style-type: none"> <li>If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase.</li> <li>If TBCTL[PHSEN] = 1, then the time-base counter (TBCNT) will be loaded with the phase (TBPHS) when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal (EPWMxSYNCl) or by a software forced synchronization.</li> </ul> |

**15.2.4.1.4 Time-Base Counter Register (TBCNT)**

The time-base counter register (TBCNT) is shown in [Figure 15-73](#) and described in [Table 15-63](#).

**Figure 15-73. Time-Base Counter Register (TBCNT)**

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-63. Time-Base Counter Register (TBCNT) Field Descriptions**

| Bits | Name  | Value   | Description  |
|------|-------|---------|--|
| 15-0 | TBCNT | 0xFFFFh | <p>Reading these bits gives the current time-base counter value.</p> <p>Writing to these bits sets the current time-base counter value. The update happens as soon as the write occurs; the write is NOT synchronized to the time-base clock (TBCLK) and the register is not shadowed.</p> |

#### 15.2.4.1.5 Time-Base Period Register (TBPRD)

The time-base period register (TBPRD) is shown in [Figure 15-74](#) and described in [Table 15-64](#).

**Figure 15-74. Time-Base Period Register (TBPRD)**

|       |   |
|-------|---|
| 15    | 0 |
| TBPRD |   |
| R/W-0 |   |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-64. Time-Base Period Register (TBPRD) Field Descriptions**

| Bits | Name  | Value   | Description   |
|------|-------|---------|---|
| 15-0 | TBPRD | 0xFFFFh | <p>These bits determine the period of the time-base counter. This sets the PWM frequency.</p> <p>Shadowing of this register is enabled and disabled by the TBCTL[PRDLD] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>If TBCTL[PRDLD] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the active register will be loaded from the shadow register when the time-base counter equals zero.</li> <li>If TBCTL[PRDLD] = 1, then the shadow is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware.</li> <li>The active and shadow registers share the same memory map address.</li> </ul> |

#### 15.2.4.2 Counter-Compare Submodule Registers

[Table 15-65](#) lists the memory-mapped registers for the counter-compare submodule. All other register offset addresses not listed in [Table 15-65](#) should be considered as reserved locations and the register contents should not be modified.

**Table 15-65. Counter-Compare Submodule Registers**

| Offset | Acronym | Register Description                                      | Section                            |
|--------|---------|---|------------------------------------|
| Eh     | CMPCTL  | Counter-Compare Control Register                          | <a href="#">Section 15.2.4.2.1</a> |
| 10h    | CMPAHR  | Counter-Compare A High-Resolution Register <sup>(1)</sup> | <a href="#">Section 15.2.4.8.2</a> |
| 12h    | CMPA    | Counter-Compare A Register                                | <a href="#">Section 15.2.4.2.2</a> |
| 14h    | CMPB    | Counter-Compare B Register                                | <a href="#">Section 15.2.4.2.3</a> |

<sup>(1)</sup> This register is only available on ePWM instances that include the high-resolution PWM (HRPWM) extension; otherwise, this location is reserved.

#### 15.2.4.2.1 Counter-Compare Control Register (CMPCTL)

The counter-compare control register (CMPCTL) is shown in [Figure 15-75](#) and described in [Table 15-66](#).

**Figure 15-75. Counter-Compare Control Register (CMPCTL)**

| 15       | Reserved  |   |          |           |   |           | 10  | 9         | 8   |
|----------|-----------|---|----------|-----------|---|-----------|-----|-----------|-----|
|          |           |   |          |           |   |           | R-0 | R-0       | R-0 |
| 7        | 6         | 5 | 4        | 3         | 2 | 1         |     |           | 0   |
| Reserved | SHDWBMODE |   | Reserved | SHDWAMODE |   | LOADBMODE |     | LOADAMODE |     |
| R-0      | R/W-0     |   | R-0      | R/W-0     |   | R/W-0     |     | R/W-0     |     |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-66. Counter-Compare Control Register (CMPCTL) Field Descriptions**

| Bits  | Name      | Value | Description  |
|-------|-----------|-------|--|
| 15-10 | Reserved  | 0     | Reserved   |
| 9     | SHDWBFULL | 0     | Counter-compare B (CMPB) Shadow Register Full Status Flag. This bit self clears once a load-strobe occurs.   |
|       |           | 1     | CMPB shadow FIFO not full yet  |
|       |           | 1     | Indicates the CMPB shadow FIFO is full; a CPU write will overwrite current shadow value.   |
| 8     | SHDWAFULL | 0     | Counter-compare A (CMPA) Shadow Register Full Status Flag. The flag bit is set when a 32-bit write to CMPA:CMPAHR register or a 16-bit write to CMPA register is made. A 16-bit write to CMPAHR register will not affect the flag. This bit self clears once a load-strobe occurs. |
|       |           | 1     | CMPA shadow FIFO not full yet  |
|       |           | 1     | Indicates the CMPA shadow FIFO is full, a CPU write will overwrite the current shadow value.   |
| 7     | Reserved  | 0     | Reserved   |
| 6     | SHDWBMODE | 0     | Counter-compare B (CMPB) Register Operating Mode   |
|       |           | 1     | Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register.   |
|       |           | 1     | Immediate mode. Only the active compare B register is used. All writes and reads directly access the active register for immediate compare action.   |
| 5     | Reserved  |       | Reserved   |
| 4     | SHDWAMODE | 0     | Counter-compare A (CMPA) Register Operating Mode   |
|       |           | 1     | Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register.   |
|       |           | 1     | Immediate mode. Only the active compare register is used. All writes and reads directly access the active register for immediate compare action  |
| 3-2   | LOADBMODE | 0-3h  | Active Counter-Compare B (CMPB) Load From Shadow Select Mode. This bit has no effect in immediate mode (CMPCTL[SHDWBMODE] = 1).  |
|       |           | 0     | Load on CTR = 0: Time-base counter equal to zero (TBCNT = 0000h)   |
|       |           | 1h    | Load on CTR = PRD: Time-base counter equal to period (TBCNT = TBPRD)   |
|       |           | 2h    | Load on either CTR = 0 or CTR = PRD  |
|       |           | 3h    | Freeze (no loads possible)   |
| 1-0   | LOADAMODE | 0-3h  | Active Counter-Compare A (CMPA) Load From Shadow Select Mode. This bit has no effect in immediate mode (CMPCTL[SHDWAMODE] = 1).  |
|       |           | 0     | Load on CTR = 0: Time-base counter equal to zero (TBCNT = 0000h)   |
|       |           | 1h    | Load on CTR = PRD: Time-base counter equal to period (TBCNT = TBPRD)   |
|       |           | 2h    | Load on either CTR = 0 or CTR = PRD  |
|       |           | 3h    | Freeze (no loads possible)   |

### 15.2.4.2.2 Counter-Compare A Register (CMPA)

The counter-compare A register (CMPA) is shown in [Figure 15-76](#) and described in [Table 15-67](#).

**Figure 15-76. Counter-Compare A Register (CMPA)**

|    |       |   |
|----|-------|---|
| 15 | CMPA  | 0 |
|    | R/W-0 |   |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-67. Counter-Compare A Register (CMPA) Field Descriptions**

| Bits | Name | Value   | Description  |
|------|------|---------|--|
| 15-0 | CMPA | 0xFFFFh | <p>The value in the active CMPA register is continuously compared to the time-base counter (TBCNT). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include:</p> <ul style="list-style-type: none"> <li>• Do nothing; the event is ignored.</li> <li>• Clear: Pull the EPWMxA and/or EPWMxB signal low</li> <li>• Set: Pull the EPWMxA and/or EPWMxB signal high</li> <li>• Toggle the EPWMxA and/or EPWMxB signal</li> </ul> <p>Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>• If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register.</li> <li>• Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full.</li> <li>• If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware.</li> <li>• In either mode, the active and shadow registers share the same memory map address.</li> </ul> |

### 15.2.4.2.3 Counter-Compare B Register (CMPB)

The counter-compare B register (CMPB) is shown in [Figure 15-77](#) and described in [Table 15-68](#).

**Figure 15-77. Counter-Compare B Register (CMPB)**

|       |   |
|-------|---|
| 15    | 0 |
| CMPB  |   |
| R/W-0 |   |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-68. Counter-Compare B Register (CMPB) Field Descriptions**

| Bits | Name | Value   | Description  |
|------|------|---------|--|
| 15-0 | CMPB | 0xFFFFh | <p>The value in the active CMPB register is continuously compared to the time-base counter (TBCNT). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare B" event. This event is sent to the action-qualifier where it is qualified and converted into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include:</p> <ul style="list-style-type: none"> <li>• Do nothing. event is ignored.</li> <li>• Clear: Pull the EPWMxA and/or EPWMxB signal low</li> <li>• Set: Pull the EPWMxA and/or EPWMxB signal high</li> <li>• Toggle the EPWMxA and/or EPWMxB signal</li> </ul> <p>Shadowing of this register is enabled and disabled by the CMPCTL[SHDWBMODE] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>• If CMPCTL[SHDWBMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADBMODE] bit field determines which event will load the active register from the shadow register:</li> <li>• Before a write, the CMPCTL[SHDWBFULL] bit can be read to determine if the shadow register is currently full.</li> <li>• If CMPCTL[SHDWBMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware.</li> <li>• In either mode, the active and shadow registers share the same memory map address.</li> </ul> |

### 15.2.4.3 Action-Qualifier Submodule Registers

[Table 15-69](#) lists the memory-mapped registers for the action-qualifier submodule. All other register offset addresses not listed in [Table 15-69](#) should be considered as reserved locations and the register contents should not be modified.

**Table 15-69. Action-Qualifier Submodule Registers**

| Offset | Acronym | Register Description                                | Section                            |
|--------|---------|---|------------------------------------|
| 16h    | AQCTLA  | Action-Qualifier Output A Control Register          | <a href="#">Section 15.2.4.3.1</a> |
| 18h    | AQCTLB  | Action-Qualifier Output B Control Register          | <a href="#">Section 15.2.4.3.2</a> |
| 1Ah    | AQSFRC  | Action-Qualifier Software Force Register            | <a href="#">Section 15.2.4.3.3</a> |
| 1Ch    | AQCSFRC | Action-Qualifier Continuous Software Force Register | <a href="#">Section 15.2.4.3.4</a> |

#### 15.2.4.3.1 Action-Qualifier Output A Control Register (AQCTLA)

The action-qualifier output A control register (AQCTLA) is shown in [Figure 15-78](#) and described in [Table 15-70](#).

**Figure 15-78. Action-Qualifier Output A Control Register (AQCTLA)**

| 15       | 12 | 11    | 10    | 9     | 8     | 7     | 6     | 5 | 4 | 3 | 2 | 1 | 0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-70. Action-Qualifier Output A Control Register (AQCTLA) Field Descriptions**

| Bits  | Name     | Value | Description   |
|-------|----------|-------|---|
| 15-12 | Reserved | 0     | Reserved  |
| 11-10 | CBD      | 0-3h  | Action when the time-base counter equals the active CMPB register and the counter is decrementing.  |
|       |          | 0     | Do nothing (action disabled)  |
|       |          | 1h    | Clear: force EPWMxA output low.   |
|       |          | 2h    | Set: force EPWMxA output high.  |
|       |          | 3h    | Toggle EPWMxA output: low output signal will be forced high, and a high signal will be forced low.  |
| 9-8   | CBU      | 0-3h  | Action when the counter equals the active CMPB register and the counter is incrementing.  |
|       |          | 0     | Do nothing (action disabled)  |
|       |          | 1h    | Clear: force EPWMxA output low.   |
|       |          | 2h    | Set: force EPWMxA output high.  |
|       |          | 3h    | Toggle EPWMxA output: low output signal will be forced high, and a high signal will be forced low.  |
| 7-6   | CAD      | 0-3h  | Action when the counter equals the active CMPA register and the counter is decrementing.  |
|       |          | 0     | Do nothing (action disabled)  |
|       |          | 1h    | Clear: force EPWMxA output low.   |
|       |          | 2h    | Set: force EPWMxA output high.  |
|       |          | 3h    | Toggle EPWMxA output: low output signal will be forced high, and a high signal will be forced low.  |
| 5-4   | CAU      | 0-3h  | Action when the counter equals the active CMPA register and the counter is incrementing.  |
|       |          | 0     | Do nothing (action disabled)  |
|       |          | 1h    | Clear: force EPWMxA output low.   |
|       |          | 2h    | Set: force EPWMxA output high.  |
|       |          | 3h    | Toggle EPWMxA output: low output signal will be forced high, and a high signal will be forced low.  |
| 3-2   | PRD      | 0-3h  | Action when the counter equals the period.<br>Note: By definition, in count up-down mode when the counter equals period the direction is defined as 0 or counting down. |
|       |          | 0     | Do nothing (action disabled)  |
|       |          | 1h    | Clear: force EPWMxA output low.   |
|       |          | 2h    | Set: force EPWMxA output high.  |
|       |          | 3h    | Toggle EPWMxA output: low output signal will be forced high, and a high signal will be forced low.  |
| 1-0   | ZRO      | 0-3h  | Action when counter equals zero.<br>Note: By definition, in count up-down mode when the counter equals 0 the direction is defined as 1 or counting up.                  |
|       |          | 0     | Do nothing (action disabled)  |
|       |          | 1h    | Clear: force EPWMxA output low.   |
|       |          | 2h    | Set: force EPWMxA output high.  |
|       |          | 3h    | Toggle EPWMxA output: low output signal will be forced high, and a high signal will be forced low.  |

#### 15.2.4.3.2 Action-Qualifier Output B Control Register (AQCTLB)

The action-qualifier output B control register (AQCTLB) is shown in [Figure 15-79](#) and described in [Table 15-71](#).

**Figure 15-79. Action-Qualifier Output B Control Register (AQCTLB)**

#### 15.2.4.4 Dead-Band Generator Submodule Registers

[Table 15-74](#) lists the memory-mapped registers for the dead-band generator submodule. All other register offset addresses not listed in [Table 15-74](#) should be considered as reserved locations and the register contents should not be modified.

**Table 15-74. Dead-Band Generator Submodule Registers**

| Offset | Acronym | Register Description                            | Section                            |
|--------|---------|---|------------------------------------|
| 1Eh    | DBCTL   | Dead-Band Generator Control Register            | <a href="#">Section 15.2.4.4.1</a> |
| 20h    | DBRED   | Dead-Band Generator Rising Edge Delay Register  | <a href="#">Section 15.2.4.4.2</a> |
| 22h    | DBFED   | Dead-Band Generator Falling Edge Delay Register | <a href="#">Section 15.2.4.4.3</a> |

#### 15.2.4.4.1 Dead-Band Generator Control Register (DBCTL)

The dead-band generator control register (DBCTL) is shown in [Figure 15-82](#) and described in [Table 15-75](#).

**Figure 15-82. Dead-Band Generator Control Register (DBCTL)**

| 15       | 6 | 5 | 4 | 3       | 2      | 1        | 0 |
|----------|---|---|---|---------|--------|----------|---|
| Reserved |   |   |   | IN_MODE | POLSEL | OUT_MODE |   |
| R-0      |   |   |   | R/W-0   | R/W-0  | R/W-0    |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-75. Dead-Band Generator Control Register (DBCTL) Field Descriptions**

| Bits | Name     | Value | Description   |
|------|----------|-------|---|
| 15-6 | Reserved | 0     | Reserved  |
| 5-4  | IN_MODE  | 0-3h  | <p>Dead Band Input Mode Control. Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown in <a href="#">Figure 15-34</a>. This allows you to select the input source to the falling-edge and rising-edge delay.</p> <p>To produce classical dead-band waveforms, the default is EPWMxA In is the source for both falling and rising-edge delays.</p> <ul style="list-style-type: none"> <li>0 EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay.</li> <li>1h EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal.</li> <li>2h EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal.</li> <li>EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal.</li> <li>3h EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal.</li> <li>EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.</li> </ul>   |
| 3-2  | POLSEL   | 0-3h  | <p>Polarity Select Control. Bit 3 controls the S3 switch and bit 2 controls the S2 switch shown in <a href="#">Figure 15-34</a>. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule.</p> <p>The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter.</p> <p>These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0,0. Other enhanced modes are also possible, but not regarded as typical usage modes.</p> <ul style="list-style-type: none"> <li>0 Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default).</li> <li>1h Active low complementary (ALC) mode. EPWMxA is inverted.</li> <li>2h Active high complementary (AHC). EPWMxB is inverted.</li> <li>3h Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.</li> </ul>  |
| 1-0  | OUT_MODE | 0-3h  | <p>Dead-band Output Mode Control. Bit 1 controls the S1 switch and bit 0 controls the S0 switch shown in <a href="#">Figure 15-34</a>. This allows you to selectively enable or bypass the dead-band generation for the falling-edge and rising-edge delay.</p> <ul style="list-style-type: none"> <li>0 Dead-band generation is bypassed for both output signals. In this mode, both the EPWMxA and EPWMxB output signals from the action-qualifier are passed directly to the PWM-chopper submodule. In this mode, the POLSEL and IN_MODE bits have no effect.</li> <li>1h Disable rising-edge delay. The EPWMxA signal from the action-qualifier is passed straight through to the EPWMxA input of the PWM-chopper submodule.</li> <li>The falling-edge delayed signal is seen on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE].</li> <li>2h Disable falling-edge delay. The EPWMxB signal from the action-qualifier is passed straight through to the EPWMxB input of the PWM-chopper submodule.</li> <li>The rising-edge delayed signal is seen on output EPWMxA. The input signal for the delay is determined by DBCTL[IN_MODE].</li> <li>3h Dead-band is fully enabled for both rising-edge delay on output EPWMxA and falling-edge delay on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE].</li> </ul> |

#### 15.2.4.4.2 Dead-Band Generator Rising Edge Delay Register (DBRED)

The dead-band generator rising edge delay register (DBRED) is shown in [Figure 15-83](#) and described in [Table 15-76](#).

**Figure 15-83. Dead-Band Generator Rising Edge Delay Register (DBRED)**

### 15.2.4.5 Trip-Zone Submodule Registers

[Table 15-78](#) lists the memory-mapped registers for the trip-zone submodule. All other register offset addresses not listed in [Table 15-78](#) should be considered as reserved locations and the register contents should not be modified.

**Table 15-78. Trip-Zone Submodule Registers**

| Offset | Acronym | Register Description                | Section                            |
|--------|---------|-------------------------------------|------------------------------------|
| 24h    | TZSEL   | Trip-Zone Select Register           | <a href="#">Section 15.2.4.5.1</a> |
| 28h    | TZCTL   | Trip-Zone Control Register          | <a href="#">Section 15.2.4.5.2</a> |
| 2Ah    | TZEINT  | Trip-Zone Enable Interrupt Register | <a href="#">Section 15.2.4.5.3</a> |
| 2Ch    | TZFLG   | Trip-Zone Flag Register             | <a href="#">Section 15.2.4.5.4</a> |
| 2Eh    | TZCLR   | Trip-Zone Clear Register            | <a href="#">Section 15.2.4.5.5</a> |
| 30h    | TZFRC   | Trip-Zone Force Register            | <a href="#">Section 15.2.4.5.6</a> |

#### 15.2.4.5.1 Trip-Zone Select Register (TZSEL)

The trip-zone select register (TZSEL) is shown in [Figure 15-85](#) and described in [Table 15-79](#).

**Figure 15-85. Trip-Zone Select Register (TZSEL)**

| 15  | 9     | 8 | 7  | 1    | 0 |
|---|-------|---|--|------|---|
| Reserved/OSHT <sub>n</sub> <sup>(1)</sup> | OSHT1 |   | Reserved/CBC <sub>n</sub> <sup>(1)</sup> | CBC1 |   |

LEGEND: R/W = Read/Write; -n = value after reset

<sup>(1)</sup> Number of register bits depends on how many trip-zone pins are available in the device. See your device-specific data manual.

**Table 15-79. Trip-Zone Submodule Select Register (TZSEL) Field Descriptions**

| Bits | Name              | Value | Description  |
|------|-------------------|-------|--|
| 15-8 | OSHT <sub>n</sub> | 0     | Trip-zone <sub>n</sub> (TZ <sub>n</sub> ) select. One-Shot (OSHT) trip-zone enable/disable. When any of the enabled pins go low, a one-shot trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register ( <a href="#">Section 15.2.4.5.2</a> ) is taken on the EPWMxA and EPWMxB outputs. The one-shot trip condition remains latched until you clear the condition via the TZCLR register ( <a href="#">Section 15.2.4.5.5</a> ). |
|      |                   | 1     | Disable TZ <sub>n</sub> as a one-shot trip source for this ePWM module.<br>Enable TZ <sub>n</sub> as a one-shot trip source for this ePWM module.  |
| 7-0  | CBC <sub>n</sub>  | 0     | Trip-zone <sub>n</sub> (TZ <sub>n</sub> ) select. Cycle-by-Cycle (CBC) trip-zone enable/disable. When any of the enabled pins go low, a cycle-by-cycle trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register ( <a href="#">Section 15.2.4.5.2</a> ) is taken on the EPWMxA and EPWMxB outputs. A cycle-by-cycle trip condition is automatically cleared when the time-base counter reaches zero.                             |
|      |                   | 1     | Disable TZ <sub>n</sub> as a CBC trip source for this ePWM module.<br>Enable TZ <sub>n</sub> as a CBC trip source for this ePWM module.  |

#### 15.2.4.5.2 Trip-Zone Control Register (TZCTL)

The trip-zone control register (TZCTL) is shown in [Figure 15-86](#) and described in [Table 15-80](#).

**Figure 15-86. Trip-Zone Control Register (TZCTL)**

|    |          |   |     |   |     |   |

| 0    | Reserved | 0     | Reserved   |

#### 15.2.4.5.4 Trip-Zone Flag Register (TZFLG)

The trip-zone flag register (TZFLG) is shown in [Figure 15-88](#) and described in [Table 15-82](#).

**Figure 15-88. Trip-Zone Flag Register (TZFLG)**

|    |          |   |     |     |     |
|----|----------|---|-----|-----|-----|
| 15 | Reserved | 3 | 2   | 1   | 0   |
|    | R-0      |   | R-0 | R-0 | R-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-82. Trip-Zone Flag Register (TZFLG) Field Descriptions**

| Bits | Name     | Value | Description   |
|------|----------|-------|---|
| 15-3 | Reserved | 0     | Reserved  |
| 2    | OST      | 0     | Latched Status Flag for A One-Shot Trip Event.<br>No one-shot trip event has occurred.  |
|      |          | 1     | Indicates a trip event has occurred on a pin selected as a one-shot trip source.<br>This bit is cleared by writing the appropriate value to the TZCLR register ( <a href="#">Section 15.2.4.5.5</a> ).  |
| 1    | CBC      | 0     | Latched Status Flag for Cycle-By-Cycle Trip Event<br>No cycle-by-cycle trip event has occurred.   |
|      |          | 1     | Indicates a trip event has occurred on a pin selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the pins is automatically cleared when the ePWM time-base counter reaches zero (TBCNT = 0000h) if the trip condition is no longer present. The condition on the pins is only cleared when the TBCNT = 0000h no matter where in the cycle the CBC flag is cleared.<br>This bit is cleared by writing the appropriate value to the TZCLR register ( <a href="#">Section 15.2.4.5.5</a> ). |
| 0    | INT      | 0     | Latched Trip Interrupt Status Flag<br>Indicates no interrupt has been generated.  |
|      |          | 1     | Indicates an EPWMxTZINT interrupt was generated because of a trip condition.<br>No further EPWMxTZINT interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts.<br>This bit is cleared by writing the appropriate value to the TZCLR register ( <a href="#">Section 15.2.4.5.5</a> ).  |

#### 15.2.4.5.5 Trip-Zone Clear Register (TZCLR)

The trip-zone clear register (TZCLR) is shown in [Figure 15-89](#) and described in [Table 15-83](#).

**Figure 15-89. Trip-Zone Clear Register (TZCLR)**

| 15  | Reserved | 3 | 2     | 1     | 0     |
|-----|----------|---|-------|-------|-------|
|     |          |   | OST   | CBC   | INT   |
| R-0 |          |   | R/W-0 | R/W-0 | R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-83. Trip-Zone Clear Register (TZCLR) Field Descriptions**

| Bits   | Name     | Value | Description  |
|--|----------|-------|--|
| 15-3   | Reserved | 0     | Reserved   |
| 2  | OST      | 0     | Clear Flag for One-Shot Trip (OST) Latch   |
|  |          | 1     | Has no effect. Always reads back a 0.<br>Clears this Trip (set) condition.                                 |
| 1  | CBC      | 0     | Clear Flag for Cycle-By-Cycle (CBC) Trip Latch   |
|  |          | 1     | Has no effect. Always reads back a 0.<br>Clears this Trip (set) condition.                                 |
| 0  | INT      | 0     | Global Interrupt Clear Flag  |
|  |          | 1     | Has no effect. Always reads back a 0.<br>Clears the trip-interrupt flag for this ePWM module (TZFLG[INT]). |
| <b>NOTE:</b> No further EPWMxTZINT interrupts will be generated until the flag is cleared. If the TZFLG[INT] bit is cleared and any of the other flag bits are set, then another interrupt pulse will be generated.<br>Clearing all flag bits will prevent further interrupts. |          |       |  |

#### 15.2.4.5.6 Trip-Zone Force Register (TZFRC)

The trip-zone force register (TZFRC) is shown in [Figure 15-90](#) and described in [Table 15-84](#).

**Figure 15-90. Trip-Zone Force Register (TZFRC)**

| 15  | Reserved | 3 | 2     | 1     | 0    |
|-----|----------|---|-------|-------|------|
|     |          |   | OST   | CBC   | Rsvd |
| R-0 |          |   | R/W-0 | R/W-0 | R-0  |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-84. Trip-Zone Force Register (TZFRC) Field Descriptions**

| Bits | Name     | Value | Description  |
|------|----------|-------|--|
| 15-3 | Reserved | 0     | Reserved   |
| 2    | OST      | 0     | Force a One-Shot Trip Event via Software   |
|      |          | 1     | Writing of 0 is ignored. Always reads back a 0.<br>Forces a one-shot trip event and sets the TZFLG[OST] bit.       |
| 1    | CBC      | 0     | Force a Cycle-by-Cycle Trip Event via Software   |
|      |          | 1     | Writing of 0 is ignored. Always reads back a 0.<br>Forces a cycle-by-cycle trip event and sets the TZFLG[CBC] bit. |
| 0    | Reserved | 0     | Reserved   |

#### 15.2.4.6 Event-Trigger Submodule Registers

[Table 15-85](#) lists the memory-mapped registers for the event-trigger submodule. See your device-specific data manual for the memory address of these registers. All other register offset addresses not listed in [Table 15-85](#) should be considered as reserved locations and the register contents should not be modified.

**Table 15-85. Event-Trigger Submodule Registers**

| Offset | Acronym | Register Description             | Section                            |
|--------|---------|----------------------------------|------------------------------------|
| 32h    | ETSEL   | Event-Trigger Selection Register | <a href="#">Section 15.2.4.6.1</a> |
| 34h    | ETPS    | Event-Trigger Prescale Register  | <a href="#">Section 15.2.4.6.2</a> |
| 36h    | ETFLG   | Event-Trigger Flag Register      | <a href="#">Section 15.2.4.6.3</a> |
| 38h    | ETCLR   | Event-Trigger Clear Register     | <a href="#">Section 15.2.4.6.4</a> |
| 3Ah    | ETFRC   | Event-Trigger Force Register     | <a href="#">Section 15.2.4.6.5</a> |

##### 15.2.4.6.1 Event-Trigger Selection Register (ETSEL)

The event-trigger selection register (ETSEL) is shown in [Figure 15-91](#) and described in [Table 15-86](#).

**Figure 15-91. Event-Trigger Selection Register (ETSEL)**

| 15       | 4   | 3     | 2      | 0           |
|----------|-----|-------|--------|-------------|
| Reserved | R-0 | INTEN | INTSEL | R/W-0 R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-86. Event-Trigger Selection Register (ETSEL) Field Descriptions**

| Bits | Name     | Value | Description   |
|------|----------|-------|---|
| 15-4 | Reserved | 0     | Reserved  |
| 3    | INTEN    | 0     | Enable ePWM Interrupt (EPWMx_INT) Generation                                  |
|      |          | 1     | Disable EPWMx_INT generation  |
| 2-0  | INTSEL   | 0-7h  | ePWM Interrupt (EPWMx_INT) Selection Options                                  |
|      |          | 0     | Reserved  |
|      |          | 1h    | Enable event time-base counter equal to zero. (TBCNT = 0000h)                 |
|      |          | 2h    | Enable event time-base counter equal to period (TBCNT = TBPRD)                |
|      |          | 3h    | Reserved  |
|      |          | 4h    | Enable event time-base counter equal to CMPA when the timer is incrementing.  |
|      |          | 5h    | Enable event time-base counter equal to CMPA when the timer is decrementing.  |
|      |          | 6h    | Enable event: time-base counter equal to CMPB when the timer is incrementing. |
|      |          | 7h    | Enable event: time-base counter equal to CMPB when the timer is decrementing. |

#### 15.2.4.6.2 Event-Trigger Prescale Register (ETPS)

The event-trigger prescale register (ETPS) is shown in [Figure 15-92](#) and described in [Table 15-87](#).

**Figure 15-92. Event-Trigger Prescale Register (ETPS)**

|    |          |     |   |        |     |       |
|----|----------|-----|---|--------|-----|-------|
| 15 | Reserved | 4   | 3 | 2      | 1   | 0     |
|    |          | R-0 |   | INTCNT | R-0 | R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-87. Event-Trigger Prescale Register (ETPS) Field Descriptions**

| Bits | Name     | Value | Description   |
|------|----------|-------|---|
| 15-4 | Reserved | 0     | Reserved  |
| 3-2  | INTCNT   | 0-3h  | ePWM Interrupt Event (EPWMx_INT) Counter Register. These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].  |
|      |          | 0     | No events have occurred.  |
|      |          | 1h    | 1 event has occurred.   |
|      |          | 2h    | 2 events have occurred.   |
|      |          | 3h    | 3 events have occurred.   |
| 1-0  | INTPRD   | 0-3h  | ePWM Interrupt (EPWMx_INT) Period Select. These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (ETSEL[INT] = 1). If the interrupt status flag is set from a previous interrupt (ETFLG[INT] = 1) then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared.<br><br>Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear.<br><br>Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. |
|      |          | 0     | Disable the interrupt event counter. No interrupt will be generated and ETFLG[INT] is ignored.  |
|      |          | 1h    | Generate an interrupt on the first event INTCNT = 01 (first event)  |
|      |          | 2h    | Generate interrupt on ETPS[INTCNT] = 1,0 (second event)   |
|      |          | 3h    | Generate interrupt on ETPS[INTCNT] = 1,1 (third event)  |

#### 15.2.4.6.3 Event-Trigger Flag Register (ETFLG)

The event-trigger flag register (ETFLG) is shown in [Figure 15-93](#) and described in [Table 15-88](#).

**Figure 15-93. Event-Trigger Flag Register (ETFLG)**

|    |          |     |   |   |     |
|----|----------|-----|---|---|-----|
| 15 | Reserved | R-0 | 1 | 0 | INT |
|----|----------|-----|---|---|-----|

LEGEND: R = Read only; -n = value after reset

**Table 15-88. Event-Trigger Flag Register (ETFLG) Field Descriptions**

| Bits | Name     | Value | Description   |
|------|----------|-------|---|
| 15-1 | Reserved | 0     | Reserved  |
| 0    | INT      | 0     | Latched ePWM Interrupt (EPWMx_INT) Status Flag<br>Indicates no event occurred   |
|      |          | 1     | Indicates that an ePWMx interrupt (EPWMx_INT) was generated. No further interrupts will be generated until the flag bit is cleared. Up to one interrupt can be pending while the ETFLG[INT] bit is still set. If an interrupt is pending, it will not be generated until after the ETFLG[INT] bit is cleared. Refer to <a href="#">Figure 15-47</a> . |

#### 15.2.4.6.4 Event-Trigger Clear Register (ETCLR)

The event-trigger clear register (ETCLR) is shown in [Figure 15-94](#) and described in [Table 15-89](#).

**Figure 15-94. Event-Trigger Clear Register (ETCLR)**

|    |          |     |   |   |     |
|----|----------|-----|---|---|-----|
| 15 | Reserved | R-0 | 1 | 0 | INT |
|----|----------|-----|---|---|-----|

LEGEND: R = Read only; -n = value after reset

**Table 15-89. Event-Trigger Clear Register (ETCLR) Field Descriptions**

| Bits | Name     | Value | Description  |
|------|----------|-------|--|
| 15-1 | Reserved | 0     | Reserved   |
| 0    | INT      | 0     | ePWM Interrupt (EPWMx_INT) Flag Clear Bit<br>Writing a 0 has no effect. Always reads back a 0. |
|      |          | 1     | Clears the ETFLG[INT] flag bit and enable further interrupts pulses to be generated.           |

#### 15.2.4.6.5 Event-Trigger Force Register (ETFRC)

The event-trigger force register (ETFRC) is shown in [Figure 15-95](#) and described in [Table 15-90](#).

**Figure 15-95. Event-Trigger Force Register (ETFRC)**

|    |          |     |     |     |
|----|----------|-----|-----|-----|
| 15 | Reserved | R-0 | 1   | 0   |
|    |          |     | INT | R-0 |

LEGEND: R = Read only; -n = value after reset

**Table 15-90. Event-Trigger Force Register (ETFRC) Field Descriptions**

| Bits | Name     | Value | Description   |
|------|----------|-------|---|
| 15-1 | Reserved | 0     | Reserved  |
| 0    | INT      | 0     | INT Force Bit. The interrupt will only be generated if the event is enabled in the ETSEL register. The INT flag bit will be set regardless. |
|      |          | 1     | Writing 0 to this bit will be ignored. Always reads back a 0.   |
|      |          | 1     | Generates an interrupt on $\overline{EPWMxINT}$ and set the INT flag bit. This bit is used for test purposes.                               |

#### 15.2.4.7 PWM-Chopper Submodule Register

The PWM-chopper control register (PCCTL) is shown in [Figure 15-96](#) and described in [Table 15-91](#).

**Figure 15-96. PWM-Chopper Control Register (PCCTL)**

| 15       | 11 | 10      | 8 | 7       | 5 | 4       | 1 | 0     |

|       |          | 1     | Enable chopping function                      |

#### 15.2.4.8 High-Resolution PWM Submodule Registers

[Table 15-92](#) lists the memory-mapped registers for the high-resolution PWM submodule. All other register offset addresses not listed in [Table 15-92](#) should be considered as reserved locations and the register contents should not be modified.

**Table 15-92. High-Resolution PWM Submodule Registers**

| Offset | Acronym | Register Description                       | Section                            |
|--------|---------|--|------------------------------------|
| 4h     | TBPHSHR | Time-Base Phase High-Resolution Register   | <a href="#">Section 15.2.4.8.1</a> |
| 10h    | CMPAHR  | Counter-Compare A High-Resolution Register | <a href="#">Section 15.2.4.8.2</a> |
| 40h    | HRCTL   | HRPWM Control Register                     | <a href="#">Section 15.2.4.8.3</a> |

#### 15.2.4.8.1 Time-Base Phase High-Resolution Register (TBPHSHR)

The time-base phase high-resolution register (TBPHSHR) is shown in [Figure 15-97](#) and described in [Table 15-93](#).

**Figure 15-97. Time-Base Phase High-Resolution Register (TBPHSHR)**

| 15     | 8 | 7 | 0        |
|--------|---|---|----------|
| TBPHSH |   |   | Reserved |
| R/W-0  |   |   | R/W-0    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-93. Time-Base Phase High-Resolution Register (TBPHSHR) Field Descriptions**

| Bit  | Field    | Value | Description                          |
|------|----------|-------|--------------------------------------|
| 15-8 | TBPHSH   | 0-FFh | Time-base phase high-resolution bits |
| 7-0  | Reserved | 0     | Reserved                             |

#### 15.2.4.8.2 Counter-Compare A High-Resolution Register (CMPAHR)

The counter-compare A high-resolution register (CMPAHR) is shown in [Figure 15-98](#) and described in [Table 15-94](#).

**Figure 15-98. Counter-Compare A High-Resolution Register (CMPAHR)**

| 15     | 8 | 7 | 0        |
|--------|---|---|----------|
| CMPAHR |   |   | Reserved |
| R/W-0  |   |   | R/W-0    |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-94. Counter-Compare A High-Resolution Register (CMPAHR) Field Descriptions**

| Bit  | Field    | Value | Description  |
|------|----------|-------|--|
| 15-8 | CMPAHR   | 1-FFh | Compare A High-Resolution register bits for MEP step control. A minimum value of 1h is needed to enable HRPWM capabilities. Valid MEP range of operation 1-255h. |
| 7-0  | Reserved | 0     | Reserved   |

### 15.2.4.8.3 HRPWM Control Register (HRCTL)

The HRPWM control register (HRCTL) is shown in [Figure 15-99](#) and described in [Table 15-95](#).

**Figure 15-99. HRPWM Control Register (HRCTL)**

| 15       | 4        | 3          | 2       | 1 | 0 |
|----------|----------|------------|---------|---|---|
| Reserved | PULSESEL | DELBUSSSEL | DELMODE |   |   |
| R-0      | R/W-0    | R/W-0      | R/W-0   |   |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-95. HRPWM Control Register (HRCTL) Field Descriptions**

| Bit  | Field      | Value                       | Description   |
|------|------------|-----------------------------|---|
| 15-4 | Reserved   | 0                           | Reserved  |
| 3    | PULSESEL   | 0<br>1                      | Pulse select bits. Selects which pulse to use for timing events in the HRPWM module:<br>0 Select CNT_zero pulse<br>1 Select PRD_eq pulse<br>Note: The user needs to select the pulse to match the selection in the EPWM module. If TBPHSHR bus is selected, then CNT_zero pulse should be used. If COMPAHR bus is selected, then it should match the bit setting of the CMPCTL[LOADMODE] bits in the EPWM module as follows:<br>0 CNT_zero pulse<br>1h PRD_eq pulse<br>2h CNT_zero or PRD_eq (should not use with HRPWM)<br>3h No loads (should not use with HRPWM) |
| 2    | DELBUSSSEL | 0<br>1                      | Delay Bus Select Bit: Selects which bus is used to select the delay for the PWM pulse:<br>0 Select CMPAHR(8) bus from compare module of EPWM (default on reset).<br>1 Select TBPHSHR(8) bus from time base module.  |
| 1-0  | DELMODE    | 0-3h<br>0<br>1h<br>2h<br>3h | Delay Mode Bits: Selects which edge of the PWM pulse the delay is inserted:<br>0 No delay inserted (default on reset)<br>1h Delay inserted rising edge<br>2h Delay inserted falling edge<br>3h Delay inserted on both edges<br>Note: When DELMODE = 0,0, the HRCALM[CALMODE] bits are ignored and the delay line is in by-pass mode. Additionally, DLYIN is connected to CALIN and a continuous low value is fed to the delay line to minimize activity in the module.  |

## 15.3 Enhanced Capture (eCAP) Module

### 15.3.1 *Introduction*

#### 15.3.1.1 Purpose of the Peripheral

Uses for eCAP include:

- Sample rate measurements of audio inputs
- Speed measurements of rotating machinery (for example, toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

#### 15.3.1.2 Features

The eCAP module includes the following features:

- 32-bit time base counter
- 4-event time-stamp registers (each 32 bits)
- Edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt on either of the four events
- Single shot capture of up to four event time-stamps
- Continuous mode capture of time-stamps in a four-deep circular buffer
- Absolute time-stamp capture
- Difference (Delta) mode time-stamp capture
- All above resources dedicated to a single input pin
- When not used in capture mode, the ECAP module can be configured as a single channel PWM output

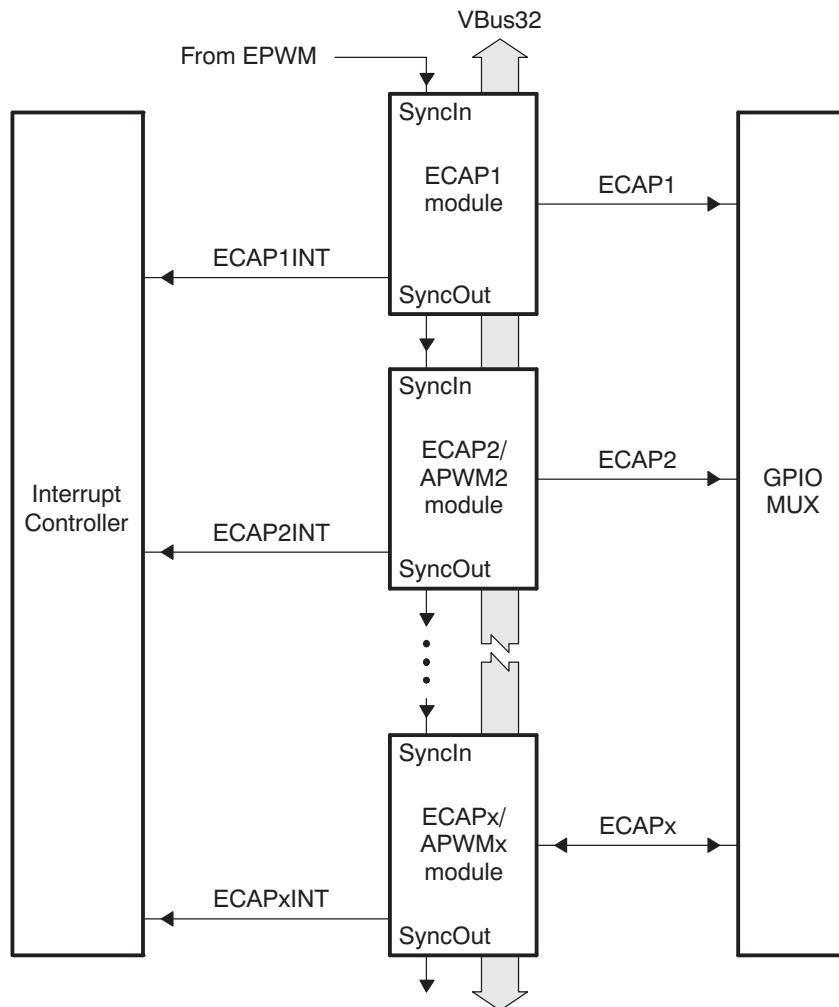

### 15.3.2 Functional Description

The eCAP module represents one complete capture channel that can be instantiated multiple times depending on the target device. In the context of this guide, one eCAP channel has the following independent key resources:

- Dedicated input capture pin
- 32-bit time base counter
- 4 × 32-bit time-stamp capture registers (CAP1-CAP4)
- 4-stage sequencer (Modulo4 counter) that is synchronized to external events, ECAP pin rising/falling edges.
- Independent edge polarity (rising/falling edge) selection for all 4 events
- Input capture signal prescaling (from 2-62)
- One-shot compare register (2 bits) to freeze captures after 1 to 4 time-stamp events
- Control for continuous time-stamp captures using a 4-deep circular buffer (CAP1-CAP4) scheme
- Interrupt capabilities on any of the 4 capture events

Multiple identical eCAP modules can be contained in a system as shown in [Figure 15-100](#). The number of modules is device-dependent and is based on target application needs. In this chapter, the letter x within a signal or module name is used to indicate a generic eCAP instance on a device.

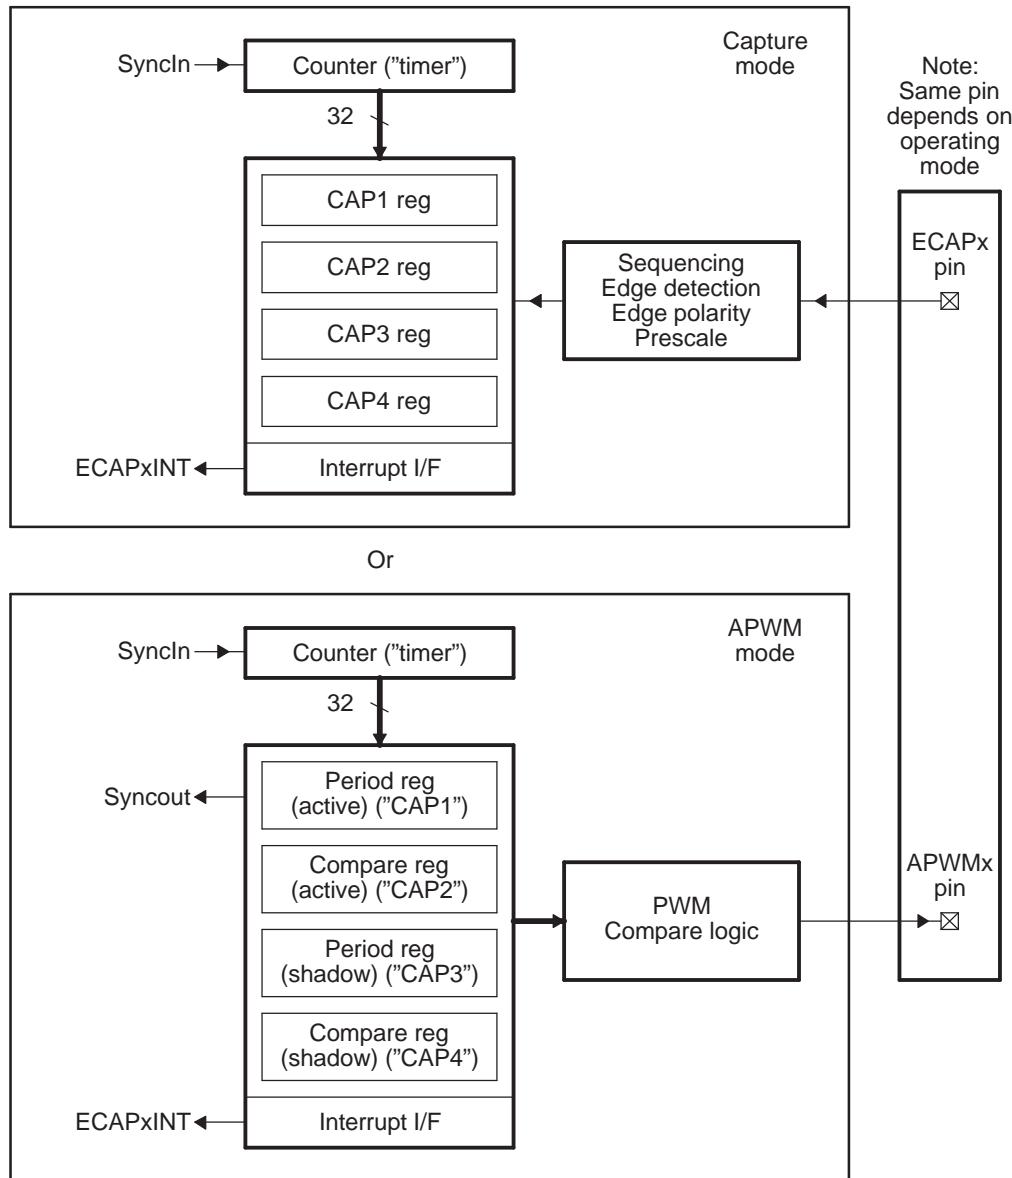

**Figure 15-100. Multiple eCAP Modules**

### 15.3.2.1 Capture and APWM Operating Mode

You can use the eCAP module resources to implement a single-channel PWM generator (with 32 bit capabilities) when it is not being used for input captures. The counter operates in count-up mode, providing a time-base for asymmetrical pulse width modulation (PWM) waveforms. The CAP1 and CAP2 registers become the active period and compare registers, respectively, while CAP3 and CAP4 registers become the period and capture shadow registers, respectively. [Figure 15-101](#) is a high-level view of both the capture and auxiliary pulse-width modulator (APWM) modes of operation.

**Figure 15-101. Capture and APWM Modes of Operation**

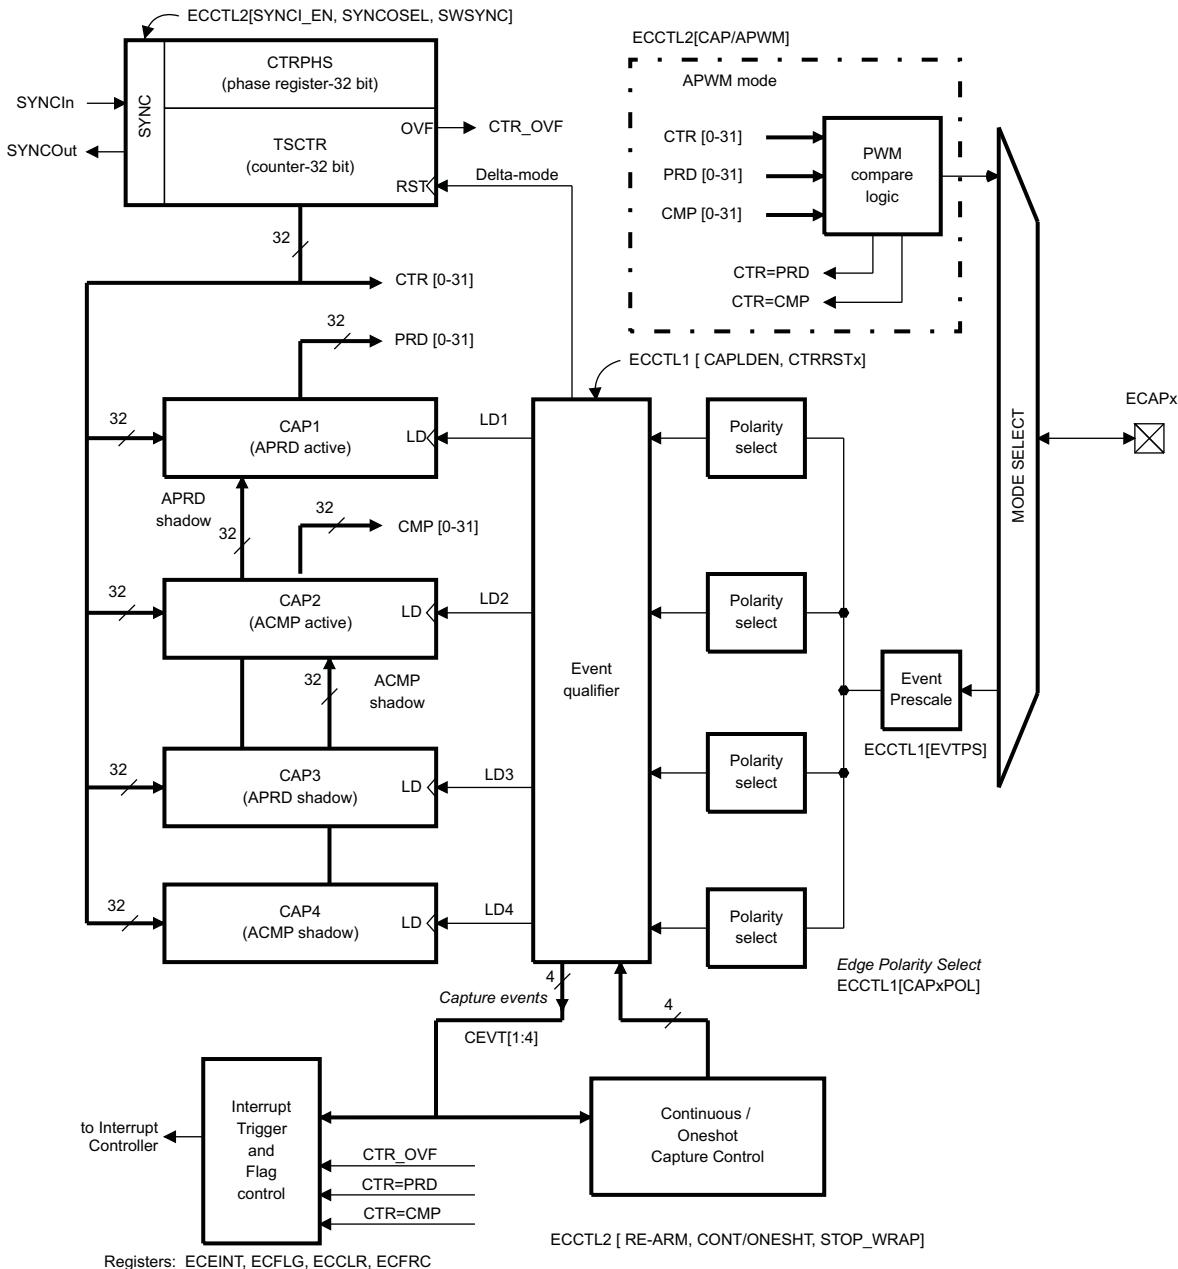

- (1) A single pin is shared between CAP and APWM functions. In capture mode, it is an input; in APWM mode, it is an output.
- (2) In APWM mode, writing any value to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.

### 15.3.2.2 Capture Mode Description

Figure 15-102 shows the various components that implement the capture function.

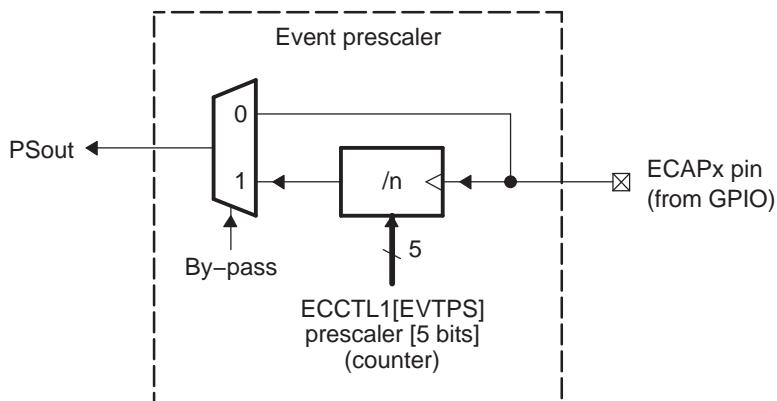

**Figure 15-102. Capture Function Diagram**

### 15.3.2.2.1 Event Prescaler

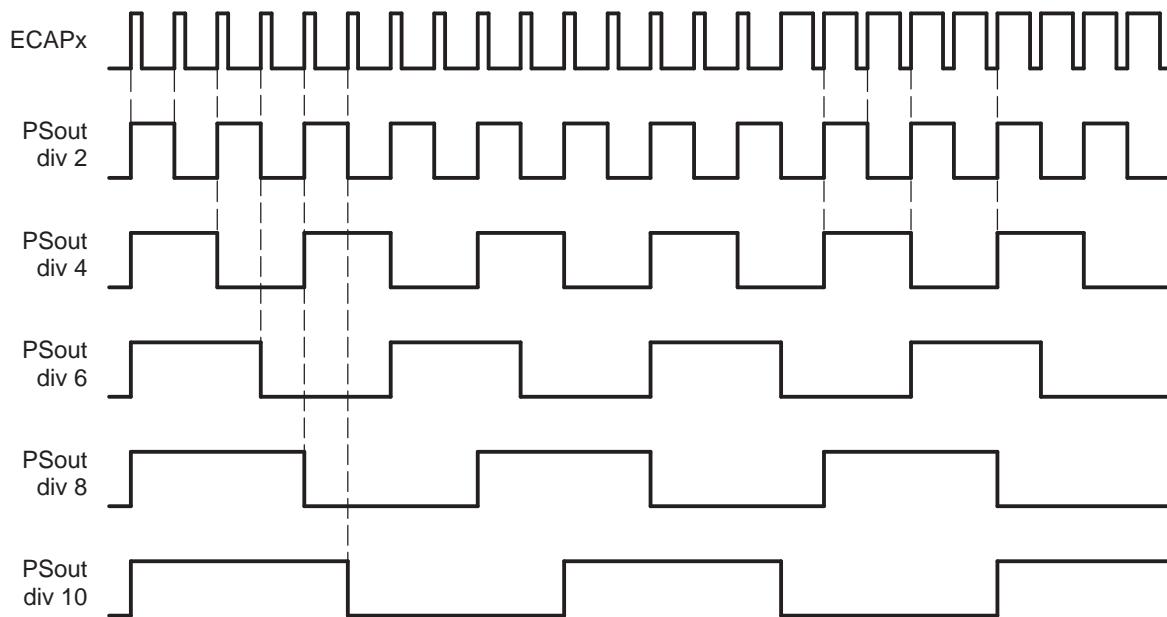

An input capture signal (pulse train) can be prescaled by  $N = 2-62$  (in multiples of 2) or can bypass the prescaler. This is useful when very high frequency signals are used as inputs. [Figure 15-103](#) shows a functional diagram and [Figure 15-104](#) shows the operation of the prescale function.

**Figure 15-103. Event Prescale Control**

- (1) When a prescale value of 1 is chosen (ECCTL1[13:9] = 0000) the input capture signal by-passes the prescale logic completely.

**Figure 15-104. Prescale Function Waveforms**

### 15.3.2.2.2 Edge Polarity Select and Qualifier

- Four independent edge polarity (rising edge/falling edge) selection multiplexers are used, one for each capture event.
- Each edge (up to 4) is event qualified by the Modulo4 sequencer.
- The edge event is gated to its respective CAP $n$  register by the Mod4 counter. The CAP $n$  register is loaded on the falling edge.

### 15.3.2.2.3 Continuous/One-Shot Control

- The Mod4 (2 bit) counter is incremented via edge qualified events (CEVT1-CEVT4).
- The Mod4 counter continues counting (0->1->2->3->0) and wraps around unless stopped.
- A 2-bit stop register is used to compare the Mod4 counter output, and when equal stops the Mod4 counter and inhibits further loads of the CAP1-CAP4 registers. This occurs during one-shot operation.

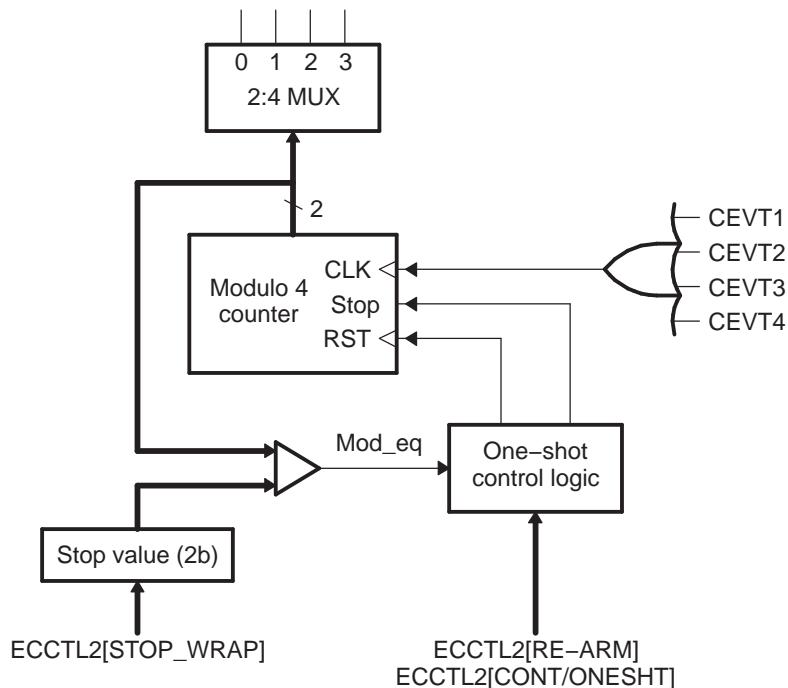

The continuous/one-shot block (Figure 15-105) controls the start/stop and reset (zero) functions of the Mod4 counter via a mono-shot type of action that can be triggered by the stop-value comparator and re-armed via software control.

Once armed, the eCAP module waits for 1-4 (defined by stop-value) capture events before freezing both the Mod4 counter and contents of CAP1-4 registers (time-stamps).

Re-arming prepares the eCAP module for another capture sequence. Also re-arming clears (to zero) the Mod4 counter and permits loading of CAP1-4 registers again, providing the CAPLDEN bit is set.

In continuous mode, the Mod4 counter continues to run (0->1->2->3->0), the one-shot action is ignored, and capture values continue to be written to CAP1-4 in a circular buffer sequence.

**Figure 15-105. Continuous/One-shot Block Diagram**

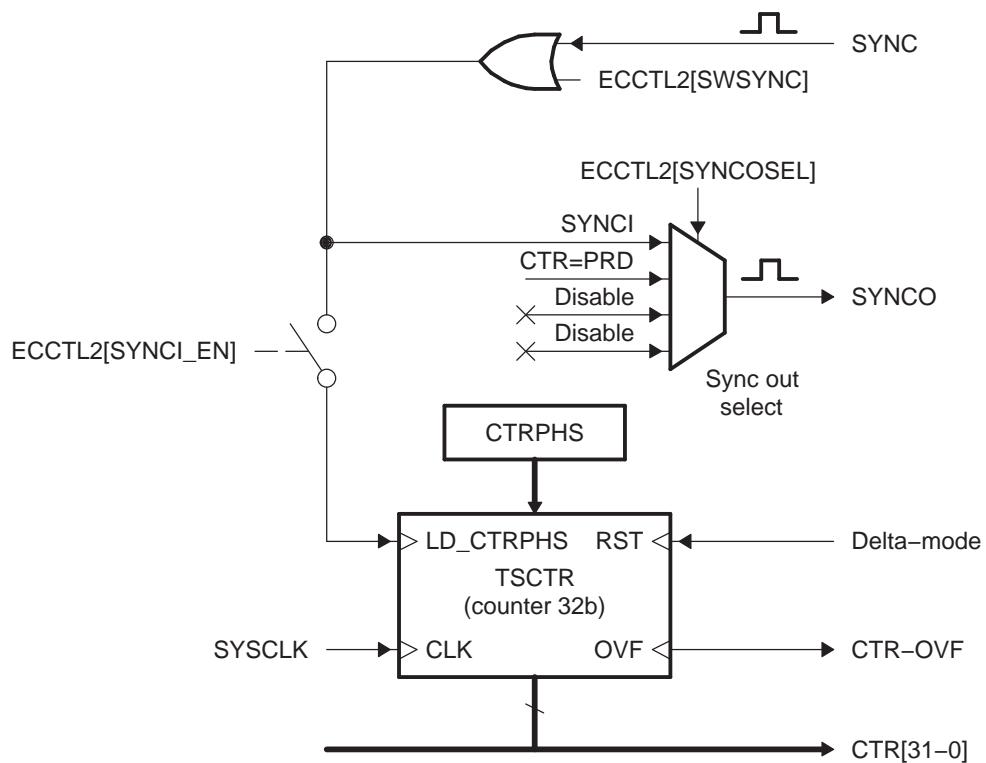

#### 15.3.2.2.4 32-Bit Counter and Phase Control

This counter (Figure 15-106) provides the time-base for event captures, and is clocked via the system clock.

A phase register is provided to achieve synchronization with other counters, via a hardware and software forced sync. This is useful in APWM mode when a phase offset between modules is needed.

On any of the four event loads, an option to reset the 32-bit counter is given. This is useful for time difference capture. The 32-bit counter value is captured first, then it is reset to 0 by any of the LD1-LD4 signals.

**Figure 15-106. Counter and Synchronization Block Diagram**

### 15.3.2.2.5 CAP1-CAP4 Registers

These 32-bit registers are fed by the 32-bit counter timer bus, CTR[0-31] and are loaded (capture a time-stamp) when their respective LD inputs are strobed.

Loading of the capture registers can be inhibited via control bit CAPLDEN. During one-shot operation, this bit is cleared (loading is inhibited) automatically when a stop condition occurs, StopValue = Mod4.

CAP1 and CAP2 registers become the active period and compare registers, respectively, in APWM mode.

CAP3 and CAP4 registers become the respective shadow registers (APRD and ACMP) for CAP1 and CAP2 during APWM operation.

### 15.3.2.2.6 Interrupt Control

An Interrupt can be generated on capture events (CEVT1-CEVT4, CTROVF) or APWM events (CTR = PRD, CTR = CMP). See [Figure 15-107](#).

A counter overflow event (FFFF FFFFh->0000 0000h) is also provided as an interrupt source (CTROVF).

The capture events are edge and sequencer qualified (that is, ordered in time) by the polarity select and Mod4 gating, respectively.

One of these events can be selected as the interrupt source (from the eCAPn module) going to the interrupt controller.

Seven interrupt events (CEVT1, CEVT2, CEVT3, CEVT4, CNTOVF, CTR = PRD, CTR = CMP) can be generated. The interrupt enable register (ECEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (ECFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated to the interrupt controller only if any of the interrupt events are enabled, the flag bit is 1, and the INT flag bit is 0. The interrupt service routine must clear the global interrupt flag bit and the serviced event via the interrupt clear register (ECCLR) before any other interrupt pulses are generated. You can force an interrupt event via the interrupt force register (ECFRC). This is useful for test purposes.

### 15.3.2.2.7 Shadow Load and Lockout Control

In capture mode, this logic inhibits (locks out) any shadow loading of CAP1 or CAP2 from APRD and ACMP registers, respectively.

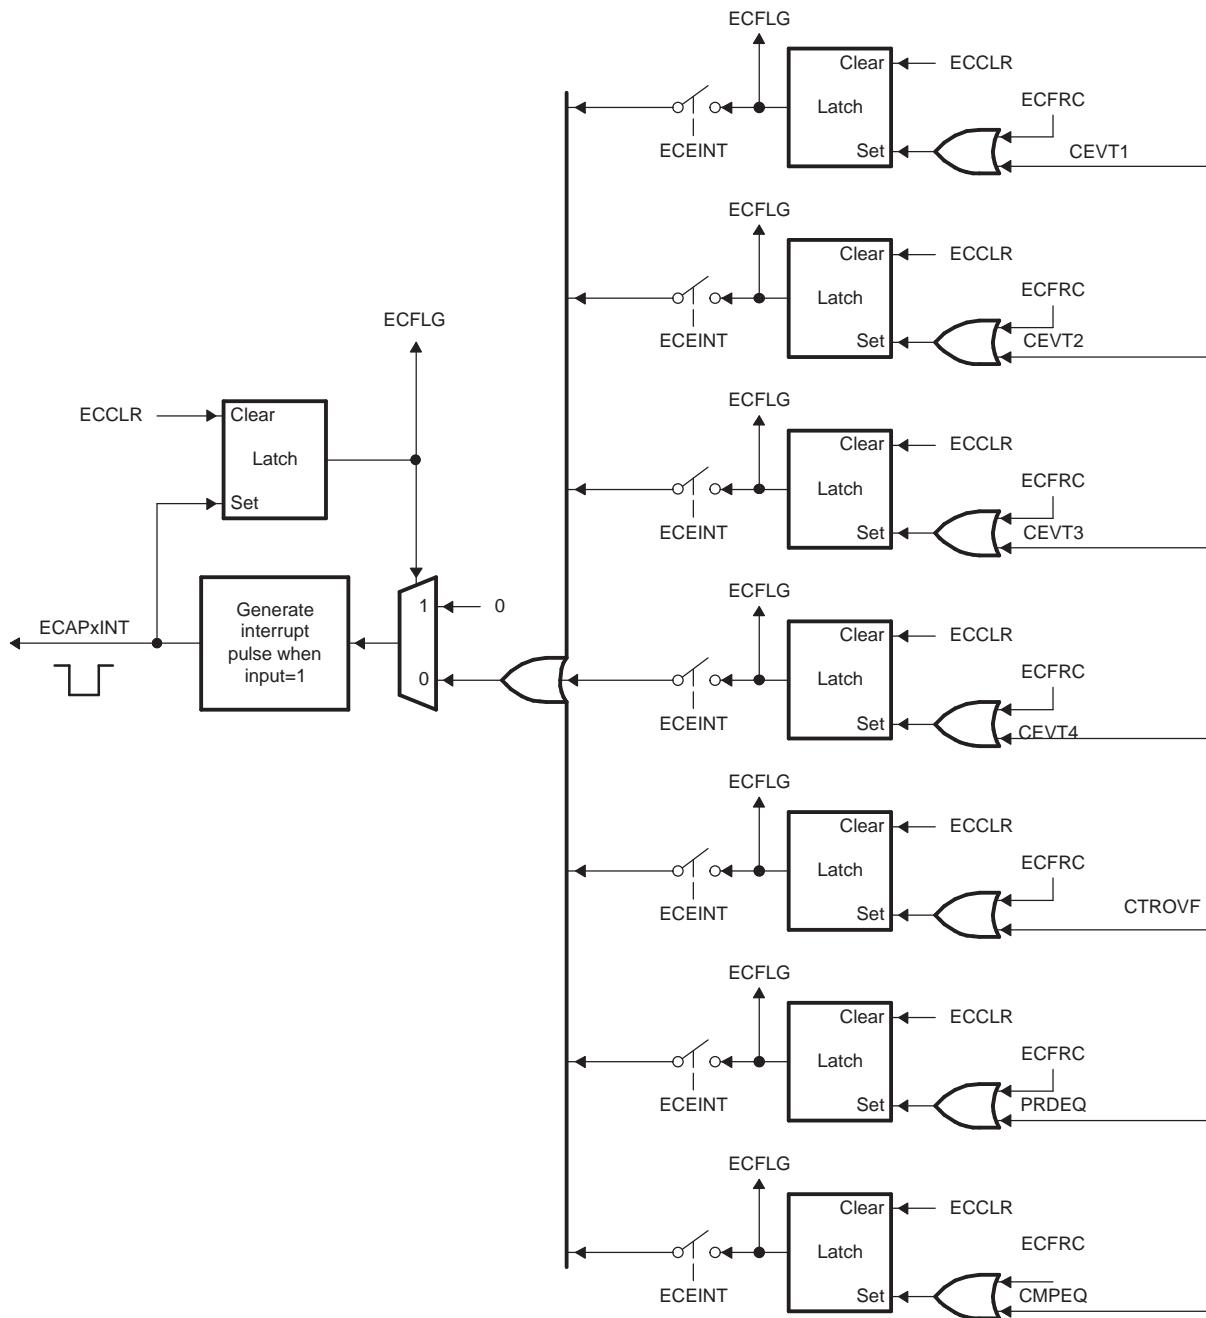

In APWM mode, shadow loading is active and two choices are permitted:

- Immediate - APRD or ACMP are transferred to CAP1 or CAP2 immediately upon writing a new value.
- On period equal, CTR[31:0] = PRD[31:0]

---

**NOTE:** The CEVT1, CEVT2, CEVT3, CEVT4 flags are only active in capture mode (ECCTL2[CAP/APWM == 0]). The CTR = PRD, CTR = CMP flags are only valid in APWM mode (ECCTL2[CAP/APWM == 1]). CNTOVF flag is valid in both modes.

---

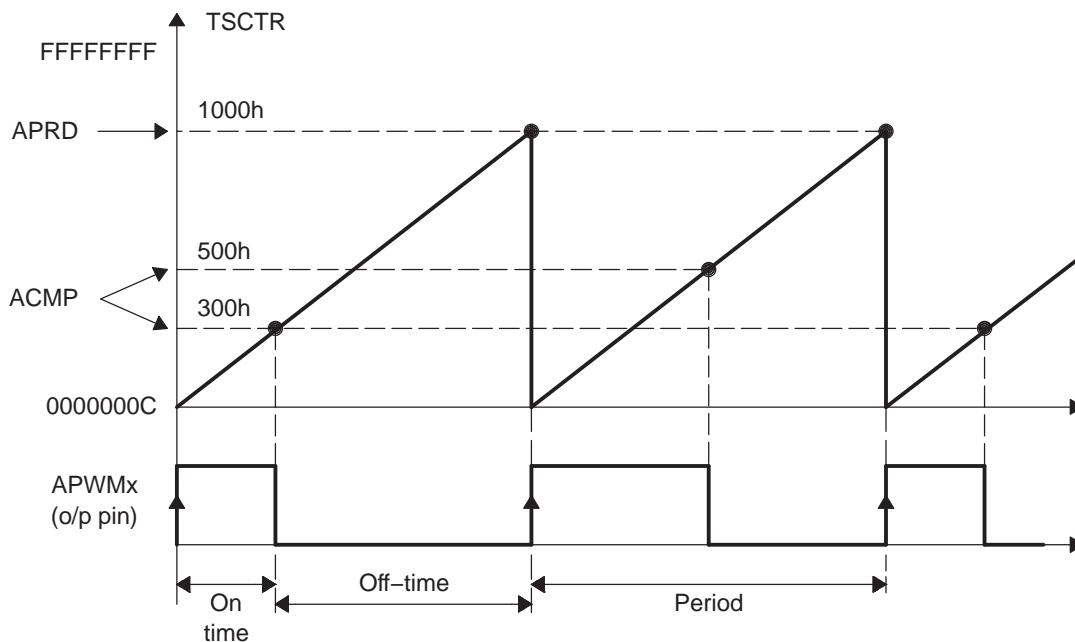

**Figure 15-107. Interrupts in eCAP Module**

### 15.3.2.2.8 APWM Mode Operation

Main operating highlights of the APWM section:

- The time-stamp counter bus is made available for comparison via 2 digital (32-bit) comparators.
- When CAP1/2 registers are not used in capture mode, their contents can be used as Period and Compare values in APWM mode.
- Double buffering is achieved via shadow registers APRD and ACMP (CAP3/4). The shadow register contents are transferred over to CAP1/2 registers either immediately upon a write, or on a CTR = PRD trigger.
- In APWM mode, writing to CAP1/CAP2 active registers will also write the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 will invoke the shadow mode.
- During initialization, you must write to the active registers for both period and compare. This automatically copies the initial values into the shadow values. For subsequent compare updates, during run-time, you only need to use the shadow registers.

**Figure 15-108. PWM Waveform Details Of APWM Mode Operation**

The behavior of APWM active-high mode (APWMPOL == 0) is:

CMP = 0x00000000, output low for duration of period (0% duty)

CMP = 0x00000001, output high 1 cycle

CMP = 0x00000002, output high 2 cycles

CMP = PERIOD, output high except for 1 cycle (<100% duty)

CMP = PERIOD+1, output high for complete period (100% duty)

CMP > PERIOD+1, output high for complete period

The behavior of APWM active-low mode (APWMPOL == 1) is:

CMP = 0x00000000, output high for duration of period (0% duty)

CMP = 0x00000001, output low 1 cycle

CMP = 0x00000002, output low 2 cycles

CMP = PERIOD, output low except for 1 cycle (<100% duty)

CMP = PERIOD+1, output low for complete period (100% duty)

CMP > PERIOD+1, output low for complete period

### 15.3.3 Use Cases

The following sections will provide Applications examples and code snippets to show how to configure and operate the eCAP module. For clarity and ease of use, below are useful #defines which will help in the understanding of the examples.

```

// ECCTL1 ( ECAP Control Reg 1)
//=====
// CAPxPOL bits
#define EC_RISING          0x0
#define EC_FALLING         0x1

// CTRRSTx bits
#define EC_ABS_MODE        0x0
#define EC_DELTA_MODE      0x1

// PRESCALE bits
#define EC_BYPASS          0x0
#define EC_DIV1             0x0
#define EC_DIV2             0x1
#define EC_DIV4             0x2
#define EC_DIV6             0x3
#define EC_DIV8             0x4
#define EC_DIV10            0x5

// ECCTL2 ( ECAP Control Reg 2)
//=====
// CONT/ONESHOT bit
#define EC_CONTINUOUS       0x0
#define EC_ONESHOT          0x1

// STOPVALUE bit
#define EC_EVENT1           0x0
#define EC_EVENT2           0x1
#define EC_EVENT3           0x2
#define EC_EVENT4           0x3

// RE-ARM bit
#define EC_ARM              0x1

// TSCTRSTOP bit
#define EC_FREEZE           0x0
#define EC_RUN               0x1

// SYNCSEL bit
#define EC_SYNCIN            0x0
#define EC_CTR_PRD           0x1
#define EC_SYNC_DIS          0x2

// CAP/APWM mode bit
#define EC_CAP_MODE          0x0
#define EC_APWM_MODE         0x1

// APWMMPOL bit
#define EC_ACTV_HI           0x0
#define EC_ACTV_LO           0x1

// Generic
#define EC_DISABLE           0x0
#define EC_ENABLE            0x1
#define EC_FORCE             0x1

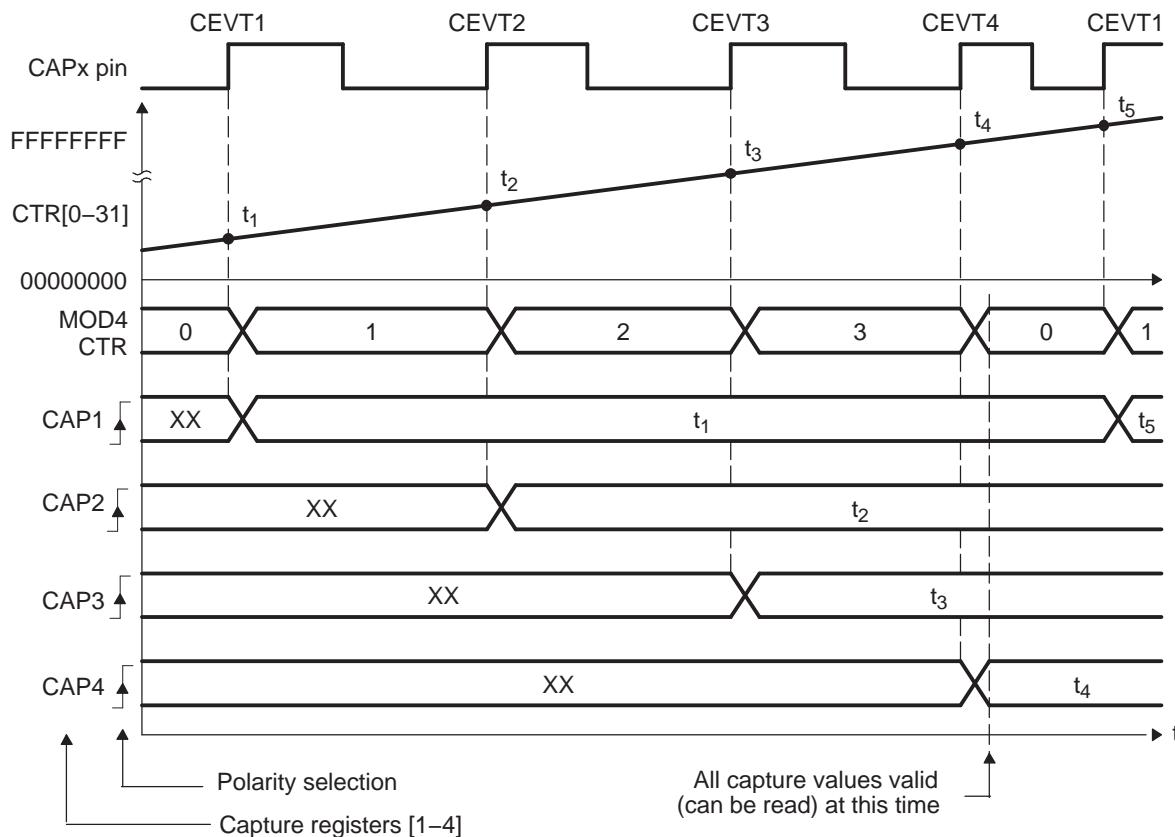

```

### 15.3.3.1 Absolute Time-Stamp Operation Rising Edge Trigger Example

Figure 15-109 shows an example of continuous capture operation (Mod4 counter wraps around). In this figure, TSCTR counts-up without resetting and capture events are qualified on the rising edge only, this gives period (and frequency) information.

On an event, the TSCTR contents (time-stamp) is first captured, then Mod4 counter is incremented to the next state. When the TSCTR reaches FFFF FFFFh (maximum value), it wraps around to 0000 0000h (not shown in Figure 15-109), if this occurs, the CTROVF (counter overflow) flag is set, and an interrupt (if enabled) occurs, CTROVF (counter overflow) Flag is set, and an Interrupt (if enabled) occurs. Captured time-stamps are valid at the point indicated by the diagram, after the 4th event, hence event CEVT4 can conveniently be used to trigger an interrupt and the CPU can read data from the CAPn registers.

**Figure 15-109. Capture Sequence for Absolute Time-Stamp, Rising Edge Detect**

**Table 15-96. ECAP Initialization for CAP Mode Absolute Time, Rising Edge Trigger**

| Register | Bit        | Value         |
|----------|------------|---------------|
| ECCTL1   | CAP1POL    | EC_RISING     |
| ECCTL1   | CAP2POL    | EC_RISING     |
| ECCTL1   | CAP3POL    | EC_RISING     |
| ECCTL1   | CAP4POL    | EC_RISING     |
| ECCTL1   | CTRRST1    | EC_ABS_MODE   |
| ECCTL1   | CTRRST2    | EC_ABS_MODE   |
| ECCTL1   | CTRRST3    | EC_ABS_MODE   |
| ECCTL1   | CTRRST4    | EC_ABS_MODE   |
| ECCTL1   | CAPLDEN    | EC_ENABLE     |
| ECCTL1   | PRESCALE   | EC_DIV1       |
| ECCTL2   | CAP_APWM   | EC_CAP_MODE   |
| ECCTL2   | CONT_ONESH | EC_CONTINUOUS |
| ECCTL2   | SYNCO_SEL  | EC_SYNCO_DIS  |
| ECCTL2   | SYNCI_EN   | EC_DISABLE    |
| ECCTL2   | TSCTRSTOP  | EC_RUN        |

**Example 15-9. Code Snippet for CAP Mode Absolute Time, Rising Edge Trigger**

```
// Code snippet for CAP mode Absolute Time, Rising edge trigger

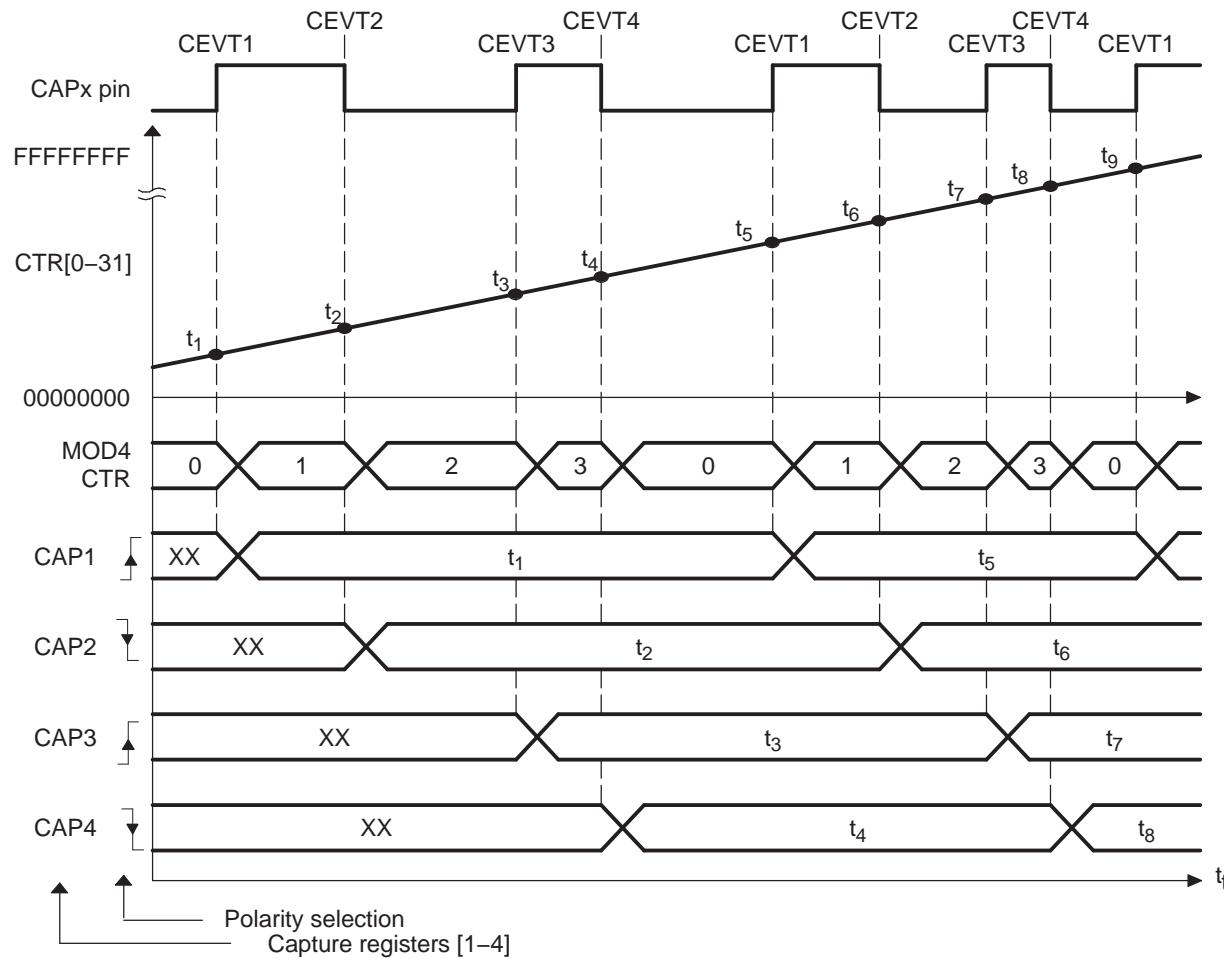

// Run Time ( e.g. CEVT4 triggered ISR call)
//=====
TSt1 = ECAPxRegs.CAP1;           // Fetch Time-Stamp captured at t1
TSt2 = ECAPxRegs.CAP2;           // Fetch Time-Stamp captured at t2
TSt3 = ECAPxRegs.CAP3;           // Fetch Time-Stamp captured at t3
TSt4 = ECAPxRegs.CAP4;           // Fetch Time-Stamp captured at t4

Period1 = TSt2-TSt1;             // Calculate 1st period
Period2 = TSt3-TSt2;             // Calculate 2nd period
Period3 = TSt4-TSt3;             // Calculate 3rd period
```

### 15.3.3.2 Absolute Time-Stamp Operation Rising and Falling Edge Trigger Example

In Figure 15-110 the eCAP operating mode is almost the same as in the previous section except capture events are qualified as either rising or falling edge, this now gives both period and duty cycle information: Period1 =  $t_3 - t_1$ , Period2 =  $t_5 - t_3$ , ...etc. Duty Cycle1 (on-time %) =  $(t_2 - t_1) / \text{Period1} \times 100\%$ , etc. Duty Cycle1 (off-time %) =  $(t_3 - t_2) / \text{Period1} \times 100\%$ , etc.

**Figure 15-110. Capture Sequence for Absolute Time-Stamp, Rising and Falling Edge Detect**

**Table 15-97. ECAP Initialization for CAP Mode Absolute Time, Rising and Falling Edge Trigger**

| Register | Bit        | Value         |
|----------|------------|---------------|
| ECCTL1   | CAP1POL    | EC_RISING     |
| ECCTL1   | CAP2POL    | EC_FALLING    |
| ECCTL1   | CAP3POL    | EC_RISING     |
| ECCTL1   | CAP4POL    | EC_FALLING    |
| ECCTL1   | CTRRST1    | EC_ABS_MODE   |
| ECCTL1   | CTRRST2    | EC_ABS_MODE   |
| ECCTL1   | CTRRST3    | EC_ABS_MODE   |
| ECCTL1   | CTRRST4    | EC_ABS_MODE   |
| ECCTL1   | CAPLDEN    | EC_ENABLE     |
| ECCTL1   | PRESCALE   | EC_DIV1       |
| ECCTL2   | CAP_APWM   | EC_CAP_MODE   |
| ECCTL2   | CONT_ONESH | EC_CONTINUOUS |
| ECCTL2   | SYNCO_SEL  | EC_SYNCO_DIS  |
| ECCTL2   | SYNCI_EN   | EC_DISABLE    |
| ECCTL2   | TSCTRSTOP  | EC_RUN        |

**Example 15-10. Code Snippet for CAP Mode Absolute Time, Rising and Falling Edge Trigger**

```
// Code snippet for CAP mode Absolute Time, Rising & Falling edge triggers

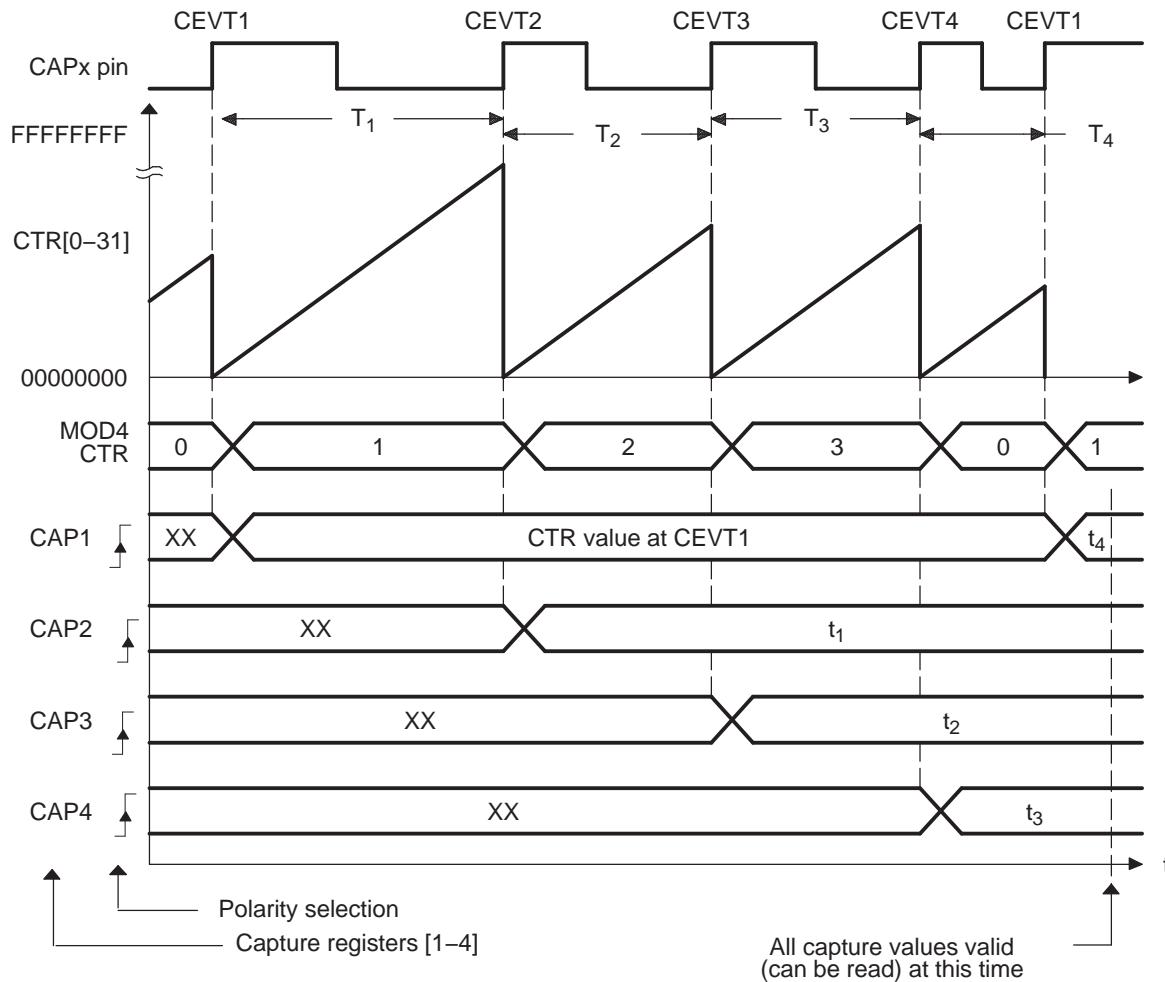

// Run Time ( e.g. CEVT4 triggered ISR call)
//=====
TSt1 = ECAPxRegs.CAP1;           // Fetch Time-Stamp captured at t1
TSt2 = ECAPxRegs.CAP2;           // Fetch Time-Stamp captured at t2
TSt3 = ECAPxRegs.CAP3;           // Fetch Time-Stamp captured at t3
TSt4 = ECAPxRegs.CAP4;           // Fetch Time-Stamp captured at t4

Period1 = TSt3-TSt1;             // Calculate 1st period
DutyOnTime1 = TSt2-TSt1;         // Calculate On time
DutyOffTime1 = TSt3-TSt2;        // Calculate Off time
```

### 15.3.3.3 Time Difference (Delta) Operation Rising Edge Trigger Example

Figure 15-111 shows how the eCAP module can be used to collect Delta timing data from pulse train waveforms. Here Continuous Capture mode (TSCTR counts-up without resetting, and Mod4 counter wraps around) is used. In Delta-time mode, TSCTR is Reset back to Zero on every valid event. Here Capture events are qualified as Rising edge only. On an event, TSCTR contents (time-stamp) is captured first, and then TSCTR is reset to Zero. The Mod4 counter then increments to the next state. If TSCTR reaches FFFF FFFFh (maximum value), before the next event, it wraps around to 0000 0000h and continues, a CNTOVF (counter overflow) Flag is set, and an Interrupt (if enabled) occurs. The advantage of Delta-time Mode is that the CAPn contents directly give timing data without the need for CPU calculations: Period1 =  $T_1$ , Period2 =  $T_2$ ,...etc. As shown in Figure 15-111, the CEVT1 event is a good trigger point to read the timing data,  $T_1$ ,  $T_2$ ,  $T_3$ ,  $T_4$  are all valid here.

**Figure 15-111. Capture Sequence for Delta Mode Time-Stamp, Rising Edge Detect**

**Table 15-98. ECAP Initialization for CAP Mode Delta Time, Rising Edge Trigger**

| Register | Bit        | Value         |
|----------|------------|---------------|
| ECCTL1   | CAP1POL    | EC_RISING     |
| ECCTL1   | CAP2POL    | EC_RISING     |
| ECCTL1   | CAP3POL    | EC_RISING     |
| ECCTL1   | CAP4POL    | EC_RISING     |
| ECCTL1   | CTRRST1    | EC_DELTA_MODE |
| ECCTL1   | CTRRST2    | EC_DELTA_MODE |
| ECCTL1   | CTRRST3    | EC_DELTA_MODE |
| ECCTL1   | CTRRST4    | EC_DELTA_MODE |
| ECCTL1   | CAPLDEN    | EC_ENABLE     |
| ECCTL1   | PRESCALE   | EC_DIV1       |
| ECCTL2   | CAP_APWM   | EC_CAP_MODE   |
| ECCTL2   | CONT_ONESH | EC_CONTINUOUS |
| ECCTL2   | SYNCO_SEL  | EC_SYNCO_DIS  |
| ECCTL2   | SYNCI_EN   | EC_DISABLE    |
| ECCTL2   | TSCTRSTOP  | EC_RUN        |

**Example 15-11. Code Snippet for CAP Mode Delta Time, Rising Edge Trigger**

```
// Code snippet for CAP mode Delta Time, Rising edge trigger

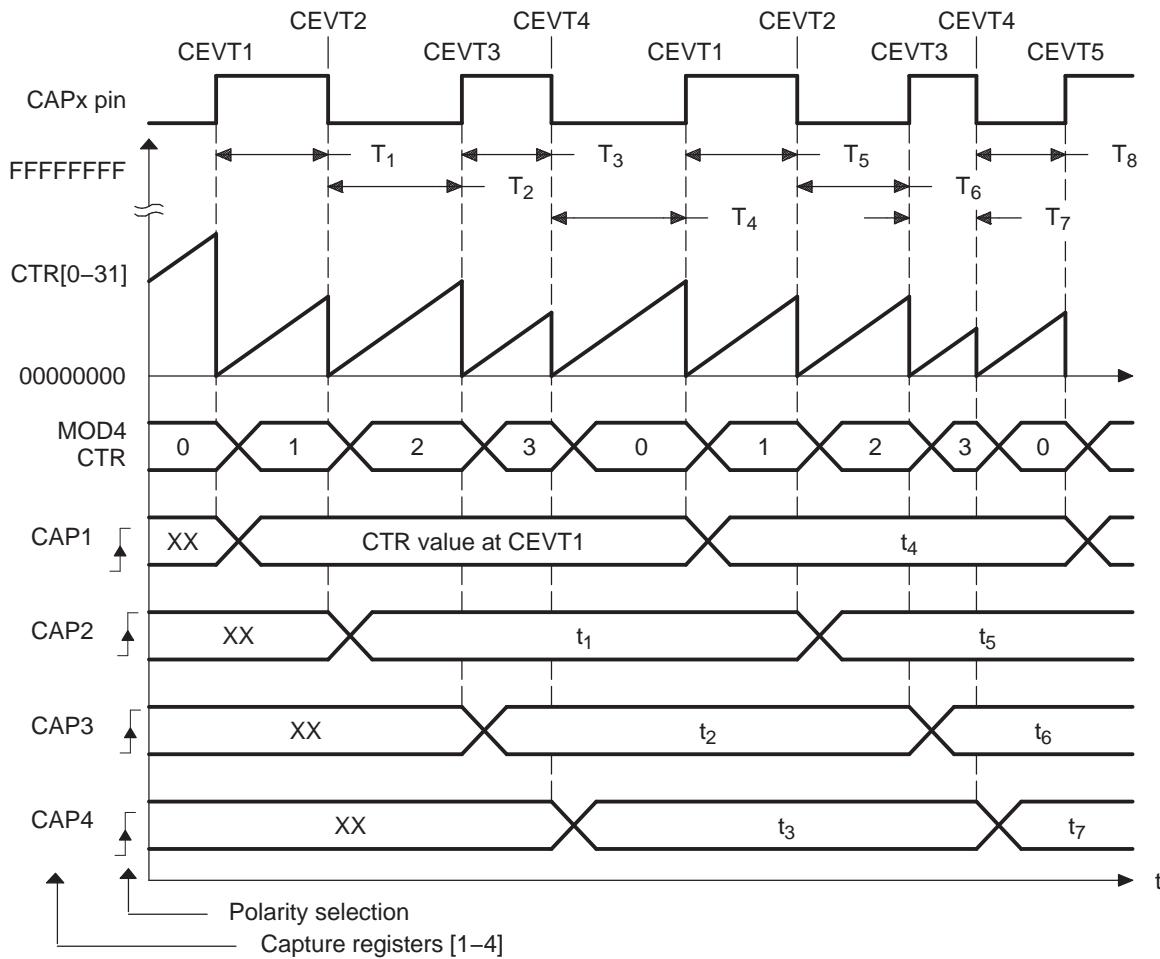

// Run Time ( e.g. CEVT1 triggered ISR call)
//=====
// Note: here Time-stamp directly represents the Period value.
Period4 = ECAPxRegs.CAP1;      // Fetch Time-Stamp captured at T1
Period1 = ECAPxRegs.CAP2;      // Fetch Time-Stamp captured at T2
Period2 = ECAPxRegs.CAP3;      // Fetch Time-Stamp captured at T3
Period3 = ECAPxRegs.CAP4;      // Fetch Time-Stamp captured at T4
```

#### 15.3.3.4 Time Difference (Delta) Operation Rising and Falling Edge Trigger Example

In Figure 15-112 the eCAP operating mode is almost the same as in previous section except Capture events are qualified as either Rising or Falling edge, this now gives both Period and Duty cycle information: Period1 =  $T_1 + T_2$ , Period2 =  $T_3 + T_4$ , ...etc Duty Cycle1 (on-time %) =  $T_1 / \text{Period1} \times 100\%$ , etc Duty Cycle1 (off-time %) =  $T_2 / \text{Period1} \times 100\%$ , etc

During initialization, you must write to the active registers for both period and compare. This will then automatically copy the init values into the shadow values. For subsequent compare updates, that is, during run-time, only the shadow registers must be used.

**Figure 15-112. Capture Sequence for Delta Mode Time-Stamp, Rising and Falling Edge Detect**

**Table 15-99. ECAP Initialization for CAP Mode Delta Time, Rising and Falling Edge Triggers**

| Register | Bit        | Value         |
|----------|------------|---------------|
| ECCTL1   | CAP1POL    | EC_RISING     |
| ECCTL1   | CAP2POL    | EC_FALLING    |
| ECCTL1   | CAP3POL    | EC_RISING     |
| ECCTL1   | CAP4POL    | EC_FALLING    |
| ECCTL1   | CTRRST1    | EC_DELTA_MODE |
| ECCTL1   | CTRRST2    | EC_DELTA_MODE |
| ECCTL1   | CTRRST3    | EC_DELTA_MODE |
| ECCTL1   | CTRRST4    | EC_DELTA_MODE |
| ECCTL1   | CAPLDEN    | EC_ENABLE     |
| ECCTL1   | PRESCALE   | EC_DIV1       |
| ECCTL2   | CAP_APWM   | EC_CAP_MODE   |
| ECCTL2   | CONT_ONESH | EC_CONTINUOUS |
| ECCTL2   | SYNCO_SEL  | EC_SYNCO_DIS  |

**Example 15-12. Code Snippet for CAP Mode Delta Time, Rising and Falling Edge Triggers**

```
// Code snippet for CAP mode Delta Time, Rising and Falling edge triggers

// Run Time ( e.g. CEVT1 triggered ISR call)
//=====
// Note: here Time-stamp directly represents the Duty cycle values.
DutyOnTime1 = ECAPxRegs.CAP2;      // Fetch Time-Stamp captured at T2
DutyOffTime1 = ECAPxRegs.CAP3;     // Fetch Time-Stamp captured at T3
DutyOnTime2 = ECAPxRegs.CAP4;      // Fetch Time-Stamp captured at T4
DutyOffTime2 = ECAPxRegs.CAP1;     // Fetch Time-Stamp captured at T1

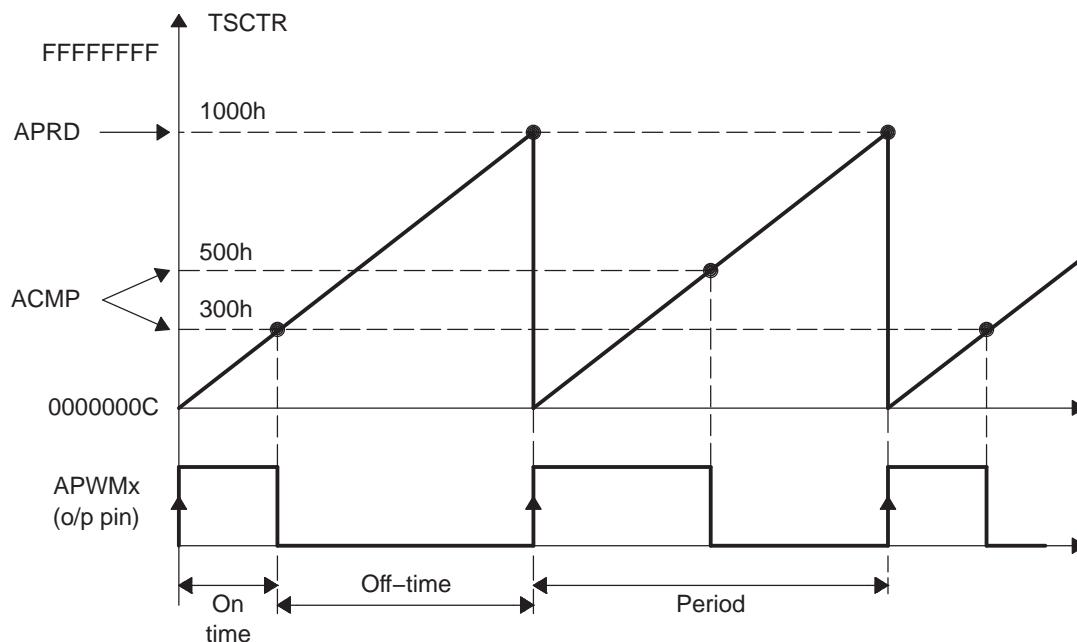

Period1 = DutyOnTime1 + DutyOffTime1;
Period2 = DutyOnTime2 + DutyOffTime2;
```

### 15.3.3.5 Application of the APWM Mode

#### 15.3.3.5.1 Simple PWM Generation (Independent Channel/s) Example

In this example, the eCAP module is configured to operate as a PWM generator. Here a very simple single channel PWM waveform is generated from output pin APWM<sub>n</sub>. The PWM polarity is active high, which means that the compare value (CAP2 reg is now a compare register) represents the on-time (high level) of the period. Alternatively, if the APWMPOL bit is configured for active low, then the compare value represents the off-time.

**Figure 15-113. PWM Waveform Details of APWM Mode Operation**

**Table 15-100. ECAP Initialization for APWM Mode**

| Register | Bit       | Value        |
|----------|-----------|--------------|
| CAP1     | CAP1      | 0x1000       |
| CTRPHS   | CTRPHS    | 0x0          |
| ECCTL2   | CAP_APWM  | EC_APWM_MODE |
| ECCTL2   | APWMPOL   | EC_ACTV_HI   |
| ECCTL2   | SYNCI_EN  | EC_DISABLE   |
| ECCTL2   | SYNCO_SEL | EC_SYNCO_DIS |
| ECCTL2   | TSCTRSTOP | EC_RUN       |

**Example 15-13. Code Snippet for APWM Mode**

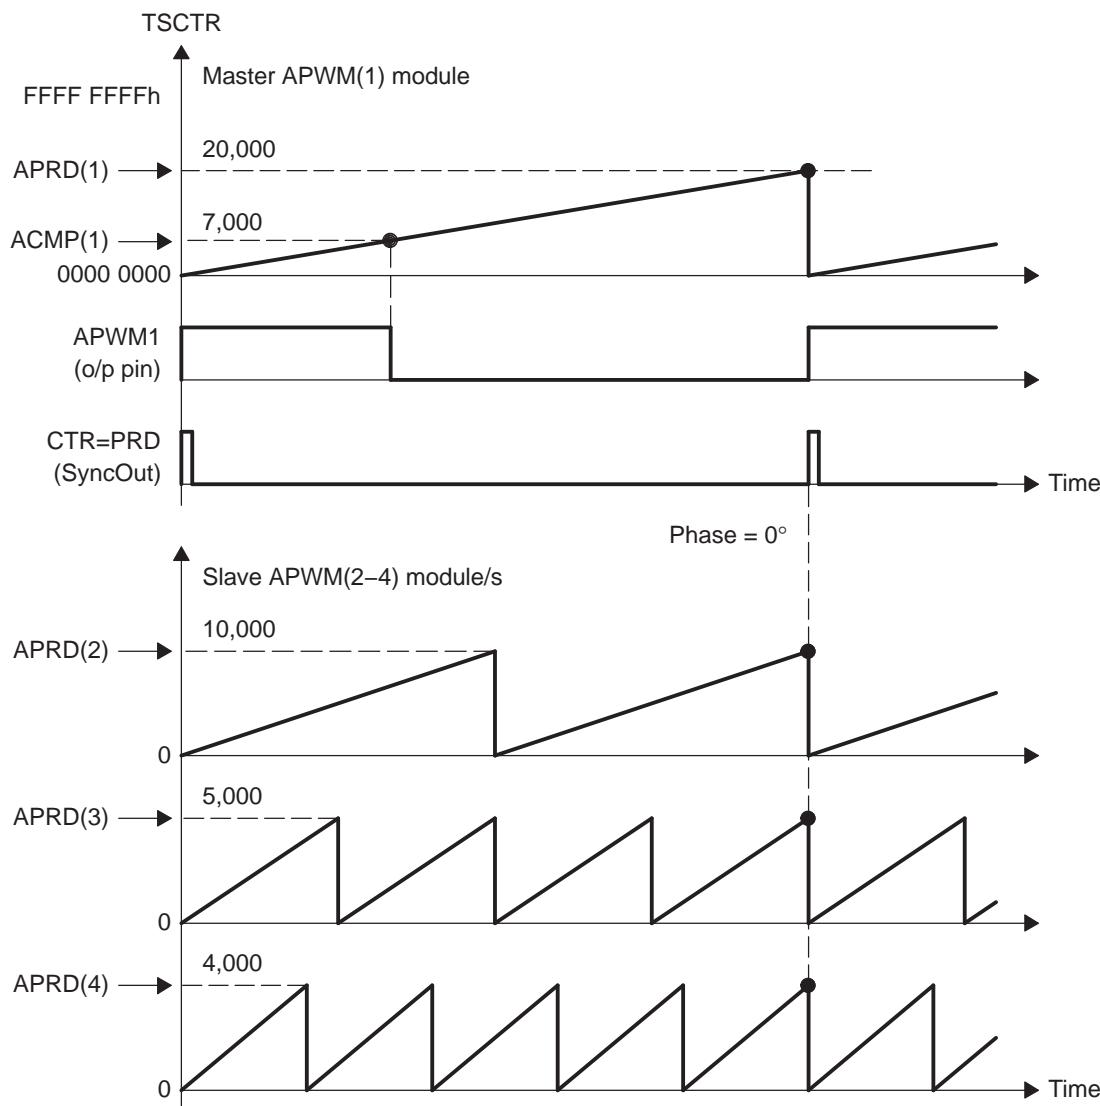

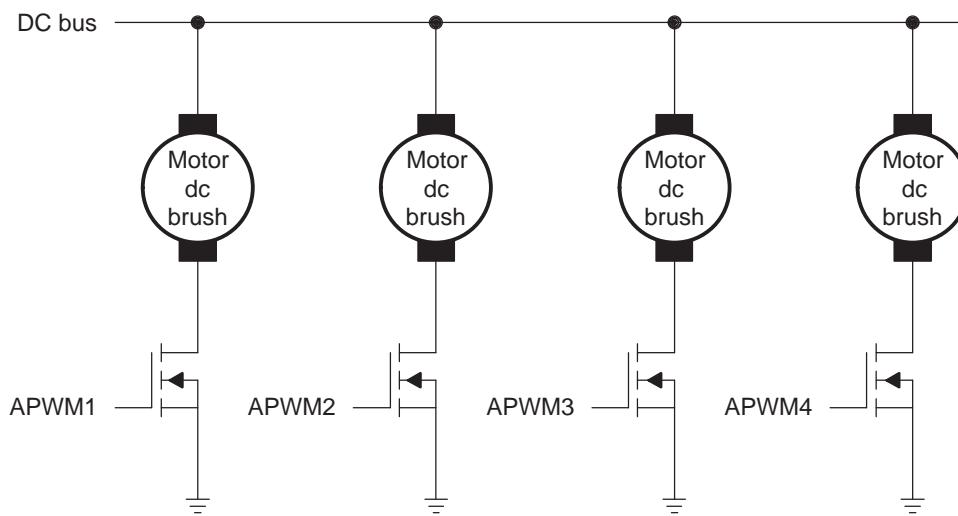

```
// Code snippet for APWM mode Example 1

// Run Time (Instant 1, e.g. ISR call)
//=====
ECAPxRegs.CAP2 = 0x300;      // Set Duty cycle i.e. compare value

// Run Time (Instant 2, e.g. another ISR call)
//=====
ECAPxRegs.CAP2 = 0x500;      // Set Duty cycle i.e. compare value
```

**15.3.3.5.2 Multichannel PWM Generation with Synchronization Example**

Figure 15-114 takes advantage of the synchronization feature between eCAP modules. Here 4 independent PWM channels are required with different frequencies, but at integer multiples of each other to avoid "beat" frequencies. Hence one eCAP module is configured as the Master and the remaining 3 are Slaves all receiving their synch pulse (CTR = PRD) from the master. Note the Master is chosen to have the lower frequency ( $F_1 = 1/20,000$ ) requirement. Here Slave2 Freq =  $2 \times F_1$ , Slave3 Freq =  $4 \times F_1$  and Slave4 Freq =  $5 \times F_1$ . Note here values are in decimal notation. Also, only the APWM1 output waveform is shown.

**Figure 15-114. Multichannel PWM Example Using 4 eCAP Modules**

**Table 15-101. ECAP1 Initialization for Multichannel PWM Generation with Synchronization**

| Register | Bit       | Value        |
|----------|-----------|--------------|
| CAP1     | CAP1      | 20000        |

| ECCTL2   | SYNCO_SEL | EC_SYNCO_DIS |
| ECCTL2   | TSCTRSTOP | EC_RUN       |

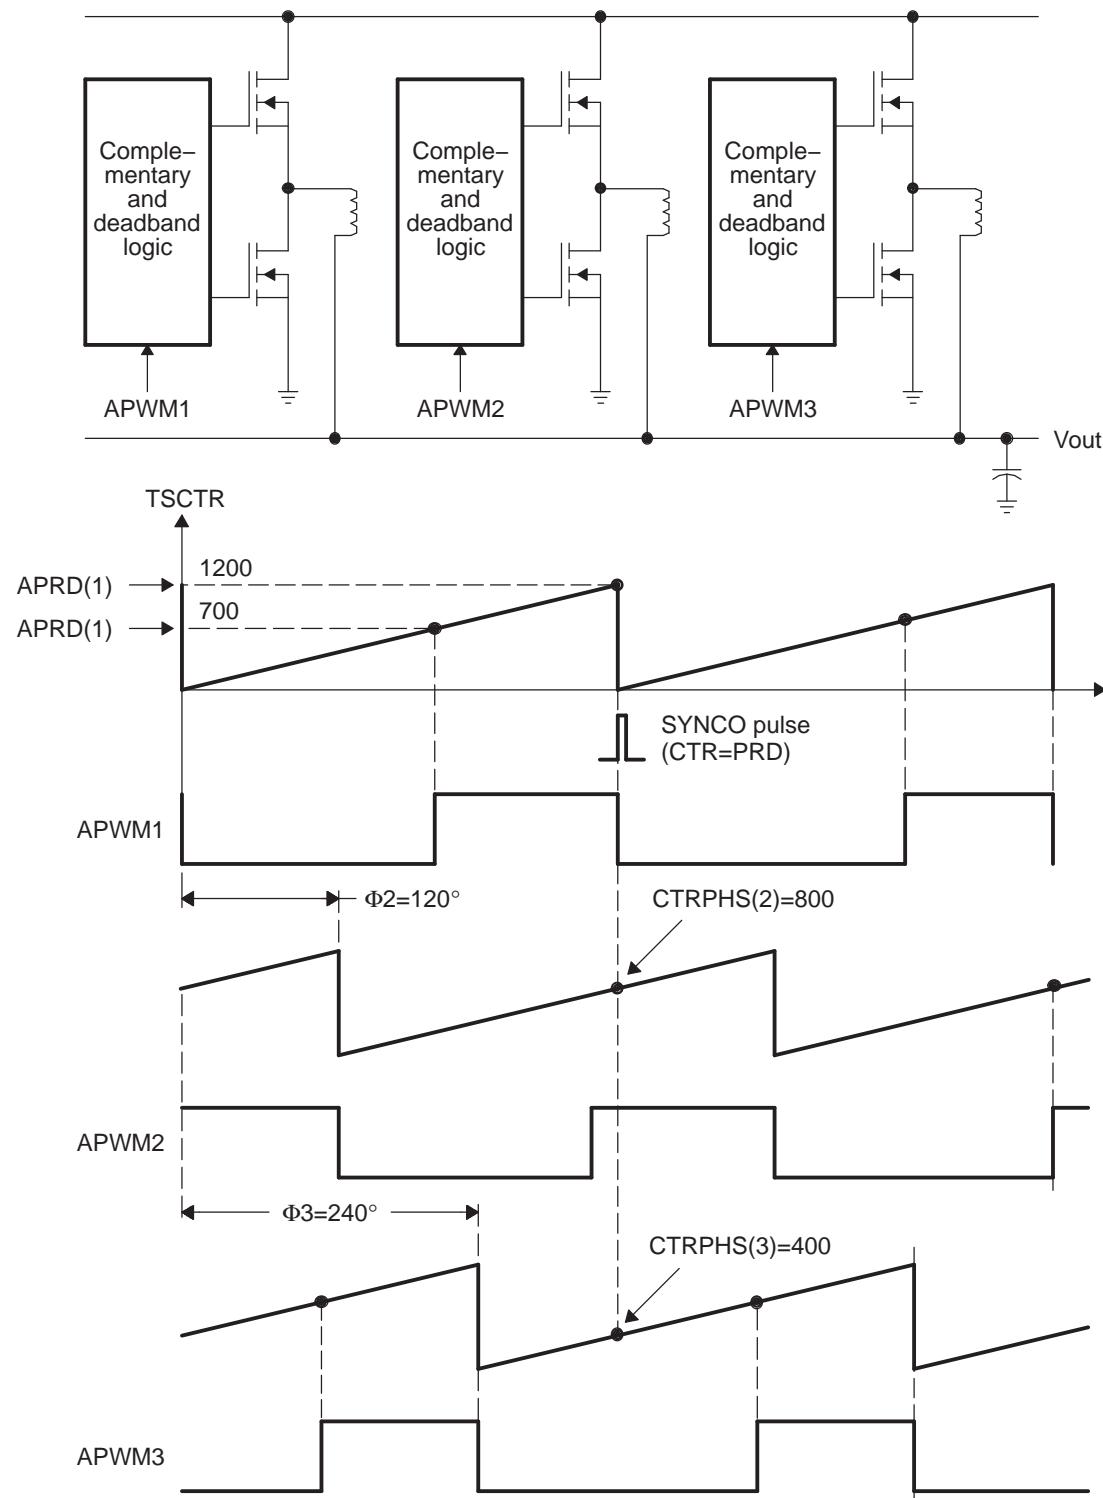

***Example 15-14. Code Snippet for Multichannel PWM Generation with Synchronization***

```
// Code snippet for APWM mode Example 2

// Run Time (Note: Example execution of one run-time instant)
//=====
ECAP1Regs.CAP2 = 7000;      // Set Duty cycle i.e., compare value = 7000
ECAP2Regs.CAP2 = 2000;      // Set Duty cycle i.e., compare value = 2000
ECAP3Regs.CAP2 = 550;       // Set Duty cycle i.e., compare value = 550
ECAP4Regs.CAP2 = 6500;      // Set Duty cycle i.e., compare value = 6500
```

***15.3.3.5.3 Multichannel PWM Generation with Phase Control Example***

In [Figure 15-115](#), the Phase control feature of the APWM mode is used to control a 3 phase Interleaved DC/DC converter topology. This topology requires each phase to be off-set by 120° from each other. Hence if “Leg” 1 (controlled by APWM1) is the reference Leg (or phase), that is, 0°, then Leg 2 need 120° off-set and Leg 3 needs 240° off-set. The waveforms in [Figure 15-115](#) show the timing relationship between each of the phases (Legs). Note eCAP1 module is the Master and issues a sync out pulse to the slaves (modules 2, 3) whenever TSCTR = Period value.

**Figure 15-115. Multiphase (channel) Interleaved PWM Example Using 3 eCAP Modules**

**Table 15-105. ECAP1 Initialization for Multichannel PWM Generation with Phase Control**

| Register | Bit       | Value        |
|----------|-----------|--------------|
| CAP1     | CAP1      | 1200         |

**Example 15-15. Code Snippet for Multichannel PWM Generation with Phase Control**

```
// Code snippet for APWM mode Example 3

// Run Time (Note: Example execution of one run-time instant)
//=====
// All phases are set to the same duty cycle
ECAP1Regs.CAP2 = 700;      // Set Duty cycle i.e. compare value = 700
ECAP2Regs.CAP2 = 700;      // Set Duty cycle i.e. compare value = 700
ECAP3Regs.CAP2 = 700;      // Set Duty cycle i.e. compare value = 700
```

### 15.3.4 Registers

**Table 15-108** shows the eCAP module control and status register set. All 32-bit registers are aligned on even address boundaries and are organized in little-endian mode. The 16 least-significant bits of a 32-bit register are located on lowest address (even address).

---

**NOTE:** In APWM mode, writing to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.

---

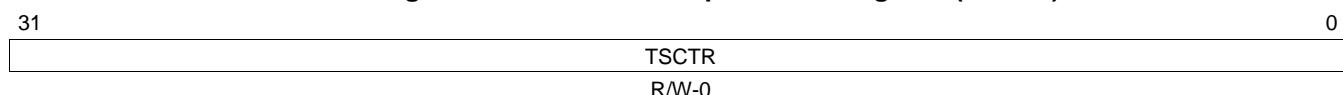

**Table 15-108. Control and Status Register Set**

| Offset | Acronym | Description                         | Size (x16) | Section                           |

#### 15.3.4.1 Time-Stamp Counter Register (TSCTR)

The time-stamp counter register (TSCTR) is shown in [Figure 15-116](#) and described in [Table 15-109](#).

**Figure 15-116. Time-Stamp Counter Register (TSCTR)**

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-109. Time-Stamp Counter Register (TSCTR) Field Descriptions**

| Bit  | Field | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | TSCTR | 0-FFFF FFFFh | Active 32-bit counter register that is used as the capture time-base |

#### 15.3.4.2 Counter Phase Control Register (CTRPHS)

The counter phase control register (CTRPHS) is shown in [Figure 15-117](#) and described in [Table 15-110](#).

**Figure 15-117. Counter Phase Control Register (CTRPHS)**

|    |        |       |
|----|--------|-------|
| 31 | CTRPHS | 0     |
|    |        | R/W-0 |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-110. Counter Phase Control Register (CTRPHS) Field Descriptions**

| Bit  | Field  | Value        | Description  |
|------|--------|--------------|--|
| 31-0 | CTRPHS | 0xFFFF FFFFh | Counter phase value register that can be programmed for phase lag/lead. This register shadows TSCTR and is loaded into TSCTR upon either a SYNC1 event or S/W force via a control bit. Used to achieve phase control synchronization with respect to other eCAP and EPWM time-bases. |

#### 15.3.4.3 Capture 1 Register (CAP1)

The capture 1 register (CAP1) is shown in [Figure 15-118](#) and described in [Table 15-111](#).

**Figure 15-118. Capture 1 Register (CAP1)**

|    |      |       |
|----|------|-------|
| 31 | CAP1 | 0     |
|    |      | R/W-0 |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-111. Capture 1 Register (CAP1) Field Descriptions**

| Bit  | Field | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | CAP1  | 0xFFFF FFFFh | This register can be loaded (written) by: <ul style="list-style-type: none"><li>• Time-Stamp (i.e., counter value) during a capture event</li><li>• Software - may be useful for test purposes</li><li>• APRD active register when used in APWM mode</li></ul> |

#### 15.3.4.4 Capture 2 Register (CAP2)

The capture 2 register (CAP2) is shown in [Figure 15-119](#) and described in [Table 15-112](#).

**Figure 15-119. Capture 2 Register (CAP2)**

|    |      |       |
|----|------|-------|
| 31 | CAP2 | 0     |
|    |      | R/W-0 |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-112. Capture 2 Register (CAP2) Field Descriptions**

| Bit  | Field | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | CAP2  | 0xFFFF FFFFh | This register can be loaded (written) by: <ul style="list-style-type: none"> <li>• Time-Stamp (i.e., counter value) during a capture event</li> <li>• Software - may be useful for test purposes</li> <li>• ACMP active register when used in APWM mode</li> </ul> |

#### 15.3.4.5 Capture 3 Register (CAP3)

The capture 3 register (CAP3) is shown in [Figure 15-120](#) and described in [Table 15-113](#).

**Figure 15-120. Capture 3 Register (CAP3)**

|    |      |       |
|----|------|-------|
| 31 | CAP3 | 0     |
|    |      | R/W-0 |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-113. Capture 3 Register (CAP3) Field Descriptions**

| Bit  | Field | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | CAP3  | 0xFFFF FFFFh | In CMP mode, this is a time-stamp capture register. In APWM mode, this is the period shadow (APRD) register. You update the PWM period value through this register. In this mode, CAP3 shadows CAP1. |

#### 15.3.4.6 Capture 4 Register (CAP4)

The capture 4 register (CAP4) is shown in [Figure 15-121](#) and described in [Table 15-114](#).

**Figure 15-121. Capture 4 Register (CAP4)**

|    |      |       |
|----|------|-------|
| 31 | CAP4 | 0     |
|    |      | R/W-0 |

LEGEND: R/W = Read/Write; -n = value after reset

**Table 15-114. Capture 4 Register (CAP4) Field Descriptions**

| Bit  | Field | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | CAP4  | 0xFFFF FFFFh | In CMP mode, this is a time-stamp capture register. In APWM mode, this is the compare shadow (ACMP) register. You update the PWM compare value through this register. In this mode, CAP4 shadows CAP2. |

#### 15.3.4.7 ECAP Control Register 1 (ECCTL1)

The ECAP control register 1 (ECCTL1) is shown in [Figure 15-122](#) and described in [Table 15-115](#).

**Figure 15-122. ECAP Control Register 1 (ECCTL1)**

|           |         |         |          |         |         |         |         |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-116. ECAP Control Register 2 (ECCTL2) Field Descriptions**

| Bit   | Field     | Value  | Description   |
|-------|-----------|--------|---|
| 15-11 | Reserved  | 0      | Reserved  |
| 10    | APWM POL  | 0<br>1 | APWM output polarity select. This is applicable only in APWM operating mode<br>Output is active high (Compare value defines high time)<br>Output is active low (Compare value defines low time)   |
| 9     | CAP/APWM  | 0<br>1 | CAP/APWM operating mode select<br>ECAP module operates in capture mode. This mode forces the following configuration: <ul style="list-style-type: none"><li>Inhibits TSCTR resets via CTR = PRD event</li><li>Inhibits shadow loads on CAP1 and 2 registers</li><li>Permits user to enable CAP1-4 register load</li><li>ECAPn/APWMn pin operates as a capture input</li></ul> ECAP module operates in APWM mode. This mode forces the following configuration: <ul style="list-style-type: none"><li>Resets TSCTR on CTR = PRD event (period boundary)</li><li>Permits shadow loading on CAP1 and 2 registers</li><li>Disables loading of time-stamps into CAP1-4 registers</li><li>ECAPn/APWMn pin operates as a APWM output</li></ul> |
| 8     | SWSYNC    | 0<br>1 | Software-forced Counter (TSCTR) Synchronizing. This provides a convenient software method to synchronize some or all ECAP time bases. In APWM mode, the synchronizing can also be done via the CTR = PRD event.<br>Writing a zero has no effect. Reading always returns a zero<br>Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero.<br>Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful.   |
| 7-6   | SYNCO_SEL | 0-3h   | Sync-Out Select<br>0 Select sync-in event to be the sync-out signal (pass through)<br>1h Select CTR = PRD event to be the sync-out signal<br>2h Disable sync out signal<br>3h Disable sync out signal   |
| 5     | SYNCI_EN  | 0<br>1 | Counter (TSCTR) Sync-In select mode<br>0 Disable sync-in option<br>1 Enable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.  |
| 4     | TSCTRSTOP | 0<br>1 | Time Stamp (TSCTR) Counter Stop (freeze) Control<br>0 TSCTR stopped<br>1 TSCTR free-running   |

**Table 15-116. ECAP Control Register 2 (ECCTL2) Field Descriptions (continued)**

| Bit | Field       | Value | Description   |
|-----|-------------|-------|---|
| 3   | RE-ARM      |       | <p>One-Shot Re-Arming Control, that is, wait for stop trigger. Note: The re-arm function is valid in one shot or continuous mode.</p> <p>0 Has no effect (reading always returns a 0)</p> <p>1 Arms the one-shot sequence as follows:<br/>           1) Resets the Mod4 counter to zero<br/>           2) Unfreezes the Mod4 counter<br/>           3) Enables capture register loads</p>   |
| 2-1 | STOP_WRAP   | 0-3h  | <p>Stop value for one-shot mode. This is the number (between 1-4) of captures allowed to occur before the CAP(1-4) registers are frozen, that is, capture sequence is stopped.<br/>           Wrap value for continuous mode. This is the number (between 1-4) of the capture register in which the circular buffer wraps around and starts again.</p> <p>0 Stop after Capture Event 1 in one-shot mode.<br/>           Wrap after Capture Event 1 in continuous mode.</p> <p>1h Stop after Capture Event 2 in one-shot mode.<br/>           Wrap after Capture Event 2 in continuous mode.</p> <p>2h Stop after Capture Event 3 in one-shot mode.<br/>           Wrap after Capture Event 3 in continuous mode.</p> <p>3h Stop after Capture Event 4 in one-shot mode.<br/>           Wrap after Capture Event 4 in continuous mode.</p> <p>Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur:<br/>           • Mod4 counter is stopped (frozen)<br/>           • Capture register loads are inhibited<br/>           In one-shot mode, further interrupt events are blocked until re-armed.</p> |
| 0   | CONT/ONESHT | 0     | <p>Continuous or one-shot mode control (applicable only in capture mode)</p> <p>0 Operate in continuous mode</p> <p>1 Operate in one-shot mode</p>  |

#### 15.3.4.9 ECAP Interrupt Enable Register (ECEINT)

The ECAP interrupt enable register (ECEINT) is shown in [Figure 15-124](#) and described in [Table 15-117](#).

The interrupt enable bits (CEVT $n$ ) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers.

The proper procedure for configuring peripheral modes and interrupts is:

1. Disable global interrupts
2. Stop eCAP counter
3. Disable eCAP interrupts
4. Configure peripheral registers
5. Clear spurious eCAP interrupt flags
6. Enable eCAP interrupts
7. Start eCAP counter
8. Enable global interrupts

**Figure 15-124. ECAP Interrupt Enable Register (ECEINT)**

| Bit  | Field | Value      | Description  |
|------|-------|------------|--------------|
| 31-0 | REV   | 44D2 2100h | Revision ID. |

## 15.4 Enhanced Quadrature Encoder Pulse (eQEP) Module

### 15.4.1 Introduction

A single track of slots patterns the periphery of an incremental encoder disk, as shown in Figure 15-129. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark/light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position, and zero reference.

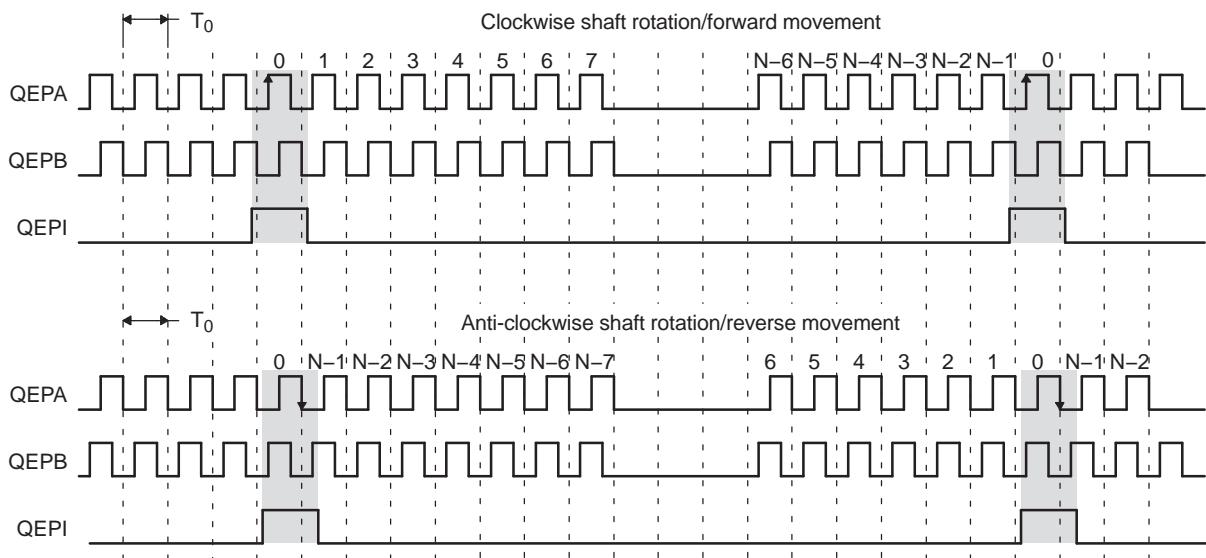

**Figure 15-129. Optical Encoder Disk**

To derive direction information, the lines on the disk are read out by two different photo-elements that "look" at the disk pattern with a mechanical shift of 1/4 the pitch of a line pair between them. This shift is realized with a reticle or mask that restricts the view of the photo-element to the desired part of the disk lines. As the disk rotates, the two photo-elements generate signals that are shifted 90 degrees out of phase from each other. These are commonly called the quadrature QEPA and QEPB signals. The clockwise direction for most encoders is defined as the QEPA channel going positive before the QEPB channel and vice versa as shown in Figure 15-130.

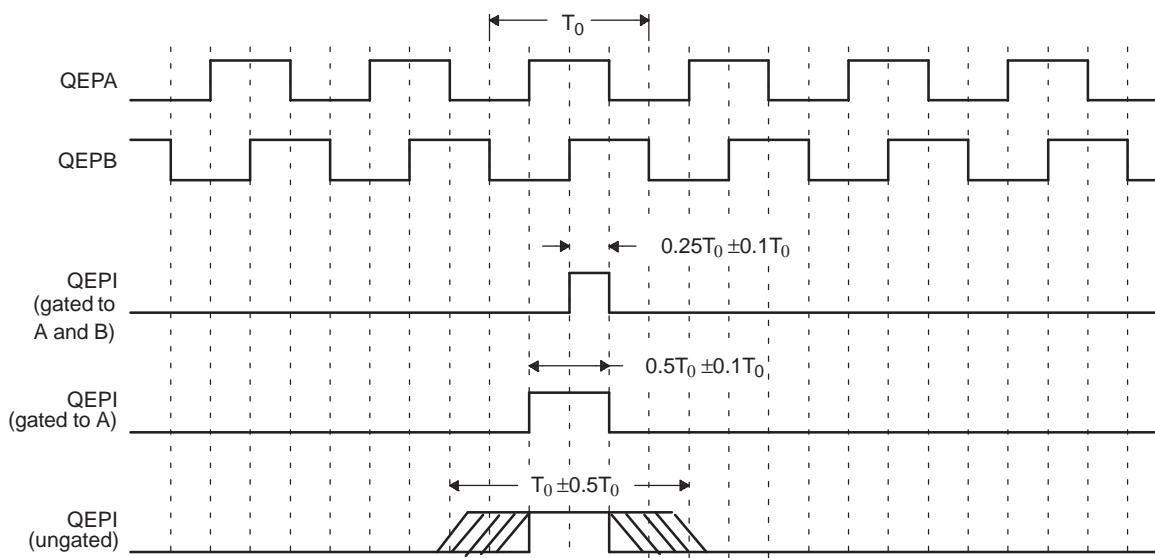

The encoder wheel typically makes one revolution for every revolution of the motor or the wheel may be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the velocity of the motor. For example, a 2000-line encoder directly coupled to a motor running at 5000 revolutions per minute (rpm) results in a frequency of 166.6 KHz, so by measuring the frequency of either the QEPA or QEPB output, the processor can determine the velocity of the motor.

**Figure 15-130. QEP Encoder Output Signal for Forward/Reverse Movement**

Quadrature encoders from different manufacturers come with two forms of index pulse (gated index pulse or ungated index pulse) as shown in [Figure 15-131](#). A nonstandard form of index pulse is ungated. In the ungated configuration, the index edges are not necessarily coincident with A and B signals. The gated index pulse is aligned to any of the four quadrature edges and width of the index pulse and can be equal to a quarter, half, or full period of the quadrature signal.

**Figure 15-131. Index Pulse Example**

Some typical applications of shaft encoders include robotics and even computer input in the form of a mouse. Inside your mouse you can see where the mouse ball spins a pair of axles (a left/right, and an up/down axle). These axles are connected to optical shaft encoders that effectively tell the computer how fast and in what direction the mouse is moving.

**General Issues:** Estimating velocity from a digital position sensor is a cost-effective strategy in motor control. Two different first order approximations for velocity may be written as:

$$v(k) \approx \frac{x(k) - x(k-1)}{T} = \frac{\Delta X}{T} \quad (1)$$

$$v(k) \approx \frac{X}{t(k) - t(k-1)} = \frac{X}{\Delta T} \quad (2)$$

where

$v(k)$ : Velocity at time instant k

$x(k)$ : Position at time instant k

$x(k-1)$ : Position at time instant k - 1

T: Fixed unit time or inverse of velocity calculation rate

$\Delta X$ : Incremental position movement in unit time

$t(k)$ : Time instant "k"

$t(k-1)$ : Time instant "k - 1"

X: Fixed unit position

$\Delta T$ : Incremental time elapsed for unit position movement.

[Equation 1](#) is the conventional approach to velocity estimation and it requires a time base to provide unit time event for velocity calculation. Unit time is basically the inverse of the velocity calculation rate.

The encoder count (position) is read once during each unit time event. The quantity  $[x(k) - x(k-1)]$  is formed by subtracting the previous reading from the current reading. Then the velocity estimate is computed by multiplying by the known constant  $1/T$  (where T is the constant time between unit time events and is known in advance).

Estimation based on [Equation 1](#) has an inherent accuracy limit directly related to the resolution of the position sensor and the unit time period T. For example, consider a 500-line per revolution quadrature encoder with a velocity calculation rate of 400 Hz. When used for position the quadrature encoder gives a four-fold increase in resolution, in this case, 2000 counts per revolution. The minimum rotation that can be detected is therefore 0.0005 revolutions, which gives a velocity resolution of 12 rpm when sampled at 400 Hz. While this resolution may be satisfactory at moderate or high speeds, for example, 1% error at 1200 rpm, it would clearly prove inadequate at low speeds. In fact, at speeds below 12 rpm, the speed estimate would erroneously be zero much of the time.

At low speed, [Equation 2](#) provides a more accurate approach. It requires a position sensor that outputs a fixed interval pulse train, such as the aforementioned quadrature encoder. The width of each pulse is defined by motor speed for a given sensor resolution. [Equation 2](#) can be used to calculate motor speed by measuring the elapsed time between successive quadrature pulse edges. However, this method suffers from the opposite limitation, as does [Equation 1](#). A combination of relatively large motor speeds and high sensor resolution makes the time interval  $\Delta T$  small, and thus more greatly influenced by the timer resolution. This can introduce considerable error into high-speed estimates.

For systems with a large speed range (that is, speed estimation is needed at both low and high speeds), one approach is to use [Equation 2](#) at low speed and have the software switch over to [Equation 1](#) when the motor speed rises above some specified threshold.

### 15.4.2 Functional Description

This section provides the eQEP inputs and functional description.

---

**NOTE:** Multiple identical eQEP modules can be contained in a system. The number of modules is device-dependent and is based on target application needs. In this document, the letter x within a signal or module name is used to indicate a generic eQEP instance on a device.

---

#### 15.4.2.1 EQEP Inputs

The eQEP inputs include two pins for quadrature-clock mode or direction-count mode, an index (or 0 marker), and a strobe input.

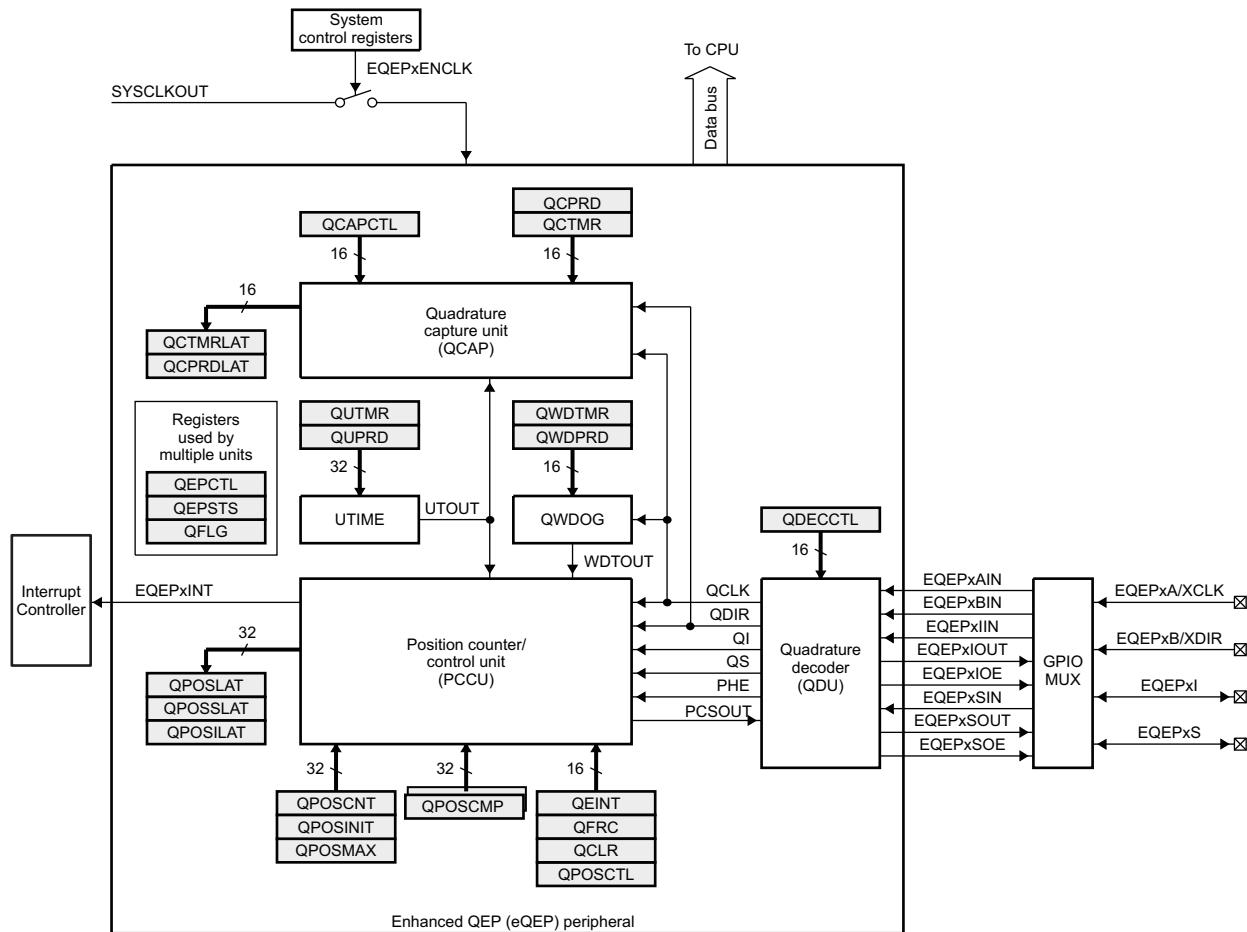

- QEPA/XCLK and QEPB/XDIR: These two pins can be used in quadrature-clock mode or direction-count mode.
  - Quadrature-clock Mode: The eQEP encoders provide two square wave signals (A and B) 90 electrical degrees out of phase whose phase relationship is used to determine the direction of rotation of the input shaft and number of eQEP pulses from the index position to derive the relative position information. For forward or clockwise rotation, QEPA signal leads QEPB signal and vice versa. The quadrature decoder uses these two inputs to generate quadrature-clock and direction signals.
  - Direction-count Mode: In direction-count mode, direction and clock signals are provided directly from the external source. Some position encoders have this type of output instead of quadrature output. The QEPA pin provides the clock input and the QEPB pin provides the direction input.
- QEPI: Index or Zero Marker: The eQEP encoder uses an index signal to assign an absolute start position from which position information is incrementally encoded using quadrature pulses. This pin is connected to the index output of the eQEP encoder to optionally reset the position counter for each revolution. This signal can be used to initialize or latch the position counter on the occurrence of a desired event on the index pin.
- QEPS: Strobe Input: This general-purpose strobe signal can initialize or latch the position counter on the occurrence of a desired event on the strobe pin. This signal is typically connected to a sensor or limit switch to notify that the motor has reached a defined position.

#### 15.4.2.2 Functional Description

The eQEP peripheral contains the following major functional units (as shown in [Figure 15-132](#)):

- Programmable input qualification for each pin (part of the GPIO MUX)
- Quadrature decoder unit (QDU)
- Position counter and control unit for position measurement (PCCU)
- Quadrature edge-capture unit for low-speed measurement (QCAP)
- Unit time base for speed/frequency measurement (UTIME)
- Watchdog timer for detecting stalls (QWDOG)

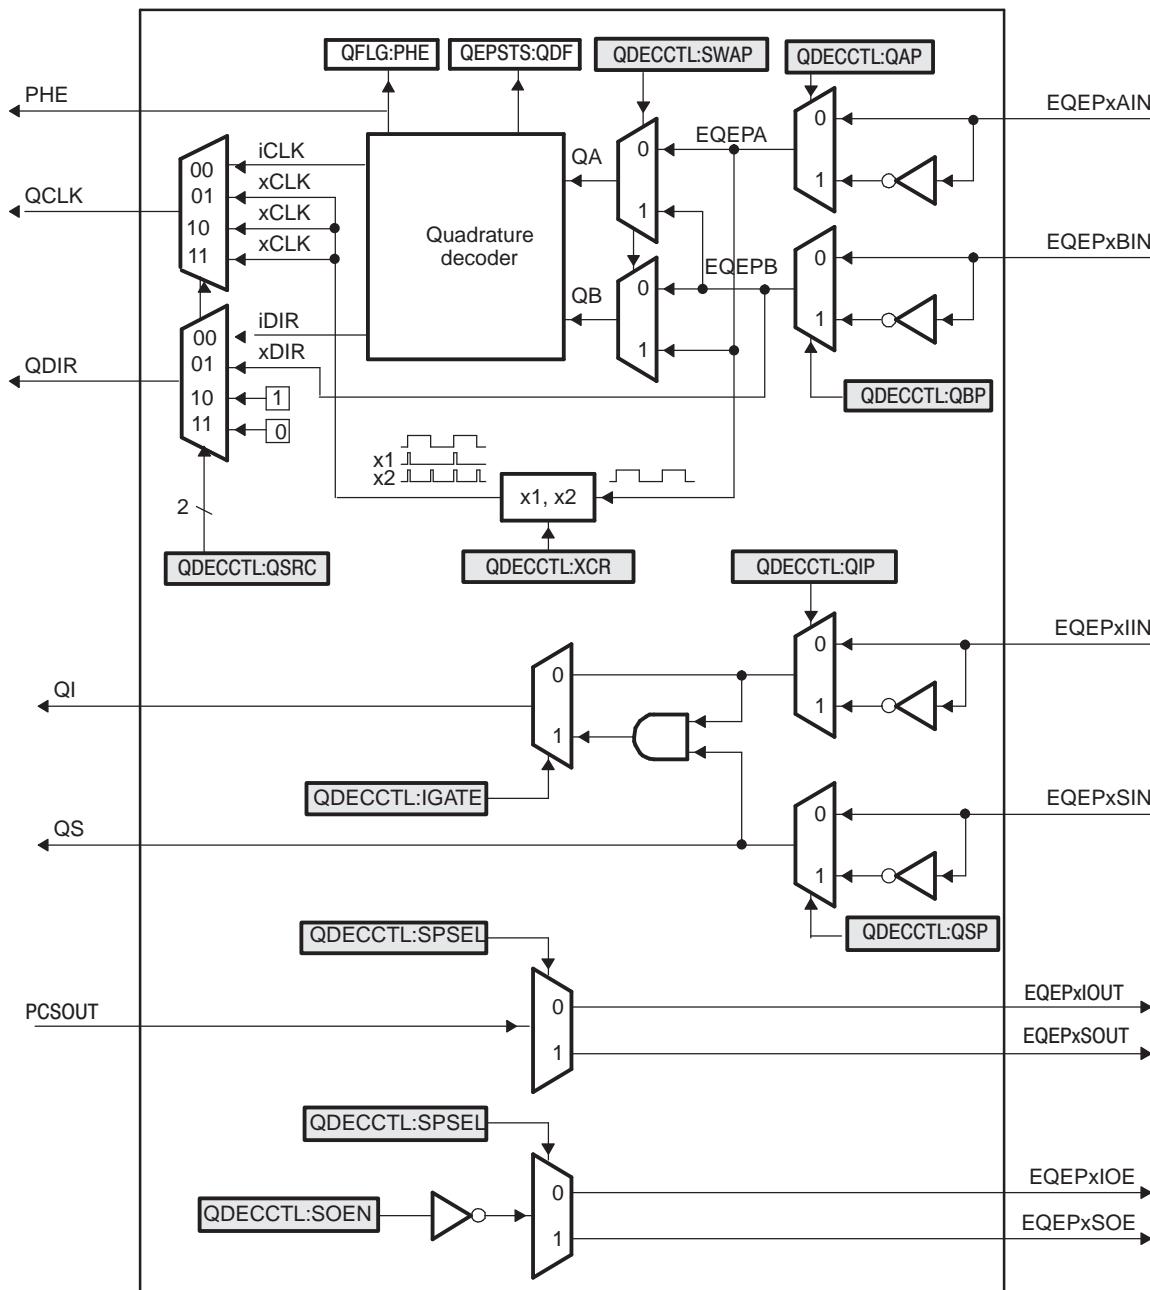

**Figure 15-132. Functional Block Diagram of the eQEP Peripheral**

### 15.4.2.3 Quadrature Decoder Unit (QDU)

Figure 15-133 shows a functional block diagram of the QDU.

**Figure 15-133. Functional Block Diagram of Decoder Unit**

### 15.4.2.3.1 Position Counter Input Modes

Clock and direction input to position counter is selected using the QSRC bit in the eQEP decoder control register (QDECCTL), based on interface input requirement as follows:

- Quadrature-count mode
- Direction-count mode
- UP-count mode
- DOWN-count mode

#### 15.4.2.3.1.1 Quadrature Count Mode

The quadrature decoder generates the direction and clock to the position counter in quadrature count mode.

**Direction Decoding**— The direction decoding logic of the eQEP circuit determines which one of the sequences (QEPA, QEPB) is the leading sequence and accordingly updates the direction information in the QDF bit in the eQEP status register (QEPSTS). [Table 15-122](#) and [Figure 15-134](#) show the direction decoding logic in truth table and state machine form. Both edges of the QEPA and QEPB signals are sensed to generate count pulses for the position counter. Therefore, the frequency of the clock generated by the eQEP logic is four times that of each input sequence. [Figure 15-135](#) shows the direction decoding and clock generation from the eQEP input signals.

**Phase Error Flag**— In normal operating conditions, quadrature inputs QEPA and QEPB will be 90 degrees out of phase. The phase error flag (PHE) is set in the QFLG register when edge transition is detected simultaneously on the QEPA and QEPB signals to optionally generate interrupts. State transitions marked by dashed lines in [Figure 15-134](#) are invalid transitions that generate a phase error.

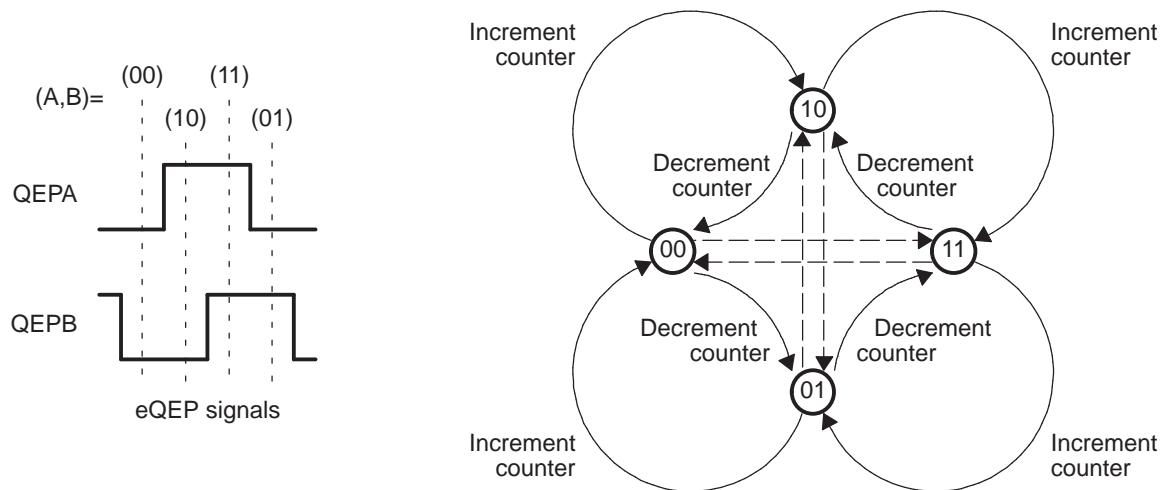

**Count Multiplication**— The eQEP position counter provides 4x times the resolution of an input clock by generating a quadrature-clock (QCLK) on the rising/falling edges of both eQEP input clocks (QEPA and QEPB) as shown in [Figure 15-135](#).

**Reverse Count**— In normal quadrature count operation, QEPA input is fed to the QA input of the quadrature decoder and the QEPB input is fed to the QB input of the quadrature decoder. Reverse counting is enabled by setting the SWAP bit in the eQEP decoder control register (QDECCTL). This will swap the input to the quadrature decoder thereby reversing the counting direction.

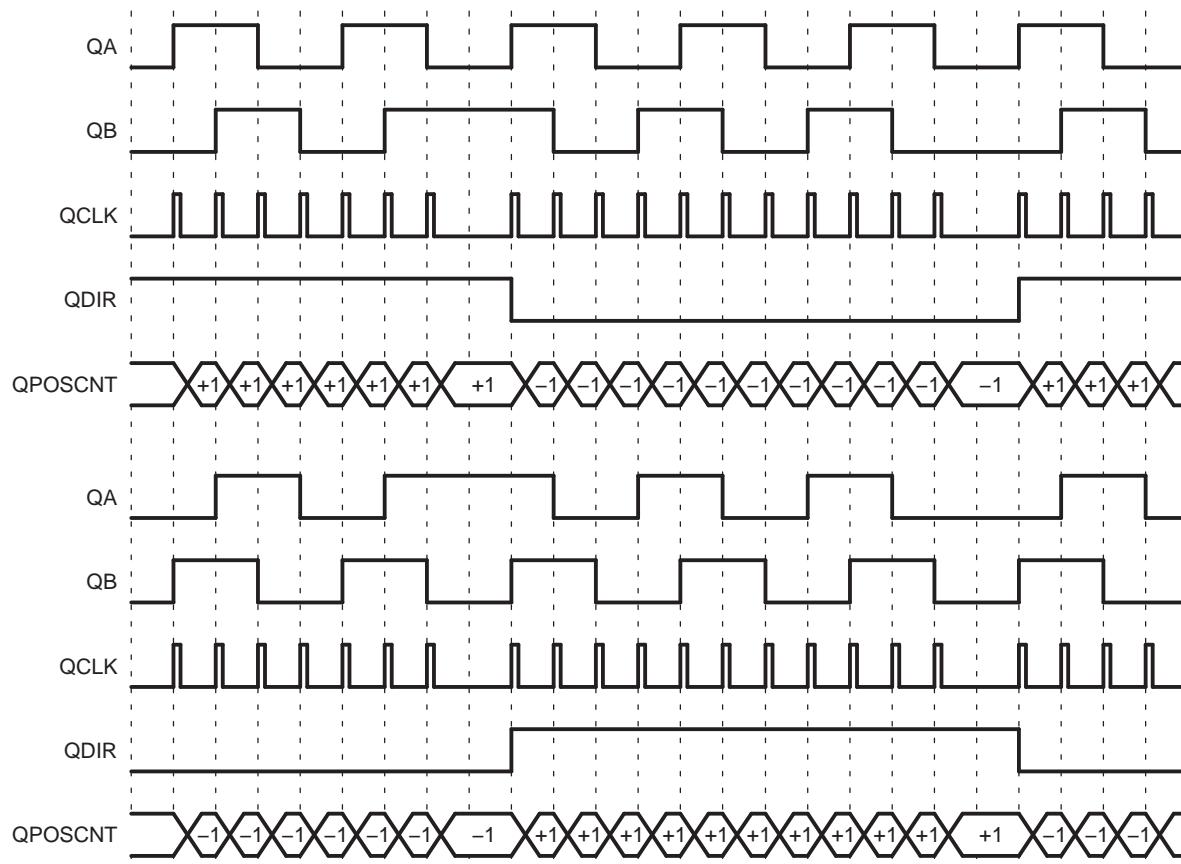

**Table 15-122. Quadrature Decoder Truth Table**

| Previous Edge | Present Edge | QDIR   | QPOSCNT                |
|---------------|--------------|--------|------------------------|
| QA↑           | QB↑          | UP     | Increment              |
|               | QB↓          | DOWN   | Decrement              |
|               | QA↓          | TOGGLE | Increment or Decrement |
| QA↓           | QB↓          | UP     | Increment              |
|               | QB↑          | DOWN   | Decrement              |
|               | QA↑          | TOGGLE | Increment or Decrement |
| QB↑           | QA↑          | DOWN   | Increment              |
|               | QA↓          | UP     | Decrement              |
|               | QB↓          | TOGGLE | Increment or Decrement |
| QB↓           | QA↓          | DOWN   | Increment              |
|               | QA↑          | UP     | Decrement              |
|               | QB↑          | TOGGLE | Increment or Decrement |

**Figure 15-134. Quadrature Decoder State Machine**

**Figure 15-135. Quadrature-clock and Direction Decoding**

#### **15.4.2.3.1.2 Direction-count Mode**

Some position encoders provide direction and clock outputs, instead of quadrature outputs. In such cases, direction-count mode can be used. QEPA input will provide the clock for position counter and the QEPB input will have the direction information. The position counter is incremented on every rising edge of a QEPA input when the direction input is high and decremented when the direction input is low.

#### **15.4.2.3.1.3 Up-Count Mode**

The counter direction signal is hard-wired for up count and the position counter is used to measure the frequency of the QEPA input. Setting of the XCR bit in the eQEP decoder control register (QDECCTL) enables clock generation to the position counter on both edges of the QEPA input, thereby increasing the measurement resolution by 2x factor.

#### **15.4.2.3.1.4 Down-Count Mode**

The counter direction signal is hardwired for a down count and the position counter is used to measure the frequency of the QEPA input. Setting of the XCR bit in the eQEP decoder control register (QDECCTL) enables clock generation to the position counter on both edges of a QEPA input, thereby increasing the measurement resolution by 2x factor.

#### **15.4.2.3.2 eQEP Input Polarity Selection**

Each eQEP input can be inverted using the in the eQEP decoder control register (QDECCTL[8:5]) control bits. As an example, setting of the QIP bit in QDECCTL inverts the index input.

#### **15.4.2.3.3 Position-Compare Sync Output**

The eQEP peripheral includes a position-compare unit that is used to generate the position-compare sync signal on compare match between the position counter register (QPOS\_CNT) and the position-compare register (QPOS\_CMP). This sync signal can be output using an index pin or strobe pin of the EQEP peripheral.

Setting the SOEN bit in the eQEP decoder control register (QDECCTL) enables the position-compare sync output and the SPSEL bit in QDECCTL selects either an eQEP index pin or an eQEP strobe pin.

#### **15.4.2.4 Position Counter and Control Unit (PCCU)**

The position counter and control unit provides two configuration registers (QEPCTL and QPOSCTL) for setting up position counter operational modes, position counter initialization/latch modes and position-compare logic for sync signal generation.

##### **15.4.2.4.1 Position Counter Operating Modes**

Position counter data may be captured in different manners. In some systems, the position counter is accumulated continuously for multiple revolutions and the position counter value provides the position information with respect to the known reference. An example of this is the quadrature encoder mounted on the motor controlling the print head in the printer. Here the position counter is reset by moving the print head to the home position and then position counter provides absolute position information with respect to home position.

In other systems, the position counter is reset on every revolution using index pulse and position counter provides rotor angle with respect to index pulse position.

Position counter can be configured to operate in following four modes

- Position Counter Reset on Index Event
- Position Counter Reset on Maximum Position
- Position Counter Reset on the first Index Event
- Position Counter Reset on Unit Time Out Event (Frequency Measurement)

In all the above operating modes, position counter is reset to 0 on overflow and to QPOSMAX register value on underflow. Overflow occurs when the position counter counts up after QPOSMAX value. Underflow occurs when position counter counts down after "0". Interrupt flag is set to indicate overflow/underflow in QFLG register.

#### 15.4.2.4.1.1 Position Counter Reset on Index Event (QEPCTL[PCRM] = 00)

If the index event occurs during the forward movement, then position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the QPOSMAX register on the next eQEP clock.

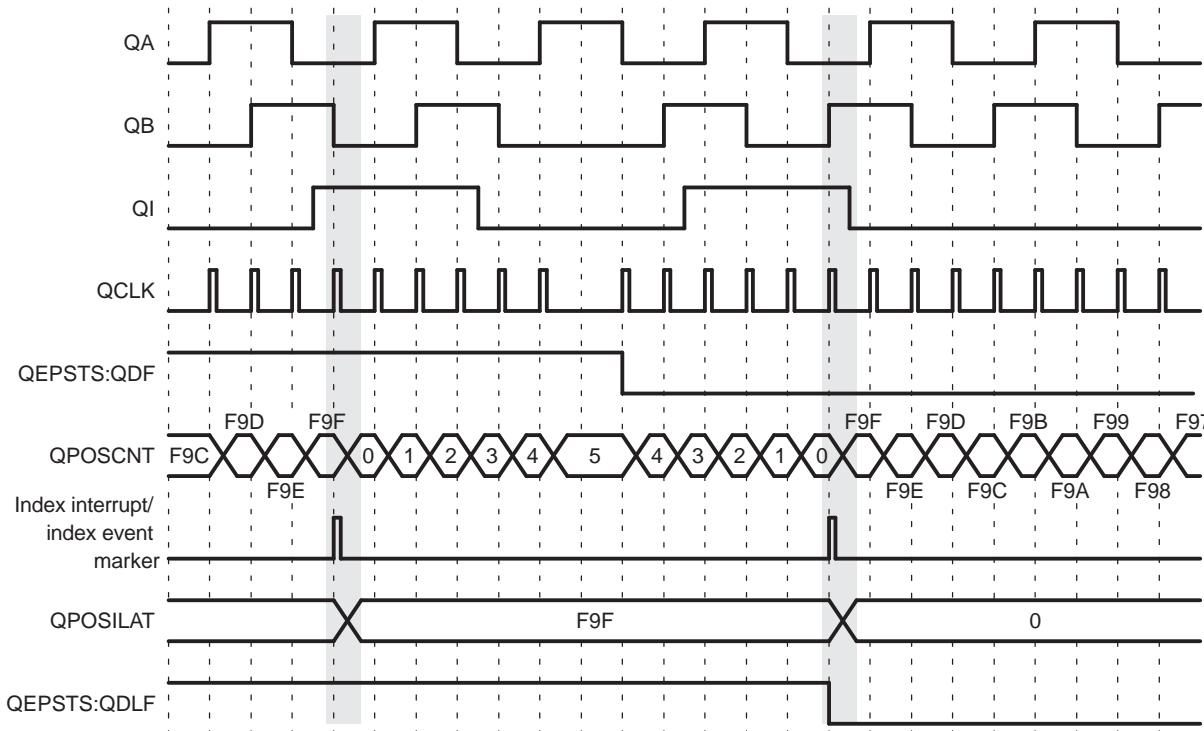

First index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and direction on the first index event marker (QEPSTS[FIDF]) in QEPSTS registers, it also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for index event reset operation.

For example, if the first reset operation occurs on the falling edge of QEPB during the forward direction, then all the subsequent reset must be aligned with the falling edge of QEPB for the forward rotation and on the rising edge of QEPB for the reverse rotation as shown in [Figure 15-136](#).

The position-counter value is latched to the QPOSILAT register and direction information is recorded in the QEPSTS[QDLF] bit on every index event marker. The position-counter error flag (QEPSTS[PCEF]) and error interrupt flag (QFLG[PCE]) are set if the latched value is not equal to 0 or QPOSMAX. The position-counter error flag (QEPSTS[PCEF]) is updated on every index event marker and an interrupt flag (QFLG[PCE]) will be set on error that can be cleared only through software.

The index event latch configuration QEPCTL[IEL] bits are ignored in this mode and position counter error flag/interrupt flag are generated only in index event reset mode.

**Figure 15-136. Position Counter Reset by Index Pulse for 1000 Line Encoder (QPOSMAX = 3999 or F9Fh)**

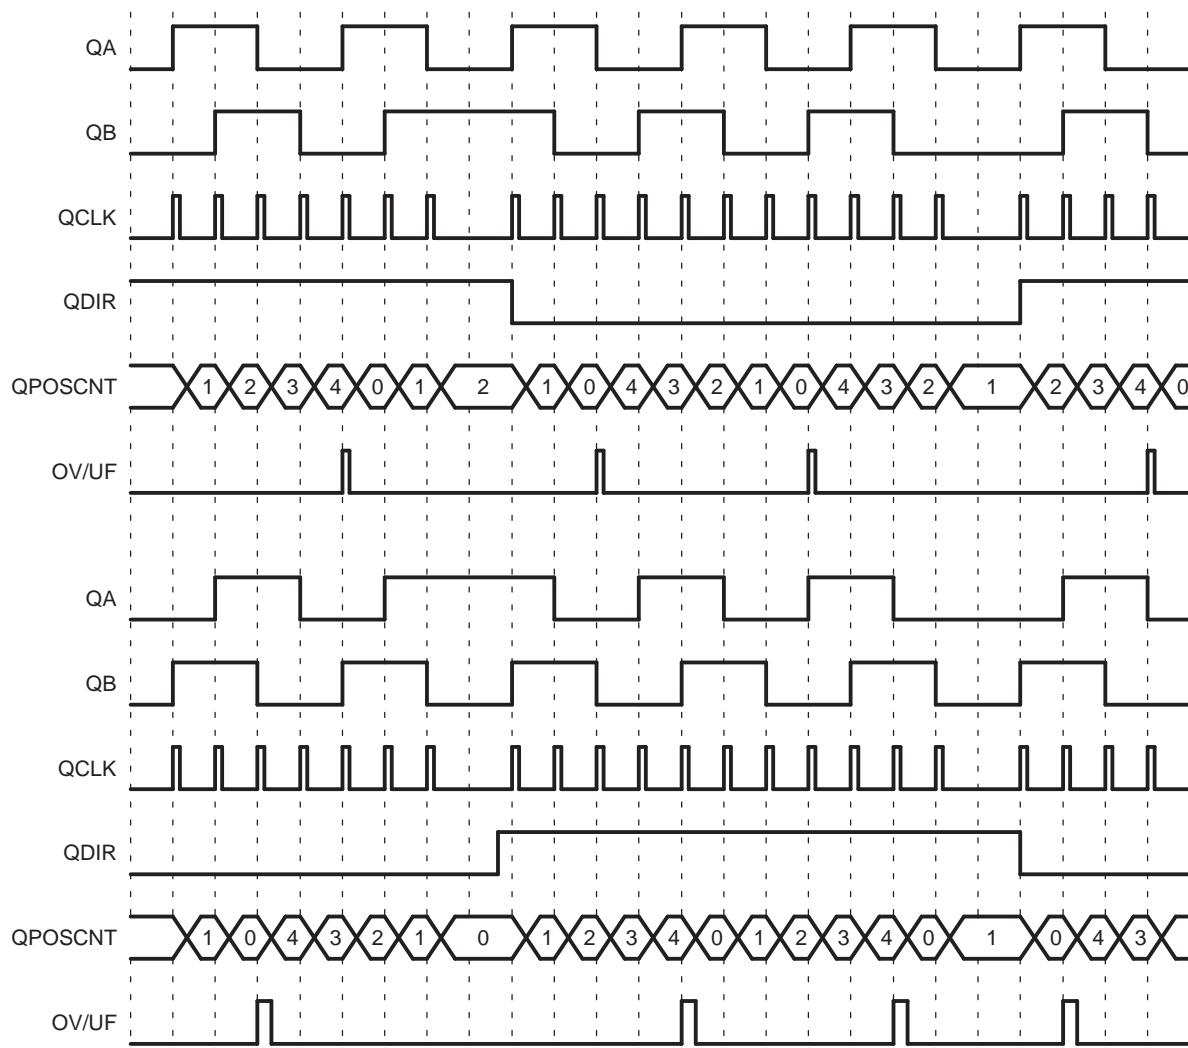

#### 15.4.2.4.1.2 Position Counter Reset on Maximum Position (QEPCTL[PCRM]=01)

If the position counter is equal to QPOSMAX, then the position counter is reset to 0 on the next eQEP clock for forward movement and position counter overflow flag is set. If the position counter is equal to ZERO, then the position counter is reset to QPOSMAX on the next QEP clock for reverse movement and position counter underflow flag is set. Figure 15-137 shows the position counter reset operation in this mode.

First index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and direction on the first index event marker (QEPSTS[FIDF]) in the QEPSTS registers; it also remembers the quadrature edge on the first index marker so that the same relative quadrature transition is used for the software index marker (QEPCTL[IEL]=11).

**Figure 15-137. Position Counter Underflow/Overflow (QPOSMAX = 4)**

#### **15.4.2.4.1.3 Position Counter Reset on the First Index Event ( $QEPCTL[PCRM] = 10$ )**

If the index event occurs during forward movement, then the position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the QPOSMAX register on the next eQEP clock. Note that this is done only on the first occurrence and subsequently the position counter value is not reset on an index event; rather, it is reset based on maximum position as described in [Section 15.4.2.4.1.2](#).

First index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and direction on the first index event marker (QEPSTS[FIDF]) in QEPSTS registers. It also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for software index marker ( $QEPCTL[IEL]=11$ ).

#### **15.4.2.4.1.4 Position Counter Reset on Unit Time out Event ( $QEPCTL[PCRM] = 11$ )**

In this mode, the QPOSCNT value is latched to the QPOSLAT register and then the QPOSCNT is reset (to 0 or QPOSMAX, depending on the direction mode selected by QDECCTL[QSRC] bits on a unit time event). This is useful for frequency measurement.

#### **15.4.2.4.2 Position Counter Latch**

The eQEP index and strobe input can be configured to latch the position counter (QPOSCNT) into QPOSILAT and QPOSSLAT, respectively, on occurrence of a definite event on these pins.

##### **15.4.2.4.2.1 Index Event Latch**

In some applications, it may not be desirable to reset the position counter on every index event and instead it may be required to operate the position counter in full 32-bit mode ( $QEPCTL[PCRM] = 01$  and  $QEPCTL[PCRM] = 10$  modes).

In such cases, the eQEP position counter can be configured to latch on the following events and direction information is recorded in the QEPSTS[QDLF] bit on every index event marker.

- Latch on Rising edge ( $QEPCTL[IEL] = 01$ )
- Latch on Falling edge ( $QEPCTL[IEL] = 10$ )
- Latch on Index Event Marker ( $QEPCTL[IEL] = 11$ )

This is particularly useful as an error checking mechanism to check if the position counter accumulated the correct number of counts between index events. As an example, the 1000-line encoder must count 4000 times when moving in the same direction between the index events.

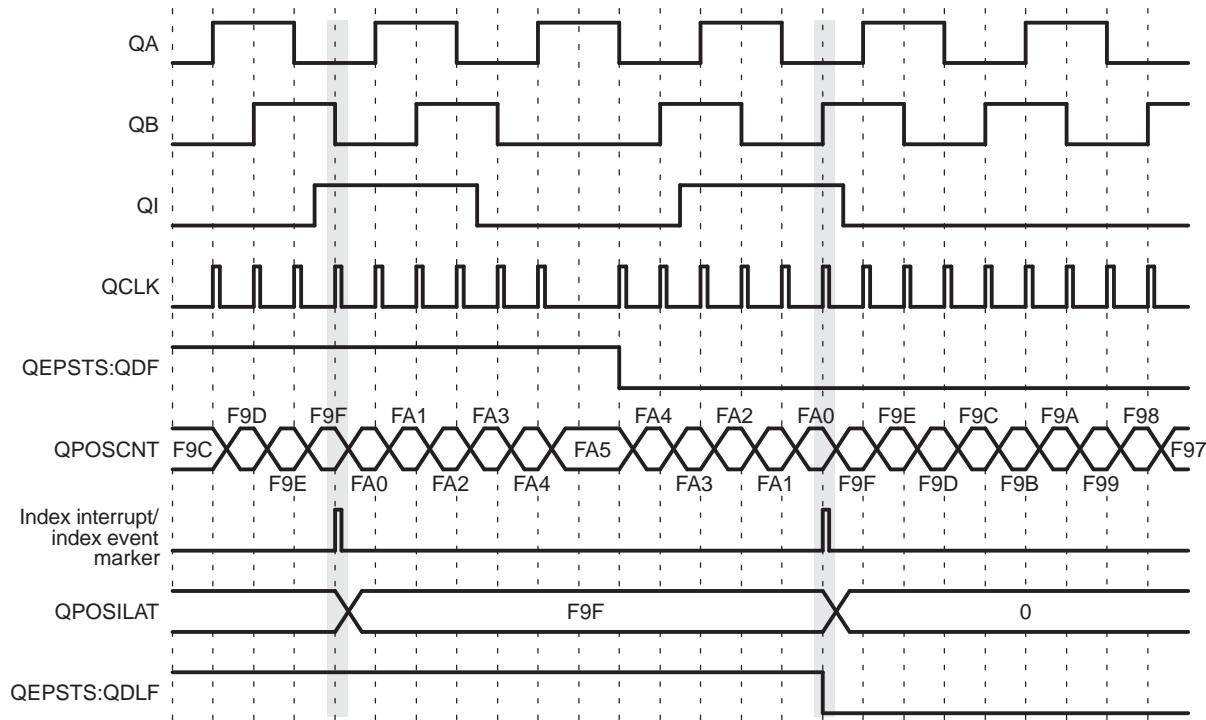

The index event latch interrupt flag (QFLG[IEL]) is set when the position counter is latched to the QPOSILAT register. The index event latch configuration bits ( $QEPCTZ[IEL]$ ) are ignored when  $QEPCTL[PCRM] = 00$ .

**Latch on Rising Edge ( $QEPCTL[IEL] = 01$ )**— The position counter value (QPOSCNT) is latched to the QPOSILAT register on every rising edge of an index input.

**Latch on Falling Edge ( $QEPCTL[IEL] = 10$ )**— The position counter value (QPOSCNT) is latched to the QPOSILAT register on every falling edge of index input.

**Latch on Index Event Marker/Software Index Marker ( $QEPCTL[IEL] = 11$ )**— The first index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (QEPSTS[FIMF]) and direction on the first index event marker (QEPSTS[FIDF]) in the QEPSTS registers. It also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for latching the position counter ( $QEPCTL[IEL] = 11$ ).

[Figure 15-138](#) shows the position counter latch using an index event marker.

**Figure 15-138. Software Index Marker for 1000-line Encoder (QEPCTL[IEL] = 1)**

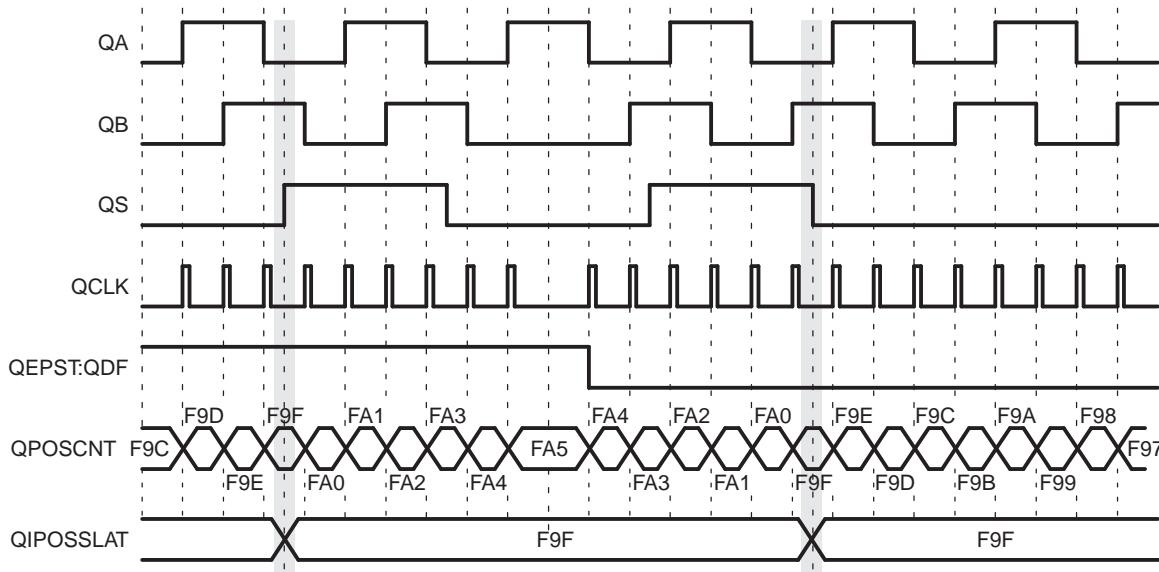

#### 15.4.2.4.2.2 Strobe Event Latch

The position-counter value is latched to the QPOSSLAT register on the rising edge of the strobe input by clearing the QEPCTL[SEL] bit.

If the QEPCTL[SEL] bit is set, then the position counter value is latched to the QPOSSLAT register on the rising edge of the strobe input for forward direction and on the falling edge of the strobe input for reverse direction as shown in [Figure 15-139](#).

The strobe event latch interrupt flag (QFLG[SEL]) is set when the position counter is latched to the QPOSSLAT register.

**Figure 15-139. Strobe Event Latch (QEPCTL[SEL] = 1)**

#### 15.4.2.4.3 Position Counter Initialization

The position counter can be initialized using following events:

- Index event
- Strobe event
- Software initialization

**Index Event Initialization (IEI)**— The QEPI index input can be used to trigger the initialization of the position counter at the rising or falling edge of the index input.

If the QEPCTL[IEI] bits are 10, then the position counter (QPOS\_CNT) is initialized with a value in the QPOSINIT register on the rising edge of strobe input for forward direction and on the falling edge of strobe input for reverse direction.

The index event initialization interrupt flag (QFLG[IEI]) is set when the position counter is initialized with a value in the QPOSINIT register.

**Strobe Event Initialization (SEI)**— If the QEPCTL[SEI] bits are 10, then the position counter is initialized with a value in the QPOSINIT register on the rising edge of strobe input.

If the QEPCTL[SEL] bits are 11, then the position counter (QPOS\_CNT) is initialized with a value in the QPOSINIT register on the rising edge of strobe input for forward direction and on the falling edge of strobe input for reverse direction.

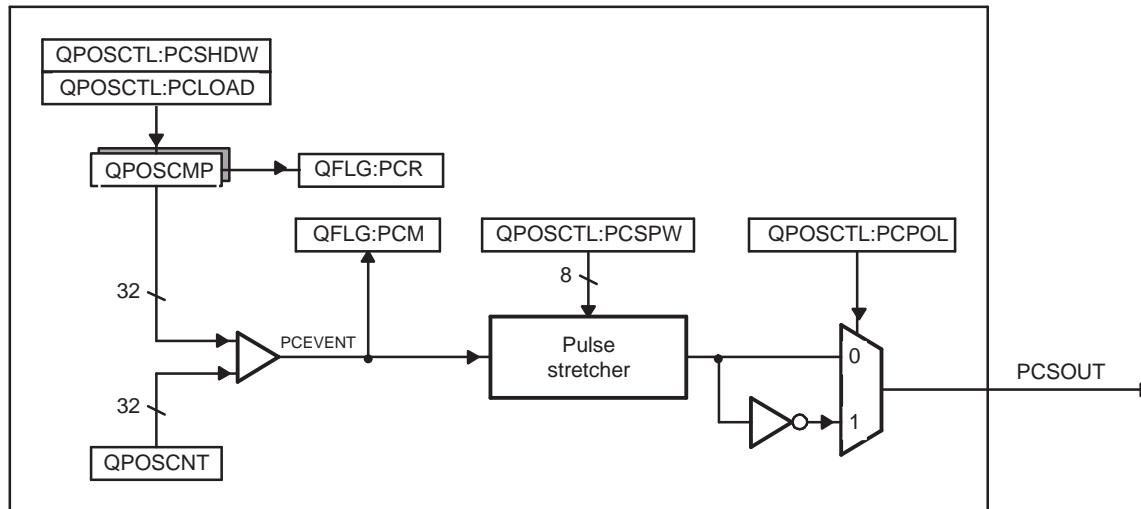

The strobe event initialization interrupt flag (QFLG[SEI]) is set when the position counter is initialized with a value in the QPOSINIT register.

**Software Initialization (SWI)**— The position counter can be initialized in software by writing a 1 to the QEPCTL[SWI] bit, which will automatically be cleared after initialization.

#### 15.4.2.4.4 eQEP Position-compare Unit

The eQEP peripheral includes a position-compare unit that is used to generate a sync output and/or interrupt on a position-compare match. [Figure 15-140](#) shows a diagram. The position-compare (QPOS\_CMP) register is shadowed and shadow mode can be enabled or disabled using the QPOSCTL[PSSHDW] bit. If the shadow mode is not enabled, the CPU writes directly to the active position compare register.

**Figure 15-140. eQEP Position-compare Unit**

In shadow mode, you can configure the position-compare unit (QPOSCTL[PCLOAD]) to load the shadow register value into the active register on the following events and to generate the position-compare ready (QFLG[PCR]) interrupt after loading.

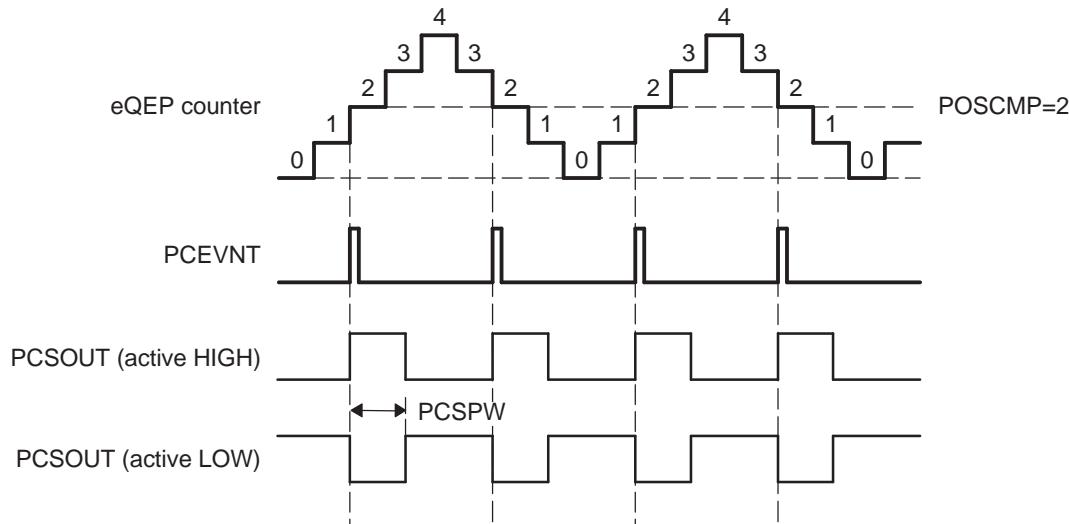

- Load on compare match
- Load on position-counter zero event

The position-compare match (QFLG[PCM]) is set when the position-counter value (QPOSCNT) matches with the active position-compare register (QPOS CMP) and the position-compare sync output of the programmable pulse width is generated on compare match to trigger an external device.

For example, if QPOS CMP = 2, the position-compare unit generates a position-compare event on 1 to 2 transitions of the eQEP position counter for forward counting direction and on 3 to 2 transitions of the eQEP position counter for reverse counting direction (see [Figure 15-141](#)).

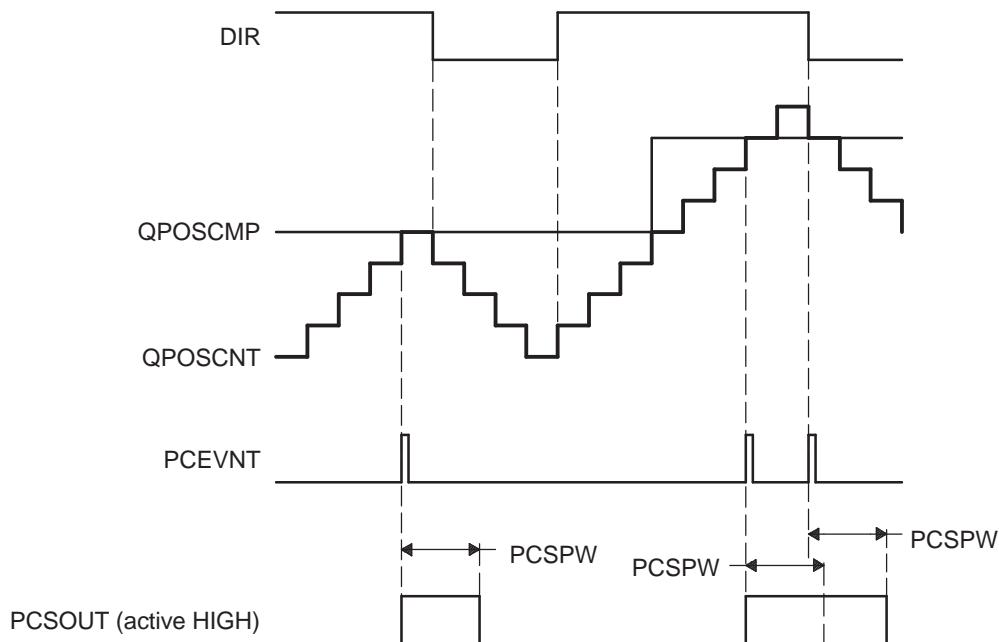

[Figure 15-163](#) shows the layout of the eQEP Position-Compare Control Register (QPOSCTL) and [Table 15-138](#) describes the QPOSCTL bit fields.

**Figure 15-141. eQEP Position-compare Event Generation Points**

The pulse stretcher logic in the position-compare unit generates a programmable position-compare sync pulse output on the position-compare match. In the event of a new position-compare match while a previous position-compare pulse is still active, then the pulse stretcher generates a pulse of specified duration from the new position-compare event as shown in [Figure 15-142](#).

**Figure 15-142. eQEP Position-compare Sync Output Pulse Stretcher**

### 15.4.2.5 eQEP Edge Capture Unit

The eQEP peripheral includes an integrated edge capture unit to measure the elapsed time between the unit position events as shown in [Figure 15-143](#). This feature is typically used for low speed measurement using the following equation:

$$v(k) = \frac{X}{t(k) - t(k-1)} = \frac{X}{\Delta T} \quad (3)$$

where,

- X - Unit position is defined by integer multiple of quadrature edges (see [Figure 15-144](#))
- $\Delta T$  - Elapsed time between unit position events
- $v(k)$  - Velocity at time instant "k"

The eQEP capture timer (QCTMR) runs from prescaled SYSCLKOUT and the prescaler is programmed by the QCAPCTL[CCPS] bits. The capture timer (QCTMR) value is latched into the capture period register (QCPRD) on every unit position event and then the capture timer is reset, a flag is set in QEPSTS[UPEVNT] to indicate that new value is latched into the QCPRD register. Software can check this status flag before reading the period register for low speed measurement and clear the flag by writing 1.

Time measurement ( $\Delta T$ ) between unit position events will be correct if the following conditions are met:

- No more than 65,535 counts have occurred between unit position events.
- No direction change between unit position events.

The capture unit sets the eQEP overflow error flag (QEPSTS[COEF]) in the event of capture timer overflow between unit position events. If a direction change occurs between the unit position events, then an error flag is set in the status register (QEPSTS[CDEF]).

Capture Timer (QCTMR) and Capture period register (QCPRD) can be configured to latch on following events.

- CPU read of QPOSCNT register
- Unit time-out event

If the QEPCTL[QCLM] bit is cleared, then the capture timer and capture period values are latched into the QCTMRLAT and QCPRDLAT registers, respectively, when the CPU reads the position counter (QPOSCNT).

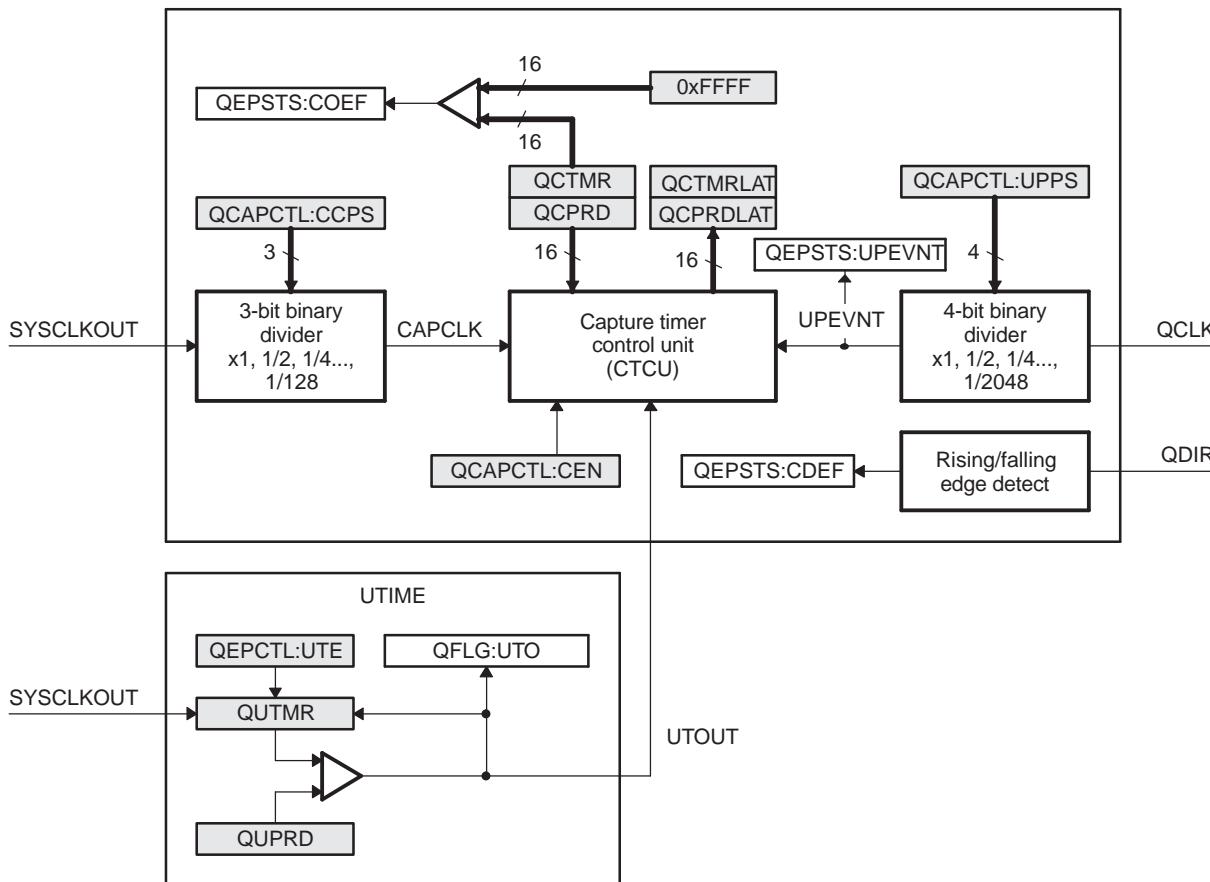

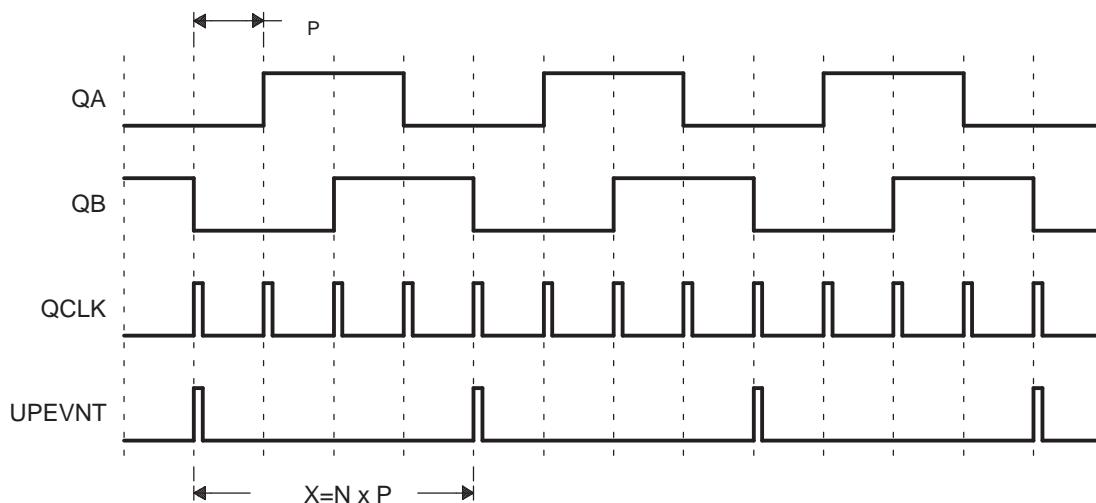

If the QEPCTL[QCLM] bit is set, then the position counter, capture timer, and capture period values are latched into the QPOSLAT, QCTMRLAT and QCPRDLAT registers, respectively, on unit time out.

[Figure 15-145](#) shows the capture unit operation along with the position counter.

---

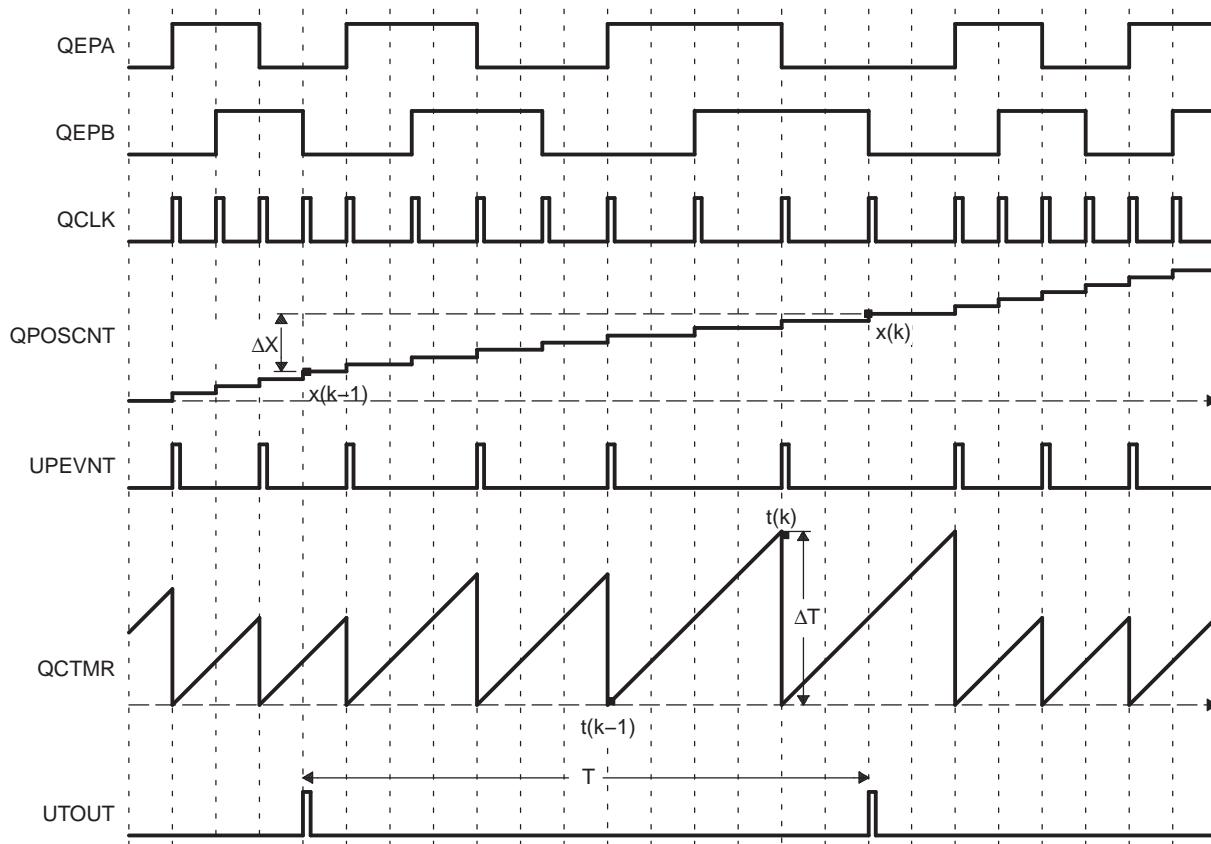

**NOTE:** The QCAPCTL register should not be modified dynamically (such as switching CAPCLK prescaling mode from QCLK/4 to QCLK/8). The capture unit must be disabled before changing the prescaler.

---

**Figure 15-143. eQEP Edge Capture Unit**

**Figure 15-144. Unit Position Event for Low Speed Measurement (QCAPCTL[UPPS] = 0010)**

N - Number of quadrature periods selected using QCAPCTL[UPPS] bits

Figure 15-145. eQEP Edge Capture Unit - Timing Details

Velocity Calculation Equations:

$$v(k) = \frac{x(k) - x(k - 1)}{T} = \frac{\Delta X}{T} \quad (4)$$

where

$v(k)$ : Velocity at time instant k

$x(k)$ : Position at time instant k

$x(k-1)$ : Position at time instant k - 1

T: Fixed unit time or inverse of velocity calculation rate

$\Delta X$ : Incremental position movement in unit time

X: Fixed unit position

$\Delta T$ : Incremental time elapsed for unit position movement

$t(k)$ : Time instant "k"

$t(k-1)$ : Time instant "k - 1"

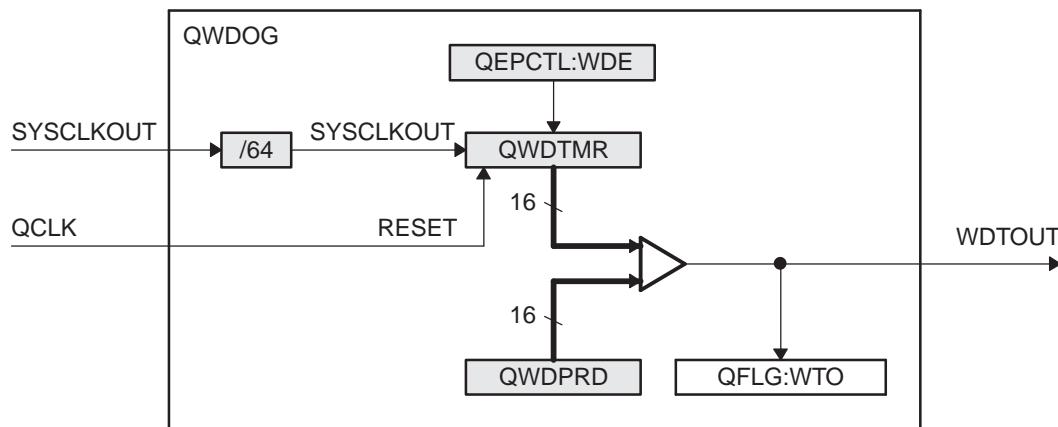

Unit time (T) and unit period (X) are configured using the QUPRD and QCAPCTL[UPPS] registers. Incremental position output and incremental time output is available in the QPOS LAT and QCPRD LAT registers.

| Parameter  | Relevant Register to Configure or Read the Information                  |
|------------|---|
| T          | Unit Period Register (QUPRD)  |
| $\Delta X$ | Incremental Position = QPOSLAT(k) - QPOSLAT(K - 1)                      |
| X          | Fixed unit position defined by sensor resolution and ZCAPCTL[UPPS] bits |
| $\Delta T$ | Capture Period Latch (QCPRDLAT)   |

### 15.4.2.6 eQEP Watchdog

The eQEP peripheral contains a 16-bit watchdog timer that monitors the quadrature-clock to indicate proper operation of the motion-control system. The eQEP watchdog timer is clocked from SYSCLKOUT/64 and the quadrate clock event (pulse) resets the watchdog timer. If no quadrature-clock event is detected until a period match (QWDPRD = QWDTMR), then the watchdog timer will time out and the watchdog interrupt flag will be set (QFLG[WTO]). The time-out value is programmable through the watchdog period register (QWDPRD).

**Figure 15-146. eQEP Watchdog Timer**

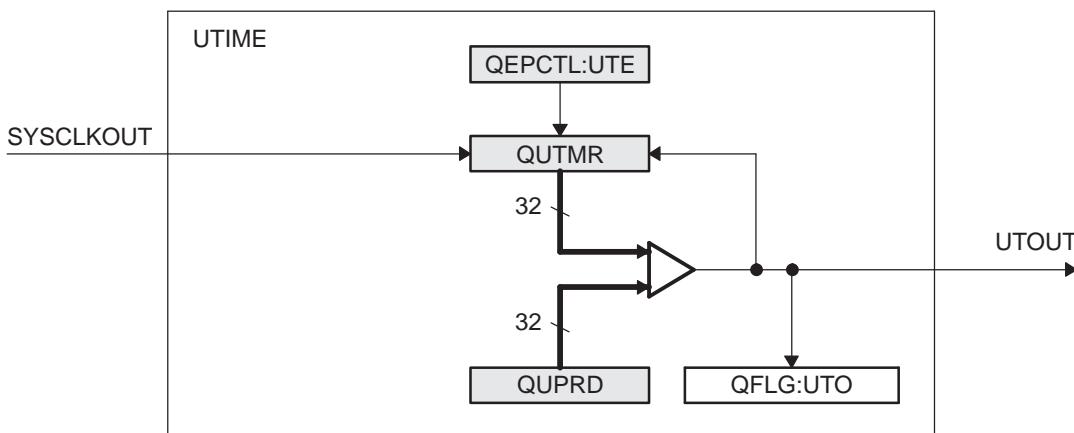

### 15.4.2.7 Unit Timer Base

The eQEP peripheral includes a 32-bit timer (QUTMR) that is clocked by SYSCLKOUT to generate periodic interrupts for velocity calculations. The unit time out interrupt is set (QFLG[UTO]) when the unit timer (QUTMR) matches the unit period register (QUPRD).

The eQEP peripheral can be configured to latch the position counter, capture timer, and capture period values on a unit time out event so that latched values are used for velocity calculation as described in Section [Section 15.4.2.5](#).

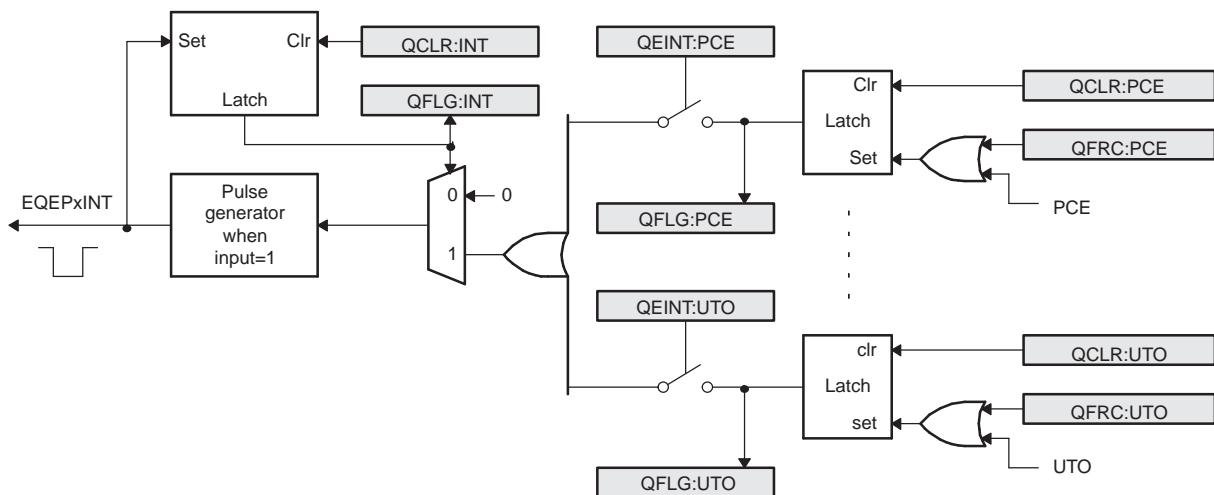

**Figure 15-147. eQEP Unit Time Base**

### 15.4.2.8 eQEP Interrupt Structure

[Figure 15-148](#) shows how the interrupt mechanism works in the EQEP module.

**Figure 15-148. EQEP Interrupt Generation**

Eleven interrupt events (PCE, PHE, QDC, WTO, PCU, PCO, PCR, PCM, SEL, IEL, and UTO) can be generated. The interrupt control register (QEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (QFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated only to the interrupt controller if any of the interrupt events is enabled, the flag bit is 1 and the INT flag bit is 0. The interrupt service routine will need to clear the global interrupt flag bit and the serviced event, via the interrupt clear register (QCLR), before any other interrupt pulses are generated. You can force an interrupt event by way of the interrupt force register (QFRC), which is useful for test purposes.

### 15.4.3 eQEP Registers

Table 15-123 lists the registers with their memory locations, sizes, and reset values.

**Table 15-123. eQEP Registers**

| Offset | Acronym    | Register Description                          | Size(x16)/ #shadow | Section                           |
|--------|------------|---|--------------------|-----------------------------------|
| 0h     | QPOS_CNT   | eQEP Position Counter Register                | 2/0                | <a href="#">Section 15.4.3.1</a>  |
| 4h     | QPOS_INIT  | eQEP Position Counter Initialization Register | 2/0                | <a href="#">Section 15.4.3.2</a>  |
| 8h     | QPOS_MAX   | eQEP Maximum Position Count Register          | 2/0                | <a href="#">Section 15.4.3.3</a>  |
| Ch     | QPOS_CMP   | eQEP Position-Compare Register                | 2/1                | <a href="#">Section 15.4.3.4</a>  |
| 10h    | QPOS_INDEX | eQEP Index Position Latch Register            | 2/0                | <a href="#">Section 15.4.3.5</a>  |
| 14h    | QPOSSLAT   | eQEP Strobe Position Latch Register           | 2/0                | <a href="#">Section 15.4.3.6</a>  |
| 18h    | QPOS_LAT   | eQEP Position Counter Latch Register          | 2/0                | <a href="#">Section 15.4.3.7</a>  |
| 1Ch    | QUTMR      | eQEP Unit Timer Register                      | 2/0                | <a href="#">Section 15.4.3.8</a>  |

### 15.4.3.1 eQEP Position Counter Register (QPOSCNT)

**Figure 15-149. eQEP Position Counter Register (QPOSCNT)**

|    |         |   |
|----|---------|---|
| 31 | QPOSCNT | 0 |
|    | R/W-0   |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-124. eQEP Position Counter Register (QPOSCNT) Field Descriptions**

| Bits | Name    | Value        | Description  |
|------|---------|--------------|--|
| 31-0 | QPOSCNT | 0xFFFF FFFFh | This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. |

### 15.4.3.2 eQEP Position Counter Initialization Register (QPOSINIT)

**Figure 15-150. eQEP Position Counter Initialization Register (QPOSINIT)**

|    |          |   |
|----|----------|---|
| 31 | QPOSINIT | 0 |
|    | R/W-0    |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-125. eQEP Position Counter Initialization Register (QPOSINIT) Field Descriptions**

| Bits | Name     | Value        | Description  |
|------|----------|--------------|--|
| 31-0 | QPOSINIT | 0xFFFF FFFFh | This register contains the position value that is used to initialize the position counter based on external strobe or index event. The position counter can be initialized through software. |

### 15.4.3.3 eQEP Maximum Position Count Register (QPOSMAX)

**Figure 15-151. eQEP Maximum Position Count Register (QPOSMAX)**

|    |         |   |
|----|---------|---|
| 31 | QPOSMAX | 0 |
|    | R/W-0   |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-126. eQEP Maximum Position Count Register (QPOSMAX) Field Descriptions**

| Bits | Name    | Value        | Description  |
|------|---------|--------------|--|
| 31-0 | QPOSMAX | 0xFFFF FFFFh | This register contains the maximum position counter value. |

#### 15.4.3.4 eQEP Position-Compare Register (QPOSCMP)

**Figure 15-152. eQEP Position-Compare Register (QPOSCMP)**

|    |         |   |
|----|---------|---|
| 31 | QPOSCMP | 0 |
|    | R/W-0   |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-127. eQEP Position-Compare Register (QPOSCMP) Field Descriptions**

| Bits | Name    | Value        | Description  |
|------|---------|--------------|--|
| 31-0 | QPOSCMP | 0xFFFF FFFFh | The position-compare value in this register is compared with the position counter (QPOSCNT) to generate sync output and/or interrupt on compare match. |

#### 15.4.3.5 eQEP Index Position Latch Register (QPOSILAT)

**Figure 15-153. eQEP Index Position Latch Register (QPOSILAT)**

|    |          |   |
|----|----------|---|
| 31 | QPOSILAT | 0 |
|    | R-0      |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-128. eQEP Index Position Latch Register (QPOSILAT) Field Descriptions**

| Bits | Name     | Value        | Description  |
|------|----------|--------------|--|
| 31-0 | QPOSILAT | 0xFFFF FFFFh | The position-counter value is latched into this register on an index event as defined by the QEPCTL[IEL] bits. |

#### 15.4.3.6 eQEP Strobe Position Latch Register (QPOSSLAT)

**Figure 15-154. eQEP Strobe Position Latch Register (QPOSSLAT)**

|    |          |   |
|----|----------|---|
| 31 | QPOSSLAT | 0 |
|    | R-0      |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-129. eQEP Strobe Position Latch Register (QPOSSLAT) Field Descriptions**

| Bits | Name     | Value        | Description  |
|------|----------|--------------|--|
| 31-0 | QPOSSLAT | 0xFFFF FFFFh | The position-counter value is latched into this register on strobe event as defined by the QEPCTL[SEL] bits. |

### 15.4.3.7 eQEP Position Counter Latch Register (QPOSLAT)

**Figure 15-155. eQEP Position Counter Latch Register (QPOSLAT)**

|    |         |     |
|----|---------|-----|
| 31 | QPOSLAT | 0   |
|    |         | R-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-130. eQEP Position Counter Latch Register (QPOSLAT) Field Descriptions**

| Bits | Name    | Value        | Description  |
|------|---------|--------------|--|
| 31-0 | QPOSLAT | 0xFFFF FFFFh | The position-counter value is latched into this register on unit time out event. |

### 15.4.3.8 eQEP Unit Timer Register (QUTMR)

**Figure 15-156. eQEP Unit Timer Register (QUTMR)**

|    |       |       |
|----|-------|-------|
| 31 | QUTMR | 0     |
|    |       | R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-131. eQEP Unit Timer Register (QUTMR) Field Descriptions**

| Bits | Name  | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | QUTMR | 0xFFFF FFFFh | This register acts as time base for unit time event generation. When this timer value matches with unit time period value, unit time event is generated. |

### 15.4.3.9 eQEP Unit Period Register (QUPRD)

**Figure 15-157. eQEP Unit Period Register (QUPRD)**

|    |       |       |
|----|-------|-------|
| 31 | QUPRD | 0     |
|    |       | R/W-0 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-132. eQEP Unit Period Register (QUPRD) Field Descriptions**

| Bits | Name  | Value        | Description  |
|------|-------|--------------|--|
| 31-0 | QUPRD | 0xFFFF FFFFh | This register contains the period count for unit timer to generate periodic unit time events to latch the eQEP position information at periodic interval and optionally to generate interrupt. |

### 15.4.3.10 eQEP Watchdog Timer Register (QWDTMR)

**Figure 15-158. eQEP Watchdog Timer Register (QWDTMR)**

|    |        |   |
|----|--------|---|
| 15 | QWDTMR | 0 |
|    | R/W-0  |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-133. eQEP Watchdog Timer Register (QWDTMR) Field Descriptions**

| Bits | Name   | Value        | Description   |
|------|--------|--------------|---|
| 15-0 | QWDTMR | 0xFFFF FFFFh | This register acts as time base for watch dog to detect motor stalls. When this timer value matches with watch dog period value, watch dog timeout interrupt is generated. This register is reset upon edge transition in quadrature-clock indicating the motion. |

### 15.4.3.11 eQEP Watchdog Period Register (QWDPRD)

**Figure 15-159. eQEP Watchdog Period Register (QWDPRD)**

|    |        |   |
|----|--------|---|
| 15 | QWDPRD | 0 |
|    | R/W-0  |   |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-134. eQEP Watchdog Period Register (QWDPRD) Field Description**

| Bits | Name   | Value   | Description  |
|------|--------|---------|--|
| 15-0 | QWDPRD | 0xFFFFh | This register contains the time-out count for the eQEP peripheral watch dog timer. When the watchdog timer value matches the watchdog period value, a watchdog timeout interrupt is generated. |

**15.4.3.12 QEP Decoder Control Register (QDECCTL)**
**Figure 15-160. QEP Decoder Control Register (QDECCTL)**

| 15    | 14    | 13    | 12    | 11       | 10    | 9     | 8     |
|-------|-------|-------|-------|----------|-------|-------|-------|
| QSRC  |       | SOEN  | SPSEL | XCR      | SWAP  | IGATE | QAP   |
| R/W-0 |       | R/W-0 | R/W-0 | R/W-0    | R/W-0 | R/W-0 | R/W-0 |
| 7     | 6     | 5     | 4     |          |       |       | 0     |
| QBP   | QIP   | QSP   |       | Reserved |       |       |       |
| R/W-0 | R/W-0 | R/W-0 |       | R-0      |       |       |       |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-135. eQEP Decoder Control Register (QDECCTL) Field Descriptions**

| Bits  | Name     | Value | Description   |
|-------|----------|-------|---|
| 15-14 | QSRC     | 0-3h  | Position-counter source selection   |
|       |          | 0     | Quadrature count mode (QCLK = iCLK, QDIR = iDIR)  |
|       |          | 1h    | Direction-count mode (QCLK = xCLK, QDIR = xDIR)   |
|       |          | 2h    | UP count mode for frequency measurement (QCLK = xCLK, QDIR = 1)   |
|       |          | 3h    | DOWN count mode for frequency measurement (QCLK = xCLK, QDIR = 0)   |
| 13    | SOEN     | 0     | Sync output-enable  |
|       |          | 1     | Disable position-compare sync output  |
|       |          | 1     | Enable position-compare sync output   |
| 12    | SPSEL    | 0     | Sync output pin selection   |
|       |          | 0     | Index pin is used for sync output   |
|       |          | 1     | Strobe pin is used for sync output  |
| 11    | XCR      | 0     | External clock rate   |
|       |          | 0     | 2x resolution: Count the rising/falling edge  |
|       |          | 1     | 1x resolution: Count the rising edge only   |
| 10    | SWAP     | 0     | Swap quadrature clock inputs. This swaps the input to the quadrature decoder, reversing the counting direction. |
|       |          | 0     | Quadrature-clock inputs are not swapped   |
|       |          | 1     | Quadrature-clock inputs are swapped   |
| 9     | IGATE    | 0     | Index pulse gating option   |
|       |          | 0     | Disable gating of Index pulse   |
|       |          | 1     | Gate the index pin with strobe  |
| 8     | QAP      | 0     | QEPA input polarity   |
|       |          | 0     | No effect   |
|       |          | 1     | Negates QEPA input  |
| 7     | QBP      | 0     | QEPB input polarity   |
|       |          | 0     | No effect   |
|       |          | 1     | Negates QEPB input  |
| 6     | QIP      | 0     | QEPI input polarity   |
|       |          | 0     | No effect   |
|       |          | 1     | Negates QEPI input  |
| 5     | QSP      | 0     | QEPS input polarity   |
|       |          | 0     | No effect   |
|       |          | 1     | Negates QEPS input  |
| 4-0   | Reserved | 0     | Always write as 0   |

### 15.4.3.13 eQEP Control Register (QEPCCTL)

**Figure 15-161. eQEP Control Register (QEPCCTL)**

**Table 15-136. eQEP Control Register (QEPCCTL) Field Descriptions (continued)**

| Bits | Name | Value | Description   |
|------|------|-------|---|
| 6    | SEL  | 0     | Strobe event latch of position counter<br><br>The position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the QDECCTL register.   |
|      |      | 1     | <b>Clockwise Direction:</b> Position counter is latched on rising edge of QEPS strobe<br><b>Counter Clockwise Direction:</b> Position counter is latched on falling edge of QEPS strobe   |
| 5-4  | IEL  | 0-3h  | Index event latch of position counter (software index marker)<br><br>0 Reserved<br>1h Latches position counter on rising edge of the index signal<br>2h Latches position counter on falling edge of the index signal<br>3h Software index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the QPOSILAT register and the direction flag is latched in the QEPSTS[QDLF] bit. This mode is useful for software index marking. |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 15-143. eQEP Status Register (QEPSTS) Field Descriptions**

| Bit  | Field    | Value | Description  |
|------|----------|-------|--|
| 15-8 | Reserved | 0     | Always write as 0  |
| 7    | UPEVNT   | 0     | Unit position event flag   |
|      |          | 1     | No unit position event detected  |
|      |          | 1     | Unit position event detected. Write 1 to clear.  |
| 6    | FDF      | 0     | Direction on the first index marker. Status of the direction is latched on the first index event marker. |
|      |          | 1     | Counter-clockwise rotation (or reverse movement) on the first index event                                |
|      |          | 1     | Clockwise rotation (or forward movement) on the first index event  |
| 5    | QDF      | 0     | Quadrature direction flag  |
|      |          | 0     | Counter-clockwise rotation (or reverse movement)   |
|      |          | 1     | Clockwise rotation (or forward movement)   |
| 4    | QDLF     | 0     | eQEP direction latch flag. Status of direction is latched on every index event marker.                   |
|      |          | 0     | Counter-clockwise rotation (or reverse movement) on index event marker                                   |
|      |          | 1     | Clockwise rotation (or forward movement) on index event marker   |
| 3    | COEF     | 0     | Capture overflow error flag  |
|      |          | 0     | Sticky bit, cleared by writing 1   |
|      |          | 1     | Overflow occurred in eQEP Capture timer (QEPCTMR)  |
| 2    | CDEF     | 0     | Capture direction error flag   |
|      |          | 0     | Sticky bit, cleared by writing 1   |
|      |          | 1     | Direction change occurred between the capture position event.  |
| 1    | FIMF     | 0     | First index marker flag  |
|      |          | 0     | Sticky bit, cleared by writing 1   |
|      |          | 1     | Set by first occurrence of index pulse   |
| 0    | PCEF     | 0     | Position counter error flag. This bit is not sticky and it is updated for every index event.             |
|      |          | 1     | No error occurred during the last index transition.  |
|      |          |       | Position counter error   |

### 15.4.3.21 eQEP Capture Timer Register (QCTMR)

| 16.4 Supported Use Cases .....    | 1746 |
| 16.5 USB Registers .....          | 1747 |

## 16.1 Introduction

The USB controller provides a low-cost connectivity solution for numerous consumer portable devices by providing a mechanism for data transfer between USB devices with a line/bus speed up to 480 Mbps. The device USB subsystem has two independent USB 2.0 Modules built around two OTG controllers. The OTG supplement feature, the support for a dynamic role change, is also supported. Each port has the support for a dual-role feature allowing for additional versatility enabling operation capability as a host or peripheral. Both ports have identical capabilities and operate independent of each other.

Each USB controller is built around the Mentor USB OTG controller (musbmhdrc) and TI PHY. Each USB controller has user configurable 32K Bytes of Endpoint FIFO and has the support for 15 'Transmit' endpoints and 15 'Receive' endpoints in addition to Endpoint 0. The USB subsystem makes use of the CPPI 4.1 DMA for accelerating data movement via a dedicated DMA hardware.

The two USB modules share the CPPI DMA controller and accompanying Queue Manager, Interrupt Pacer, Power Management module, and PHY/UTMI clock.

Within the descriptions of the USB subsystem that would follow, the term USB controller or USB PHY is used to mean/refer to any of the two USB controllers or PHYs existing within the USB subsystem. The term USB module is used to mean/refer to any of the two USB modules. USB0 is used to refer to one of the USB modules and USB1 is used to refer to the other USB module.

| USB1  | One of the two USB2.0 Compliant USB Module                        |
| USBSS | USB Subsystem (contains USB0 and USB1)                            |
| UTMI  | USB 2.0 Transceiver Macrocell Interface                           |
| XDMA  | Transfer DMA (DMA other than CPPI DMA used within the Controller) |

### 16.1.2 USB Features

The main features of the USB subsystem are:

- Contains 2 usb20otg\_f controller modules with the following features:
  - Built around the Mentor USB 2.0 OTG core (musbmhdrc)
  - Supports USB 2.0 peripheral at speeds HS (480 Mb/s) and FS (12 Mb/s)
  - Supports USB 2.0 host or OTG at speeds HS (480 Mb/s), FS (12 Mb/s), and LS (1.5 Mb/s)
  - Supports all modes of transfers (control, bulk, interrupt, and isochronous)
  - Supports high bandwidth ISO mode
  - Supports 16 Transmit (TX) and 16 Receive (RX) endpoints including endpoint 0
  - Supports USB OTG extensions for Session Resume (SRP) and Host Negotiation (HNP)
  - Includes a 32K endpoint FIFO RAM, and supports programmable FIFO sizes
  - Includes RNDIS mode for accelerating RNDIS type protocols using short packet termination over USB
  - Includes CDC Linux mode for accelerating CDC type protocols using short packet termination over USB
  - Includes an RNDIS like mode for terminating RNDIS type protocols without using short packet termination for support of MSC applications
- Includes two USB2.0 OTG PHYs
- Interfaces to the CPU via 3 OCP interfaces:
  - Master OCP HP interface for the DMA
  - Master OCP HP interface for the Queue manager
  - Slave OCP MMR interface
- Includes a CPPI 4.1 compliant DMA controller sub-module with 30 RX and 30 TX simultaneous data connections
- Includes a CPPI 4.1 DMA scheduler
- DMA supports CPPI host descriptor formats
- DMA supports stall on buffer starvation
- Supports data buffer sizes up to 4M bytes
- CPPI FIFO interface per TX/RX endpoint
- Provides a CPPI Queue Manager module with 92 queues for queuing/de-queuing packets.
- DMA pacing logic for interrupts
- Loopback MGC test using the UTMI interfaces

### 16.1.3 Unsupported USB OTG and PHY Features

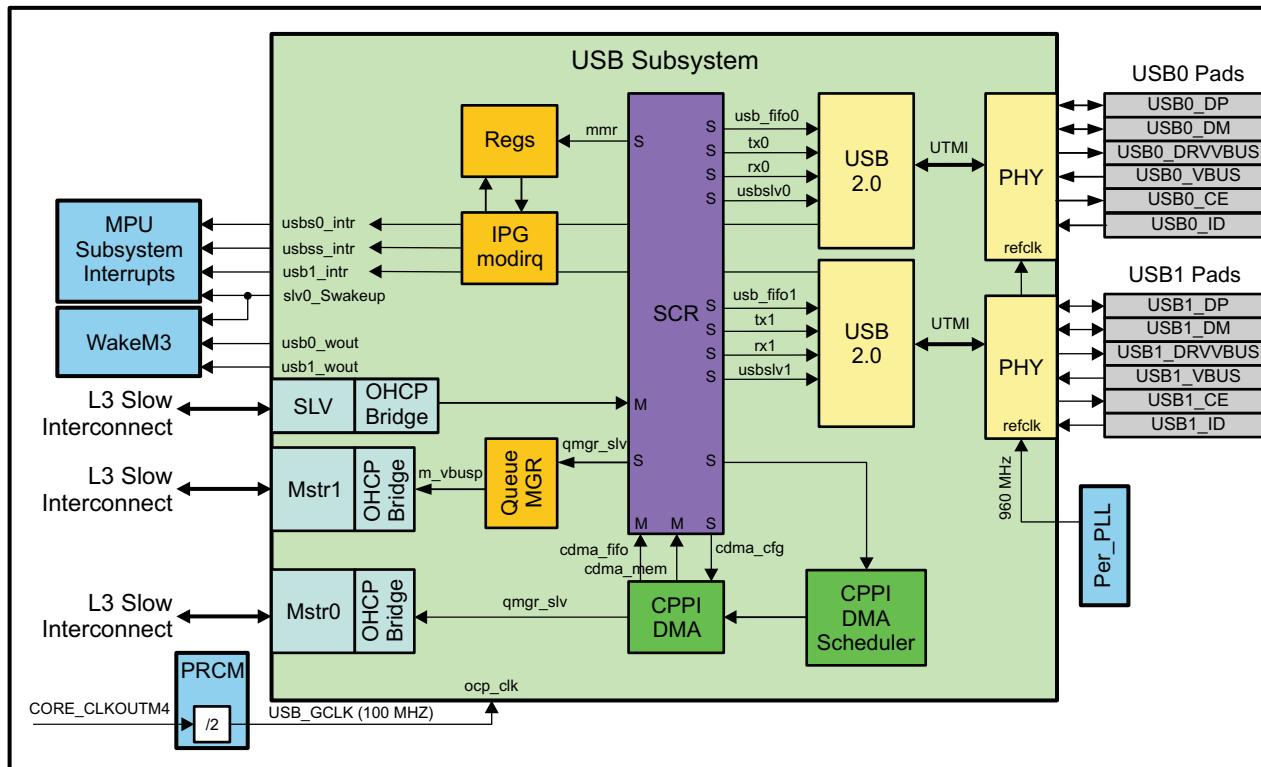

This device supports USBOTG module host, device and OTG features.

## 16.2 Integration

This device implements the USB2.0 OTG dual port module and PHY for interfacing to USB as a peripheral or host.

Figure 16-1 shows the integration of the USB module on this device.

**Figure 16-1. USB Integration**

### 16.2.1 USB Connectivity Attributes

The USB module itself has a very large number of interrupt outputs. For ease of integration, these outputs are all routed to a pair of interrupt aggregators. These aggregator blocks generate a single interrupt on the first occurrence of any interrupt from the USB or DMA logic of the module.

**Table 16-1. USB Connectivity Attributes**

| Attributes          | Type                                     |
|---------------------|--|
| Power domain        | Peripheral Domain                        |
| Clock domain        | PD_PER_L3S_GCLK (OCP)<br>CLKDCOLDO (PHY) |
| Reset signals       | DEF_DOM_RST_N<br>USB POR_N               |
| Idle/Wakeup signals | Smart idle<br>Wakeup                     |

**Table 16-1. USB Connectivity Attributes (continued)**

| Attributes        | Type  |
|-------------------|---|
| Interrupt request | 4 interrupts<br>usbss (USBSSINT) to MPU subsystem<br>usb0 (USBINT0) to MPU subsystem<br>usb1 (USBINT1) to MPU subsystem<br>slv0p_Swakeup (USBWAKEUP) to MPU subsystem and WakeM3<br>2 Wakeup Events to WakeM3<br>usb0_wuout<br>usb1_wuout |
| DMA request       | None  |
| Physical address  | L3 Slow slave port  |

### 16.2.2 USB Clock and Reset Management

Each USB controller has a PHY module that generates the UTMI clock. The UTMI clock is fixed in the UTMI specification for an 8-bit interface at 60 MHz (480 Mb/s). The PHYs require a low-jitter 960-MHz source clock.

**Table 16-2. USB Clock Signals**

| Clock Signal                                 | Max Freq | Reference / Source | Comments                     |

### 16.2.4 USB GPIO Details

The USB module supports configuration of the DP and DM pins as pass-through GPIOs. In this device, the GPIO mode is used to provide UART over USB interface functionality. Chip level logic allows connection of the UART TX/RX data signals to either DP or DM in either normal or inverted state as shown in [Figure 16-2](#). The diagram shows the UART2 / USB0 port implementation. This logic is also replicated for the UART3 / USB1 ports.

**Figure 16-2. USB GPIO Integration**

### 16.2.5 USB Unbonded PHY Pads

The USBOTGSS includes two USB PHY modules. On packages where only 1 PHY is bonded out to pins (e.g. 13x13 package), the following procedures must be followed in order to ensure that the unbonded PHY pads do not cause issues with USBOTGSS operation:

- The USB Controller corresponding to the unbonded PHY must be placed in Host Mode by setting Bit2 of the USB Core DEVCTL register.
- The unbonded PHY must be placed in the SUSPEND state by setting Bits[1:0] of the USB Core POWER register.
- The Control Module USB\_CTRLx register corresponding to the unbonded PHY must have the following bits programmed as shown:
  - CHGDET\_DIS = 1
  - CM\_PWRDN = 1
  - GPIO MODE = 0

## 16.3 Functional Description

The USB controller within the device supports 15 Transmit endpoints and 15 Receive endpoints in addition to Endpoint 0. (The use of these endpoints for IN and OUT transactions depends on whether the USB controller is being used as a device/peripheral or as a host. When used as a peripheral, IN transactions are processed through TX endpoints and OUT transactions are processed through Rx endpoints. When used as a host, IN transactions are processed through Rx endpoints and OUT transactions are processed through TX endpoints.)

These additional endpoints can be individually configured in software to handle either Bulk transfers (which also allows them to handle Interrupt transfers), Isochronous transfers or Control transfers. Further, the endpoints can also be allocated to different target device functions on the fly – maximizing the number of devices that can be simultaneously supported.

Each endpoint requires a chunk of memory allocated within the FIFO to be associated with it. The USB module has a single block of FIFO RAM (32 Kbytes in size) to be shared by all endpoints. The FIFO for Endpoint 0 is required to be 64 bytes deep and will buffer 1 packet. The first 64 Bytes of the FIFO RAM is reserved by hardware for Endpoint 0 usage and for this reason user software does not need (nor has the capability) to allocate FIFO for Endpoint 0. The rest of the FIFO RAM is user configurable with regard to the other endpoint FIFOs, which may be from 8 to 8192 bytes in size and can buffer either 1 or 2 packets.

Separate FIFOs may be associated with each endpoint: alternatively a TX endpoint and the Rx endpoint with the same Endpoint number can be configured to use the same FIFO, for example to reduce the size of RAM block needed, provided they can never be active at the same time.

The role (host or device) that the USB controller assumes is chosen by user firmware programming the respective USB controller MODE register defined within the USB subsystem space. Note that some USB pins have not been bonded out and the functions of these pins are controlled by user software via dedicated registers.

The user has access to the controller through the OCP slave interface via the CPU. The user can process USB transactions entirely from the CPU or can also use the DMA to perform data transfer. The CPPI DMA can be used to service Endpoints 1 to 15 not Endpoint 0. CPU access method is used to service Endpoint 0 transactions.

### 16.3.1 VBUS Voltage Sourcing Control

When any of the USB controllers assumes the role of a host, the USB is required to supply a 5V power source to an attached device through its VBUS line. In order to achieve this task, the USB controller requires the use of an external power logic (or charge pump) capable of sourcing 5V power. A USB\_DRVVBUS is used as a control signal to enable/disable this external power logic to either source or disable power on the VBUS line. The control on the USB\_DRVVBUS is automatic and is handled by the USB controller. The control should be transparent to the user so long as the proper hardware connection and software initialization are in place. The USB controller drives the USB\_DRVVBUS signal high when it assumes the role of a host while the controller is in session. When assuming the role of a device, the controller drives the USB\_DRVVBUS signal low disabling the external charge pump/power logic; hence, no power is driven on the VBUS line (in this case, power is expected to be sourced by the external host).

Note that both USBs are self-powered and the device does not rely on the voltage on the VBUS line sourced by an external host for controller operation when assuming the role of a device. The power on the VBUS is used to identify the presence of a Host. It is also used to power up the pull-up on the D+ line. The USB PHY would continually monitor the voltage on the VBUS and report the status to USB controller.

### 16.3.2 Pullup/PullDown Resistors

Since the USB controllers are dual role controllers, capable of assuming a role of a host or device, the necessary required pull-up/pull-down resistors can not exist external to the device. These pull-up/pull-down resistors exist internal to the device, within the PHY to be more specific, and are enabled and disabled based on the role the controller assumes allowing dynamic hardware configuration.

When assuming the role of a host, the data lines are pulled low by the PHY enabling the internal 15KOhms resistors. When assuming the role of a device the required 1.5Kohm pull-up resistor on the D+ line is enabled automatically to signify the USB capability to the external host as a FS device (HS operation is negotiated during reset bus condition).

### 16.3.3 Role Assuming Method

For an OTG controller, the usual method followed by the controller to assume the role of a host or a device is governed by the state of the ID pin which in turn is controlled by the USB cable connector type. The device has bonded out these ID pins and allows the control to be handled directly from the connector, i.e. the USB controller would assume the role based on the cable end inserted to the mini or micro A/B connector. An alternate method where the ID pin signal is bypassed and the firmware controls the role the controller assumes exists via register access allowing additional control for systems that do not require the use of the USB ID pin. In this case the USBnMODE [Bit7=IDDIG\_MUX] needs to be programmed with a value of 1 so that Register programming will be used.

Two registers, USB0 Mode Register at offset 10E8h and USB1 Mode Register at offset 18E8h, are used for a user to select the role the USB controller assumes. The user is required to program the corresponding register prior to the USB controller is in session.

### 16.3.4 Clock, PLL, and PHY Initialization

Prior to configuring the USB Module Registers, the USB SubSystem and PHY are required to be released from reset, enable interconnects and controllers clocks as well as configure the USB PHY with appropriate setting. Not all registers related for this task are captured within this document. Please refer to the PRCM for clocking and Control Module for PHY configuration registers definitions.

### 16.3.5 Indexed and Non-Indexed Register Spaces

The USB controller provides two mechanisms for accessing endpoint control and status registers; Indexed and Non-Indexed method.

**Indexed Endpoint Control/Status Register Space.** This register space can be thought of as a region populated with Proxy Registers. This register space is a memory-mapped region at offset 1410h to 141Fh for USB0 and 1C10h to 1C1Fh for USB1. The endpoint register space mapped at this region is selected by programming the corresponding INDEX register (@ offsets 140Eh and 1C0Eh for USB0 and USB1 respectively) of the controller.

By programming the INDEX register with the corresponding endpoint number, the control and status register corresponding to that particular endpoint is accessible from this Indexed Region. In other words, Index Register region behaves as a proxy to access a selected endpoint registers.

**Non-indexed Endpoint Control/Status Register Space.** These regions are dedicated endpoint registers memory-mapped residing at offsets 1500h to 16FFh for USB0 and 1D00h to 1EFFh for USB1. Registers at offset 1500h to 150Fh belong to Endpoint 0; registers at offset 1510h to 151Fh belong to Endpoint 1... and lastly registers at offset 16F0h to 16FFh belong to Endpoint 15 for USB0. Similarly registers at offset 1D00h to 1E0Fh belong to Endpoint 0; registers at offset 1D10h to 1D1Fh belong to Endpoint 1... and finally registers at offset 1DF0h to 1DFFh belong to Endpoint 15 for USB1.

This allows the user/firmware to access an endpoint register region directly from its unique space, as specified within a non-indexed region or from a proxy space by programming the corresponding Index register.

Note: The control and status registers/regions apply to both Tx and Rx of a given Endpoint. That is, Endpoint 1 Tx and Endpoint 1 Rx registers occupy the same register space.

For detailed information about the USB controller registers, see [Section 16.5](#).

### 16.3.6 Dynamic FIFO Sizing

Each USB module supports a total of 32K bytes of FIFO RAM to dynamically allocate FIFO to all endpoints in use. Each endpoint requires a FIFO to be associated with it. There is one set of register per endpoint available for FIFO allocation, excluding endpoint 0. FIFO configuration registers are Indexed registers and cannot be accessed directly; configuration takes place via accessing proxy registers. The INDEX register at addresses 140Eh or 1C0Eh must be set to the appropriate endpoint. In other words, the Endpoint FIFO configuration registers do not have non-indexed regions.

The allocation of FIFO space to the different endpoints requires programming for each Tx and Rx endpoint with the following information:

- The start address of the FIFO within the RAM block
- The maximum size of packet to be supported
- Whether double-buffering is required

(These last two together define the amount of space that needs to be allocated to the FIFO.)

It is the responsibility of the firmware to ensure that all the Tx and Rx endpoints (other than endpoint 0) that are active in the current USB configuration have a block of FIFO RAM allocated for their use. The maximum FIFO size for endpoint 0 required is 64 bytes deep and which is large enough to buffer one packet. For this reason, the first 64 bytes of FIFO memory is reserved for Endpoint 0 usage and this resource allocation is implied to be available at all times and no FIFO allocation is required for Endpoint 0. For endpoints other than endpoint 0, the FIFO RAM interface is configurable and must have a minimum size of 8 bytes and should be capable of buffering either 1 or 2 packets. Separate FIFOs may be associated with each endpoint: alternatively a Tx endpoint and the Rx endpoint with the same Endpoint number can be configured to use the same FIFO, to reduce the size of RAM block needed, provided they can never be active at the same time.

**NOTE:** The option of dynamically setting FIFO sizes only applies to Endpoints 1-15. Endpoint 0 FIFO has a fixed size (64 bytes) and a fixed location which is the first 64 Bytes of FIFO (FIFO addresses 0-63).

### 16.3.7 USB Controller Host and Peripheral Modes Operation

The two USB modules can be used in a range of different environments. They can be used as either a high-speed or a full-speed USB peripheral device attached to a conventional USB host (such as a PC) in a point-to-point type of arrangement. As a host, the USB modules can also be used with another peripheral device of any speed (high-, full-, or low-speed) in a point-to-point arrangement or can be used as the host to a range of peripheral devices in a multi-point setup; one-to-many via hub. Note that the role each USB controller is assuming is independent of each other. Two options (h/w or s/w) exist for a USB role assumption/configuration.

For a USB Peripheral configuration the user has the option of using the cable end to select the role by attaching the mini or micro b side of the cable (can consider this as a h/w option) or use the optional method where the firmware is required to program the respective USB Mode Register IDDIG bit field with a value of '1' prior to the USB controller goes into session (can consider this as a s/w option).

Similarly, for a USB host configuration the user has the option of using the cable end to select the role by attaching the mini or micro a side of the cable (can consider this as a h/w option) or use the optional method where the firmware is required to program the respective USB Mode Register IDDIG bit field with a value of '0' value prior to the USB controller going into session (can consider this as a s/w option).

When using the s/w option, the USB ID pin state is ignored/bypassed (this is a similar configuration where an ID pin does not exist) and the USB2.0 controller role adaptation of a host or peripheral (device) is dependent upon the state of the respective USB Mode Register IDDIG field. If the IDDIG field is programmed by the user with a value of '1' prior to the USB going into session, it would assume the role of a peripheral/device. However, if the IDDIG field is programmed with the value of '0', the USB controller will assume the role of a host. What this means is that the USB cable end, connector, will not be able to control the role of the OTG controller and the user needs to be aware of the firmware program setting prior to performing a USB connection.

The procedure for the USB2.0 OTG controller determining its operating modes (usb controller assuming a role of a host or a peripheral) starts when the USB 2.0 controller goes into a session. The USB 2.0 controller is in session when either it senses a voltage ( $\geq 4.4V$ ) on the USBx\_VBUSIN pin and the controller sets its DEVCTL[SESSION] bit field or when the firmware sets the DEVCTL[SESSION] bit; assuming that it will operating as a host.

When the DEVCTL[SESSION] bit is set, the controller will start sensing the state of the Iddig signal, which in turn is controlled either by the USBx\_ID pin (h/w option) or by the IDDIG bit field of the MODE Register (s/w option). If the state of the iddig signal is found to be low (IDDIG is programmed with '0') then the USB2.0 controller will assume the role of a host and when it finds the iddig signal to be high (IDDIG is programmed with '1') then it will assume the role of a device. Note that iddig is an internal signal that could be driven to high or low via firmware from dedicated registers.

Upon the USB controller determining its role as a host, it will drive the USBx\_DRVVBUS pin high to enable the external power logic so that it starts sourcing the required 5V power (must be  $\geq 4.4V$  but to account for the voltage drop on the cable it is suggested to be in the neighborhood of 4.75V). The USB2.0 controller will then wait for the voltage of the USBx\_VBUSIN to go high. Upon sampling a little time later, if it does not see the voltage on the USBx\_VBUSIN pin to be within a Vbus Valid range ( $\geq 4.4V$ ), it will generate a Vbus error interrupt. Assuming that the voltage level of the USBx\_VBUSIN is found to be within the Vbus Valid range, the USB 2.0 host controller will wait for a device to connect; that is for it to see one of its data lines USB0/1\_DP/DM be pulled high.

When assuming the role of a peripheral, assuming that the firmware has set the POWER[SOFTCONN] bit, and the USBx\_ID pin is floating (h/w option) or USBx Mode Register IDDIG bit field is programmed with '1' (s/w option) and an external host is sourcing power on the USBx\_VBUSIN line then the USB2.0 controller will set the DEVCTL[SESSION] bit instructing the controller to go into session. Note that the voltage on the USBx\_VBUSIN pin must be within Vbus Valid range (i.e. greater or equal to 4.4V). When the controller goes into session, it will force the USB2.0 Controller to sense the state of the iddig signal. Once it senses iddig signal to be high, it will enable its 1.5Kohm pull-up resistor to signify the external host that it is a Full-Speed device. Note that even when operating as a High-Speed peripheral; the USB controller has to first come up as Full-Speed and then later transition to High-Speed. The USB2.0 controller will then waits for a reset signal from the external host. Then after, if High-Speed option has been selected it will negotiate for a High-Speed operation and if its request has been accepted by the host, it will enable its precision 45ohm termination resistors (to stop signal reflection) on its data lines and disable the 1.5Kohm resistor.

### 16.3.8 Protocol Description(s)

This section describes the implementation of the USB protocol(s) by the USB modules.

#### 16.3.8.1 USB Controller Peripheral Mode Operation

The USB controller assumes the role of a peripheral when the USBx\_ID pin is floating or USB Mode Register[iddig=bit8] is set to 1 (provided that iddig\_mux, which is bit7 of USBnMODE is also set to 1) by the user application prior to the controller goes into session. When the USB controller go into session it will assume the role of a device.

Soft connect –After a POR or USB Module soft reset, the SOFTCONN bit of POWER register (bit 6) is cleared to 0. The controller will therefore appear disconnected until the software has set the SOFTCONN bit to 1. The application software can then choose when to set the PHY into its normal mode. Systems with a lengthy initialization procedure may use this to ensure that initialization is complete and the system is ready to perform enumeration before connecting to the USB. Once the SOFTCONN bit has been set, the software can also simulate a disconnect by clearing this bit to 0.

Entry into suspend mode –When operating as a peripheral device, the controller monitors activity on the bus and when no activity has occurred for 3 ms, it goes into Suspend mode. If the Suspend interrupt has been enabled, an interrupt will be generated at this time.

At this point, the controller can then be left active (and hence able to detect when Resume signaling occurs on the USB), or the application may arrange to disable the controller by stopping its clock. However, the controller will not then be able to detect Resume signaling on the USB if clocks are not running. If such is the case, external hardware will be needed to detect Resume signaling (by monitoring the DM and DP signals), so that the clock to the controller can be restarted.

Resume Signaling –When resume signaling occurs on the bus, first the clock to the controller must be restarted if necessary. Then the controller will automatically exit Suspend mode. If the Resume interrupt is enabled, an interrupt will be generated.

Initiating a remote wakeup –If the software wants to initiate a remote wakeup while the controller is in Suspend mode, it should set the POWER[RESUME] bit to 1. The software should leave then this bit set for approximately 10 ms (minimum of 2 ms, a maximum of 15 ms) before resetting it to 0.

**NOTE:** No resume interrupt will be generated when the software initiates a remote wakeup.

Reset Signaling –When reset signaling or bus condition occurs on the bus, the controller performs the following actions:

- Clears FADDR register to 0
- Clears INDEX register to 0
- Flushes all endpoint FIFOs
- Clears all controller control/status registers
- Generates a reset interrupt
- Enables all interrupts at the core level.

If the HSENA bit within the POWER register (bit 5) is set, the controller also tries to negotiate for high-speed operation. Whether high-speed operation is selected is indicated by HSMODE bit of POWER register (bit 4). When the application software receives a reset interrupt, it should close any open pipes and wait for bus enumeration to begin.

##### 16.3.8.1.1 Control Transactions:Peripheral Mode

Endpoint 0 is the main control endpoint of the core. The software is required to handle all the standard device requests that may be sent or received via endpoint 0. These are described in Universal Serial Bus Specification, Revision 2.0, Chapter 9. The protocol for these device requests involves different numbers and types of transactions per request/command. To accommodate this, the software needs to take a state machine approach to command decoding and handling.

The Standard Device Requests received by a USB peripheral device can be divided into three categories: Zero Data Requests (in which all the information is included in the command; no additional data is required), Write Requests (in which the command will be followed by additional data), and Read Requests (in which the device is required to send data back to the host).

This section looks at the sequence of actions that the software must perform to process these different types of device request.

**NOTE:** The Setup packet associated with any standard device request should include an 8-byte command. Any setup packet containing a command field other than 8 bytes will be automatically rejected by the controller.

#### 16.3.8.1.1.1 Zero Data Requests: Peripheral Mode

Zero data requests have all their information included in the 8-byte command and require no additional data to be transferred. Examples of Zero Data standard device requests are:

- SET\_FEATURE
- CLEAR\_FEATURE
- SET\_ADDRESS
- SET\_CONFIGURATION
- SET\_INTERFACE

The sequence of events will begin, as with all requests, when the software receives an endpoint 0 interrupt. The RXPKTRDY bit of PERI\_CSR0 (bit 0) will also have been set. The 8-byte command should then be read from the endpoint 0 FIFO, decoded and the appropriate action taken.

For example, if the command is SET\_ADDRESS, the 7-bit address value contained in the command should be written to the FADDR register at the completion of the command. The PERI\_CSR0 register should be written by setting the SERV\_RXPKTRDY bit (bit 6) (indicating that the command has been read from the FIFO) and also setting the DATAEND bit (bit 3) (indicating that no further data is expected for this request). The interval between setting SERV\_RXPKTRDY bit and DATAEND bit should be very small to avoid getting a SETUPEND error condition. It is highly recommended to set both bits at the same time.

When the host moves to the status stage of the request, a second endpoint 0 interrupt will be generated to indicate that the request has completed. No further action is required from the software. The second interrupt is just a confirmation that the request completed successfully. For SET\_ADDRESS command, the address should be written to FADDR register at the completion of the command, i.e. when the status stage interrupt is received.

If the command is an unrecognized command, or for some other reason cannot be executed, then when it has been decoded, the PERI\_CSR0 register should be written to set the SERV\_RXPKTRDY bit (bit 6) and to set the SENDSTALL bit (bit 5). When the host moves to the status stage of the request, the controller will send a STALL packet telling the host that the request was not executed. A second endpoint 0 interrupt will be generated and the SENTSTALL bit (bit 2 of PERI\_CSR0) will be set.

If the host sends more data after the DATAEND bit has been set, then the controller will send a STALL packet automatically. An endpoint 0 interrupt will be generated and the SENTSTALL bit (bit 2 of PERI\_CSR0) will be set.

**NOTE:** DMA is not supported for endpoint 0; endpoint 0 is always serviced via CPU.

#### 16.3.8.1.1.2 Write Requests: Peripheral Mode

Write requests involve an additional packet (or packets) of data being sent from the host after the 8-byte command. An example of a Write standard device request is: SET\_DESCRIPTOR.

The sequence of events will begin, as with all requests, when the software receives an endpoint 0 interrupt. The RXPKTRDY bit of PERI\_CSR0 will also have been set. The 8-byte command should then be read from the Endpoint 0 FIFO and decoded.

As with a zero data request, the PERI\_CSR0 register should then be written to set the SERV\_RXPKTRDY bit (bit 6) (indicating that the command has been read from the FIFO) but in this case the DATAEND bit (bit 3) should not be set (indicating that more data is expected).

When a second endpoint 0 interrupt is received, the PERI\_CSR0 register should be read to check the endpoint status. The RXPKTRDY bit of PERI\_CSR0 should be set to indicate that a data packet has been received. The COUNT0 register should then be read to determine the size of this data packet. The data packet can then be read from the endpoint 0 FIFO.

If the length of the data associated with the request (indicated by the wLength field in the command) is greater than the maximum packet size for endpoint 0, further data packets will be sent. In this case, PERI\_CSR0 should be written to set the SERV\_RXPKTRDY bit, but the DATAEND bit should not be set.

When all the expected data packets have been received, the PERI\_CSR0 register should be written to set the SERV\_RXPKTRDY bit and to set the DATAEND bit (indicating that no more data is expected).

When the host moves to the status stage of the request, another endpoint 0 interrupt will be generated to indicate that the request has completed. No further action is required from the software, the interrupt is just a confirmation that the request completed successfully.

If the command is an unrecognized command, or for some other reason cannot be executed, then when it has been decoded, the PERI\_CSR0 register should be written to set the SERV\_RXPKTRDY bit (bit 6) and to set the SENDSTALL bit (bit 5). When the host sends more data, the controller will send a STALL to tell the host that the request was not executed. An endpoint 0 interrupt will be generated and the SENTSTALL bit of PERI\_CSR0 (bit 2) will be set.

If the host sends more data after the DATAEND has been set, then the controller will send a STALL. An endpoint 0 interrupt will be generated and the SENTSTALL bit of PERI\_CSR0 (bit 2) will be set.

#### **16.3.8.1.1.3 Read Requests: Peripheral Mode**

Read requests have a packet (or packets) of data sent from the function to the host after the 8-byte command. Examples of Read Standard Device Requests are:

- GET\_CONFIGURATION
- GET\_INTERFACE
- GET\_DESCRIPTOR
- GET\_STATUS
- SYNCH\_FRAME

The sequence of events will begin, as with all requests, when the software receives an endpoint 0 interrupt. The RXPKTRDY bit of PERI\_CSR0 (bit 0) will also have been set. The 8-byte command should then be read from the endpoint 0 FIFO and decoded. The PERI\_CSR0 register should then be written to set the SERV\_RXPKTRDY bit (bit 6) (indicating that the command has read from the FIFO).

The data to be sent to the host should then be written to the endpoint 0 FIFO. If the data to be sent is greater than the maximum packet size for endpoint 0, only the maximum packet size should be written to the FIFO. The PERI\_CSR0 register should then be written to set the TXPKTRDY bit (bit 1) (indicating that there is a packet in the FIFO to be sent). When the packet has been sent to the host, another endpoint 0 interrupt will be generated and the next data packet can be written to the FIFO.

When the last data packet has been written to the FIFO, the PERI\_CSR0 register should be written to set the TXPKTRDY bit and to set the DATAEND bit (bit 3) (indicating that there is no more data after this packet).

When the host moves to the status stage of the request, another endpoint 0 interrupt will be generated to indicate that the request has completed. No further action is required from the software: the interrupt is just a confirmation that the request completed successfully.

If the command is an unrecognized command, or for some other reason cannot be executed, then when it has been decoded, the PERI\_CSR0 register should be written to set the SERV\_RXPKTRDY bit (bit 6) and to set the SENDSTALL bit (bit 5). When the host requests data, the controller will send a STALL to tell the host that the request was not executed. An endpoint 0 interrupt will be generated and the SENTSTALL bit of PERI\_CSR0 (bit 2) will be set.

If the host requests more data after DATAEND (bit 3) has been set, then the controller will send a STALL. An endpoint 0 interrupt will be generated and the SENTSTALL bit of PERI\_CSR0 (bit 2) will be set.

#### 16.3.8.1.1.4 Endpoint 0 States: Peripheral Mode

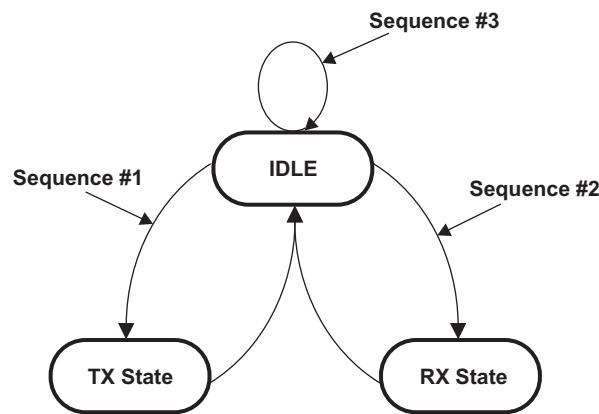

When the USB controller is operating as a peripheral device, the endpoint 0 control needs three modes – IDLE, TX and RX – corresponding to the different phases of the control transfer and the states endpoint 0 enters for the different phases of the transfer (described in later sections).

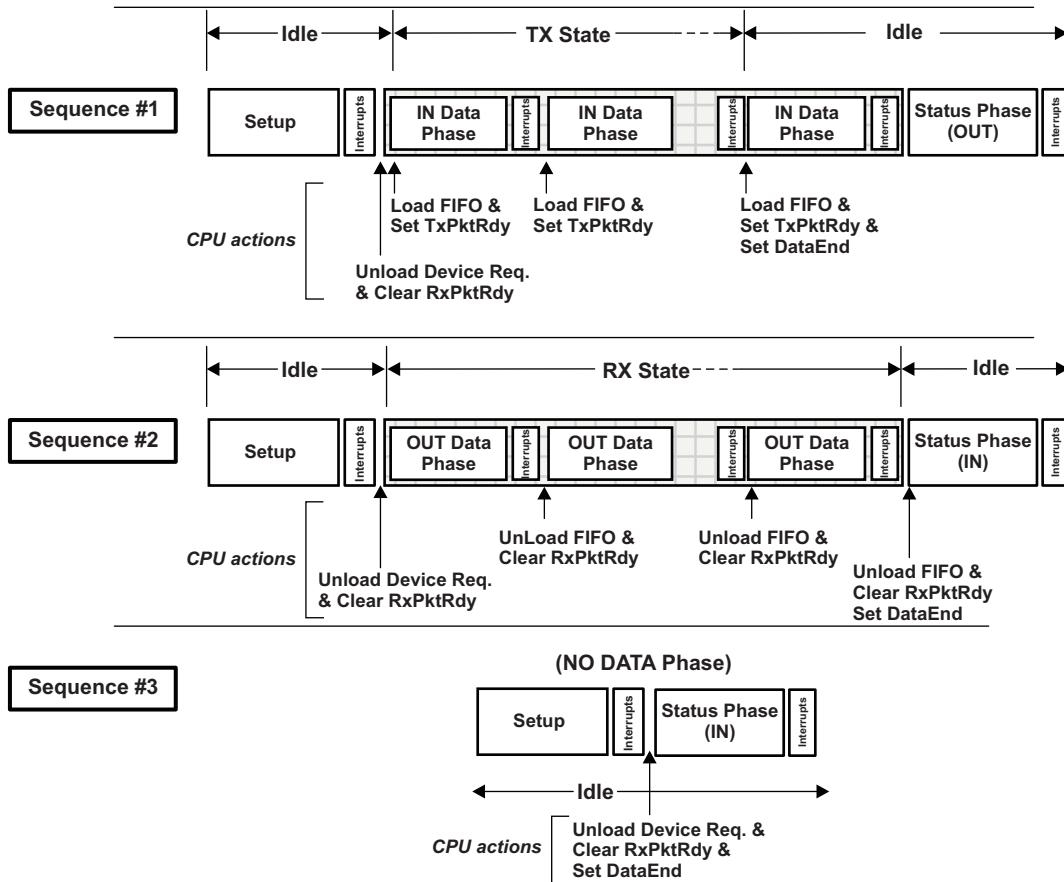

The default mode on power-up or reset should be IDLE. RXPKTRDY bit of PERI\_CSR0 (bit 0) becoming set when endpoint 0 is in IDLE state indicates a new device request. Once the device request is unloaded from the FIFO, the controller decodes the descriptor to find whether there is a data phase and, if so, the direction of the data phase of the control transfer (in order to set the FIFO direction). See [Figure 16-3](#).

Depending on the direction of the data phase, endpoint 0 goes into either TX state or RX state. If there is no Data phase, endpoint 0 remains in IDLE state to accept the next device request.

The actions that the CPU needs to take at the different phases of the possible transfers (for example, loading the FIFO, setting TXPKTRDY) are indicated in [Figure 16-4](#).

**Figure 16-3. CPU Actions at Transfer Phases**

**Figure 16-4. Sequence of Transfer**

#### 16.3.8.1.1.4.1 Endpoint 0 Interrupt Generating Events: Peripheral Mode

An Endpoint 0 interrupt is generated when any of the below events occur and Interrupt Service handler should determine the right event and launch the proper handler

The following events will cause Endpoint 0 Interrupt to be generated while the controller is operating assuming the role of a device/peripheral:

- The controller sets the RXPKTRDY bit of PERI\_CSR0 (bit 0) after a valid token has been received and data has been written to the FIFO (legal status condition).
- The controller clears the TXPKTRDY bit of PERI\_CSR0 (bit 1) after the packet of data in the FIFO has been successfully transmitted to the host (legal status condition).
- The controller sets the SENTSTALL bit of PERI\_CSR0 (bit 2) after a control transaction is ended due to a protocol violation (illegal status condition).
- The controller sets the SETUPEND bit of PERI\_CSR0 (bit 4) because a control transfer has ended before DATAEND (bit 3 of PERI\_CSR0) is set (illegal status condition).

In order to determine the cause of the interrupt, the detail below recommends the order of cause determination and execution.

Whenever the endpoint 0 service routine is entered, the software must first check to see if the current control transfer has been ended due to either a STALL condition or a premature end of control transfer. If the control transfer ends due to a STALL condition, the SENTSTALL bit would be set. If the control transfer ends due to a premature end of control transfer, the SETUPEND bit would be set. In either case, the software should abort processing the current control transfer and set the state to IDLE.

Once the software has determined that the interrupt was not generated by an illegal bus state, the next action taken depends on the endpoint state.

If endpoint 0 is in IDLE state, the only valid reason an interrupt can be generated is as a result of the controller receiving data from the bus. The service routine must check for this by testing the RXPKTRDY bit of PERI\_CSR0 (bit 0). If this bit is set, then the controller has received a SETUP packet. This must be unloaded from the FIFO and decoded to determine the action the controller must take. Depending on the command contained within the SETUP packet, endpoint 0 will enter one of three states:

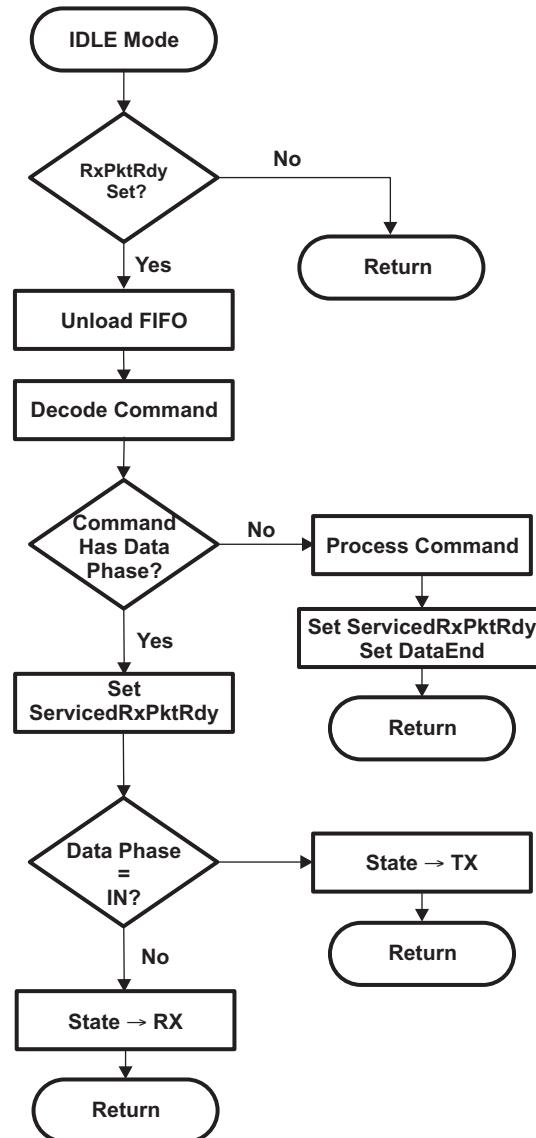

- If the command is a single packet transaction (SET\_ADDRESS, SET\_INTERFACE etc.) without any data phase, the endpoint will remain in IDLE state.
- If the command has an OUT data phase (SET\_DESCRIPTOR etc.), the endpoint will enter RX state.
- If the command has an IN data phase (GET\_DESCRIPTOR etc.), the endpoint will enter TX state.
- If the endpoint 0 is in TX state, the interrupt indicates that the core has received an IN token and data from the FIFO has been sent. The software must respond to this either by placing more data in the FIFO if the host is still expecting more data or by setting the DATAEND bit to indicate that the data phase is complete. Once the data phase of the transaction has been completed, endpoint 0 should be returned to IDLE state to await the next control transaction (status stage).
- If the endpoint is in RX state, the interrupt indicates that a data packet has been received. The software must respond by unloading the received data from the FIFO. The software must then determine whether it has received all of the expected data. If it has, the software should set the DATAEND bit and return endpoint 0 to IDLE state. If more data is expected, the firmware should set the SERV\_RXPKTRDY bit of PERI\_CSR0 (bit 6) to indicate that it has read the data in the FIFO and leave the endpoint in RX state.

#### 16.3.8.1.1.4.2 Idle Mode: Control Transfer of Peripheral Mode

IDLE mode is the mode the Endpoint 0 control needs to select at power-on or reset and is the mode to which the Endpoint 0 control should return when the RX and TX modes are terminated.

It is also the mode in which the SETUP phase of control transfer is handled (as outlined in [Figure 16-5](#)).

**Figure 16-5. Flow Chart of Setup Stage of a Control Transfer in Peripheral Mode**

#### 16.3.8.1.1.4.3 TX Mode: Control Transfer of Peripheral Mode

When the endpoint is in TX state, all arriving IN tokens need to be treated as part of a data phase until the required amount of data has been sent to the host. If either a SETUP or an OUT token is received while the endpoint is in the TX state, this will cause a SETUPEND condition to occur as the core expects only IN tokens.

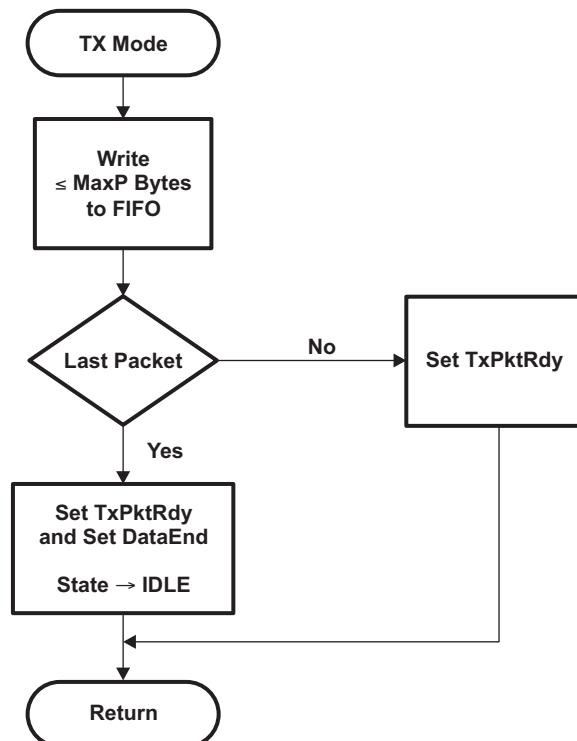

Three events can cause TX mode to be terminated before the expected amount of data has been sent as shown in [Figure 16-6](#):

1. The host sends an invalid token causing a SETUPEND condition (bit 4 of PERI\_CSR0 is set).
2. The firmware sends a packet containing less than the maximum packet size for Endpoint 0.
3. The firmware sends an empty data packet.

Until the transaction is terminated, the firmware simply needs to load the FIFO when it receives an interrupt which indicates that a packet has been sent from the FIFO. An interrupt is generated when TXPKTRDY is cleared.

When the firmware forces the termination of a transfer (by sending a short or empty data packet), it should set the DATAEND bit of PERI\_CSR0 (bit 3) to indicate to the core that the data phase is complete and that the core should next receive an acknowledge packet.

**Figure 16-6. Flow Chart of Transmit Data Stage of a Control Transfer in Peripheral Mode**

#### 16.3.8.1.1.4.4 Rx Mode: Control Transfer of Peripheral Mode

In RX mode, all arriving data should be treated as part of a data phase until the expected amount of data has been received. If either a SETUP or an IN token is received while the endpoint is in RX state, a SETUPEND condition will occur as the controller expects only OUT tokens.

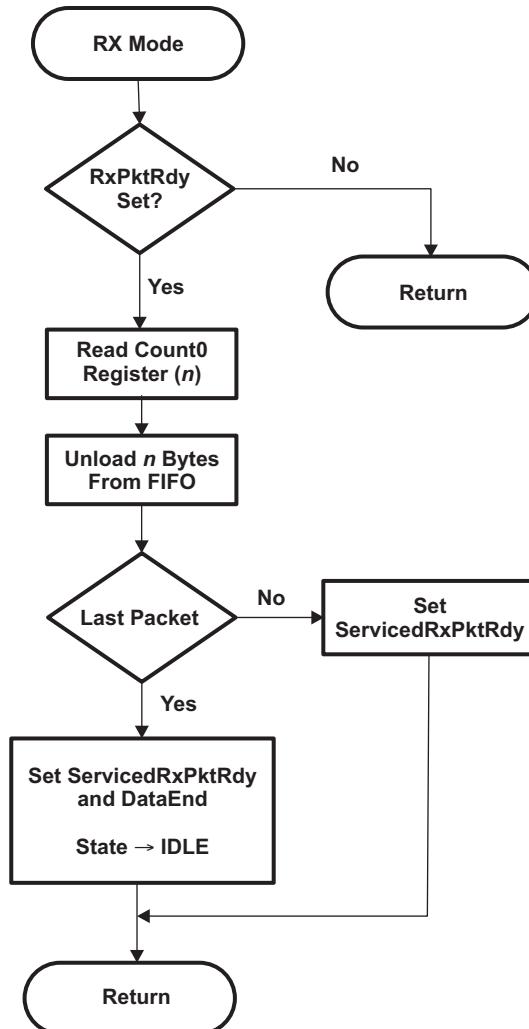

Three events can cause RX mode to be terminated before the expected amount of data has been received as shown in [Figure 16-7](#):

1. The host sends an invalid token causing a SETUPEND condition (setting bit 4 of PERI\_CSR0).
2. The host sends a packet which contains less than the maximum packet size for endpoint 0.
3. The host sends an empty data packet.

Until the transaction is terminated, the software unloads the FIFO when it receives an interrupt that indicates new data has arrived (setting RXPKTRDY bit of PERI\_CSR0) and to clear RXPKTRDY by setting the SERV\_RXPKTRDY bit of PERI\_CSR0 (bit 6).

When the software detects the termination of a transfer (by receiving either the expected amount of data or an empty data packet), it should set the DATAEND bit (bit 3 of PERI\_CSR0) to indicate to the controller that the data phase is complete and that the core should receive an acknowledge packet next.

**Figure 16-7. Flow Chart of Receive Data Stage of a Control Transfer in Peripheral Mode**

#### **16.3.8.1.1.4.5 Error Handling: Control Transfer of Peripheral Mode**

A control transfer may be aborted due to a protocol error on the USB, the host prematurely ending the transfer, or if the software wishes to abort the transfer (for example, because it cannot process the command).

The controller automatically detects protocol errors and sends a STALL packet to the host under the following conditions:

- The host sends more data during the OUT Data phase of a write request than was specified in the command. This condition is detected when the host sends an OUT token after the DATAEND bit (bit 3 of PERI\_CSR0) has been set.
- The host requests more data during the IN Data phase of a read request than was specified in the command. This condition is detected when the host sends an IN token after the DATAEND bit in the PERI\_CSR0 register has been set.
- The host sends more than Max Packet Size data bytes in an OUT data packet.
- The host sends a non-zero length DATA1 packet during the STATUS phase of a read request.

When the controller has sent the STALL packet, it sets the SENTSTALL bit (bit 2 of PERI\_CSR0) and generates an interrupt. When the software receives an endpoint 0 interrupt with the SENTSTALL bit set, it should abort the current transfer, clear the SENTSTALL bit, and return to the IDLE state.

If the host prematurely ends a transfer by entering the STATUS phase before all the data for the request has been transferred, or by sending a new SETUP packet before completing the current transfer, then the SETUPEND bit (bit 4 of PERI\_CSR0) will be set and an endpoint 0 interrupt generated. When the software receives an endpoint 0 interrupt with the SETUPEND bit set, it should abort the current transfer, set the SERV\_SETUPEND bit (bit 7 of PERI\_CSR0), and return to the IDLE state. If the RXPKTRDY bit (bit 0 of PERI\_CSR0) is set this indicates that the host has sent another SETUP packet and the software should then process this command.

If the software wants to abort the current transfer, because it cannot process the command or has some other internal error, then it should set the SENDSTALL bit (bit 5 of PERI\_CSR0). The controller will then send a STALL packet to the host, set the SENTSTALL bit (bit 2 of PERI\_CSR0) and generate an endpoint 0 interrupt.

#### **16.3.8.1.1.5 Additional Conditions: Control Transfer of Peripheral Mode**

When working as a peripheral device, the controller automatically responds to certain conditions on the USB bus or actions by the host. The details are:

- Stall Issued to Control Transfers
  1. The host sends more data during an OUT Data phase of a Control transfer than was specified in the device request during the SETUP phase. This condition is detected by the controller when the host sends an OUT token (instead of an IN token) after the software has unloaded the last OUT packet and set DATAEND.
  2. The host requests more data during an IN data phase of a Control transfer than was specified in the device request during the SETUP phase. This condition is detected by the controller when the host sends an IN token (instead of an OUT token) after the software has cleared TXPKTRDY and set DATAEND in response to the ACK issued by the host to what should have been the last packet.
  3. The host sends more than MaxPktSize data with an OUT data token.
  4. The host sends the wrong PID for the OUT Status phase of a Control transfer.
  5. The host sends more than a zero length data packet for the OUT Status phase.

- Zero Length Out Data Packets In Control Transfer

A zero length OUT data packet is used to indicate the end of a Control transfer. In normal operation, such packets should only be received after the entire length of the device request has been transferred (i.e., after the software has set DataEnd). If, however, the host sends a zero length OUT data packet before the entire length of device request has been transferred, this signals the premature end of the transfer. In this case, the controller will automatically flush any IN token loaded by software ready for the Data phase from the FIFO and set SETUPEND bit (bit 4 of PERI\_CSR0).

### 16.3.8.1.2 Bulk Transfer: Peripheral Mode

Bulk transactions are handled by endpoints other than endpoint 0. It is used to handle non-periodic, large bursty communication typically used for a transfer that use any available bandwidth and can also be delayed until bandwidth is available.

#### 16.3.8.1.2.1 Bulk IN Transactions: Peripheral Mode

A Bulk IN transaction is used to transfer non-periodic data from the USB peripheral device to the host.

The following optional features are available for use with a Tx endpoint used in peripheral mode for Bulk IN transactions:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO awaiting transmission to the host. Double packet buffering is enabled by setting the DPB bit of TXFIFOSZ register (bit 4).
- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint is able to accept another packet in its FIFO. This feature allows the DMA controller to load packets into the FIFO without processor intervention

##### 16.3.8.1.2.1.1 Bulk IN Transaction Setup: Peripheral Mode

In configuring a TX endpoint for bulk transactions, the TXMAXP register must be written with the maximum packet size (in bytes) for the endpoint. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the endpoint and the PERI\_TXCSR register (DMAEN and DMAMODE bit fields should be set when using DMA). [Table 16-4](#) displays the PERI\_TXCSR setting when used for Bulk transfer.

**Table 16-4. PERI\_TXCSR Register Bit Configuration for Bulk IN Transactions**

| Bit Field | Bit Name    | Description  |
|-----------|-------------|--|
| Bit 15    | AUTOSET     | Cleared to 0 if using DMA. For CPU Mode use, if AUTOSET bit is set, the TXPKTRDY bit will be automatically set when data of the maximum packet size is loaded into the FIFO. |
| Bit 14    | ISO         | Cleared to 0 for bulk mode operation.  |
| Bit 13    | MODE        | Set to 1 to make sure the FIFO is enabled (only necessary if the FIFO is shared with an RX endpoint)   |
| Bit 12    | DMAEN       | Set to 1 to enable DMA usage; not needed if CPU is being used to service the Tx Endpoint   |
| Bit 11    | FRCDATATOOG | Cleared to 0 to allow normal data toggle operations.   |
| Bit 10    | DMAMODE     | Set to 1 when DMA is used to service Tx FIFO.  |

When the endpoint is first configured (following a SET\_CONFIGURATION or SET\_INTERFACE command on Endpoint 0), the lower byte of PERI\_TXCSR should be written to set the CLRDATATOOG bit (bit 6). This will ensure that the data toggle (which is handled automatically by the controller) starts in the correct state.

Also if there are any data packets in the FIFO, indicated by the FIFONOTEMPTY bit (bit 1 of PERI\_TXCSR) being set, they should be flushed by setting the FLUSHFIFO bit (bit 3 of PERI\_TXCSR).

**NOTE:** It may be necessary to set this bit twice in succession if double buffering is enabled.

#### **16.3.8.1.2.1.2 Bulk IN Operation: Peripheral Mode**

When data is to be transferred over a Bulk IN pipe, a data packet needs to be loaded into the FIFO and the PERI\_TXCSR register written to set the TXPKTRDY bit (bit 0). When the packet has been sent, the TXPKTRDY bit will be cleared by the USB controller and an interrupt generated to signify to the user/application that the next packet can be loaded into the FIFO. If double packet buffering is enabled, then after the first packet has been loaded and the TXPKTRDY bit set, the TXPKTRDY bit will immediately be cleared (will not wait for the loaded first packet to be driven out) by the USB controller and an interrupt generated so that a second packet can be loaded into the FIFO. The software should operate in the same way, loading a packet when it receives an interrupt, regardless of whether double packet buffering is enabled or not.

In the general case, the packet size must not exceed the size specified by the lower 11 bits of the TXMAXP register. This part of the register defines the payload (packet size) for transfers over the USB and is required by the USB Specification to be either 8, 16, 32, 64 (Full-Speed or High-Speed) or 512 bytes (High-Speed only).

The host may determine that all the data for a transfer has been sent by knowing the total amount of data that is expected. Alternatively it may infer that all the data has been sent when it receives a packet which is smaller than the maximum packet size configuration for that particular endpoint (TXMAXP[10-0]). In the latter case, if the total size of the data block is a multiple of this payload, it will be necessary for the function to send a null packet after all the data has been sent. This is done by setting TXPKTRDY when the next interrupt is received, without loading any data into the FIFO.

If large blocks of data are being transferred, then the overhead of calling an interrupt service routine to load each packet can be avoided by using the CPPI DMA. A separate section detailing the use of the DMA is discussed within a latter section. Suffix is to say that the PERI\_TXCSR (DMAEN and DMAMODE) bit fields need to be set and the PERI\_TXCSR[AUTOSET] bit cleared at the core level when using the DMA with an endpoint configured for any IN transaction/transfer.

#### **16.3.8.1.2.1.3 Error Handling of Bulk IN Transfer: Peripheral Mode**

If the software wants to shut down the Bulk IN pipe, it should set the SENDSTALL bit (bit 4 of PERI\_TXCSR). When the controller receives the next IN token, it will send a STALL to the host, set the SENTSTALL bit (bit 5 of PERI\_TXCSR) and generate an interrupt.

When the software receives an interrupt with the SENTSTALL bit (bit 5 of PERI\_TXCSR) set, it should clear the SENTSTALL bit. It should however leave the SENDSTALL bit set until it is ready to re-enable the Bulk IN pipe.

**NOTE:** If the host failed to receive the STALL packet for some reason, it will send another IN token, so it is advisable to leave the SENDSTALL bit set until the software is ready to re-enable the Bulk IN pipe.

When a pipe is re-enabled, the data toggle sequence should be restarted by setting the CLRDATATOG bit in the PERI\_TXCSR register (bit 6).

#### **16.3.8.1.2.2 Bulk OUT Transfer: Peripheral Mode**

A Bulk OUT transaction is used to transfer non-periodic data from the host to the function controller.

The following optional features are available for use with an Rx endpoint used in peripheral mode for Bulk OUT transactions:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO on reception from the host. Double packet buffering is enabled by setting the DPB bit of the RXFIFOSZ register (bit 4).
- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint has a packet in its FIFO. This feature can be used to allow the DMA controller to unload packets from the FIFO without processor intervention.

**NOTE:** When DMA is enabled, endpoint interrupt will not be generated for completion of packet reception. Endpoint interrupt will be generated only in the error conditions.

#### 16.3.8.1.2.2.1 Bulk OUT Transfer Setup: Peripheral Mode

In configuring an Rx endpoint for Bulk OUT transactions, the RXMAXP register must be written with the maximum packet size (in bytes) for the endpoint. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the endpoint. When using DMA for Rx Endpoints, the PERI\_RXCSR needs to have its DMAEN bit set and have its AUTOCLEAR and DMAMODE bits cleared. In addition, the relevant interrupt enable bit in the INTRRXE register should be set (if an interrupt is required for this endpoint) and the PERI\_RXCSR register should be set as shown in [Table 16-5](#).

**Table 16-5. PERI\_RXCSR Register Bit Configuration for Bulk OUT Transactions**

| Bit Field | Bit Name  | Description   |
|-----------|-----------|---|
| Bit 15    | AUTOCLEAR | Cleared to 0 if using DMA. In CPU Mode of usage, if the CPU sets AUTOCLEAR bit, the RXPKTRDY bit will be automatically cleared when a packet of RXMAXP bytes has been unloaded from the Receive FIFO. |
| Bit 14    | ISO       | Cleared to 0 to enable Bulk protocol.   |
| Bit 13    | DMAEN     | Set to 1 if a DMA request is required for this Rx endpoint.   |
| Bit 12    | DISNYET   | Cleared to 0 to allow normal PING flow control. This will affect only high speed transactions.  |
| Bit 11    | DMAMODE   | Always clear this bit to 0.   |

When the Rx endpoint is first configured (following a SET\_CONFIGURATION or SET\_INTERFACE command on Endpoint 0), the lower byte of PERI\_RXCSR should be written to set the CLRDATAOTOG bit (bit 7). This will ensure that the data toggle (which is handled automatically by the USB controller) starts in the correct state.

Also if there are any data packets in the FIFO (indicated by the RXPKTRDY bit (bit 0 of PERI\_RXCSR) being set), they should be flushed by setting the FLUSHFIFO bit (bit 4 of PERI\_RXCSR).

**NOTE:** It may be necessary to set this bit twice in succession if double buffering is enabled.

#### 16.3.8.1.2.2.2 Bulk OUT Operation: Peripheral Mode

When a data packet is received by a Bulk Rx endpoint, the RXPKTRDY bit (bit 0 of PERI\_RXCSR) is set and an interrupt is generated. The software should read the RXCOUNT register for the endpoint to determine the size of the data packet. The data packet should be read from the FIFO, and then the RXPKTRDY bit should be cleared.

The packets received should not exceed the size specified in the RXMAXP register (as this should be the value set in the wMaxPacketSize field of the endpoint descriptor sent to the host). When a block of data larger than wMaxPacketSize needs to be sent to the function, it will be sent as multiple packets. All the packets will be wMaxPacketSize in size, except the last packet which will contain the residue. The software may use an application specific method of determining the total size of the block and hence when the last packet has been received. Alternatively it may infer that the entire block has been received when it receives a packet which is less than wMaxPacketSize in size. (If the total size of the data block is a multiple of wMaxPacketSize, a null data packet will be sent after the data to signify that the transfer is complete.)

In the general case, the application software will need to read each packet from the FIFO individually. If large blocks of data are being transferred, the overhead of calling an interrupt service routine to unload each packet can be avoided by using DMA.

### **16.3.8.1.2.2.3 Bulk OUT Error Handling: Peripheral Mode**

If the software wants to shut down the Bulk OUT pipe, it should set the SENDSTALL bit (bit 5 of PERI\_RXCSR). When the controller receives the next packet it will send a STALL to the host, set the SENTSTALL bit (bit 6 of PERI\_RXCSR) and generate an interrupt.

When the software receives an interrupt with the SENTSTALL bit (bit 6 of PERI\_RXCSR) set, it should clear this bit. It should however leave the SENDSTALL bit set until it is ready to re-enable the Bulk OUT pipe.

**NOTE:** If the host failed to receive the STALL packet for some reason, it will send another packet, so it is advisable to leave the SENDSTALL bit set until the software is ready to re-enable the Bulk OUT pipe. When a Bulk OUT pipe is re-enabled, the data toggle sequence should be restarted by setting the CLRDATAOG bit (bit 7) in the PERI\_RXCSR register.

### **16.3.8.1.3 Interrupt Transfer: Peripheral Mode**

An Interrupt IN transaction uses the same protocol as a Bulk IN transaction and the configuration and operation mentioned on prior sections apply to Interrupt transfer too with minor changes. Similarly, an Interrupt OUT transaction uses almost the same protocol as a Bulk OUT transaction and can be used the same way.

Tx endpoints in the USB controller have one feature for Interrupt IN transactions that they do not support in Bulk IN transactions. In Interrupt IN transactions, the endpoints support continuous toggle of the data toggle bit.

This feature is enabled by setting the FRCDATATOOG bit in the PERI\_TXCSR register (bit 11). When this bit is set, the controller will consider the packet as having been successfully sent and toggle the data bit for the endpoint, regardless of whether an ACK was received from the host.

Another difference is that interrupt endpoints do not support PING flow control. This means that the controller should never respond with a NYET handshake, only ACK/NAK/STALL. To ensure this, the DISNYET bit in the PERI\_RXCSR register (bit 12) should be set to disable the transmission of NYET handshakes in high-speed mode.

Though DMA can be used with an interrupt OUT endpoint, it generally offers little benefit as interrupt endpoints are usually expected to transfer all their data in a single packet.

### **16.3.8.1.4 Isochronous Transfer: Peripheral Mode**

Isochronous transfers are used when working with isochronous data. Isochronous transfers provide periodic, continuous communication between host and device.

#### **16.3.8.1.4.1 Isochronous IN Transactions: Peripheral Mode**

An Isochronous IN transaction is used to transfer periodic data from the function controller to the host.

The following optional features are available for use with a Tx endpoint used in Peripheral mode for Isochronous IN transactions:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO awaiting transmission to the host. Double packet buffering is enabled by setting the DPB bit of TXFIFOSZ register (bit 4).

**NOTE:** Double packet buffering is generally advisable for isochronous transactions in order to avoid underrun errors as described in later section.

- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint is able to accept another packet in its FIFO. This feature allows the DMA controller to load packets into the FIFO without processor intervention.

However, this feature is not particularly useful with Isochronous endpoints because the packets transferred are often not maximum packet size and the PERI\_TXCSR register needs to be accessed following every packet to check for Underrun errors.

When DMA is enabled and DMAMODE bit of PERI\_TXCSR is set, endpoint interrupt will not be generated for completion of packet transfer. Endpoint interrupt will be generated only in the error conditions.

#### 16.3.8.1.4.1.1 Isochronous IN Transfer Setup: Peripheral Mode

In configuring a Tx endpoint for Isochronous IN transactions, the TXMAXP register must be written with the maximum packet size (in bytes) for the endpoint. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the endpoint. In addition, the relevant interrupt enable bit in the INTRTXE register should be set (if an interrupt is required for this endpoint) and the PERI\_TXCSR register should be set as shown in [Table 16-6](#).

**Table 16-6. PERI\_TXCSR Register Bit Configuration for Isochronous IN Transactions**

| Bit Field | Bit Name   | Description  |
|-----------|------------|--|
| Bit 14    | ISO        | Set to 1 to enable Isochronous transfer protocol.  |
| Bit 13    | MODE       | Set to 1 to ensure the FIFO is enabled (only necessary if the FIFO is shared with an Rx endpoint). |
| Bit 12    | DMAEN      | Set to 1 if DMA Requests have to be enabled.   |
| Bit 11    | FRCDATATOG | Ignored in Isochronous mode.   |
| Bit 10    | DMAMODE    | Set to 1 when DMA is enabled.  |

#### 16.3.8.1.4.1.2 Isochronous IN Transfer Operation: Peripheral Mode

An isochronous endpoint does not support data retries, so if data underrun is to be avoided, the data to be sent to the host must be loaded into the FIFO before the IN token is received. The host will send one IN token per frame (or microframe in High-speed mode), however the timing within the frame (or microframe) can vary. If an IN token is received near the end of one frame and then at the start of the next frame, there will be little time to reload the FIFO. For this reason, double buffering of the endpoint is usually necessary.

An interrupt is generated whenever a packet is sent to the host and the software may use this interrupt to load the next packet into the FIFO and set the TXPKTRDY bit in the PERI\_TXCSR register (bit 0) in the same way as for a Bulk Tx endpoint. As the interrupt could occur almost any time within a frame(/microframe), depending on when the host has scheduled the transaction, this may result in irregular timing of FIFO load requests. If the data source for the endpoint is coming from some external hardware, it may be more convenient to wait until the end of each frame(/microframe) before loading the FIFO as this will minimize the requirement for additional buffering. This can be done by using either the SOF interrupt or the external SOF\_PULSE signal from the controller to trigger the loading of the next data packet. The SOF\_PULSE is generated once per frame(/microframe) when a SOF packet is received. (The controller also maintains an external frame(/microframe) counter so it can still generate a SOF\_PULSE when the SOF packet has been lost.) The interrupts may still be used to set the TXPKTRDY bit in PERI\_TXCSR (bit 0) and to check for data overruns/underruns.

Starting up a double-buffered Isochronous IN pipe can be a source of problems. Double buffering requires that a data packet is not transmitted until the frame(/microframe) after it is loaded. There is no problem if the function loads the first data packet at least a frame(/microframe) before the host sets up the pipe (and therefore starts sending IN tokens). But if the host has already started sending IN tokens by the time the first packet is loaded, the packet may be transmitted in the same frame(/microframe) as it is loaded, depending on whether it is loaded before, or after, the IN token is received. This potential problem can be avoided by setting the ISOUPDATE bit in the POWER register (bit 7). When this bit is set, any data packet loaded into an Isochronous Tx endpoint FIFO will not be transmitted until after the next SOF packet has been received, thereby ensuring that the data packet is not sent too early.

#### 16.3.8.1.4.1.3 Isochronous IN Error Handling: Peripheral Mode

If the endpoint has no data in its FIFO when an IN token is received, it will send a null data packet to the host and set the UNDERRUN bit in the PERI\_TXCSR register (bit 2). This is an indication that the software is not supplying data fast enough for the host. It is up to the application to determine how this error condition is handled.

If the software is loading one packet per frame(/microframe) and it finds that the TXPKTRDY bit in the PERI\_TXCSR register (bit 0) is set when it wants to load the next packet, this indicates that a data packet has not been sent (perhaps because an IN token from the host was corrupted). It is up to the application how it handles this condition: it may choose to flush the unsent packet by setting the FLUSHFIFO bit in the PERI\_TXCSR register (bit 3), or it may choose to skip the current packet.

#### **16.3.8.1.4.2 Isochronous OUT Transactions: Peripheral Mode**

An isochronous OUT transaction is used to transfer periodic data from the host to the function controller.

Following optional features are available for use with an Rx endpoint used in Peripheral mode for Isochronous OUT transactions:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO on reception from the host. Double packet buffering is enabled by setting the DPB bit of RXFIFOSZ register (bit 4). **NOTE:** Double packet buffering is generally advisable for Isochronous transactions in order to avoid overrun errors.
- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint has a packet in its FIFO. This feature can be used to allow the DMA controller to unload packets from the FIFO without processor intervention. However, this feature is not particularly useful with Isochronous endpoints because the packets transferred are often not maximum packet size and the PERI\_RXCSR register needs to be accessed following every packet to check for Overrun or CRC errors. When DMA is enabled, endpoint interrupt will not be generated for completion of packet reception. Endpoint interrupt will be generated only in the error conditions.

#### **16.3.8.1.4.2.1 Isochronous OUT Setup: Peripheral Mode**

In configuring an Rx endpoint for Isochronous OUT transactions, the RXMAXP register must be written with the maximum packet size (in bytes) for the endpoint. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the endpoint. In addition, the relevant interrupt enable bit in the INTRRXE register should be set (if an interrupt is required for this endpoint) and the PERI\_RXCSR register should be set as shown in [Table 16-7](#).

**Table 16-7. PERI\_RXCSR Register Bit Configuration for Isochronous OUT Transactions**

| Bit Field | Bit Name  | Description   |
|-----------|-----------|---|
| Bit 15    | AUTOCLEAR | Cleared to 0 if using DMA. In CPU Mode of usage, if the CPU sets AUTOCLEAR bit, the RXPKTRDY bit will be automatically cleared when a packet of RXMAXP bytes has been unloaded from the Receive FIFO. |
| Bit 14    | ISO       | Set to 1 to configure endpoint usage for Isochronous transfer.  |
| Bit 13    | DMAEN     | Set to 1 if a DMA request is required for this Rx endpoint.   |
| Bit 12    | DISNYET   | Ignored in Isochronous Mode.  |
| Bit 11    | DMAMODE   | Always clear this bit to 0.   |

#### 16.3.8.1.4.2.2 Isochronous OUT Operation: Peripheral Mode

An Isochronous endpoint does not support data retries so, if a data overrun is to be avoided, there must be space in the FIFO to accept a packet when it is received. The host will send one packet per frame (or microframe in High-speed mode); however, the time within the frame can vary. If a packet is received near the end of one frame(/microframe) and another arrives at the start of the next frame, there will be little time to unload the FIFO. For this reason, double buffering of the endpoint is usually necessary.

An interrupt is generated whenever a packet is received from the host and the software may use this interrupt to unload the packet from the FIFO and clear the RXPKTRDY bit in the PERI\_RXCSR register (bit 0) in the same way as for a Bulk Rx endpoint. As the interrupt could occur almost any time within a frame(/microframe), depending on when the host has scheduled the transaction, the timing of FIFO unload requests will probably be irregular. If the data sink for the endpoint is going to some external hardware, it may be better to minimize the requirement for additional buffering by waiting until the end of each frame(/microframe) before unloading the FIFO. This can be done by using either the SOF interrupt or the external SOF\_PULSE signal from the controller to trigger the unloading of the data packet. The SOF\_PULSE is generated once per frame(/microframe) when a SOF packet is received. (The controller also maintains an external frame(/microframe) counter so it can still generate a SOF\_PULSE when the SOF packet has been lost.) The interrupts may still be used to clear the RXPKTRDY bit in PERI\_RXCSR and to check for data overruns/underruns.

#### 16.3.8.1.4.2.3 Isochronous OUT Error Handling: Peripheral Mode

If there is no space in the FIFO to store a packet when it is received from the host, the OVERRUN bit in the PERI\_RXCSR register (bit 2) will be set. This is an indication that the software is not unloading data fast enough for the host. It is up to the application to determine how this error condition is handled.

If the controller finds that a received packet has a CRC error, it will still store the packet in the FIFO and set the RXPKTRDY bit (bit 0 of PERI\_RXCSR) and the DATAERROR bit (bit 3 of PERI\_RXCSR). It is left up to the application to determine how this error condition is handled.

The number of USB packets sent in any microframe will depend on the amount of data to be transferred, and is indicated through the PIDs used for the individual packets. If the indicated number of packets have not been received by the end of a microframe, the INCOMPRX bit (bit 8) bit in the PERI\_RXCSR register will be set to indicate that the data in the FIFO is incomplete. Equally, if a packet of the wrong data type is received, then the PID Error bit is the PERI\_RXCSR register will be set. In each case, an interrupt will, however, still be generated to allow the data that has been received to be read from the FIFO.

**Note:** The circumstances in which a PID Error or INCOMPRX is reported depends on the precise sequence of packets received.

When the core is operating in peripheral mode, the details are in [Table 16-8](#).

**Table 16-8. Isochronous OUT Error Handling: Peripheral Mode**

| No. Packet(s) Expected | Data Packet(s) Received | Response                     |
|------------------------|-------------------------|------------------------------|
| 1                      | DATA0                   | OK                           |
|                        | DATA1                   | PID Error set                |
|                        | DATA2                   | PID Error set                |
|                        | MDATA                   | PID Error set                |
| 2                      | DATA0                   | OK                           |
|                        | DATA1                   | INCOMPRX Set                 |
|                        | DATA2                   | INCOMPRX Set + PID Error set |
|                        | MDATA                   | INCOMPRX Set                 |
|                        | MDATA DATA0             | PID Error Set                |
| 3                      | MDATA DATA1             | OK                           |
|                        | MDATA DATA2             | PID Error Set                |
|                        | MDATA MDATA             | PID Error Set                |
|                        | DATA0                   | OK                           |
|                        | DATA1                   | INCOMPRX Set                 |

**Table 16-8. Isochronous OUT Error Handling: Peripheral Mode (continued)**

| No. Packet(s) Expected | Data Packet(s) Received | Response      |
|------------------------|-------------------------|---------------|
|                        | DATA2                   | INCOMPRX Set  |
|                        | MDATA                   | INCOMPRX Set  |
|                        | MDATA DATA0             | PID Error set |

|                        | MDATA DATA2             | INCOMPRX Set  |
|                        | MDATA MDATA             | INCOMPRX Set  |
|                        | MDATA MDATA DATA0       | PID Error set |
|                        | MDATA MDATA DATA1       | PID Error set |
|                        | MDATA MDATA DATA2       | OK            |
|                        | MDATA MDATA MDATA       | PID Error set |

### 16.3.8.2 USB Controller Host Mode Operation

The USB controller assumes the role of a host when the USBx\_ID pin state is grounded or USB Mode Register[iddig=bit8] is cleared to 0 (provided that iddig\_mux, which is bit7 of USBnMODE is also set to 1) by the user application prior to the controller goes into session. When the USB controller go into session, application/firmware sets the DEVCTL[SESSION] bit to 1, it will assume the role of a host.

- Entry into Suspend mode. When operating as a host, the USB controller can be prompted to go into Suspend mode by setting the SUSPENDM bit in the POWER register. When this bit is set, the controller will complete the current transaction then stop the transaction scheduler and frame counter. No further transactions will be started and no SOF packets will be generated. If the ENSUSPM bit (bit 0 of POWER register) is set, the UTMI+ PHY will go into low-power mode when the controller goes into suspend mode.
- Sending Resume Signaling. When the application requires the controller to leave suspend mode, it needs to clear the SUSPENDM bit in the POWER register, set the RESUME bit and leave it set for 20ms. While the RESUME bit is high, the controller will generate Resume signaling on the bus. After 20 ms, the CPU should clear the RESUME bit, at which point the frame counter and transaction scheduler will be started.
- Responding to Remote Wake-up. If Resume signaling is detected from the target while the controller is in suspend mode, the UTMI+ PHY will be brought out of low-power mode and UTMI clock is restarted. The controller will then exit suspend mode and automatically set the RESUME bit in the POWER register (bit 2) to '1' to take over generating the Resume signaling from the target. If the resume interrupt is enabled, an interrupt will be generated.
- Reset Signaling. If the RESET bit in the POWER register (bit 3) is set while the controller is in Host mode, it will generate Reset signaling on the bus. If the HSENAB bit in the POWER register (bit 5) was set, it will also try to negotiate for high-speed operation. The software should keep the RESET bit set for at least 20 ms to ensure correct resetting of the target device. After the software has cleared the bit, the controller will start its frame counter and transaction scheduler. Whether high-speed operation is selected will be indicated by HSMODE bit of POWER register (bit 4).

### 16.3.8.2.1 Control Transactions: Host Mode

Host control transactions are conducted through Endpoint 0 and the software is required to handle all the Standard Device Requests that may be sent or received via Endpoint 0 (as described in Universal Serial Bus Specification, Revision 2.0). Endpoint 0 can only be serviced via CPU and DMA mode can not be used.

There are three categories of Standard Device Requests to be handled: Zero Data Requests (in which all the information is included in the command); Write Requests (in which the command will be followed by additional data); and Read Requests (in which the device is required to send data back to the host).

1. Zero Data Requests comprise a SETUP command followed by an IN Status Phase.
2. Write Requests comprise a SETUP command, followed by an OUT Data Phase which is in turn followed by an IN Status Phase.
3. Read Requests comprise a SETUP command, followed by an IN Data Phase which is in turn followed by an OUT Status Phase.

A timeout may be set to limit the length of time for which the host controller will retry a transaction which is continually NAKed by the target. This limit can be between 2 and 215 frames/microframes and is set through the NAKLIMIT0 register.

The following sections describe the actions that the CPU needs to take in issuing these different types of request through looking at the steps to take in the different phases of a control transaction.

**Note:** Before initiating any transactions as a Host, the FADDR register needs to be set to address the peripheral device. When the device is first connected, FADDR should be set to zero. After a SET\_ADDRESS command is issued, FADDR should be set the target's new address.

#### 16.3.8.2.1.1 Setup Phase of Control Transaction: Host Mode

For the SETUP Phase of a control transaction (Figure 16-8), the software driving the USB host device needs to:

1. Load the 8 bytes of the required Device request command into the Endpoint 0 FIFO
2. Set SETUPPKT and TXPKTRDY (bits 3 and 1 of HOST\_CSR0, respectively).

**NOTE:** These bits must be set together.

The controller then proceeds to send a SETUP token followed by the 8-byte command/request to Endpoint 0 of the addressed device, retrying as necessary. *Note:* On errors, the controller retries the transaction three times.

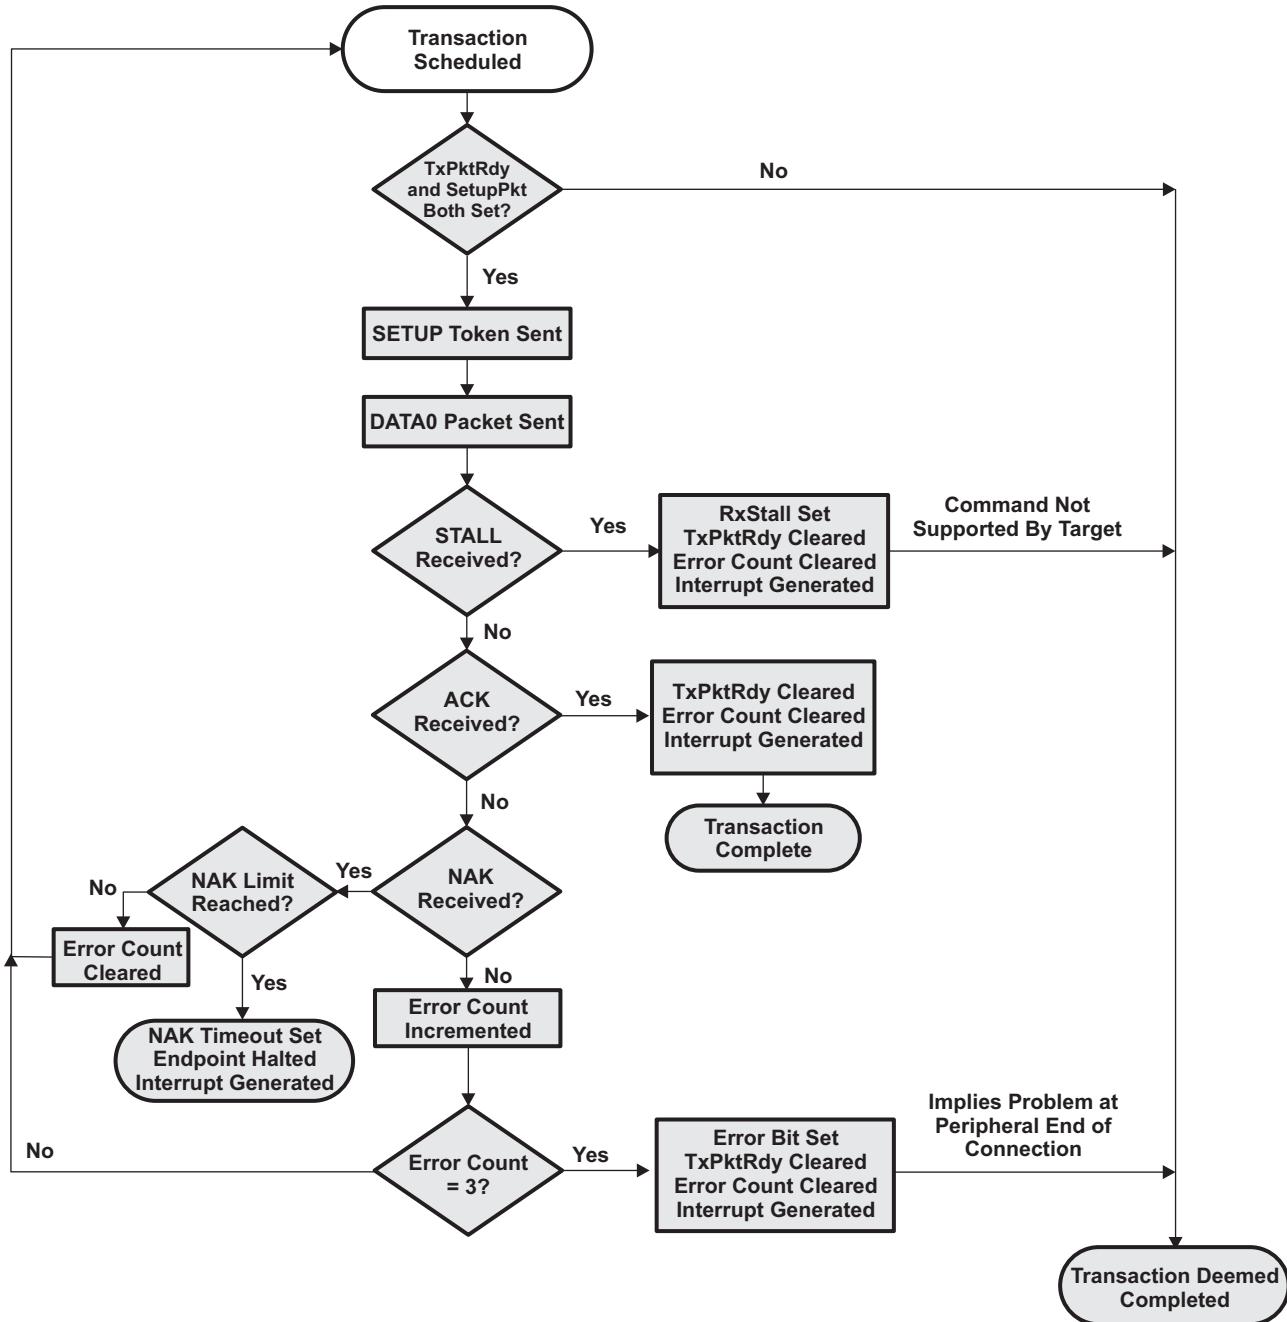

3. At the end of the attempt to send the 8-byte request data, the controller will generate an Endpoint 0 interrupt. The software should then read HOST\_CSR0 to establish whether the RXSTALL bit (bit 2), the ERROR bit (bit 4) or the NAK\_TIMEOUT bit (bit 7) has been set.

If RXSTALL is set, it indicates that the target did not accept the command (for example, because it is not supported by the target device) and so has issued a STALL response. If ERROR is set, it means that the controller has tried to send the SETUP Packet and the following data packet three times without getting any response.

If NAK\_TIMEOUT is set, it means that the controller has received a NAK response to each attempt to send the SETUP packet, for longer than the time set in HOST\_NAKLIMIT0. The controller can then be directed either to continue trying this transaction (until it times out again) by clearing the NAK\_TIMEOUT bit or to abort the transaction by flushing the FIFO before clearing the NAK\_TIMEOUT bit.

4. If none of RXSTALL, ERROR or NAK\_TIMEOUT is set, the SETUP Phase has been correctly ACKed and the software should proceed to the following IN Data Phase, OUT Data Phase or IN Status Phase specified for the particular Standard Device Request.

**Figure 16-8. Flow Chart of Setup Stage of a Control Transfer in Host Mode**

#### 16.3.8.2.1.2 Data Phase (IN Data Phase) of a Control Transaction: Host Mode

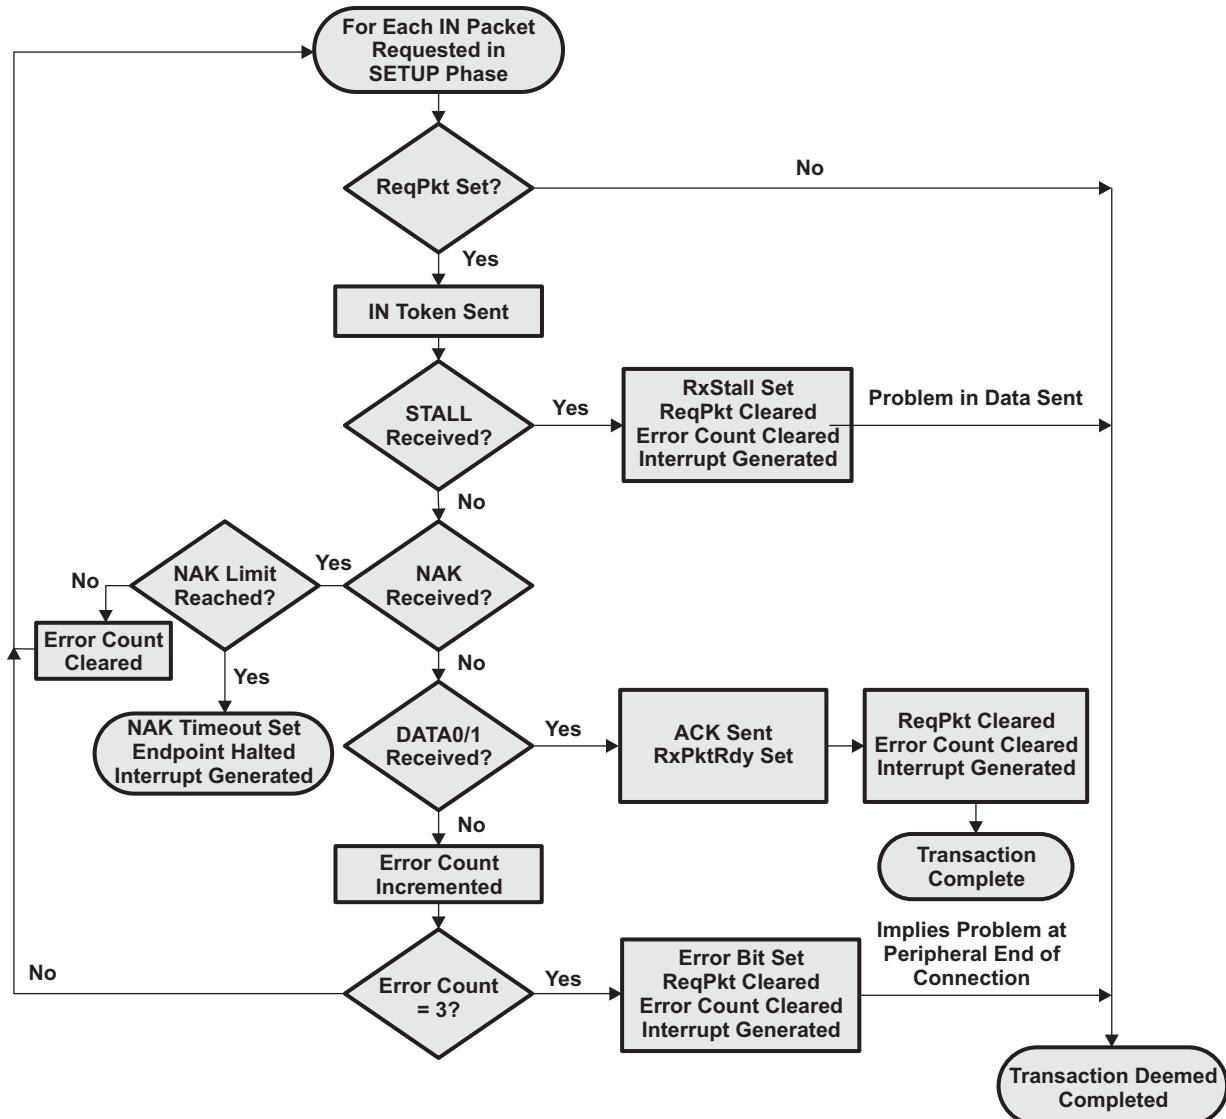

For the IN Data Phase of a control transaction (Figure 16-9), the software driving the USB host device needs to

1. Set REQPKT bit of HOST\_CSR0 (bit 5)
  2. Wait while the controller sends the IN token and receives the required data back.
  3. When the controller generates the Endpoint 0 interrupt, read HOST\_CSR0 to establish whether the RXSTALL bit (bit 2), the ERROR bit (bit 4), the NAK\_TIMEOUT bit (bit 7) or RXPKTRDY bit (bit 0) has been set.
- If RXSTALL is set, it indicates that the target has issued a STALL response.

- If ERROR is set, it means that the controller has tried to send the required IN token three times without getting any response. If NAK\_TIMEOUT bit is set, it means that the controller has received a NAK response to each attempt to send the IN token, for longer than the time set in HOST\_NAKLIMIT0. The controller can then be directed either to continue trying this transaction (until it times out again) by clearing the NAK\_TIMEOUT bit or to abort the transaction by clearing REQPKT before clearing the NAK\_TIMEOUT bit
4. If RXPKTRDY has been set, the software should read the data from the Endpoint 0 FIFO, then clear RXPKTRDY.
  5. If further data is expected, the software should repeat Steps 1-4.

When all the data has been successfully received, the CPU should proceed to the OUT Status Phase of the Control Transaction.

**Figure 16-9. Flow Chart of Data Stage (IN Data Phase) of a Control Transfer in Host Mode**

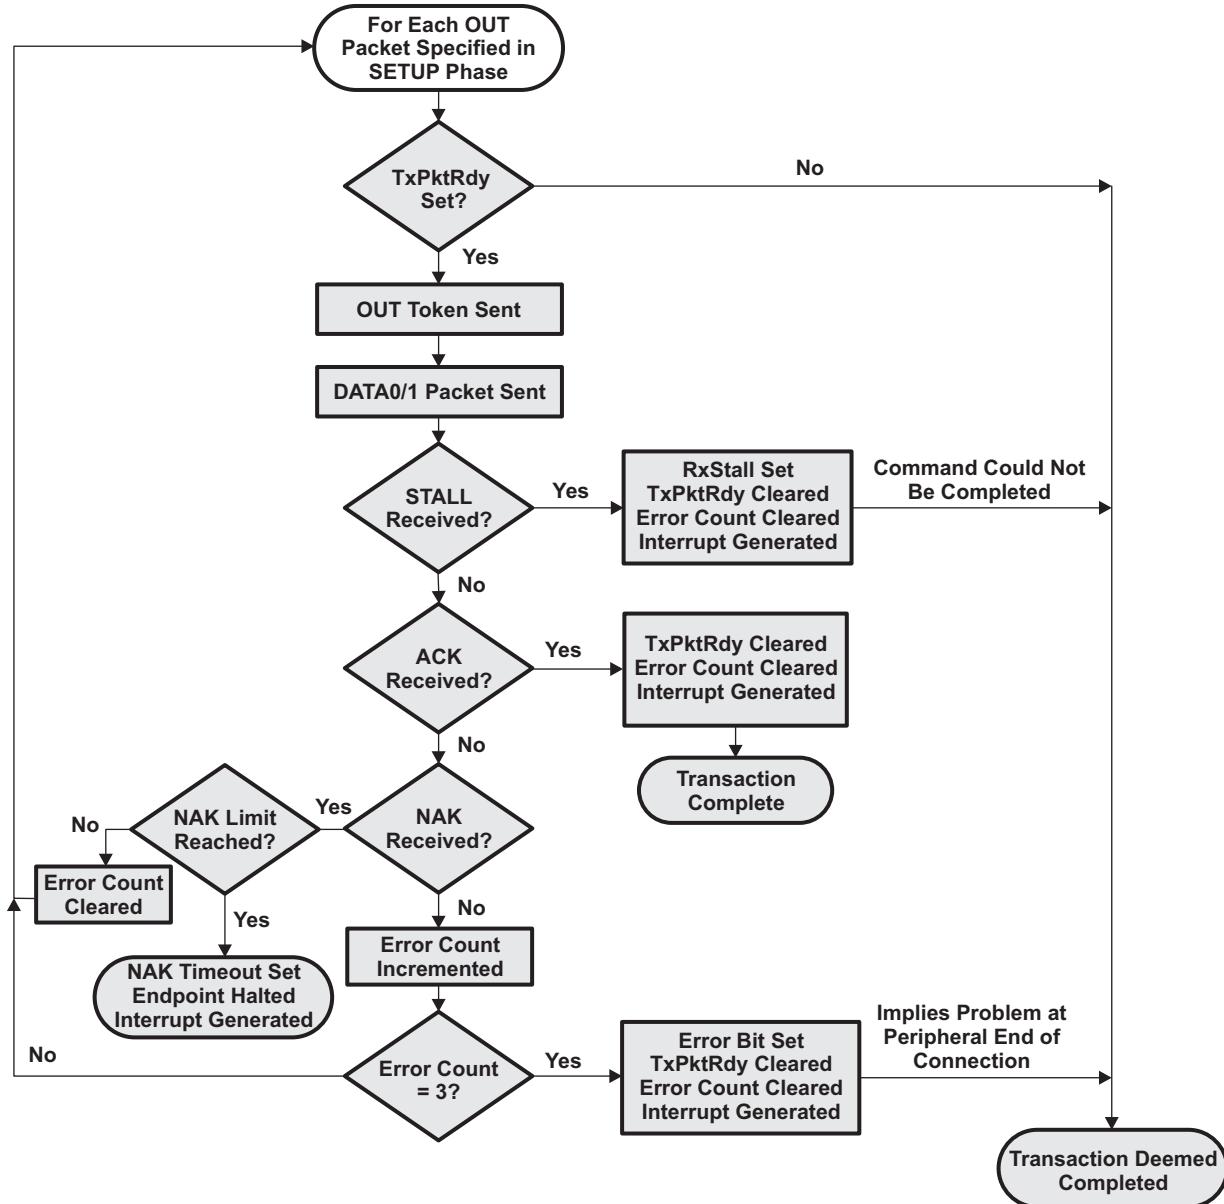

#### 16.3.8.2.1.3 Data Phase (OUT Data Phase) of a Control Transaction: Host Mode

For the OUT Data Phase of a control transaction (Figure 16-10), the software driving the USB host device needs to:

1. Load the data to be sent into the endpoint 0 FIFO.
2. Set the TXPKTRDY bit of HOST\_CSR0 (bit 1). The controller then proceeds to send an OUT token followed by the data from the FIFO to Endpoint 0 of the addressed device, retrying as necessary.
3. At the end of the attempt to send the data, the controller will generate an Endpoint 0 interrupt. The software should then read HOST\_CSR0 to establish whether the RXSTALL bit (bit 2), the ERROR bit (bit 4) or the NAK\_TIMEOUT bit (bit 7) has been set.  
If RXSTALL bit is set, it indicates that the target has issued a STALL response.  
If ERROR bit is set, it means that the controller has tried to send the OUT token and the following data packet three times without getting any response. If NAK\_TIMEOUT is set, it means that the controller has received a NAK response to each attempt to send the OUT token, for longer than the time set in the HOST\_NAKLIMIT0 register. The controller can then be directed either to continue trying this transaction (until it times out again) by clearing the NAK\_TIMEOUT bit or to abort the transaction by flushing the FIFO before clearing the NAK\_TIMEOUT bit.  
If none of RXSTALL, ERROR or NAKLIMIT is set, the OUT data has been correctly ACKed.
4. If further data needs to be sent, the software should repeat Steps 1-3.  
When all the data has been successfully sent, the software should proceed to the IN Status Phase of the Control Transaction.

**Figure 16-10. Flow Chart of Data Stage (OUT Data Phase) of a Control Transfer in Host Mode**

#### 16.3.8.2.1.4 Status Phase (Status for OUT Data Phase or Setup Phase) of a Control Transaction: Host Mode

IN Status Phase of a control transfer exists for a Zero Data Request or for a Write Request of a control transfer. The IN Status Phase follows the Setup Stage, if no Data Stage of a control transfer exists, or OUT Data Phase of a Data Stage of a control transfer.

For the IN Status Phase of a control transaction (Figure 16-11), the software driving the USB Host device needs to:

1. Set the STATUSPKT and REQPKT bits of HOST\_CSR0 (bit 6 and bit 5, respectively).
  2. Wait while the controller sends an IN token and receives a response from the USB peripheral device.
  3. When the controller generates the Endpoint 0 interrupt, read HOST\_CSR0 to establish whether the RXSTALL bit (bit 2), the ERROR bit (bit 4), the NAK\_TIMEOUT bit (bit 7) or RXPKTRDY bit (bit 0) has been set.
- If RXSTALL bit is set, it indicates that the target could not complete the command and so has issued a

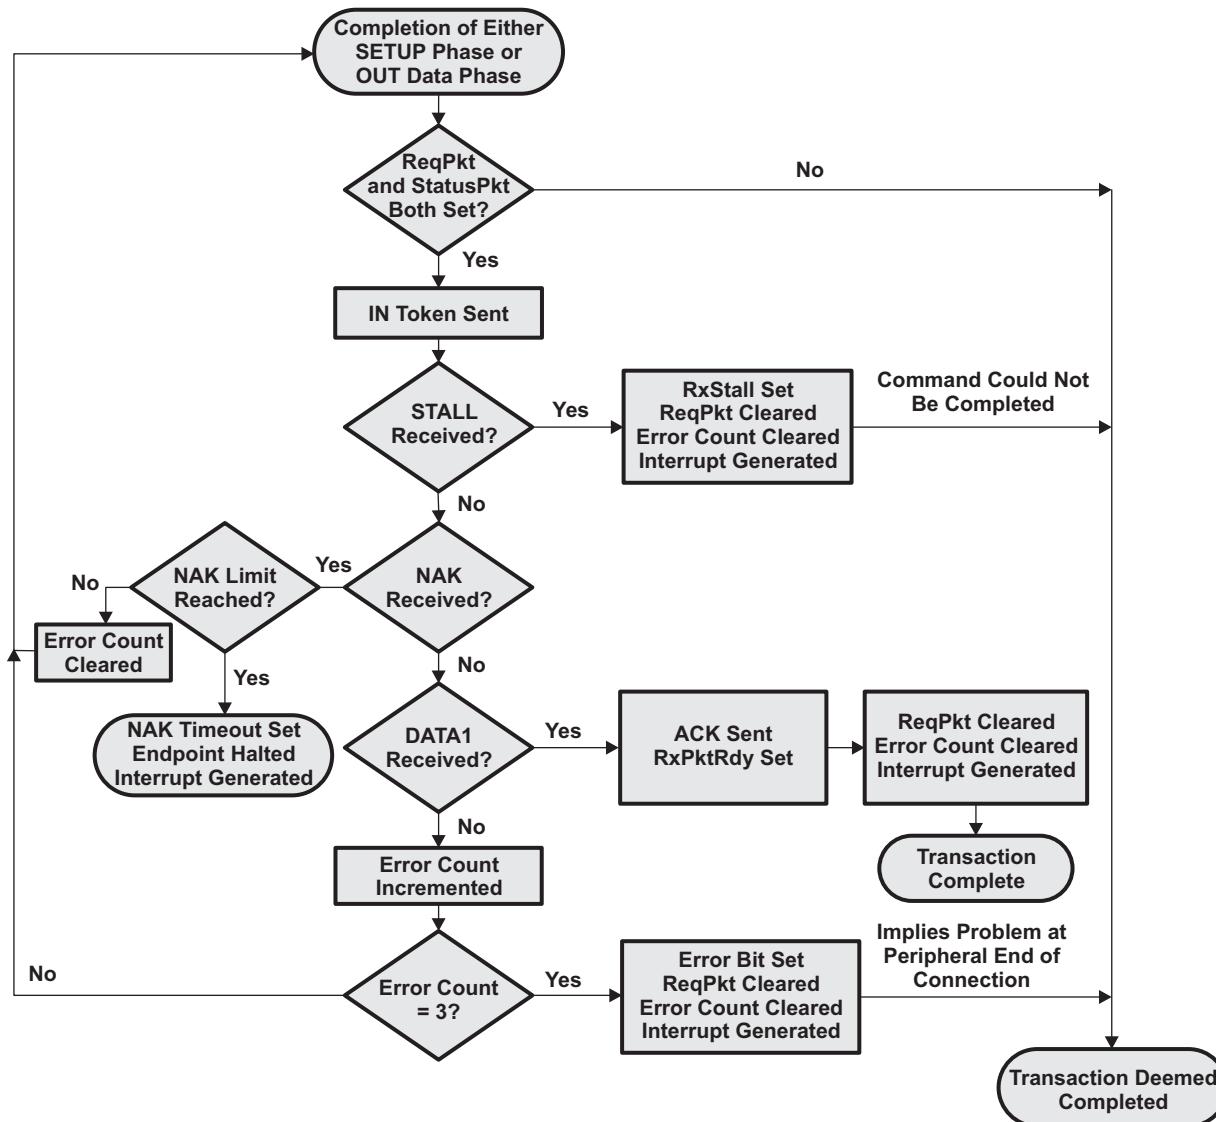

STALL response.

If ERROR bit is set, it means that the controller has tried to send the required IN token three times without getting any response.

If NAK\_TIMEOUT bit is set, it means that the controller has received a NAK response to each attempt to send the IN token, for longer than the time set in the HOST\_NAKLIMIT0 register. The controller can then be directed either to continue trying this transaction (until it times out again) by clearing the NAK\_TIMEOUT bit or to abort the transaction by clearing REQPKT bit and STATUSPKT bit before clearing the NAK\_TIMEOUT bit.

4. The CPU should clear the STATUSPPKT bit of HOST\_CSR0 together with (i.e., in the same write operation as) RxPktRdy if this has been set.

**Figure 16-11. Flow Chart of Status Stage of Zero Data Request or Write Request of a Control Transfer in Host Mode**

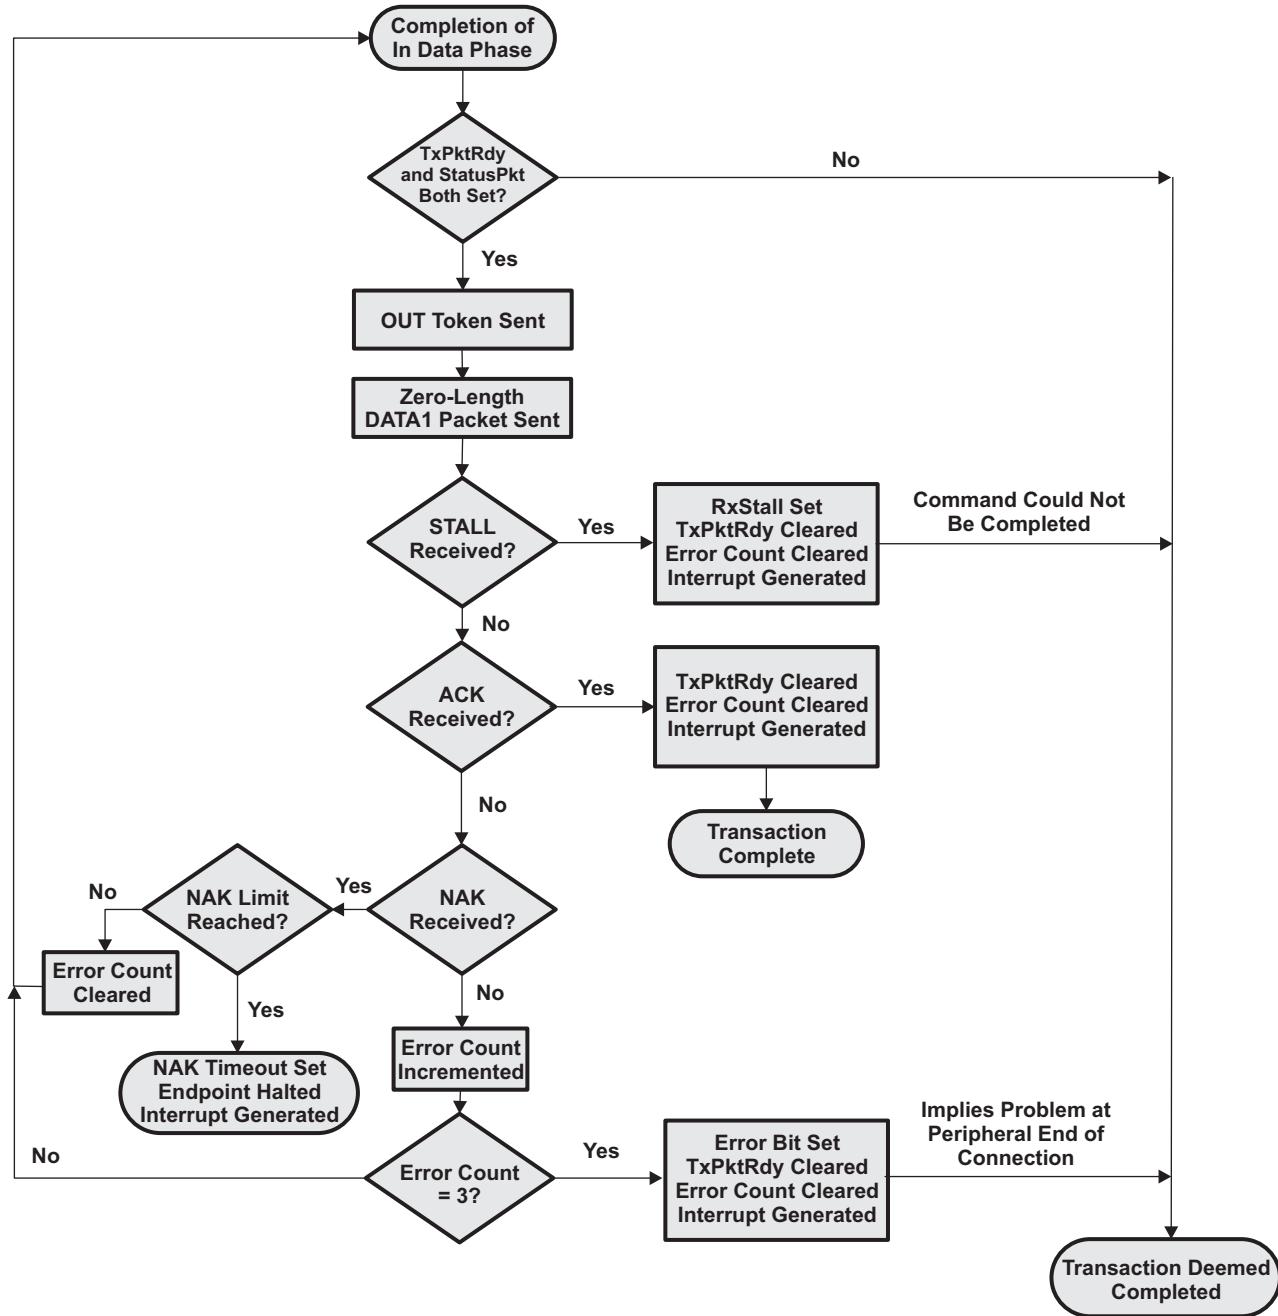

#### 16.3.8.2.1.5 Status Phase for a Read Request of a Control Transaction: Host Mode

OUT Status Phase of a control transfer exist for a Read Request or a control transfer where data was received by the host controller. The OUT Status phase follows the IN Data Stage of a control transfer.

For the OUT Status Phase of a control transaction (Figure 16-12), the CPU driving the host device needs to:

1. Set STATUSPKT and TXPKTRDY bits of HOST\_CSR0 (bit 6 and bit 1, respectively).  
NOTE: These bits need to be set together
2. Wait while the controller sends the OUT token and a zero-length DATA1 packet.
3. At the end of the attempt to send the data, the controller will generate an Endpoint 0 interrupt. The software should then read HOST\_CSR0 to establish whether the RXSTALL bit (bit 2), the ERROR bit (bit 4) or the NAK\_TIMEOUT bit (bit 7) has been set.  
If RXSTALL bit is set, it indicates that the target could not complete the command and so has issued a STALL response.  
If ERROR bit is set, it means that the controller has tried to send the STATUS Packet and the following data packet three times without getting any response.  
If NAK\_TIMEOUT bit is set, it means that the controller has received a NAK response to each attempt to send the IN token, for longer than the time set in the HOST\_NAKLIMIT0 register. The controller can then be directed either to continue trying this transaction (until it times out again) by clearing the NAK\_TIMEOUT bit or to abort the transaction by flushing the FIFO before clearing the NAK\_TIMEOUT bit.
4. If none of RXSTALL, ERROR or NAK\_TIMEOUT bits is set, the STATUS Phase has been correctly ACKed.

**Figure 16-12. Chart of Status Stage of a Read Request of a Control Transfer in Host Mode**

### 16.3.8.2.2 Bulk Transfer: Host Mode

Bulk transactions are handled by endpoints other than endpoint 0. It is used to handle non-periodic, large bursty communication typically used for a transfer that use any available bandwidth and can also be delayed until bandwidth is available.

#### 16.3.8.2.2.1 Bulk IN Transactions: Host Mode

A Bulk IN transaction may be used to transfer non-periodic data from the external USB peripheral to the host.

The following optional features are available for use with an Rx endpoint used in host mode to receive the data:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO on reception from the host. This allows that one packet can be received while another is being read. Double packet buffering is enabled by setting the DPB bit of RXFIFOSZ register (bit 4).
- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint has a packet in its FIFO. This feature can be used to allow the DMA controller to unload packets from the FIFO without processor intervention.

When DMA is enabled, endpoint interrupt will not be generated for completion of packet reception. Endpoint interrupt will be generated only in the error conditions. For more information see section on CPPI DMA

#### **16.3.8.2.2.1.1 Bulk IN Setup: Host Mode**

Before initiating any Bulk IN Transactions in Host mode:

- The HOST\_RXTYPE register for the endpoint that is to be used needs to be programmed as:
  - Operating speed in the SPEED bit field (bits 7 and 6).
  - Set 10 (binary value) in the PROT field for bulk transfer.
  - Endpoint Number of the target device in RENDPN field. This is the endpoint number contained in the Rx endpoint descriptor returned by the target device during enumeration.
- The RXMAXP register for the controller endpoint must be written with the maximum packet size (in bytes) for the transfer. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the target endpoint.
- The HOST\_RXINTERVAL register needs to be written with the required value for the NAK limit (2-215 frames/microframes), or set to zero if the NAK timeout feature is not required.
- The relevant interrupt enable bit in the INTRRXE register should be set (if an interrupt is required for this endpoint).

**Note:** Whether interrupt is handled from PDR level or Core level, interrupt is required to be enabled at the core level. See details on Core Interrupt registers, CTRLR register, and sections on Interrupt Handling

- The AUTOREQ bit field should be used only when servicing transfers using CPU mode and must be cleared when using DMA Mode. For DMA Mode, dedicated registers USB0/1 Req Registers exist and the HOST\_RXCSR[AUTOREQ] should be cleared.

When DMA is enabled, the following bits of HOST\_RXCSR register should be set as:

- Clear AUTOCLEAR.
- Set DMAEN (bit 13) to 1 if a DMA request is required for this endpoint.
- Clear DSINYET (bit 12) to 0 to allow normal PING flow control. This will affect only High Speed transactions.
- Clear DMAMODE (bit 11) to 0.

**Note:** If DMA is enabled, the USB0/1 Auto Req register can be set for generating IN tokens automatically after receiving the data. Set the bit field RXn\_AUTOREQ (where n is the endpoint number) with binary value 01 or 11.

When the endpoint is first configured, the endpoint data toggle should be cleared to 0 either by using the DATATOGWREN and DATATOG bits of HOST\_RXCSR (bit 10 and bit 9) to toggle the current setting or by setting the CLRDATATOG bit of HOST\_RXCSR (bit 7). This will ensure that the data toggle (which is handled automatically by the controller) starts in the correct state. Also if there are any data packets in the FIFO (indicated by the RXPKTRDY bit (bit 0 of HOST\_RXCSR) being set), they should be flushed by setting the FLUSHFIFO bit of HOST\_RXCSR (bit 4).

**NOTE:** It may be necessary to set this bit twice in succession if double buffering is enabled.

#### 16.3.8.2.2.1.2 Bulk IN Operation: Host Mode

When Bulk data is required from the USB peripheral device, the software should set the REQPKT bit in the corresponding HOST\_RXCSR register (bit 5). The controller will then send an IN token to the selected peripheral endpoint and waits for data to be returned.

If data is correctly received, RXPKTRDY bit of HOST\_RXCSR (bit 0) is set. If the USB peripheral device responds with a STALL, RXSTALL bit (bit 6 of HOST\_RXCSR) is set. If a NAK is received, the controller tries again and continues to try until either the transaction is successful or the POLINTVL\_NAKLIMIT set in the HOST\_RXINTERVAL register is reached. If no response at all is received, two further attempts are made before the controller reports an error by setting the ERROR bit of HOST\_RXCSR (bit 2).

The controller then generates the appropriate endpoint interrupt, whereupon the software should read the corresponding HOST\_RXCSR register to determine whether the RXPKTRDY, RXSTALL, ERROR or DATAERR\_NAKTIMEOUT bit is set and act accordingly. If the DATAERR\_NAKTIMEOUT bit is set, the controller can be directed either to continue trying this transaction (until it times out again) by clearing the DATAERR\_NAKTIMEOUT bit or to abort the transaction by clearing REQPKT bit before clearing the DATAERR\_NAKTIMEOUT bit.

The packets received should not exceed the size specified in the RXMAXP register (as this should be the value set in the wMaxPacketSize field of the endpoint descriptor sent to the host).

In the general case, the application software (if CPU is servicing the endpoint) will need to read each packet from the FIFO individually. If large blocks of data are being transferred, the overhead of calling an interrupt service routine to unload each packet can be avoided by using DMA.

**Note:** When using DMA, see [Section 16.3.9, Communications Port Programming Interface \(CPPI\) 4.1 DMA](#), for the proper configuration of the core register, HOST\_RXCSR.

#### 16.3.8.2.2.1.3 Bulk IN Error Handling: Host Mode

If the target wants to shut down the Bulk IN pipe, it will send a STALL response to the IN token. This will result in the RXSTALL bit of HOST\_RXCSR (bit 6) being set.

#### 16.3.8.2.2.2 Bulk OUT Transactions: Host Mode

A Bulk OUT transaction may be used to transfer non-periodic data from the host to the USB peripheral.

Following optional features are available for use with a Tx endpoint used in Host mode to transmit this data:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO awaiting transmission to the peripheral device. Double packet buffering is enabled by setting the DPB bit of TXFIFOSZ register (bit 4).
- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint is able to accept another packet in its FIFO. This feature can be used to allow the DMA controller to load packets into the FIFO without processor intervention. For more information on using DMA, consult the section discussing CPPI DMA.

When DMA is enabled and DMAMODE bit in HOST\_TXCSR register is set, an endpoint interrupt will not be generated for completion of packet reception. An endpoint interrupt will be generated only in the error conditions.

### 16.3.8.2.2.2.1 Bulk OUT Setup: Host Mode

Before initiating any bulk OUT transactions:

- The target function address needs to be set in the TXFUNCADDR register for the selected controller endpoint. (TXFUNCADDR register is available for all endpoints from EP0 to EP15.)
- The HOST\_TXTYPE register for the endpoint that is to be used needs to be programmed as:
  - Operating speed in the SPEED bit field (bits 7 and 6).
  - Set PROT field to 10b for bulk transfer.
  - Enter Endpoint Number of the target device in TENDPN field. This is the endpoint number contained in the OUT(Tx) endpoint descriptor returned by the target device during enumeration.
- The TXMAXP register for the controller endpoint must be written with the maximum packet size (in bytes) for the transfer. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the target endpoint.
- The HOST\_TXINTERVAL register needs to be written with the required value for the NAK limit (2-215 frames/microframes), or set to zero if the NAK timeout feature is not required.
- The relevant interrupt enable bit in the INTRTXE register should be set (if an interrupt is required for this endpoint).
- The following bits of HOST\_TXCSR register should be set as:
  - Set the MODE bit (bit 13) to 1 to ensure the FIFO is enabled (only necessary if the FIFO is shared with an Rx endpoint).
  - Clear the FRCDATATOG bit (bit 11) to 0 to allow normal data toggle operations.
  - Clear/Set AUTOSET bit (bit 15). The setting of this bit depends on the desire of the user/application in automatically setting the TXPKTRDY bit when servicing transactions using CPU.

**Note:** If DMA is needed to be used in place of the CPU, the following table displays the setting of the core register HOST\_TXCSR register in Host mode. For the CPPI DMA registers settings consult the section on CPPI DMA within this document.

| Bit Field | Bit Name   | Description  |
|-----------|------------|--|
| Bit 15    | AUTOSET    | Cleared to 0 if using DMA. For CPU Mode use, if AUTOSET bit is set, the TXPKTRDY bit will be automatically set when data of the maximum packet size is loaded into the FIFO. |
| Bit 14    | ISO        | Cleared to 0 for bulk mode operation.  |
| Bit 13    | MODE       | Set to 1 to make sure the FIFO is enabled (only necessary if the FIFO is shared with an RX endpoint)   |
| Bit 12    | DMAEN      | Set to 1 to enable DMA usage; not needed if CPU is being used to service the Tx Endpoint   |
| Bit 11    | FRCDATATOG | Cleared to 0 to allow normal data toggle operations.   |
| Bit 10    | DMAMODE    | Set to 1 when DMA is used to service Tx FIFO.  |

When the endpoint is first configured, the endpoint data toggle should be cleared to 0 either by using the DATATOGWREN bit and DATATOG bit of HOST\_TXCSR (bit 9 and bit 8) to toggle the current setting or by setting the CLRDATATOG bit of HOST\_TXCSR (bit 6). This will ensure that the data toggle (which is handled automatically by the controller) starts in the correct state. Also, if there are any data packets in the FIFO (indicated by the FIFONOTEMPTY bit of HOST\_TXCSR register (bit 1) being set), they should be flushed by setting the FLUSHFIFO bit (bit 3 of HOST\_TXCSR).

**NOTE:** It may be necessary to set this bit twice in succession if double buffering is enabled.

#### 16.3.8.2.2.2.2 Bulk OUT Operation: Host Mode

When Bulk data is required to be sent to the USB peripheral device, the software should write the first packet of the data to the FIFO (or two packets if double-buffered) and set the TXPKTRDY bit in the corresponding HOST\_TXCSR register (bit 0). The controller will then send an OUT token to the selected peripheral endpoint, followed by the first data packet from the FIFO.

If data is correctly received by the peripheral device, an ACK should be received whereupon the controller will clear TXPKTRDY bit of HOST\_TXCSR (bit 0). If the USB peripheral device responds with a STALL, the RXSTALL bit (bit 5) of HOST\_TXCSR is set. If a NAK is received, the controller tries again and continues to try until either the transaction is successful or the NAK limit set in the HOST\_RXINTERVAL register is reached. If no response at all is received, two further attempts are made before the controller reports an error by setting ERROR bit in HOST\_TXCSR (bit 2).

The controller then generates the appropriate endpoint interrupt, whereupon the software should read the corresponding HOST\_TXCSR register to determine whether the RXSTALL (bit 5), ERROR (bit 2) or NAK\_TIMEOUT (bit 7) bit is set and act accordingly. If the NAK\_TIMEOUT bit is set, the controller can be directed either to continue trying this transaction (until it times out again) by clearing the NAK\_TIMEOUT bit or to abort the transaction by flushing the FIFO before clearing the NAK\_TIMEOUT bit.

If large blocks of data are being transferred, then the overhead of calling an interrupt service routine to load each packet can be avoided by using DMA.

#### 16.3.8.2.2.2.3 Bulk OUT Error Handling: Host Mode

If the target wants to shut down the Bulk OUT pipe, it will send a STALL response. This is indicated by the RXSTALL bit of HOST\_TXCSR register (bit 5) being set.

#### 16.3.8.2.3 Interrupt Transfer: Host Mode

When the controller is operating as the host, interactions with an Interrupt endpoint on the USB peripheral device are handled in very much the same way as the equivalent Bulk transactions (described in previous sections).

The principal difference as far as operational steps are concerned is that the PROT field of HOST\_RXTYPE and HOST\_TXTYPE (bits 5-4) need to be set (binary value) to represent an Interrupt transaction. The required polling interval also needs to be set in the HOST\_RXINTERVAL and HOST\_TXINTERVAL registers.

#### 16.3.8.2.4 Isochronous Transfer: Host Mode

Isochronous transfers are used when working with isochronous data. Isochronous transfers provide periodic, continuous communication between host and device.

An Isochronous IN transaction is used to transfer periodic data from the USB peripheral to the host.

##### 16.3.8.2.4.1 Isochronous IN Transactions: Host Mode

The following optional features are available for use with an Rx endpoint used in Host mode to receive this data:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO on reception from the host. This allows that one packet can be received while another is being read. Double packet buffering is enabled by setting the DPB bit of RXFIFOSZ register (bit 4).
- AutoRequest: When the AutoRequest feature is enabled, the REQPKT bit of HOST\_RXCSR (bit 5) will be automatically set when the RXPKTRDY bit is cleared. This only applies when the CPU is being used to service the endpoint. When using DMA, this bit field needs to be cleared to Zero. CPPI DMA has its own configuration registers that renders a similar task, USB0/1 Auto Req registers, that needs to be used to have a similar effect. For more information, see [Section 16.3.9, Communications Port Programming Interface \(CPPI\) 4.1 DMA](#).
- DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint has a packet in its FIFO. This feature can be used to allow the DMA controller to unload packets from the FIFO without processor intervention. However, this feature is not particularly useful with isochronous

endpoints because the packets transferred are often not maximum packet size.

- When DMA is enabled, endpoint interrupt will not be generated for completion of packet reception. Endpoint interrupt will be generated only in the error conditions.

#### **16.3.8.2.4.1.1 Isochronous IN Transfer Setup: Host**

Before initiating an Isochronous IN Transactions in Host mode:

- The target function address needs to be set in the RXFUNCADDR register for the selected controller endpoint (RXFUNCADDR register is available for all endpoints from EP0 to EP4).
- The HOST\_RXTYPE register for the endpoint that is to be used needs to be programmed as:
  - Operating speed in the SPEED bit field (bits 7 and 6).
  - Set 01 (binary value) in the PROT field for isochronous transfer.
  - Endpoint Number of the target device in RENDPN field. This is the endpoint number contained in the Rx endpoint descriptor returned by the target device during enumeration.
- The RXMAXP register for the controller endpoint must be written with the maximum packet size (in bytes) for the transfer. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the target endpoint.
- The HOST\_RXINTERVAL register needs to be written with the required transaction interval (usually one transaction per frame/microframe).
- The relevant interrupt enable bit in the INTRRXE register should be set (if an interrupt is required for this endpoint).
- The following bits of HOST\_RXCSR register should be set as:
  - Clear AUTOCLEAR
  - Set the DMAEN bit (bit 13) to 1 if a DMA request is required for this endpoint.
  - Clear the DISNYET it (bit 12) to 0 to allow normal PING flow control. This will only affect High Speed transactions.
  - Clear DMAMODE bit (bit 11) to 0.
- If DMA is enabled, AUTOREQ register can be set for generating IN tokens automatically after receiving the data. Set the bit field RXn\_AUTOREQ (where n is the endpoint number) with binary value 01 or 11. For detailed information on using CPPI DMA, consult related section within this document.

#### **16.3.8.2.4.1.2 Isochronous IN Operation: Host Mode**

The operation starts with the software setting REQPKT bit of HOST\_RXCSR (bit 5). This causes the controller to send an IN token to the target.

When a packet is received, an interrupt is generated which the software may use to unload the packet from the FIFO and clear the RXPKTRDY bit in the HOST\_RXCSR register (bit 0) in the same way as for a Bulk Rx endpoint. As the interrupt could occur almost any time within a frame(/microframe), the timing of FIFO unload requests will probably be irregular. If the data sink for the endpoint is going to some external hardware, it may be better to minimize the requirement for additional buffering by waiting until the end of each frame before unloading the FIFO. This can be done by using the SOF\_PULSE signal from the controller to trigger the unloading of the data packet. The SOF\_PULSE is generated once per frame(/microframe). The interrupts may still be used to clear the RXPKTRDY bit in HOST\_RXCSR.

#### **16.3.8.2.4.1.3 Isochronous IN Error Handling: Host Mode**

If a CRC or bit-stuff error occurs during the reception of a packet, the packet will still be stored in the FIFO but the DATAERR\_NAKTIMEOUT bit of HOST\_RXCSR (bit 3) is set to indicate that the data may be corrupt.

**Note:** The number of USB packets sent in any microframe will depend on the amount of data to be transferred, and is indicated through the PIDs used for the individual packets. If the indicated numbers of packets have not been received by the end of a microframe, the INCOMPRX bit in the HOST\_RXCSR register will be set to indicate that the data in the FIFO is incomplete. Equally, if a packet of the wrong data type is received, then the PID Error bit is the HOST\_RXCSR register will be set. In each case, an interrupt will, however, still be generated to allow the data that has been received to be read from the FIFO.

#### 16.3.8.2.4.2 Isochronous OUT Transactions: Host Mode

An Isochronous OUT transaction may be used to transfer periodic data from the host to the USB peripheral.

Following optional features are available for use with a Tx endpoint used in Host mode to transmit this data:

- Double packet buffering: When enabled, up to two packets can be stored in the FIFO awaiting transmission to the peripheral device. Double packet buffering is enabled by setting the DPB bit of TXFIFOSZ register (bit 4).

DMA: If DMA is enabled for the endpoint, a DMA request will be generated whenever the endpoint is able to accept another packet in its FIFO. This feature can be used to allow the DMA controller to load packets into the FIFO without processor intervention.

However, this feature is not particularly useful with isochronous endpoints because the packets transferred are often not maximum packet size.

When DMA is enabled and endpoint interrupt will not be generated for completion of packet reception. Endpoint interrupt will be generated only in the error conditions.

#### 16.3.8.2.4.2.1 Isochronous OUT Transfer Setup: Host Mode

Before initiating any Isochronous OUT transactions:

- The target function address needs to be set in the TXFUNCADDR register for the selected controller endpoint (TXFUNCADDR register is available for all endpoints from EP0 to EP4).
  - The HOST\_TXTYPE register for the endpoint that is to be used needs to be programmed as:
    - Operating speed in the SPEED bit field (bits 7 and 6).
    - Set 01 (binary value) in the PROT field for isochronous transfer.
    - Endpoint Number of the target device in TENDPN field. This is the endpoint number contained in the OUT(Tx) endpoint descriptor returned by the target device during enumeration.
  - The TXMAXP register for the controller endpoint must be written with the maximum packet size (in bytes) for the transfer. This value should be the same as the wMaxPacketSize field of the Standard Endpoint Descriptor for the target endpoint.
  - The HOST\_TXINTERVAL register needs to be written with the required transaction interval (usually one transaction per frame/microframe).
  - The relevant interrupt enable bit in the INTRTXE register should be set (if an interrupt is required for this endpoint).
  - The following bits of HOST\_TXCSR register should be set as:
    - Set the MODE bit (bit 13) to 1 to ensure the FIFO is enabled (only necessary if the FIFO is shared with an Rx endpoint).
    - Set the DMAEN bit (bit 12) to 1 if a DMA request is required for this endpoint
    - The FRCDATATOG bit (bit 11) is ignored for isochronous transactions.
    - Set the DMAMODE bit (bit 10) to 1 when DMA is enabled.
- For more details in using DMA, consult CPPI DMA section within this document.

#### 16.3.8.2.4.2.2 Isochronous OUT Transfer Operation: Host Mode

The operation starts when the software writes to the FIFO and sets TXPKTRDY bit of HOST\_TXCSR (bit 0). This triggers the controller to send an OUT token followed by the first data packet from the FIFO.

An interrupt is generated whenever a packet is sent and the software may use this interrupt to load the next packet into the FIFO and set the TXPKTRDY bit in the HOST\_TXCSR register (bit 0) in the same way as for a Bulk Tx endpoint. As the interrupt could occur almost any time within a frame, depending on when the host has scheduled the transaction, this may result in irregular timing of FIFO load requests. If the data source for the endpoint is coming from some external hardware, it may be more convenient to wait until the end of each frame before loading the FIFO as this will minimize the requirement for additional buffering. This can be done by using the SOF\_PULSE signal from the controller to trigger the loading of the next data packet. The SOF\_PULSE is generated once per frame(/microframe). The interrupts may still be used to set the TXPKTRDY bit in HOST\_TXCSR.

### 16.3.9 Communications Port Programming Interface (CPPI) 4.1 DMA

The CPPI DMA module supports the transmission and reception of USB packets. The CPPI DMA is designed to facilitate the segmentation and reassembly of CPPI compliant packets to/from smaller data blocks that are natively compatible with the specific requirements of each networking port. Multiple Tx and Rx channels are provided for all endpoints (excluding endpoint 0) within the DMA allowing multiple segmentation or reassembly operations to be effectively performed in parallel (but not actually simultaneously). The DMA controller maintains state information for each of the ports/channels which allows packet segmentation and reassembly operations to be time division multiplexed between channels in order to share the underlying DMA hardware. A DMA scheduler is used to control the ordering and rate at which this multiplexing occurs.

The CPPI (version 4.1) DMA controller sub-module is a common 15 port DMA controller. It supports 15 Tx and 15 Rx channels and each port attaches to the associated endpoint in the controller. Port 1 maps to endpoint 1 and Port 2 maps to endpoint 2 and so on with Port 15 mapped to endpoint 15; endpoint 0 can not utilize the DMA and the firmware is responsible to load or offload the endpoint 0 FIFO via CPU.

#### 16.3.9.1 CPPI Terminology

**Host** — The host is an intelligent system resource that configures and manages each communications control module. The host is responsible for allocating memory, initializing all data structures, and responding to port interrupts.

**Main Memory** — The area of data storage managed by the CPU. The CPPI DMA (CDMA) reads and writes CPPI packets from and to main memory. This memory can exist internal or external from the device.

**Queue Manager (QM)** — The QM is responsible for accelerating management of a variety of Packet Queues and Free Descriptor / Buffer Queues. It provides status indications to the CDMA Scheduler when queues are empty or full.

**CPPI DMA (CDMA)** — The CDMA is responsible for transferring data between the CPPI FIFO and Main Memory. It acquires free Buffer Descriptor from the QM (Receive Submit Queue) for storage of received data, posts received packets pointers to the Receive Completion Queue, transmits packets stored on the Transmit Submit Queue (Transmit Queue), and posts completed transmit packets to the Transmit Completion Queue.

**CDMA Scheduler (CDMAS)** — The CDMAS is responsible for scheduling CDMA transmit and receive operations. It uses Queue Indicators from the QM and the CDMA to determine the types of operations to schedule.

**CPPI FIFO** — The CPPI FIFO provides FIFO interfaces (for each of the 15 transmit and 15 receive endpoints).

**Transfer DMA (XDMA)** — The XDMA receives DMA requests from the Mentor USB 2.0 Core and initiates DMAs to the CPPI FIFO.

**Endpoint FIFOs** — The Endpoint FIFOs are the USB packet storage elements used by the Mentor USB 2.0 Core for packet transmission or reception. The XDMA transfers data between the CPPI FIFO and the Endpoint FIFOs for transmit operations and between the Endpoint FIFOs and the CPPI FIFO for receive operations.

**Port** — A port is the communications module (peripheral hardware) that contains the control logic for Direct Memory Access for a single transmit/receive interface or set of interfaces. Each port may have multiple communication channels that transfer data using homogenous or heterogeneous protocols. A port is usually subdivided into transmit and receive pairs which are independent of each other. Each endpoint, excluding endpoint 0, has its own dedicated port.

**Channel** — A channel refers to the sub-division of information (flows) that is transported across ports. Each channel has associated state information. Channels are used to segregate information flows based on the protocol used, scheduling requirements (example: CBR, VBR, ABR), or concurrency requirements (that is, blocking avoidance). All fifteen ports per USB Module have dedicated single channels, channel 0, associated for their use in a USB application.

**Data Buffer** — A data buffer is a single data structure that contains payload information for transmission to or reception from a port. A data buffer is a byte aligned contiguous block of memory used to store packet payload data. A data buffer may hold any portion of a packet and may be linked together (via descriptors) with other buffers to form packets. Data buffers may be allocated anywhere within the 32-bit memory space. The Buffer Length field of the packet descriptor indicates the number of valid data bytes in the buffer. There may be from 1 to 4M-1 valid data bytes in each buffer.

**Host Buffer Descriptor (Buffer Descriptor)** — A buffer descriptor is a single data structure that contains information about one or more data buffers. This type of descriptor is required when more than one descriptor is needed to define an entire packet, i.e., it either defines the middle of a packet or end of a packet.

**Start of Packet (SOP)** — Packet along side Buffer Descriptors are used to hold information about Packets. When multiple Descriptors are used to hold a single packet information or a single Descriptor is used to hold a single packet information, the first descriptor is referred to as a Packet Descriptor which is also Start-of-Packet Descriptor.

**Host Packet Descriptor (Packet Descriptor)** — A packet descriptor is another name for the first buffer descriptor within a packet. Some fields within a data buffer descriptor are only valid when it is a packet descriptor including the tags, packet length, packet type, and flags. This type of descriptor is always used to define a packet since it provides packet level information that is useful to both the ports and the Host in order to properly process the packet. It is the only descriptor used when single descriptor solely defines a packet. When multiple descriptors are needed to define a packet, the packet descriptor is the first descriptor used to define a packet.

**Free Descriptor/Buffer Queue** — A free descriptor/buffer queue is a hardware managed list of available descriptors with pre-linked empty buffers that are to be used by the receive ports for host type descriptors. Free Descriptor/Buffer Queues are implemented by the Queue Manager.

**Teardown Descriptor** — Teardown Descriptor is a special structure which is not used to describe either a packet or a buffer but is instead used to describe the completion of a channel halt and teardown event. Channel teardown is an important function because it ensures that when a connection is no longer needed that the hardware can be reliably halted and any remaining packets which had not yet been transmitted can be reclaimed by the Host without the possibility of losing buffer or descriptor references (which results in a memory leak).

**Packet Queue** — A packet queue is hardware managed list of valid (i.e. populated) packet descriptors that is used for forwarding a packet from one entity to another for any number of purposes.

**NOTE:** All descriptors (regardless of type) must be allocated at addresses that are naturally aligned to the smallest power of 2 that is equal to or greater than the descriptor size.

### 16.3.9.2 Data Structures

Two data structures are mainly used to identify data buffers used by packet and buffer descriptors. A third Descriptor, Teardown Descriptor, exists. The purpose of this Descriptor is a channel halt and teardown event. Each of these Descriptor layouts as well as bit fields are shown below.

#### 16.3.9.2.1 Host Packet Descriptor/ Packet Descriptor (SOP Descriptor)

Descriptors are designed to be used when USB like application requires support for true, unlimited fragment count scatter/gather type operations. The Packet Descriptor is the first descriptor on multiple descriptors setup or the only descriptor in a single descriptors setup. The Packet Descriptor contains the following information:

- Indicator which identifies the descriptor as a packet descriptor (always 10h)
- Source and destination tags (reserved)
- Packet type
- Packet length
- Protocol specific region size
- Protocol specific control/statusbits
- Pointer to the first valid byte in the SOP data buffer

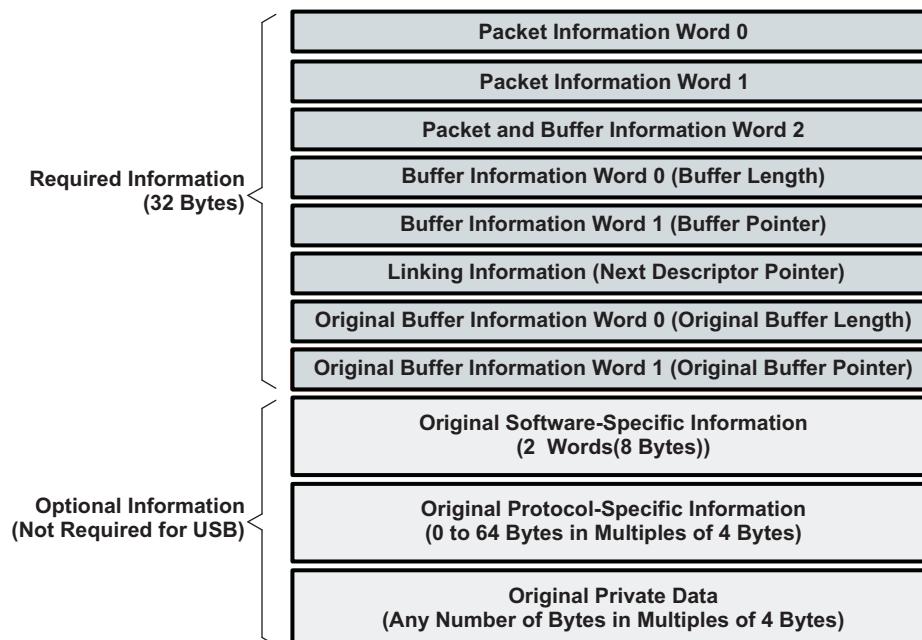

- Length of the SOP data buffer
- Pointer to the next buffer descriptor in the

Packet descriptors can vary in size by design of their defined fields from 32 bytes up to 104 bytes. Within this range, packet descriptors always contain 32 bytes of required information and may also contain 8 bytes of software specific tagging information and up to 64 bytes (indicated in 4 byte increments) of protocol specific information. How much protocol specific information (and therefore the allocated size of the descriptors) is application dependent. Port will make use of the first 32 bytes only.

From a general USB use perspective, a 32-byte descriptor size is suffix and the use of this size is expected for a normal USB usage.

The packet descriptor layout is shown in [Figure 16-13](#) and described within [Table 16-9](#) through [Table 16-16](#).

**Figure 16-13. Packet Descriptor Layout**

**Table 16-9. Packet Descriptor Word 0 (PD0) Bit Field Descriptions**

| Bits  | Field Name                         | Description   |
|-------|------------------------------------|---|
| 31-27 | Descriptor type                    | The host packet descriptor type is 16 decimal (10h). The CPU initializes this field.  |
| 26-22 | Protocol-specific valid word count | This field indicates the valid number of 32-bit words in the protocol-specific region. The CPU initializes this field. This is encoded in increments of 4 bytes as:<br>0 = 0 byte<br>1 = 4 bytes<br>...<br>16 = 64 bytes<br>17-31 = Reserved  |
| 21-0  | Packet length                      | The length of the packet in bytes. If the packet length is less than the sum of the buffer lengths, then the packet data will be truncated. A packet length greater than the sum of the buffers is an error. The valid range for the packet length is 0 to (4M - 1) bytes. The CPU initializes this field for transmitted packets; the DMA overwrites this field on packet reception. |

**Table 16-10. Packet Descriptor Word 1 (PD1) Bit Field Descriptions**

| Bits  | Field Name                | Description   |
|-------|---------------------------|---|
| 31-27 | Source Tag; Port #        | This field indicates the port number (0-31) from which the packet originated. The DMA overwrites this field on packet reception. This is the RX Endpoint number from which the packet originated. |
| 26-21 | Source Tag; Channel #     | This field indicates the channel number within the port from which the packet originated. The DMA overwrites this field on packet reception. This field is always 0-67.                           |
| 20-16 | Source Tag: Sub-channel # | This field indicates the sub-channel number (0-31) within the channel from which the packet originated. The DMA overwrites this field on packet reception. This field is always 0.                |
| 15-0  | Destination Tag           | This field is application-specific. This field is always 0.   |

**Table 16-11. Packet Descriptor Word 2 (PD2) Bit Field Descriptions**

| Bits  | Field Name                   | Description   |
|-------|------------------------------|---|
| 31    | Packet error                 | This bit indicates if an error occurred during reception of this packet (0 = no error occurred; 1 = error occurred). The DMA overwrites this field on packet reception. Additional information about different errors may be encoded in the protocol specific fields in the descriptor.   |
| 30-26 |                              | This field indicates the type of this packet. The CPU initializes this field for transmitted packets; the DMA overwrites this field on packet reception. This field is encoded as:<br>5 = USB<br>8-31 = Reserved  |
| 25-20 | Reserved                     | Reserved  |
| 19    | Zero-length packet indicator | If a zero-length USB packet is received, the XDMA will send the CDMA a data block with a byte count of 0 and this bit is set. The CDMA will then perform normal EOP termination of the packet without transferring data. For transmit, if a packet has this bit set, the XDMA will ignore the CPPI packet size and send a zero-length packet to the USB controller. |
| 18-16 | Protocol-specific            | This field contains protocol-specific flags/information that can be assigned based on the packet type. Not used for USB.  |
| 15    | Return policy                | This field indicates the return policy for this packet. The CPU initializes this field.<br>0 = Entire packet (still linked together) should be returned to the queue specified in bits 11-0.<br>1 = Each buffer should be returned to the queue specified in bits 11-0 of Word 2 in their respective descriptors. The Tx DMA will return each buffer in sequence.   |
| 14    | On-chip                      | This field indicates whether or not this descriptor is in a region which is in on-chip memory space (1) or in external memory (0).  |
| 13-12 | Packet return queue mgr #    | This field indicates which queue manager in the system the descriptor is to be returned to after transmission is complete. This field is not altered by the DMA during transmission or reception and is initialized by the CPU. There is only one queue manager in the USB HS/FS device controller. This field must always be 0.                                    |
| 11-0  | Packet return queue #        | This field indicates the queue number within the selected queue manager that the descriptor is to be returned to after transmission is complete. This field is not altered by the DMA during transmission or reception and is initialized by the CPU.   |

**Table 16-12. Packet Descriptor Word 3 (PD3) Bit Field Descriptions**

| Bits  | Field Name      | Description   |
|-------|-----------------|---|
| 31-22 | Reserved        | Reserved  |
| 21-0  | Buffer 0 length | The buffer length field indicates how many valid data bytes are in the buffer. The CPU initializes this field for transmitted packets; the DMA overwrites this field on packet reception. |

**Table 16-13. Packet Descriptor Word 4 (PD4) Bit Field Descriptions**

| Bits | Field Name       | Description   |
|------|------------------|---|
| 31-0 | Buffer 0 pointer | The buffer pointer is the byte-aligned memory address of the buffer associated with the buffer descriptor. The CPU initializes this field for transmitted packets; the DMA overwrites this field on packet reception. |

**Table 16-14. Packet Descriptor Word 5 (PD5) Bit Field Descriptions**

| Bits | Field Name              | Description  |
|------|-------------------------|--|
| 31-0 | Next descriptor pointer | The 32-bit word aligned memory address of the next buffer descriptor in the packet. If the value of this pointer is zero, then the current buffer is the last buffer in the packet. The CPU initializes this field for transmitted packets; the DMA overwrites this field on packet reception. |

**Table 16-15. Packet Descriptor Word 6 (PD6) Bit Field Descriptions**

| Bits  | Field Name               | Description   |
|-------|--------------------------|---|
| 31-22 | Reserved                 | Reserved  |
| 21-0  | Original buffer 0 length | The buffer length field indicates the original size of the buffer in bytes. This value is not overwritten during reception. This value is read by the Rx DMA to determine the actual buffer size as allocated by the CPU at initialization. Since the buffer length in Word 3 is overwritten by the Rx port during reception, this field is necessary to permanently store the buffer size information. |

**Table 16-16. Packet Descriptor Word 7 (PD7) Bit Field Descriptions**

| Bits  | Field Name                | Description  |
|-------|---------------------------|--|
| 31-22 | Reserved                  | Reserved   |
| 21-0  | Original buffer 0 pointer | The buffer pointer is the byte-aligned memory address of the buffer associated with the buffer descriptor. This value is not overwritten during reception. This value is read by the Rx DMA to determine the actual buffer location as allocated by the CPU at initialization. Since the buffer pointer in Word 4 is overwritten by the Rx port during reception, this field is necessary to permanently store the buffer pointer information. |

#### 16.3.9.2.2 Host Buffer Descriptor/Buffer Descriptor (BD)

The buffer descriptor is identical in size and organization to a Packet Descriptor but does not include valid information in the packet level fields and does not include a populated region for protocol specific information. The packet level fields are not needed since the SOP descriptor contains this information and additional copy of this data is not needed/necessary.

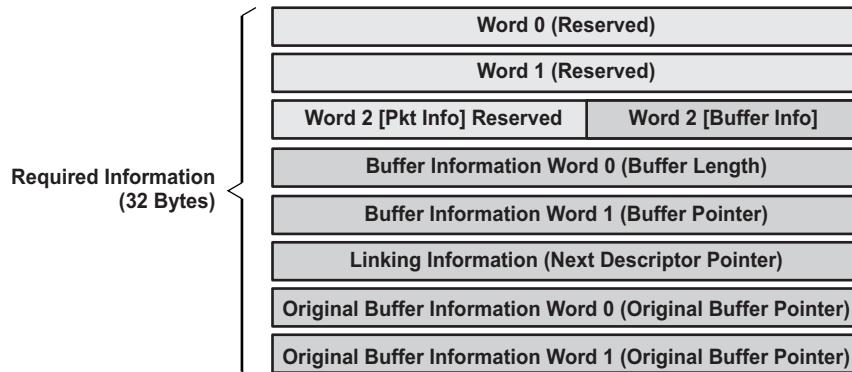

Host buffer descriptors are designed to be linked onto a host packet descriptor or another host buffer descriptor to provide support for unlimited scatter / gather type operations. Host buffer descriptors provide information about a single corresponding data buffer. Every host buffer descriptor stores the following information:

- Pointer to the first valid byte in the data
- Length of the data buffer
- Pointer to the next buffer descriptor in the packet

Buffer descriptors always contain 32 bytes of required information. Since it is a requirement that it is possible to convert a descriptor between a Buffer Descriptor and a Packet Descriptor (by filling in the appropriate fields) in practice, Buffer Descriptors will be allocated using the same sizes as Packet Descriptors. In addition, since the 5 LSBs of the Descriptor Pointers are used in CPPI 4.1 for the purpose of indicating the length of the descriptor, the minimum size of a descriptor is always 32 bytes

The buffer descriptor layout is shown in [Figure 16-14](#) and described within [Table 16-17](#) through [Table 16-24](#).

**Figure 16-14. Buffer Descriptor (BD) Layout**

**Table 16-17. Buffer Descriptor Word 0 (BD0) Bit Field Descriptions**

| Bits | Field Name | Description |
|------|------------|-------------|
| 31-0 | Reserved   | Reserved    |

**Table 16-18. Buffer Descriptor Word 1 (BD1) Bit Field Descriptions**

| Bits | Field Name | Description |
|------|------------|-------------|
| 31-0 | Reserved   | Reserved    |

**Table 16-19. Buffer Descriptor Word 2 (BD2) Bit Field Descriptions**

| Bits  | Field Name                | Description  |
|-------|---------------------------|--|
| 31-15 | Reserved                  | Reserved   |
| 14    | On-chip                   | This field indicates whether or not this descriptor is in a region which is on-chip memory space (1) or in external memory (0).  |
| 13-12 | Packet return queue mgr # | This field indicates which queue manager in the system the descriptor is to be returned to after transmission is complete. This field is not altered by the DMA during transmission or reception and is initialized by the CPU. There is only 1 queue manager in the USB HS/FS device controller. This field must always be 0. |
| 11-0  | Packet return queue #     | This field indicates the queue number within the selected queue manager that the descriptor is to be returned to after transmission is complete. This field is not altered by the DMA during transmission or reception and is initialized by the CPU.  |

**Table 16-20. Buffer Descriptor Word 3 (BD3) Bit Field Descriptions**

| Bits  | Field Name      | Description   |
|-------|-----------------|---|
| 31-22 | Reserved        | Reserved  |
| 21-0  | Buffer 0 length | The buffer length field indicates how many valid data bytes are in the buffer. The CPU initializes this field for transmitted packets. The DMA overwrites this field upon packet reception. |

**Table 16-21. Buffer Descriptor Word 4 (BD4) Bit Field Descriptions**

| Bits | Field Name       | Description   |
|------|------------------|---|
| 31-0 | Buffer 0 pointer | The buffer pointer is the byte-aligned memory address of the buffer associated with the buffer descriptor. The CPU initializes this field for transmitted packets. The DMA overwrites this field upon packet reception. |

**Table 16-22. Buffer Descriptor Word 5 (BD5) Bit Field Descriptions**

| Bits | Field Name               | Description  |
|------|--------------------------|--|
| 31-0 | Next description pointer | The 32-bit word aligned memory address of the next buffer descriptor in the packet. If the value of this pointer is zero, then the current descriptor is the last descriptor in the packet. The CPU initializes this field for transmitted packets. The DMA overwrites this field upon packet reception. |

**Table 16-23. Buffer Descriptor Word 6 (BD6) Bit Field Descriptions**

| Bits  | Field Name               | Description   |
|-------|--------------------------|---|
| 31-22 | Reserved                 | Reserved  |
| 21-0  | Original buffer 0 length | The buffer length field indicates the original size of the buffer in bytes. This value is not overwritten during reception. This value is read by the Rx DMA to determine the actual buffer size as allocated by the CPU at initialization. Since the buffer length in Word 3 is overwritten by the Rx port during reception, this field is necessary to permanently store the buffer size information. |

**Table 16-24. Buffer Descriptor Word 7 (BD7) Bit Field Descriptions**

| Bits | Field Name                | Description  |
|------|---------------------------|--|
| 31-0 | Original buffer 0 pointer | The buffer pointer is the byte-aligned memory address of the buffer associated with the buffer descriptor. This value is not overwritten during reception. This value is read by the Rx DMA to determine the actual buffer location as allocated by the CPU at initialization. Since the buffer pointer in Word 4 is overwritten by the Rx port during reception, this field is necessary to permanently store the buffer pointer information. |

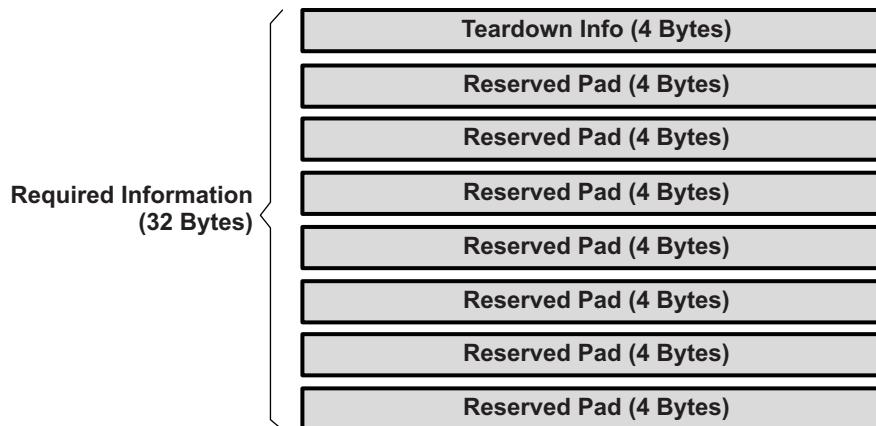

### 16.3.9.2.3 Teardown Descriptor

The Teardown Descriptor is not like the packet or buffer descriptors since it is not used to describe either a packet or a buffer. The teardown descriptor is always 32 bytes long and is comprised of 4 bytes of actual teardown information and 28 bytes of pad. The teardown descriptor layout and associated bit field descriptions are shown in the Figure below and Tables that follows. Since the 5 LSBs of the descriptor pointers are used in CPPI 4.1 for the purpose of indicating the length of the descriptor, the minimum size of a descriptor is 32 bytes.

The teardown descriptor is used to describe a channel halt and teardown event. Channel teardown ensures that when a connection is no longer needed that the hardware can be reliably halted and any remaining packets which had not yet been transmitted can be reclaimed by the host without the possibility of losing buffer or descriptor references (which results in a memory leak).

The teardown descriptor contains the following information:

- Indicator which identifies the descriptor as a teardown packet descriptor
- DMA controller number where teardown
- Channel number within DMA where teardown occurred
- Indicator of whether this teardown was for the Tx or Rx channel

**Figure 16-15. Teardown Descriptor Layout****Table 16-25. Teardown Descriptor Word 0 Bit Field Descriptions**

| Bits  | Field Name      | Description   |
|-------|-----------------|---|
| 31-27 | Descriptor type | The teardown descriptor type is 19 decimal (13h)                |
| 26-17 | Reserved        | Reserved  |
| 16    | TX_RX           | Indicates whether teardown is a TX (0) or RX (1).               |
| 15-10 | DMA number      | Indicates the DMA number for this teardown.                     |
| 9-6   | Reserved        | Reserved  |
| 5-0   | Channel number  | Indicates the channel number within the DMA that was torn down. |

**Table 16-26. Teardown Descriptor Words 1 to 7 Bit Field Descriptions**

| Bits | Field Name | Description |
|------|------------|-------------|
| 31-0 | Reserved   | Reserved    |

Teardown operation of an endpoint requires three operations. The teardown register in the CPPI DMA must be written, the corresponding endpoint bit in TEARDOWN of the USB module must be set, and the FlushFIFO bit in the Mentor USB controller Tx/RxCSR register must be set.

The following is the Transmit teardown procedure highlighting the steps required to be followed:

1. Set the TX\_TEARDOWN bit in the CPPI DMA TX channel n global configuration register (TXGCRn).
2. Set the appropriate TX\_TDOWN bit in the USBOTG controller's USB teardown register (TEARDOWN). Write Tx Endpoint Number to teardown to TEARDOWN[TX\_TDOWN] field.
3. Check if the teardown descriptor has been received on the teardown queue: The completion queue (see Queue Assignment table) is usually used as the Teardown Completion queue when the Teardown descriptor has been received, the descriptor address will be loaded onto CTRLD[Completion Queue #] register:
  - (a) If not, go to step 2
  - (b) If so, go to step 4
4. Set the appropriate TX\_TDOWN bit in the USBOTG controller's USB teardown register (TEARDOWN). Set the bit corresponding to the Channel Number within TEARDOWN[TX\_TDOWN] field.
5. Flush the TX FIFO in the Mentor OTG core: Set PERI\_TXCSR[FLUSHFIFO] for the corresponding Endpoint.
6. Re-enable the Tx DMA channel.
  - (a) Clear TXGCRn[TX\_TEARDOWN and TX\_ENABLE] bit.
  - (b) Set TXGCRn[TX\_ENABLE] bit.

### 16.3.9.3 Queue Manager

The queue manager (QM) is a hardware module that is responsible for accelerating management of the queues, i.e. queues are maintained within a queue manager module. Packets are added to a queue by writing the 32-bit descriptor address to a particular memory mapped location in the queue manager module. Packets are de-queued by reading the same location for that particular queue. A single queue manager exists within the device and handles all available 156 queues within the USB subsystem.

Descriptors are queued onto a logical queue (pushed) by writing the descriptor pointer to the Queue N Register D. When the Queue N Register D is written, this kicks off the queue manager causing it to add the descriptor to the tail of queue.

The QM keeps track of the order of the descriptors pushed within a queue or the linking status of the descriptors. To accomplish this linking status, QM will first resolve the 32-bit descriptor pointer into a 16-bit index which is used for linking a queue pointer purposes. Once the address to index computation is performed, i.e., the physical index information is determined, the QM will link that descriptor onto the descriptor chain that is maintained for that logical queue by writing the linking information out to a linking RAM which is external to the queue manager. More on linking RAM discussion would follow in latter sections. The QM will also update the queue tail pointers appropriately. Since logical queues within the queue manager are maintained using linked lists, queues cannot become full and no check for fullness is required before queuing a packet descriptor.

#### 16.3.9.3.1 Queue Types

Several types of queues exist (a total of 156 queues) within the CPPI 4.1 DMA. Regardless of the type of queue, queues are used to hold pointers to Packet or Buffer Descriptors while they are being passed between the Host and / or any of the ports in the system. All queues are maintained within the single Queue Manager module.

The following types of Queues exist:

- Free descriptor queue (unassigned to specific endpoint but assigned to specific endpoint type; receive endpoints – can be used as a receive submit queue)
- Transmit submit queue
- Transmit completion (return) queue
- Receive completion (return) queue
- Teardown queue

Dedicated queues exist where one or more queues are assigned for the use of a single endpoint and non-dedicated queues exist where no specific queue assignment to an endpoint is required (but pertains to receive endpoints only). Transmit endpoints are not allowed to use free descriptor queues.

Dedicated queues exist for each specific endpoint use and non-dedicated queues exist that can be used by any/all receive endpoints. Three queues are reserved for each endpoint/port for transmit actions with two of the three queues being transmit submit queues while the remaining queue is used as a completion/return queue. For receive actions, the only dedicated queues are completion/return queues; one queue is assigned/reserved for each receive endpoint. 32 free descriptor queues that do not have dedicated endpoint-queue assignment exist and these queues are used to service any receive endpoint as receive submit queues.

[Table 16-27](#) displays queue-endpoint assignments.

**Table 16-27. Queue-Endpoint Assignments**

| Queue Start Number | Queue Count | Queue-Endpoint Association                                    |
|--------------------|-------------|---|
| 0                  | 32          | Free Descriptor Queues/Rx Submit Queues (USB0/1 Rx Endpoints) |
| 32                 | 2           | USB0 Tx Endpoint 1  |
| 34                 | 2           | USB0 Tx Endpoint 2  |
| 36                 | 2           | USB0 Tx Endpoint 3  |
| 38                 | 2           | USB0 Tx Endpoint 4  |

**Table 16-27. Queue-Endpoint Assignments (continued)**

| Queue Start Number | Queue Count | Queue-Endpoint Association           |
|--------------------|-------------|--------------------------------------|
| 40                 | 2           | USB0 Tx Endpoint 5                   |
| 42                 | 2           | USB0 Tx Endpoint 6                   |
| 44                 | 2           | USB0 Tx Endpoint 7                   |
| 46                 | 2           | USB0 Tx Endpoint 8                   |
| 48                 | 2           | USB0 Tx Endpoint 9                   |
| 50                 | 2           | USB0 Tx Endpoint 10                  |
| 52                 | 2           | USB0 Tx Endpoint 11                  |
| 54                 | 2           | USB0 Tx Endpoint 12                  |
| 56                 | 2           | USB0 Tx Endpoint 13                  |
| 58                 | 2           | USB0 Tx Endpoint 14                  |
| 60                 | 2           | USB0 Tx Endpoint 15                  |
| 62                 | 2           | USB1 Tx Endpoint 1                   |
| 64                 | 2           | USB1 Tx Endpoint 2                   |
| 66                 | 2           | USB1 Tx Endpoint 3                   |
| 68                 | 2           | USB1 Tx Endpoint 4                   |
| 70                 | 2           | USB1 Tx Endpoint 5                   |
| 72                 | 2           | USB1 Tx Endpoint 6                   |
| 74                 | 2           | USB1 Tx Endpoint 7                   |
| 76                 | 2           | USB1 Tx Endpoint 8                   |
| 78                 | 2           | USB1 Tx Endpoint 9                   |
| 80                 | 2           | USB1 Tx Endpoint 10                  |
| 82                 | 2           | USB1 Tx Endpoint 11                  |

| 102                | 1           | USB0 Tx Endpoint 10 completion queue |
| 103                | 1           | USB0 Tx Endpoint 11 completion queue |
| 104                | 1           | USB0 Tx Endpoint 12 completion queue |
| 104                | 1           | USB0 Tx Endpoint 13 completion queue |
| 106                | 1           | USB0 Tx Endpoint 14 completion queue |
| 107                | 1           | USB0 Tx Endpoint 15 completion queue |
| 108                | 1           | Reserved                             |
| 109                | 1           | USB0 Rx Endpoint 1 completion queue  |
| 110                | 1           | USB0 Rx Endpoint 2 completion queue  |
| 111                | 1           | USB0 Rx Endpoint 3 completion queue  |
| 112                | 1           | USB0 Rx Endpoint 4 completion queue  |

**Table 16-27. Queue-Endpoint Assignments (continued)**

| Queue Start Number | Queue Count | Queue-Endpoint Association           |
|--------------------|-------------|--------------------------------------|
| 113                | 1           | USB0 Rx Endpoint 5 completion queue  |
| 114                | 1           | USB0 Rx Endpoint 6 completion queue  |
| 115                | 1           | USB0 Rx Endpoint 7 completion queue  |
| 116                | 1           | USB0 Rx Endpoint 8 completion queue  |
| 117                | 1           | USB0 Rx Endpoint 9 completion queue  |
| 118                | 1           | USB0 Rx Endpoint 10 completion queue |
| 119                | 1           | USB0 Rx Endpoint 11 completion queue |
| 120                | 1           | USB0 Rx Endpoint 12 completion queue |
| 121                | 1           | USB0 Rx Endpoint 13 completion queue |
| 122                | 1           | USB0 Rx Endpoint 14 completion queue |
| 123                | 1           | USB0 Rx Endpoint 15 completion queue |
| 124                | 1           | Reserved                             |
| 125                | 1           | USB1 Tx Endpoint 1 completion queue  |
| 126                | 1           | USB1 Tx Endpoint 2 completion queue  |
| 127                | 1           | USB1 Tx Endpoint 3 completion queue  |
| 128                | 1           | USB1 Tx Endpoint 4 completion queue  |
| 129                | 1           | USB1 Tx Endpoint 5 completion queue  |
| 130                | 1           | USB1 Tx Endpoint 6 completion queue  |
| 131                | 1           | USB1 Tx Endpoint 7 completion queue  |
| 132                | 1           | USB1 Tx Endpoint 8 completion queue  |
| 133                | 1           | USB1 Tx Endpoint 9 completion queue  |
| 134                | 1           | USB1 Tx Endpoint 10 completion queue |
| 135                | 1           | USB1 Tx Endpoint 11 completion queue |
| 136                | 1           | USB1 Tx Endpoint 12 completion queue |
| 137                | 1           | USB1 Tx Endpoint 13 completion queue |
| 138                | 1           | USB1 Tx Endpoint 14 completion queue |
| 139                | 1           | USB1 Tx Endpoint 15 completion queue |
| 140                | 1           | Reserved                             |
| 141                | 1           | USB1 Rx Endpoint 1 completion queue  |
| 142                | 1           | USB1 Rx Endpoint 2 completion queue  |
| 143                | 1           | USB1 Rx Endpoint 3 completion queue  |
| 144                | 1           | USB1 Rx Endpoint 4 completion queue  |
| 145                | 1           | USB1 Rx Endpoint 5 completion queue  |
| 146                | 1           | USB1 Rx Endpoint 6 completion queue  |
| 147                | 1           | USB1 Rx Endpoint 7 completion queue  |
| 148                | 1           | USB1 Rx Endpoint 8 completion queue  |
| 149                | 1           | USB1 Rx Endpoint 9 completion queue  |
| 150                | 1           | USB1 Rx Endpoint 10 completion queue |
| 151                | 1           | USB1 Rx Endpoint 11 completion queue |
| 152                | 1           | USB1 Rx Endpoint 12 completion queue |
| 153                | 1           | USB1 Rx Endpoint 13 completion queue |
| 154                | 1           | USB1 Rx Endpoint 14 completion queue |
| 155                | 1           | USB1 Rx Endpoint 15 completion queue |

#### 16.3.9.3.2 Free Descriptor Queue (Receive Submit Queue)

Receive endpoints/channels use queues, referred to as free descriptor queues, or receive submit queues, to forward completed receive packets to the host. The entries on the free descriptor queues have pre-attached empty buffers whose size and location are described in the original buffer information fields in the descriptor. The host is required to allocate both the descriptor and buffer and pre-link them prior to adding (submitting) a descriptor to one of the available free descriptor queue. The first 32 queues (queue 0 up to queue 31) are reserved for all 30 USB0/1 (endpoints 1 to 15 of each USB module) receive endpoints/channels to handle incoming packets to the device.

#### 16.3.9.3.3 Transmit Submit Queue

Transmit ports use packet queues, referred to as transmit submit queues, to store the packets that are waiting to be transmitted. Each transmit endpoint has dedicated queues (2 queues per port) that are reserved exclusively for a use by a single endpoint. Multiple queues per port/channel are allocated to facilitate quality of service (QoS) for applications that require QoS. The first 30 queues, queue 32 up to queue 61, are allocated for USB0 transmit endpoints 1 to 15 with two queues per endpoint. queues 62 up to queue 91, are allocated for transmit USB1 endpoints 1 to 15.

#### 16.3.9.3.4 Transmit Completion (Return) Queue

Transmit ports use packet queues, referred to as "transmit completion queues, to return packet descriptors to the host after packets have been transmitted. A single queue is reserved to be used by a single transmit endpoint. Application s/w needs to insure that the right set of queues is used to return the Descriptors after the completion of a packet transmission based on the endpoint number used. For USB0 transmit endpoints 1 to 15, queues 93–107 are reserved and assigned for use as a completion queue, respectively. Similarly for USB1 transmit endpoints 1 to 15, queues 125–139 are used as completion queues, respectively.

Transmit Completion Queues are also used to return packet Descriptors when performing a Transmit channel teardown operation.

#### 16.3.9.3.5 Receive Completion (Return) Queue

Receive ports use packet queues, referred to as receive completion queues, to return packet descriptors to the port after packets have been received. A single queue is reserved to be used by a single receive endpoint. Application s/w needs to insure that the right set of queues is used to return the descriptors after the completion of a packet reception based on the endpoint number used. For USB0 receive endpoints 1 to 15 queues 122–136 are reserved/assigned for use as a receive completion queue respectively. Similarly for USB1 receive endpoints 1 to 15, queues 137–151 is used as completion queue respectively.

Receive channel teardown is not necessary for receive transactions and no channel teardown information nor resource is available

#### 16.3.9.3.6 Diverting Queue Packets from one Queue to Another

The host can move the entire contents of one queue to another queue by writing the source queue number and the destination queue number to the Queue Diversion register. When diverting packets, the descriptors are pushed onto the tail of the destination queue.

#### 16.3.9.4 Memory Regions and Linking RAM

In addition to allocating buffer for raw data and memory for Descriptors, the host is responsible for allocating additional memory for exclusive use of the CPPI DMA Queue Manager to be used as a scratch PAD RAM. The queue manager uses this memory to manage states of descriptors submitted within the submit queues. In other words, this memory needs not to be managed by the user software and firmware responsibility lies only for allocation/reserving a chunk of memory for the use of the queue manager. The allocated memory can be a single block of memory that is contiguous or two blocks of memory that are not contiguous. These two blocks of memory are referred to as a Linking RAM Regions and should not be confused with memory regions that are used to store descriptors. That is, the use of the term *region* should be used in the context of its use.

To accomplish the linking of submitted descriptors, the queue manager will first resolve the 32-bit descriptor pointer into a 16-bit index which is used for linking and queue pointer purposes. Once the physical index information is determined, the queue manager will link that descriptor onto the descriptor chain that is maintained for that logical queue by writing the linking information out to a linking RAM which is external to the queue manager. The queue manager will also update the queue tail pointer appropriately. Since logical queues within the queue manager are maintained using linked lists, queues cannot become full and no check for fullness is required before queuing a packet descriptor.

The actual physical size of the Linking RAM region(s) to be allocated depends on the total number of descriptors defined within all memory regions. A minimum of four bytes of memory needs to be allocated for each Descriptor defined within all 16 memory regions.

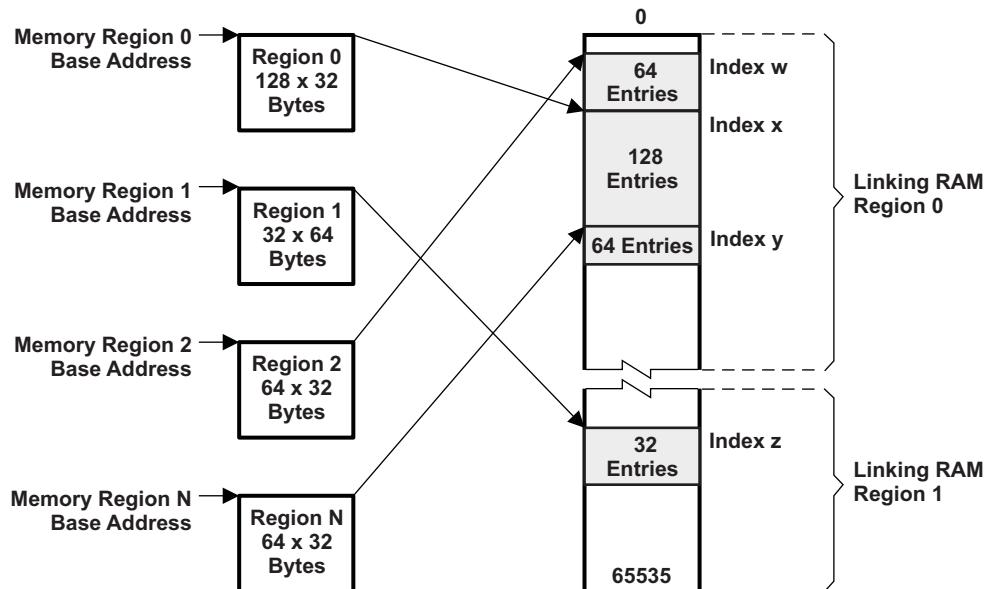

The queue manager has the capability of managing up to 16 memory regions. These memory regions are used to store descriptors of variable sizes. The total number of descriptors that can be managed by the queue manager should not exceed 64K. Each memory region has descriptors of one configurable size, that is, descriptors with different sizes cannot be housed within a single memory region. These 64K descriptors are referenced internally in the queue manager by a 16-bit quantity index.

The information about the Linking RAM regions and the size that are allocated is communicated to the CPPI DMA via three registers dedicated for this purpose. Two of the three registers are used to store the 32-bit aligned start addresses of the Linking RAM regions. The remaining one register is used to store the size of the first Linking RAM. The linking RAM size value stored here is the number of descriptors that is to be managed by the queue manager within that region not the physical size of the buffer, which is four times the number of descriptors.

Note that application is not required to use both linking RAM regions, if the size of the Linking RAM for the first region is large enough to accommodate all descriptors defined. No linking RAM size register for linking RAM region 2 exists. The size of the second linking RAM, when used, is indirectly computed from the total number of descriptors defined less the number of descriptors managed by the first linking RAM.

Figure 16-16 displays the relationship between several memory regions and linking RAM.

**Figure 16-16. Relationship Between Memory Regions and Linking RAM**

### 16.3.9.5 Zero Length Packets

A special case is the handling of null packets with the CPPI 4.1 compliant DMA controller. Upon receiving a zero length USB packet, the XFER DMA will send a data block to the DMA controller with byte count of zero and the zero byte packet bit of INFO Word 2 set. The DMA controller will then perform normal End of Packet termination of the packet, without transferring data.

If a zero-length USB packet is received, the XDMA will send the CDMA a data block with a byte count of 0 and this bit set. The CDMA will then perform normal EOP termination of the packet without transferring data. For transmit, if a packet has this bit set, the XDMA will ignore the CPPI packet size and send a zero-length packet to the USB controller.

### 16.3.9.6 CPPI DMA Scheduler

The CPPI DMA scheduler is responsible for controlling the rate and order between the different Tx and Rx threads/transfers that are provided in the CPPI DMA controller. The scheduler table RAM exists within the scheduler.

The DMA controller maintains state information for each of the channels which allows packet segmentation and reassembly operations to be time division multiplexed between channels in order to share the underlying DMA hardware. A DMA scheduler is used to control the ordering and rate at which this multiplexing occurs.

#### 16.3.9.6.1 CPPI DMA Scheduler Operation

Once the scheduler is enabled it will begin processing the entries in the table. When appropriate the scheduler will pass credits to the DMA controller to perform a Tx or Rx operation. The operation of the DMA controller is as follows:

1. After the DMA scheduler is enabled it begins with the table index set to 0.
2. The scheduler reads the entry pointed to by the index and checks to see if the channel in question is currently in a state where a DMA operation can be accepted.
  - (a) The DMA channel must be enabled AND
  - (b) The CPPI FIFO that the channel talks to has free space on TX (FIFO full signal is not asserted) or a valid block on Rx (FIFO empty signal is not asserted)
3. If the DMA channel is capable of processing a credit to transfer a block, the DMA scheduler will issue that credit via the DMA scheduling interface which is a point to point connection between the DMA Scheduler and the DMA Controller.
  - (a) The DMA controller may not be ready to accept the credit immediately and is provided a `sched_ready` signal which is used to stall the scheduler until it can accept the credit. The DMA controller only asserts the `sched_ready` signal when it is in the IDLE state.
  - (b) Once a credit has been accepted (indicated by `sched_req` and `sched_ready` both asserted), the scheduler will increment the index to the next entry and will start again at step 2.
4. If the channel in question is not currently capable of processing a credit, the scheduler will increment the index in the scheduler table to the next entry and will start at step 2.
5. Note that when the scheduler attempts to increment its index, to the value programmed in the table size register, the index will be reset to 0.

##### 16.3.9.6.1.1 CPPI DMA Scheduler Initialization

Before the scheduler can be used, the host is required to initialize and enable the block. This initialization is performed as follows:

1. The Host initializes entries within an internal memory array in the scheduler. This array contains up to 256 entries (4 entries per table word n where n=0-63) and each entry consists of a DMA channel number and a bit indicating if this is a Tx or Rx opportunity. These entries represent both the order and frequency that various Tx and Rx channels will be processed. A table size of 256 entries allows channel bandwidth to be allocated with a maximum precision of 1/256th of the total DMA bandwidth. The more entries that are present for a given channel, the bigger the slice of the bandwidth that channel will be given. Larger tables can be accommodated to allow for more precision. This array can only be written by the Host, it cannot be read.
2. If the application does not need to use the entire 256 entries, firmware can initialize the portion of the 256 entries and indicate the size of the entries used by writing onto an internal register in the scheduler which sets the actual size of the array (it can be less than 256 entries).
3. The host writes an internal register bit to enable the scheduler. The scheduler is not required to be disabled in order to change the scheduler array contents.

### **16.3.9.6.1.2 CPPI DMA Scheduler Programming Examples**

Consider a three endpoints use on a system with the following configurations: EP1-Tx, EP2-Rx, and EP2-Tx. Two assumptions are considered:

**Case 1:** Assume that you would like to service each enabled endpoints (EP1-Tx, EP2-Rx, and EP2-Tx) with equal priority.

The scheduler handles the rate at which an endpoint is serviced by the number of credits programmed (entries) for that particular endpoint within the scheduler Table Words. The scheduler has up to 256 credits that it can grant and for this example the user can configure the number of entries/credits to be anywhere from 3 to 256 with a set of 3 entries.

However, the optimum and direct programming for this scenario would be programming only the first three entries of the scheduler via scheduler Table WORD[0]. Since this case expects the Scheduler to use only the first three entries, you communicate that by programming DMA\_SCHED\_CTRL.LAST\_ENTRY with 2 (that is, 3 -1). The Enabled Endpoint numbers and the data transfer direction is then communicated by programming the first three entries of WORD[0] (ENTRY0\_CHANNEL = 1: ENTRY0\_RXTX = 0; ENTRY1\_CHANNEL = 2: ENTRY1\_RXTX = 1; ENTRY2\_CHANNEL = 2: ENTRY2\_RXTX = 0). With this programming, the Scheduler will only service the first three entries in a round-robin fashion, checking each credited endpoint for transfer one after the other, and servicing the endpoint that has data to transfer.

**Case 2:** Enabled endpoint EP1-Tx is serviced at twice the rate as the other enabled endpoints (EP2-Rx and EP2-Tx).

The number of entries/credit that has to be awarded to EP1-Tx has to be twice as much of the others. Four entries/credits would suffice to satisfy our requirement with two credits for EP1-Tx, one credit for EP2-Rx, and one credit for EP2-Tx. This requirement is satisfied by allocating any two of the four entries to EP1-Tx endpoint. Again for this example, scheduler Table WORD[0] would suffice since it can handle the first 4 entries. Even though several scenarios exist to programming the order of service for this case, one scenario would be to allow servicing EP1-Tx to back-to-back followed by the other enabled endpoints. Program DMA\_SCHED\_CTRL.LAST\_ENTRY with 3 (that is, 4 -1). Program WORD[0] (ENTRY0\_CHANNEL = 1: ENTRY0\_RXTX = 0; ENTRY1\_CHANNEL = 1: ENTRY1\_RXTX = 0; ENTRY2\_CHANNEL = 2: ENTRY2\_RXTX = 1; ENTRY3\_CHANNEL = 2: ENTRY3\_RXTX = 0).

### **16.3.9.7 CPPI DMA State Registers**

The port must store and maintain state information for each transmit and receive port/channel. The state information is referred to as the Tx DMA State and Rx DMA State.

#### **16.3.9.7.1 Transmit DMA State Registers**

The Tx DMA State is a combination of control fields and protocol specific port scratchpad space used to manipulate data structures and transmit packets. Each transmit channel has two queues. Each queue has a one head descriptor pointer and one completion pointer. There are thirty Tx DMA State registers; one for each port/channel.

The following information is stored in the Tx DMA State:

- Tx Queue Head Descriptor Pointer(s)
- Tx Completion Pointer(s)
- Protocol specific control/status (port scratchpad)

#### **16.3.9.7.2 Receive DMA State Registers**

The Rx DMA State is a combination of control fields and protocol specific port scratchpad space used to manipulate data structures in order to receive packets. Each receive channel has only one queue. Each channel queue has one head descriptor pointer and one completion pointer. There are thirty Rx DMA State registers; one for each port/channel.

The following information is stored in the Rx DMA State:

- Rx Queue Head Descriptor Pointer
- Rx Queue Completion Pointer

- Rx Buffer Offset

### 16.3.9.8 CPPI DMA Protocols Supported

Four different type of DMA transfers are supported by the CPPI 4.1 DMA; Transparent, RNDIS, Generic RNDIS, and Linux CDC. The following sections will outline the details on these DMA transfer types.

#### 16.3.9.8.1 Transparent DMA Transfer

Transparent Mode DMA operation is the default DMA mode where DMA interrupt is generated whenever a DMA packet is transferred. In the transparent mode, DMA packet size cannot be greater than USB MaxPktSize for the endpoint. This transfer type is ideal for transfer (not packet) sizes that are less than a max packet size.

##### 16.3.9.8.1.1 Transparent DMA Transfer Setup

The following will configure all 30 ports/channels for Transparent DMA Transfer type.

Make sure that RNDIS Mode is disabled globally. This allows the application to configure the CPPI DMA protocol in use to be configured per endpoint need. To disable RNDIS operation, clear RNDIS bit in the USB Control Registers corresponding to the USB Module (default setting), i.e., CTRL0[RNDIS]=0 and CTRL1[RNDIS]=0.

Configure the USB0/1 Tx/Rx DMA Mode Registers (USB0/1 TX(RX)MODE0/1) for the Endpoint field in use is programmed for Transparent Mode, i.e., TXMODE0/1[TXn\_MODE] = 00b and RXMODE0/1[RXn\_MODE] = 00b.

#### 16.3.9.8.2 RNDIS DMA Transfer

RNDIS mode DMA is used for large transfers (i.e., total data size to be transferred is greater than USB MaxPktSize where the MzxPktSize is a multiple of 64 bytes) that requires multiple USB packets. This is accomplished by breaking the larger packet into smaller packets, where each packet size being USB MaxPktSize except the last packet where its size is less than USB MaxPktSize, including zero bytes. This implies that multiple USB packets of MaxPktSize will be received and transferred together as a single large DMA transfer and the DMA interrupt is generated only at the end of the complete reception of DMA transfer. The protocol defines the end of the complete transfer by receiving a short USB packet (smaller than USB MaxPktSize as mentioned in USB specification 2.0). If the DMA packet size is an exact multiple of USB MaxPktSize, the DMA controller waits for a zero byte packet at the end of complete transfer to signify the completion of the transfer.

**NOTE:** RNDIS Mode DMA is supported only when USB MaxPktSize is an integral multiple of 64 bytes.

##### 16.3.9.8.2.1 RNDIS DMA Transfer Setup

If all endpoints in use are desired to operate in RNDIS mode, it is only suffix to configure RNDIS DMA operation in RNDIS mode at the global level and application can ignore individual endpoint DMA mode configuration. This is achieved by programming CTRLR0/1[RNDIS] with a '1.'

However if DMA mode is required to be configured at the endpoint level, it is required to disable the use of RNDIS at the global level, this is achieved by clearing RNDIS bit field (CTRLR0/1[RNDIS]=0), since global configuration over-rides endpoint configuration.

To configure RNDIS DMA mode use, configure the field that correspond to the USB module endpoint using the corresponding USB0/1 TX(RX) Mode Register, i.e., TXMODE0/1[TXn\_MODE] = 01b and RXMODE0/1[RXn\_MODE] = 01b

#### 16.3.9.8.3 Generic RNDIS DMA Transfer

Generic RNDIS DMA transfer mode is identical to the normal RNDIS mode in nearly all respects, except for the exception case where the last packet of the transfer can either be a short packet or the MaxPktSize. When the last packet size is equal to the MaxPktSize then no additional zero-byte packet is sent when using Generic RNDIS transfer. Generic RNDIS transfer makes use of a USB0/1 GENERIC RNDIS EPn Size register (there exists a register for each endpoint) that must be programmed with the

transfer size (in bytes) of the transfer for the USB Module (USB0 or USB1) prior to posting a transfer transaction. If the transfer size is an integer multiple of USB MaxPktSize then no additional zero-byte packet is sent when using Generic RNDIS transfer. However, if a short packet has been sent prior to programmed size count, the transfer would end in a similar fashion an RDIS transfer would behave. For example, if the USB MaxPktSize (Tx/RxMaxP) is programmed with a value of 64, the Generic RNDIS EP Size register for that endpoint must be programmed with a value that is an integer multiple of 64 (for example, 64, 128, 192, 256, etc.) for it behave differently than RNDIS transfer. In other words, when using Generic RNDIS mode and the DMA is tasked to transfer data transfer size that is less or equal the size value programmed within the USB0/1 GENERIC RNDIS EPn Size register.

This means that Generic RNDIS mode will perform data transfer in the same manner as RNDIS mode, closing the CPPI packet if a USB packet with a size less than the USB MaxPktSize size value is received. Otherwise, the packet will be closed when the value in the Generic RNDIS EP Size register is reached.

Using USB0/1 GENERIC RNDIS EPn Size register, a packet of up to 64K bytes (65536 bytes) can be transferred. This is to allow the host software to program the USB module to transfer data that is an exact multiple of the USB MaxPktSize (Tx/RxMaxP programmed value) without having to send an additional short packet to terminate.

**NOTE:** As in RNDIS mode, the USB max packet size (Tx/RxMaxp programmed value) of any Generic RNDIS mode enabled endpoints must be a multiple of 64 bytes. Generic RNDIS acceleration should not be enabled for endpoints where the max packet size is not a multiple of 64 bytes. Only transparent mode should be used for such endpoints.

#### 16.3.9.8.3.1 Generic RNDIS DMA Transfer Setup

Disable the use of RNDIS at the global level, this is achieved by clearing RNDIS bit field (CTRLR0/1[RNDIS]=0), since global configuration over-rides endpoint configuration.

Configure the field that correspond to the USB module endpoint using the corresponding USB0/1 TX(RX) Mode Register, i.e., TXMODE0/1[TXn\_MODE] = 11b and RXMODE0/1[RXn\_MODE] = 11b.

#### 16.3.9.8.4 Linux CDC DMA Transfer

Linux CDC DMA transfer mode acts in the same manner as RNDIS packets, except for the case where the last data matches the max USB packet size requiring additional zero-byte packet transfer in RNDIS mode and this is not the case for Linux CDC. If the last data packet of a transfer is a short packet where the data size is greater than zero and less the USB MaxPktSize, then the behavior of the Linux CDC DMA transfer type is identical with the RNDIS DMA transfer type. The only exception is when the short packet length terminating the transfer is a Null Packet. In this case, instead of transferring the Null Packet, it will transfer a data packet of size 1 byte with the data value of 00h.

In transmit operation, if an endpoint is configured or CDC Linux mode, upon receiving a Null Packet from the CPPI DMA, the XFER DMA will then generate a packet containing 1 byte of data, whose value is 00h, indicating the end of the transfer. During receive operation, the XFER DMA will recognize the one byte zero packet as a termination of the data transfer, and sends a block of data with the EOP indicator set and a byte count of one to the CPPI DMA controller. The CPPI DMA realizing the end of the transfer termination will not update/increase the packet size count of the Host Packet Descriptor.

#### 16.3.9.8.4.1 Linux CDC DMA Transfer Setup

Disable the use of RNDIS at the global level, this is achieved by clearing RNDIS bit field (CTRLR0/1[RNDIS]=0), since global configuration over-rides endpoint configuration.

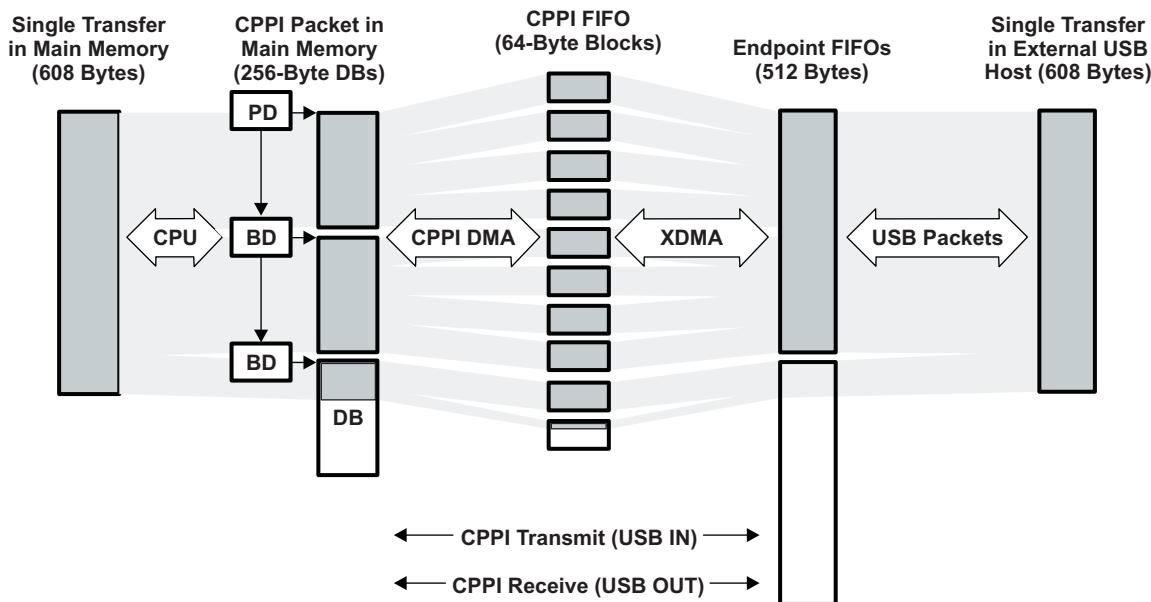

Configure the field that correspond to the USB module endpoint using the corresponding USB0/1 TX(RX) Mode Register, i.e., TXMODE0/1[TXn\_MODE] = 10b and RXMODE0/1[RXn\_MODE] = 10b.

#### 16.3.9.9 USB Data Flow Using DMA

The necessary steps required to perform a USB data transfer using the CPPI 4.1 DMA is expressed using an example for both transmit and receive cases. Assume USB0 is ready to perform a USB data transfer of size 608 bytes (see [Figure 16-17](#)).

The 608 bytes data to be transferred is described using three descriptors. Since each data buffer defined within a single descriptor has a size of 256 bytes, a 608 bytes data buffer would require three descriptors.

**Figure 16-17. High-level Transmit and Receive Data Transfer Example**

#### Example assumptions:

- The CPPI data buffers are 256 bytes in length.
- USB0 module is to be used to perform this transfer. Note that the steps required is similar for USB1 use.
- The USB0 endpoint 1 Tx and Rx endpoint 1 size are programmed to handle max USB packet size of 512 bytes.
- A single transfer length is 608 bytes.
- The SOP offset is 0.

The above translates to the following multi-descriptor setup:

#### Transmit Case

Transmit setup is as follows:

- One packet descriptor with packet length (this is NOT data buffer length, the term packet used here is to mean a transfer length not USB packet) field of 608 bytes and a Data Buffer of size 256 Bytes linked to the 1st host buffer descriptor.
- Two buffer descriptors with first buffer descriptor (this is the one linked to the packet descriptor) defining the second data buffer size of 256 Bytes which in turn is linked to the next (second) buffer descriptor.
- Second buffer fescriptor with a fata buffer size of 96 bytes (can be greater, the packet descriptor contain the size of the packet) linked to no other descriptor (NULL).

#### Receive Case

For this example since each data buffer size is 256 bytes, we would require a minimum of three descriptors that would define data buffer size of 608 bytes. The receive setup is as follows:

- Two buffer descriptors with 256 bytes of data buffer size
- One buffer descriptor with 96 bytes (can be greater) of data buffer size

Within the rest of this section, the following nomenclature is used:

**BD** — Buffer Descriptor or Host Buffer Descriptor

**DB** — Data Buffer Size of 256 Bytes

**PBD** — Pointer to Host Buffer Descriptor

**PD** — Host Packet Descriptor

**PPD** — Pointer to Host Packet Descriptor

**TXSQ** — Transmit Queue or Transmit Submit Queue (for USB0 EP1, use Queues 32 or 33, for USB1 EP1 use Queues 62 or 63)

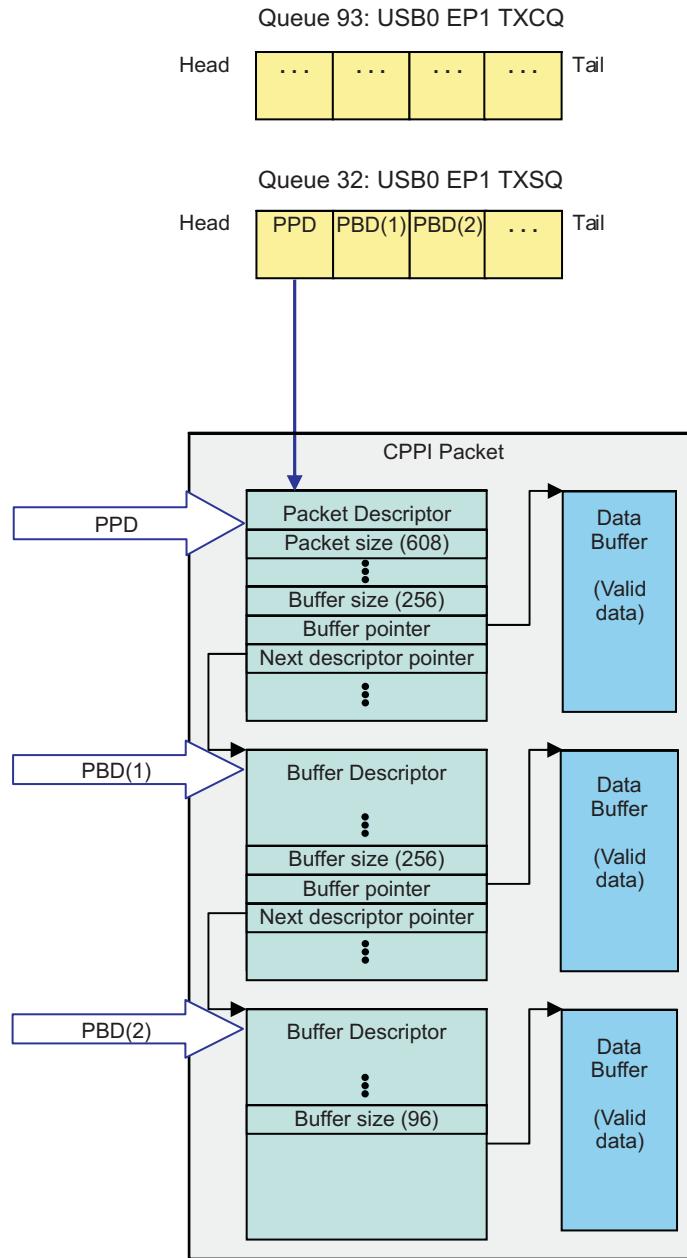

**TXCQ** — Transmit Completion Queue or Transmit Return Queue (for USB0 Tx EP1, use Queue 93, and for USB1 Tx EP1 use Queue 125)

**RXCQ** — Receive Completion Queue or Receive Return Queue (for USB0 Rx EP1, use Queue 109, for USB1 Rx EP1 use Queue 141)

**RXSQ** — Receive Free/Buffer Descriptor Queue or Receive Submit Queue. (For USB0 Rx EP1 Queue 0 is used and for USB1 Rx EP1 Queue 16 should be used)

#### 16.3.9.9.1 *Transmit USB Data Flow Using DMA*

The transmit descriptors and queue status configuration prior to the transfer taking place is shown in [Figure 16-18](#).

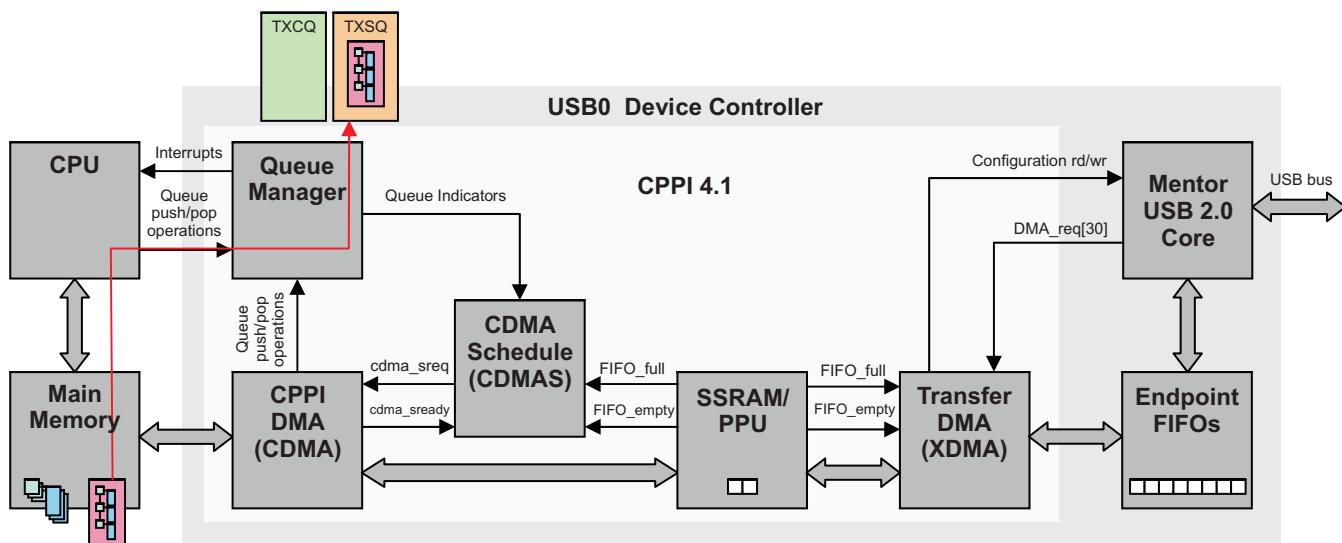

**Figure 16-18. Transmit Descriptors and Queue Status Configuration**

#### 16.3.9.9.1.1 *Transmit Initialization (Step 1)*

The CPU performs the following steps for transmit initialization:

1. Initializes Memory Region 0 base address and Memory Region 0 size, Link RAM0 Base address, Link RAM0 data size, and Link RAM1 Base address.
2. Creates PD, BDs, and DBs in main memory and link as indicated in [Figure 16-19](#).
3. Initializes and configures the Queue Manager, Channel Setup, DMA Scheduler, and Mentor USB 2.0 Core.
4. Adds (pushes) the PPD and the two PBDs to the TXSQ by writing the Packet Descriptor address to the TXSQ CTRL D Register.

[Figure 16-19](#) captures the BD/DB pair in main memory and later submitted within the TXSQ.

**Figure 16-19. Transmit USB Data Flow Example (Initialization)**

#### 16.3.9.9.1.2 CDMA and XDMA Transfer Packet Data Into Endpoint FIFO (Step 2)

The steps for CDMA and XDMA to transfer packet data into endpoint FIFO are as follows:

1. The Queue Manager informs the CDMAS that the TXSQ is not empty.
2. CDMAS checks that the CPPI FIFO FIFO\_full is not asserted, then issues a credit to the CDMA.
3. CDMA reads the Packet Descriptor pointer (PPD) and descriptor size hint from the queue manager
4. For each 64-byte block of data in the packet data payload (note that packet refers here to CPPI packet which is not the same as USB packet and it means to refer to data transfer size):
  - (a) The CDMA transfers a max burst of 64-byte block (OCP burst) from the data to be transferred in main memory to the CPPI FIFO
  - (b) The XDMA sees FIFO\_empty not asserted and transfers 64-byte block from CPPI FIFO to Endpoint FIFO.
  - (c) The CDMA performs the above two steps ('a' and 'b') three more times since the data size of the HDP is 256 bytes.
5. The CDMA reads the first buffer descriptor pointer (PBD).
6. For each 64-byte block of data in the packet data payload:
  - (a) The CDMA transfers a max burst of 64-byte block from the data to be transferred in main memory to the CPPI FIFO.
  - (b) The XDMA sees FIFO\_empty not asserted and transfers 64-byte block from CPPI FIFO to Endpoint FIFO.
  - (c) The CDMA performs the above two steps ('a' and 'b') two more times since data size of the HBD is 256 bytes.
7. The CDMA reads the second Buffer Descriptor pointer (PBD)
8. For each 64-byte block of data in the packet data payload:
  - (a) The CDMA transfers a max burst of 64-byte block from the data to be transferred in main memory to the CPPI FIFO.
  - (b) The XDMA sees FIFO\_empty not asserted and transfers 64-byte block from CPPI FIFO to Endpoint FIFO.
  - (c) The CDMA transfers the last remaining 32-byte from the data to be transferred in main memory to the CPPI FIFO.
  - (d) The XDMA sees FIFO\_empty not asserted and transfers 32-byte block from CPPI FIFO to Endpoint FIFO.

**16.3.9.9.1.3 USB 2.0 Core Transmits USB Packets for Tx (Step 3)**

1. Once the XDMA has transferred enough 64-byte blocks of burst of data from the CPPI FIFO to fill the Endpoint FIFO (accumulated 512 bytes), it signals the Mentor USB 2.0 Core that a TX packet is ready (sets the endpoint's TxPktRdy bit).
2. The USB 2.0 Core will transmit the packet from the Endpoint FIFO out on the USB BUS when it receives a corresponding IN request from the attached USB Host.
3. After the USB packet is transferred, the USB 2.0 Core issues a TX DMA\_req to the XDMA.
4. This process is repeated until (the above steps '1', '2', and '3') the entire packet has been transmitted. The XDMA will also generate the required termination packet depending on the termination mode configured for the endpoint.

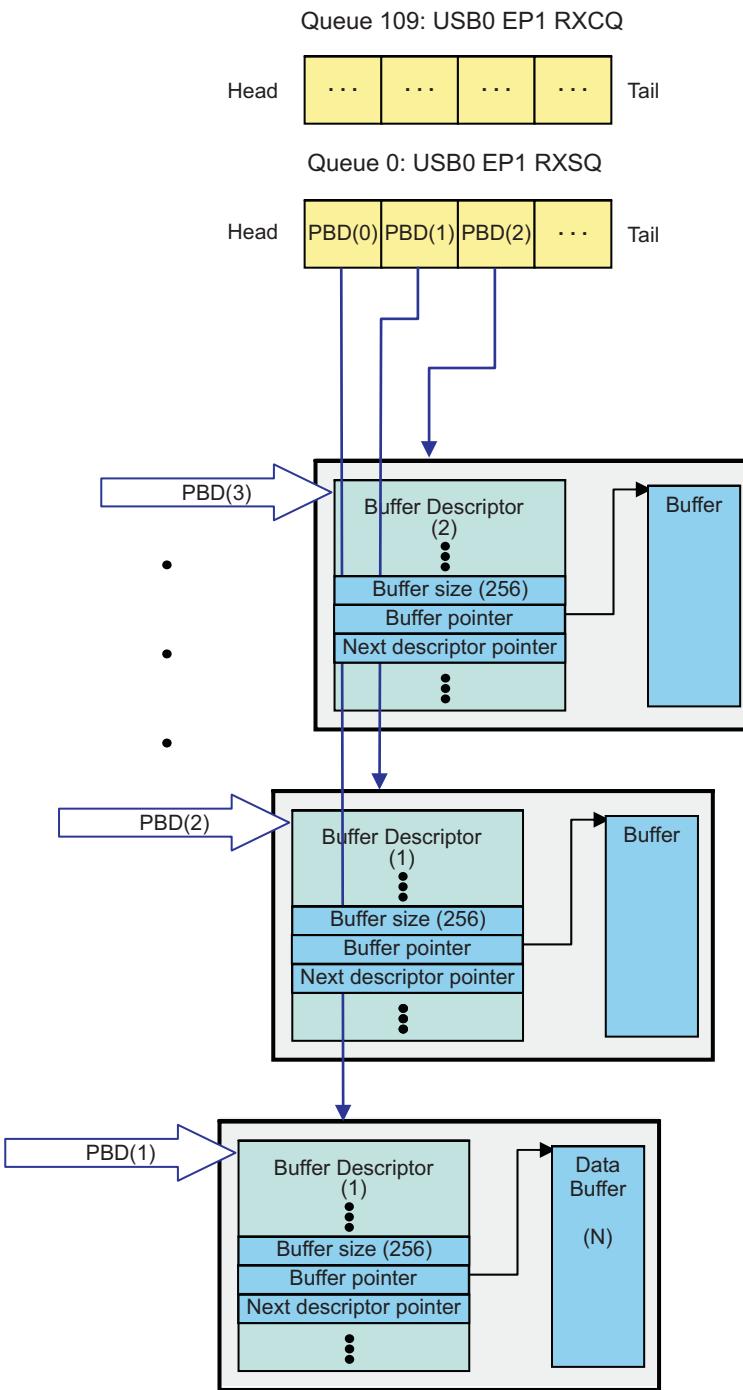

**16.3.9.9.1.4 Return Packet to Completion Queue and Interrupt CPU for Tx (Step 4)**

1. After all data for the packet has been transmitted (as specified by the packet size field), the CDMA will write the pointer of the Packet Descriptor only to the TX Completion Queue specified in the return queue manager / queue number fields of the packet descriptor.
2. The Queue Manager then indicates the status of the TXSQ (empty) to the CDMAS and the TXCQ to the CPU via an interrupt.

**16.3.9.9.2 Receive USB Data Flow Using DMA**

The receive buffer descriptors and queue status configuration prior to the transfer taking place is shown in [Figure 16-20](#).

**Figure 16-20. Receive Buffer Descriptors and Queue Status Configuration**

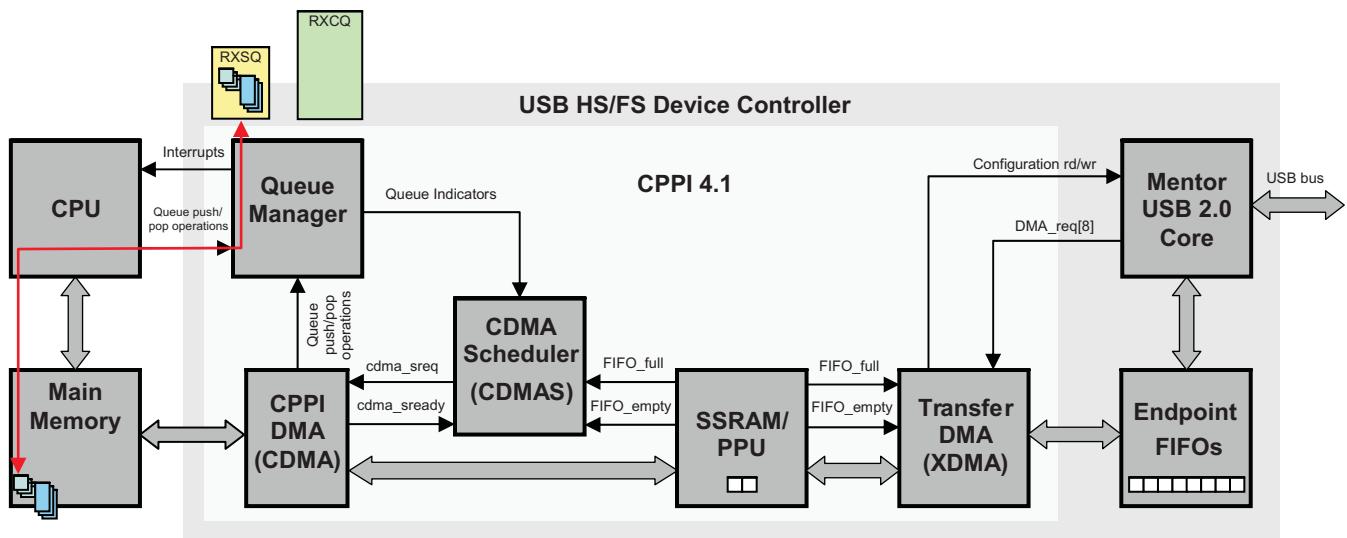

#### 16.3.9.9.2.1 Receive Initialization (Step 1)

1. The CPU initializes Queue Manager with the Memory Region 0 base address and Memory Region 0 size, Link RAM0 Base address, Link RAM0 data size, and Link RAM1 Base address.
2. The CPU creates BDs, and DBs in main memory and link them creating a BD and DB pairs.
3. CPU then initializes the RXCQ queue and configures the Queue Manager, Channel Setup, DMA Scheduler, and USB 2.0 Core.
4. It then adds (pushes) the address of the addresses/pointers of three Buffer Descriptors (PBDs) into the

RXSQ by writing onto CTRL D register.

Figure 16-21 displays receive operation Initialization.

**Figure 16-21. Receive USB Data Flow Example (Initialization)**

#### 16.3.9.9.2.2 USB 2.0 Core Receives a Packet, XDMA Starts Data Transfer for Receive (Step 2)

1. The USB 2.0 Core receives a USB packet from the USB Host and stores it in the Endpoint FIFO.
2. It then asserts a DMA\_req to the XDMA informing it that data is available in the Endpoint FIFO.
3. The XDMA verifies the corresponding CPPI FIFO is not full via the FIFO\_full signal, then starts transferring 64-byte data blocks (burst) from the Endpoint FIFO into the CPPI FIFO.

#### 16.3.9.9.2.3 CDMA Transfers Data from SSRAM / PPU to Main Memory for Receive (Step 3)

1. The CDMAS sees FIFO\_empty de-asserted (there is RX data in the FIFO) and issues a transaction credit to the CDMA.
2. The CDMA begins packet reception by fetching the first PBD from the Queue Manager using the Free Descriptor / Buffer Queue 0 (Rx Submit Queue) index that was initialized in the RX port DMA state for that channel.
3. The CDMA will then begin writing the 64-byte block of packet data into this DB.
4. The CDMA will continue filling the buffer with additional 64-byte blocks of data from the CPPI FIFO and will fetch additional PBD as needed using the Free Descriptor / Buffer Queue 1, 2, and 3 indexes for the 2nd, 3rd, and remaining buffers in the packet. After each buffer is filled, the CDMA writes the buffer descriptor to main memory.

#### 16.3.9.9.2.4 CDMA Completes the Packet Transfer for Receive (Step 4)

1. After the entire packet has been received, the CDMA writes the packet descriptor to main memory.
2. The CDMA then writes the packet descriptor to the RXCQ specified in the Queue Manager / Queue Number fields in the RX Global Configuration Register.
3. The Queue Manager then indicates the status of the RXCQ to the CPU via an interrupt.
4. The CPU can then process the received packet by popping the received packet information from the RXCQ and accessing the packet's data from main memory.

### 16.3.10 USB 2.0 Test Modes

The USB2.0 controller supports the four USB 2.0 test modes (Test\_SE0\_NAK, Test\_J, Test\_K, and Test\_Packet) defined for high-speed functions. It also supports an additional “FIFO access” test mode that can be used to test the operation of the CPU interface, the DMA controller and the RAM block.

The test modes are entered by writing to the TESTMODE register. A test mode is usually requested by the host sending a SET\_FEATURE request to Endpoint 0. When the software receives the request, it should wait until the Endpoint 0 transfer has completed (when it receives the Endpoint 0 interrupt indicating the status phase has completed) then write to the TESTMODE register.

**Note:** These test modes have no purpose in normal operation.

#### 16.3.10.1 TEST\_SE0\_NAK

To enter the Test\_SE0\_NAK test mode, the software should set the TEST\_SE0\_NAK bit in the TESTMODE register to 1. The USB controller will then go into a mode in which it responds to any valid IN token with a NAK.

#### 16.3.10.2 TEST\_J

To enter the Test\_J test mode, the software should set the TEST\_J bit in the TESTMODE register to 1. The USB controller will then go into a mode in which it transmits a continuous J on the bus.

#### 16.3.10.3 TEST\_K

To enter the Test\_K test mode, the software should set the TEST\_K bit in the TESTMODE register to 1. The USB controller will then go into a mode in which it transmits a continuous K on the bus.

#### 16.3.10.4 TEST\_PACKET

To execute the Test\_Packet, the software should:

1. Start a session (if the core is being used in Host mode).
2. Write the standard test packet (shown below) to the Endpoint 0 FIFO.
3. Write 8h to the TESTMODE register (TEST\_PACKET = 1) to enter Test\_Packet test mode.
4. Set the TxPktRdy bit in the HOST/PERI\_CSR0 register (bit 1).

The 53 byte test packet to load is as follows (all bytes in hex). The test packet only has to be loaded once; the USB controller will keep re-sending the test packet without any further intervention from the software.

Table 16-28 displays the 53 Bytes test packet content.

**Table 16-28. 53 Bytes Test Packet Content**

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| 0  | AA |
| AA | EE |
| EE | FE | FF | FF | FF | FF | FF | FF |
| FF | FF | FF | FF | FF | 7F | BF | DF |
| EF | F7 | FB | FD | FC | 7E | BF | DF |
| EF | F7 | FB | FD | 7E |    |    |    |

This data sequence is defined in Universal Serial Bus Specification Revision 2.0, Section 7.1.20. The USB controller will add the DATAA0 PID to the head of the data sequence and the CRC to the end.

### 16.3.10.5 FIFO\_ACCESS

The FIFO Access test mode allows you to test the operation of CPU Interface, the DMA controller (if configured), and the RAM block by loading a packet of up to 64 bytes into the Endpoint 0 FIFO and then reading it back out again. Endpoint 0 is used because it is a bidirectional endpoint that uses the same area of RAM for its Tx and Rx FIFOs.

**NOTE:** The core does not need to be connected to the USB bus to run this test. If it is connected, then no session should be in progress when the test is run.

The test procedure is as follows:

1. Load a packet of up to 64 bytes into the Endpoint 0 Tx FIFO.
2. Set HOST/PERI\_CSR0[TXPKTRDY].
3. Write 40h to the TESTMODE register (FIFO\_ACCESS = 1).
4. Unload the packet from the Endpoint Rx FIFO, again.
5. Set HOST/PERI\_CSR0[SERVICEDRXPKTRDY].

Writing 40h to the TESTMODE register causes the following sequence of events:

The Endpoint 0 CPU pointer (that records the number of bytes to be transmitted) is copied to the Endpoint 0 USB pointer (that records the number of bytes received).

1. The Endpoint 0 CPU pointer is reset.
2. HOST/PERI\_CSR0[TXPKTRDY] is cleared.
3. HOST/PERI\_CSR0[RXPKTRDY] is set.
4. An Endpoint 0 interrupt is generated (if enabled).

The effect of these steps is to make the Endpoint 0 controller act as if the packet loaded into the Tx FIFO has flushed and the same packet received over the USB. The data that was loaded in the Tx FIFO can now be read out of the Rx FIFO.

### 16.3.10.6 FORCE\_HOST

The Force Host test mode enables you to instruct the core to operate in Host mode, regardless of whether it is actually connected to any peripheral; that is, the state of the CID input and the LINESTATE and HOSTDISCON signals are ignored. (While in this mode, the state of the HOSTDISCON signal can be read from the BDEVICE bit in the device control register (DEVCTL)).

This mode, which is selected by writing 80h to the TESTMODE register (FORCE\_HOST = 1), allows implementation of the USB Test\_Force\_Enable (USB 2.0 Specification Section 7.1.20). It can also be used for debugging PHY problems in hardware.

While the FORCE\_HOST bit remains set, the core enters the Host mode when the SESSION bit in DEVCTL is set to 1 and remains in the Host mode until the SESSION bit is cleared to 0 even if a connected device is disconnected during the session. The operating speed while in this mode is determined by the FORCE\_HS and FORCE\_FS bits in the TESTMODE register.

## 16.4 Supported Use Cases

The USB Subsystem supports two independent USB Modules where each USB module can operate as a host or peripheral. When operating as a host, it is capable of interfacing to a single target/peripheral directly or to multiple targets via hub at low-, full-, or high-speed. When operating as a peripheral, it is capable of interfacing to a host at a full- or high-speed.

## 16.5 USB Registers

### 16.5.1 USBSS Registers

Table 16-29 lists the memory-mapped registers for the USBSS. All register offset addresses not listed in Table 16-29 should be considered as reserved locations and the register contents should not be modified.

**Table 16-29. USBSS REGISTERS**

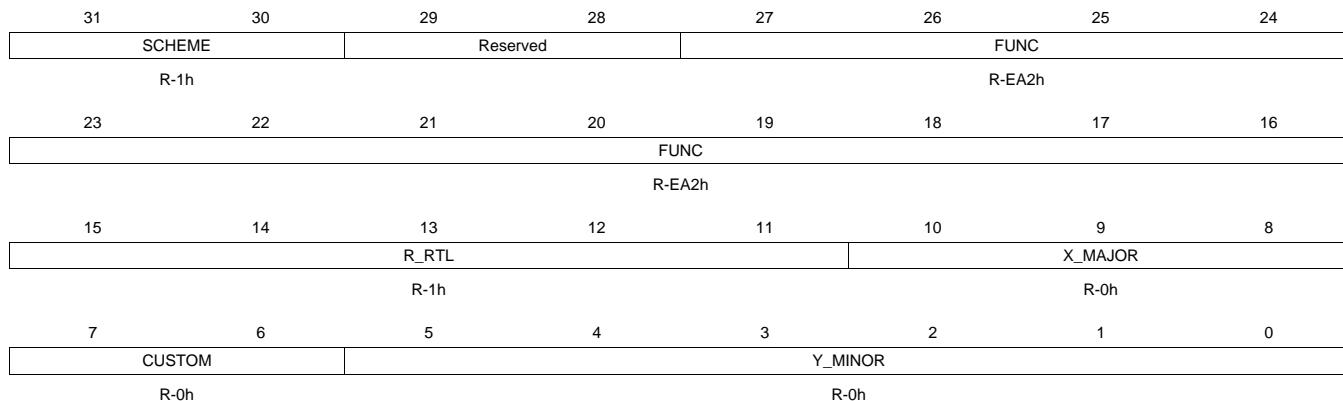

| Offset | Acronym           | Register Name | Section                           |
|--------|-------------------|---------------|-----------------------------------|

|          |          | R/W-0h               | R/W-0h | R/W-0h   |          | R/W-0h  | R/W-0h     |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 16-74. USB0CTRL Register Field Descriptions**

| Bit | Field                | Type | Reset | Description  |
|-----|----------------------|------|-------|--|
| 31  | DIS_DEB              | R/W  | 0h    | Disable the VBUS debouncer circuit fix   |
| 30  | DIS_SRTP             | R/W  | 0h    | Disable the OTG Session Request Protocol (SRP) AVALID circuit fix. When enabled (=0) this allows additional time for the VBUS signal to be measured against the VBUS thresholds. The time is specified in the USB0 SRP Fix Time Register.  |
| 5   | SOFT_RESET_ISOLATION | R/W  | 0h    | Soft reset isolation. When high this bit forces all USB0 signals that connect to the USBSS to known values during a soft reset via bit 0 of this register. This bit should be set high prior to setting bit 0 and cleared after bit 0 is cleared.  |
| 4   | RNDIS                | R/W  | 0h    | Global RNDIS mode enable for all endpoints.  |
| 3   | UINT                 | R/W  | 0h    | USB interrupt enable<br>1 = Legacy<br>0 = Current (recommended setting)<br>If uint is set high, then the mentor controller generic interrupt for USB[9] will be generated (if enabled). This requires S/W to read the mentor controller's registers to determine which interrupt from USB[0] to USB[7] that occurred. If uint is set low, then the usb20otg_f module will automatically read the mentor controller's registers and set the appropriate interrupt from USB[0] to USB[7] (if enabled). The generic interrupt for USB[9] will not be generated. |
| 1   | CLKFACK              | R/W  | 0h    | Clock stop fast ack enable.  |

**Table 16-74. USB0CTRL Register Field Descriptions (continued)**

| Bit | Field      | Type | Reset | Description   |
|-----|------------|------|-------|---|
| 0   | SOFT_RESET | R/W  | 0h    | <p>Software reset of USB0.<br/>         Write 0 = no action<br/>         Write 1 = Initiate software reset<br/>         Read 0 = Reset done, no action<br/>         Read 1 = Reset ongoing<br/>         Both the soft_reset and soft_reset_isolation bits should be asserted simultaneously.<br/>         This will cause the following sequence of actions to occur over multiple cycles:<br/>         - All USB0 output signals will go to a known constant value via multiplexers.<br/>         This removes the possibility of timing errors due to the asynchronous resets.<br/>         - All USB0 registers will be reset.<br/>         - The USB0 resets will be de-asserted.<br/>         - The reset isolation multiplexer inputs will be de-selected.<br/>         - Both the soft_reset and soft_reset_isolation bits will be automatically cleared.<br/>         Setting only the soft_reset_isolation bit will cause all USB0 output signals to go to a known constant value via multiplexers.<br/>         This will prevent future access to USB0.<br/>         To clear this condition the USBSS must be reset via a hard or soft reset.</p> |

### 16.5.2.3 USB0STAT Register (offset = 18h) [reset = 0h]

USB0STAT is shown in Figure 16-66 and described in Table 16-75.

**Figure 16-66. USB0STAT Register**

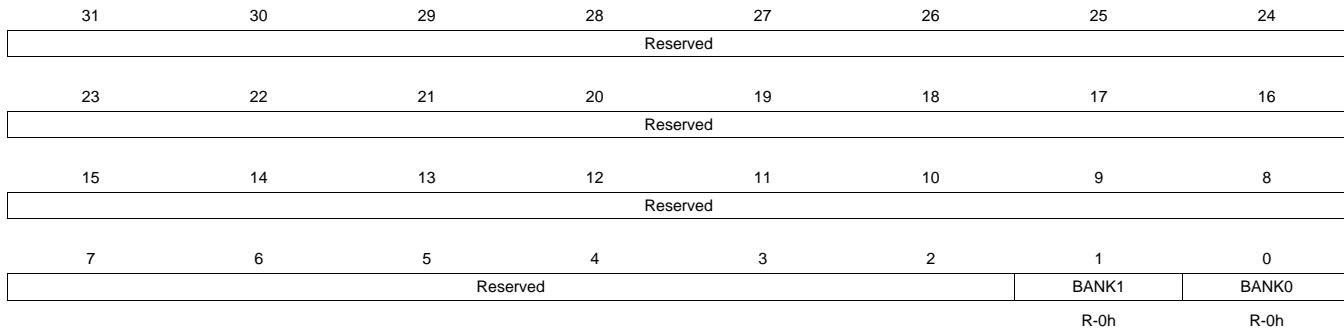

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 16-75. USB0STAT Register Field Descriptions**

**16.5.3.1 USB1REV Register (offset = 0h) [reset = 4EA20800h]**

USB1REV is shown in [Figure 16-99](#) and described in [Table 16-109](#).

**Figure 16-99. USB1REV Register**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 16-109. USB1REV Register Field Descriptions**

| Bit   | Field   | Type | Reset | Description   |
|-------|---------|------|-------|---|
| 31-30 | SCHEME  | R    | 1h    | Used to distinguish between legacy interface scheme and current.<br>0 = Legacy<br>1 = Current |
| 27-16 | FUNC    | R    | EA2h  | Function indicates a software compatible module family.                                       |
| 15-11 | R RTL   | R    | 1h    | RTL revision.<br>Will vary depending on release.  |
| 10-8  | X_MAJOR | R    | 0h    | Major revision.   |
| 7-6   | CUSTOM  | R    | 0h    | Custom revision   |
| 5-0   | Y_MINOR | R    | 0h    | Minor revision.<br>USB1 Revision Register   |

### 16.5.3.2 USB1CTRL Register (offset = 14h) [reset = 0h]

USB1CTRL is shown in [Figure 16-100](#) and described in [Table 16-110](#).

**Figure 16-100. USB1CTRL Register**

| 31       | 30      | 29                   | 28     | 27       | 26       | 25      | 24         |
|----------|---------|----------------------|--------|----------|----------|---------|------------|
| DIS_DEB  | DIS_SRП |                      |        | Reserved |          |         |            |
| R/W-0h   | R/W-0h  |                      |        |          |          |         |            |

| Reserved |         | SOFT_RESET_ISOLATION | RNDIS  | UINT     | Reserved | CLKFACK | SOFT_RESET |
|          |         |                      | R/W-0h | R/W-0h   | R/W-0h   | R/W-0h  | R/W-0h     |

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 16-110. USB1CTRL Register Field Descriptions**

| Bit | Field                | Type | Reset | Description  |
|-----|----------------------|------|-------|--|
| 31  | DIS_DEB              | R/W  | 0h    | Disable the VBUS debouncer circuit fix   |
| 30  | DIS_SRП              | R/W  | 0h    | Disable the OTG Session Request Protocol (SRP) AVALID circuit fix. When enabled (=0) this allows additional time for the VBUS signal to be measured against the VBUS thresholds. The time is specified in the USB0 SRP Fix Time Register.  |
| 5   | SOFT_RESET_ISOLATION | R/W  | 0h    | Soft reset isolation. When high this bit forces all USB1 signals that connect to the USBSS to known values during a soft reset via bit 0 of this register. This bit should be set high prior to setting bit 0 and cleared after bit 0 is cleared.  |
| 4   | RNDIS                | R/W  | 0h    | Global RNDIS mode enable for all endpoints.  |
